THEATRUM BOTANICVM:

THE

THEATER OF PLANTS.

AN HERBALL OF LARGE EXTENT:

Containing therein a more ample and exact History and declaration of the Physicall Herbs and Plants that are in other Authours, encreased by the accesse of many hundreds of new, rare, and strange Plants from all the parts of the world, with sundry Gummes, and other Physicall materials, than hath beene hitherto published by any before; And a most large demonstration of their Natures and Vertues.

Shevving vvithall the many errors, differences, and overfights of fundry Authors that have formerly written of them; and a certaine confidence, or most probable conjecture of the true and genuine Herbes and Plants.

Distributed into sundry Classes or Tribes, for the more easie knowledge of the many Herbes of one nature and property, with the chiefe notes of Dr. Lobel, Dr. Bonham, and others inserted therein.

Collected by the many yeares travaile, industry, and experience in this subject, by John Parkinson Apothecary of London, and the Kings Herbarist.

And Published by the Kings Majestyes especiall priviledge.

LONDON, Printed by Tho. Cotes.

1640.

THE KINGS MOST EXCELLENT M A I E S T I E.

Aving by long paines and endeavours, composed this Manlike Worke of Herbes and Plants, Most gracious Soveraigne (as I formerly did a Feminine of Flowers, and presented it to the Queenes most excellent Majesty) I could doe no lesse then submissively lay it at your Majesties seet, to be approved or condemned, and

if thought fit and worthy a publique passage, to offer it on the Altar of your Majestyes many favours to me, to be commanded as well as commended unto all for their owne good. For as your Majesty is Summus Pater patria, the chiefe of your people under God, that not onely provideth for their soules health, that they may have the pure Word of God, whereby to live ever, wherein we justly claime the prerogative above a. ny Nation under Heaven, and most devoutly praise God for the same, and defire religiously to live thereunder: but many wayes also for their bodily estates, by good and wholesome Lawes, that every one may live obediently and peaceably under their owne Vine and Figure, and by protection, &c. And I doubt not of your Majesties further care of their bodies health, that fuch W orkes as deliver approved remedyes may be divulged, whereby they may both cure and prevent their diseases. Most properly therefore doth this Worke belong to your Majesties Patronage both to further and defend, that malevolent spirits should not dareto cast forth their venome or aspertions, to the prejudice of any well deserving, but that therby under God and good direction, all may live in health, as well as wealth, peace, and godlines, which God grant, and that this boldnesse may be pardoned to

Your Majettyes

Loyall Subject,

Servant and Herbarift.

fay unto you that by the alteration you enjoy a double benefit, first in the bulke of the Booke which if that courfe had beene followed would have marged it well neere halfe as much more and made it the more unweldy, and likewife the dearer and never a whit the better : Secondly, in recompense of the time spent in looking for What you feek you may read that which may be more helpefull and beneficiall to you: let Momus chaps therefore be fowed up to barke no more. Among other the good uses this worke affordeth this may be one that it will helpe to correct the English names in all the Dittionaries to bee hereafter fet forth, which have them in many ignorantly, in some contrary, in most devious, in very few true, whereby many hoping for helpe in their Dictionaries when an Herball was not at hand have beene frustrated, the blind leading the blind, which how profitable, I leave to every intelligent to confider. And laftly, although Igoenot about to teach Doctors (who but little intended this practife, having enough to doe otherwayes, and yet it is as I may so say, the fundamentall part thereof, and approved by Galen in his censure of Simples, and Dioscorides Text) but to helpe their memories, and withall to shew them my judgement. that they mistake not one thing for another, or one mans plant for another, which I hope will well deferve their good liking: for the various conceites of men about Plants is for the most part according to their knowledge in them, and hath caused such mistakings and controversie, as are to be feene in their writings Goe forth now therefore thou iffue artificiall of mine, and supply the defeet of a Naturall, to beare up thy Fathers name and memo y to succeeding ages, and what in thee lyeth effect more good to thy Prince and Country then numerous of others. Which often procue rather plagues then profits thereto, and feare not the face of thy fiercest foe : but fay that while we live (although the course of the World is Orientem semperadorare Solem non occis dentem) and per multa diferimina rerum tendimus in Patriam supercoelestem, if any oppose thee, or professe himselfe a Proctor for Bauhinus or any others slips, the lists shall be ready, and the controverfie ex ore decided: if extinct let the judicious determine the matter. And because some may object fam somewhat too tart and quicke, my Apology to all is Amicus mihi Plato, Amicus Seneca sed magis Amica mihi veritas: Accept therefore in courtesie of his paines that hath onely intended it for your good, and if I have eyther slipped or overslipped, with a gentle hand amend it; so shall be still be

Thine in what he may,

IOHN PARKINSON,

Botanicus Regius.

Iohanni Parkinson Pharmacopœo Londinensi, Regis Betanico primario. S. P.

Rodeat tandem & propitià Lucinà vitali fruatur aurà decennis illa fœtura ingenii tui perspicacis, & laboris indesessi, in rimandis & aperiendis fœcundæ Vestæ penetralibus, ejusque persustranda superficie, ad Vegetabilis Regni firmamentum, cui partui neque ipsum Dioscoridem Anazarbæum pudeat obstetricari. Tam scité, tam eleganter, tam enucleaté abs te descripta depictaque omnia, quæ in hunc usque diem. Rei herbariæ stu-

diosis innotuerunt, ut habeat abundé tua Britannia unde de te possit jure gloriari: In cujus opulentissimi, amœnissimi, fertilissimi regni grande decus, Mithridatis (maximi sua ætate Regum) curiosam circa materiam medicam sedulitatem. Evacis Regis Arabum, Cratevæ, Dyonysii, Metrodori, Macri & cæterorum qui simplicium notitia cluerunt olim dotes eximias, cum neotericorum artificiosa Indagine, in unum coegisti fasciculum, datis quidem immenso disquisitionis & observationum Oceano limitibus, tam laxis tamen & sequacibus, ut ad instructissimi hujus gazophylacii supplementum, nova congeries granatim possit indies magna cum facilitate accrescere. Botanici ut plurimum meri sunt nomen clatores, qui præclaré se rem gestisse arbitrantur, si perlustratis variis plagis, nomina repertorum fimplicium, & forsan eorum Icones redigant in volumen, quo operæ pretio artisa. tis cautum existimant. Tu verò non prætermissa externa plantarum specie, ea rum corpora penetras medullitus, & fingularum virtutes in publicam falutem, & mortalium solatium tam graphice pandis, ut deinceps populares tui Angli (gens ad pacem, bellum, scientias, artes, ad omnia apta, nata) Thesauri naturæ ditissimam, morbisque tutó debellandis utilissimam partem, cultu donatam vernaculo, (historiam nempe Vegetabilium, virtutum assignatione nobilitatam) penitissime nosse, atque hasce 31 milest nudas exosculari, & sibi ipsis applicare valeant. Circa operis tui laudes volubili vel bullatà oratione expatiari injuriosum duco: quippe Vino vendibili non est opus suspensa hedera. Suum sibi parist Liber tuus encomium, quem nemo sanæ mentis, operum naturæ peritus, sine Authoris singulari commendati. one unquam perlecturus est. Siquis exoriatur Ael Momus vel Zoilus, qui Maledicendi prurigine, aut insanabili cacoethe laborans, tua carpere audeat, ille malis avibus aggressus dormientem Herculem, cum Achemone & Passalo victus vinctusque, ex victoris clava æternum pendeat. Imbellium catellorum inanes latratus spernunt generosi molossi; Non si se ruperit ille Par erit. Interim tu calumniarum securus æque & contemptor, In amplificando tuo Theatro pergito quamdiu vixeris. Hanc imponittibi provinciam, ejulque poscit soenus REX (AROLVS Dominus noster Magnæ Britaniæ Monarcha, cui placuit nuperrime honorificum tibi

dare titulum Botanici Regii Primarii, virtuti tux sane non indebitum, quo situt in Medicam Aulx samiliam accitus, tenearis opus tuum Serenissimo Principi dedicare, cum præsatione religiosa Caii Valgii ad Diuum Augustum (cui etiam lucubrationes suas botanicas offerebat illustris & eruditione spectatus vir) Vr omnibus malis humanis (præsertim fortunatarum Insularum quibus sæliciter imperat:) semper medicetur ejus Majestas: Descende audacter in arenam, in qua ut diutissime bono publico exercearis, & longissima precum vota pro Rege, Patria, probis omnibus nuncupes & sundas, atque alacriter & strenue in Botanica desudes palæstrà, opto tibi si non Artephii Philosophi, millenarii dicti, saltem nobilis Rizotomiantiqui, Antonii Cassoris (Plinio noti) sæculum, qui centessimum annum excessit, nullum corporis malum expertus, ac ne ætate quidem memoria aut vigore concussis. Vale ex meo Museo Londini Jdibus Aprilia Anno salutis, 1640.

THEODORVS de MAYERNE, Eques auratus, Baro Albona, in Aula Regum Magna Britannia Iacobi & Caroli, P.& F. Archiatrorum Comes.

In Laudem Operis, & Authoris Domini Iohannis Parkinsoni Archi Botanici Regii Dignist: & Pharmocopolæ Peritisimi.

Hic fimul Alcinoi spectas & Adonidis hortos,
Quicquid & Herbarum barbara Colchis habet.
Asplcis hic quicquid Borex contermina Thule,

Aveque vero solam genericam societatem incunt Plante cum hominibus, quia ambo in una viventium familia sed illarum plurima as Hierem vendicant cum homanic partibus sympashiam & analogiam, unde dice capiti als a oculis, alia pulmonibus, alia jecori, alia lieni specificam dicarunt operam. & ab illis quibus famulantur partibus nomenclaturas suas derivarunt, neque nuda tantum nomina earum ferunt, sed insigui a, quibus ut magnatum famuli discriminantur: nam (si Hermeticis credimus) signaturas phyliognomonicas plantis inuffit summus natura parens, & ipsis quasi tot emblemata & characteres insculpsis non modo occultarum suarum virium indices & notas sed partium quibus inserviunt figuras & expreslas imagines, incundi sima similicudine references quas Querceranus & Crollius curiosius delinearuns : gestic calamus in hoc campo liberius spatiari, sed ne cancellos suos mea transiliat Epistola, revoco me ad Theatrum euum, in quo apparei mira genii ingeniique tui in re Botanica fælicitus, labor indefessus, nec horarum modo sed (quod pudet dicere) mummorum tuorum sumptus non mediocris : Vereor mi Parkinsone, te non posse cum Matthiolo eloriari, te Macenates habuisse Imperatores, Reges, Archiduces, Cardinales, Episcopos, (ipsius utor verbu) qui auro argentoque hos conatos tuos juverint cumulatius. Credo nullos imbres aureos horsum tuum irrigaffe, su porius ut bono publico inservires privato defuisti, ut liberius vacares studio, Pharmacapolium deseruisti, spretoque vilioris lucelli aucupio totus inhortulo tuo consenescis: quid dixi, te senescere 3 nullane in Paradiso tuo arbor vita, qua senedutem tuam retardet ? nullane in Theatro tuo herba Balsamica, nettaris nativi restauratrices, ex quibus Medea suum antidotum composuit, magnum illud secretum, quo A sonem ultimo confectum senio restituit juvenunissi illarum notitia infælicim perierit, at nostrates Herbæ quæ quotannis repullulant, revirescunt. reflorescunt parem si non etati tue, fame quidem tue gratiam indulgebunt, & perenni gratitudine semper spirabuut suavem nominis tui auram : mihi cum talia desunt Pharmaca non deerum vota ve diu vivas & valeus.

Datum Calend Aprilis. 1640. Tuus

Simon Baskervill Eques Auratus. D. M. To

To Englands chiefest Herbarist, Master Fobn Parkinfon.

Worthy Sir.

Have given (as was due) many thankes to my learned good friend Dr. Bainbridge. for communicating to me the light and perufall of your chargeable, industrious, juto communicating to me the figuration possess. The Commonwealth of learning, dicious, ufefull, Herculean Boranical labours. The Commonwealth of learning, particularly the Tribe of Physitians, Apothecaries, Chirurgians, the Court of Nobles, and Gentles, of all who love knowledge, delight, and the honour and good of their Country, owe thankes to you, a Benefactour to the publique, to your Nation, tomany millions of particular persons, to the present and succeeding ages. A

Triumphall evergreene Lawrell crowne is due to you, for maftering such difficulties, for conquering the great enemyes of a civili World Ignorance and Burbarisme, for saving bimany Citizens of your owne Country, from danger, diseases, destruction, by your carefull understanding directions, for proper fit remedies, in such a rationall pleasing way. Oxford and England are happy in the foundation of a specious illustrious physicke Garden, compleately beautifully walled, and gated, now in levelling, and planting with the charges and expences of thousands by the many wayes Honourable Earle of Danby, the furnishing and enriching whereof and of many a glorious Tempe, withall usefull delightfull plants, will be the better expedited by your painefull happy fatisfying Worke.

THO.CLATTON, His Majelies professor of Physicke, Oxon.

To the excellent Herbarist M. Fobn Parkinson.

Am a stranger to your selfa, but not to your learned, and elaborate volumnes. I have with delight, and admiration surveyed your Theatrum Botanicum, a specious, and statewith delight and admiration surveyed your Theatrum Bosanicum, a specious, and state-ly Fabrique, collected and composed with excessive paines, and charges, exquisite Art, and Judgement: wherein; may at once be seen, whatsoever (worth th' observing) lyeth dispersed in the severall Boranique monuments of former Ages, and the present; It being indeed, a felect Destoration of some Ages, and the present: It being indeed, a select Defloration of them all : enriched, and beautifyed with new discoveries (at home, and abroad, so far as both th' Indies) of many rare Plants,

Herbes, and Flowers. It is a curious pourtait, and description of the Earths flowerd mantle, the Botanique Pandects, and the Herbatists Oracle a rich Magazitt of soveraigne Medicines, physicall experiments, and other ratities. And which I may not omit. It is (not without th' influence of some benigne Constellation) an Auspicious designe of our Dxford Garden, which being (by the Munificence of the Honorable Founder) once finished, will be * 590anua musques, th' eyes Rendez.vom, * Elian in of most delightfull, and ravishing objects; another Paradise. In a word, this Theater, is without the description Parallell, the most compleate, and absolute Worke (in this kinde) yet knowne unto the world: and on of Tespe, will be a perpetual! Monument of your Name, Art, and Industry. Such (Sir) is your merit, and the vote of one that is fincerely,

Philips of Land

Your affellionate friend IOHN BAINBRIDGE. Doctor of Phylique, and Professor of Astronomy, Oxen.

To the Worthy Apothecary and Herbarist Mafter IOHN PARKINSON.

Outsive built us a Boranicke Theater; with fach excellent skill and advantage to the Outside built us a noranice a neares, with near one of the Hernitphers; and all Speciator; that at one view he commands the prospect of both Hernitphers; and all their vegetables in the pride of beauty: ranged in their proper orders, decking the Hils, Plaines, Valleyes, Medowes, Woods, and Barkes, with fuch a world of shapes and colours, so delightfull to the eye, so winning upon the rationall Soule which feeds on ra-rities! that we cannot hope for a more compleate Paradise upon earth; till Nature have found out a new stocke for more variety; what can be added to this I see not; nor is it (I believe) yet knowne to the best of Artists that have made search.

Io. Speed . Med. D. Oxon.

Iohannes Mauritius.

To my good Friend Mr. Iohn Parkinson.

译说Y Age of Verse is out, what then! shall [Be filent, and not open in this cry And generall applause? that have more cause Then some that crowded in; nor shall the lawes Of friendship draw me from the rigide way Of bare and naked truth, and force me say, In Court civility, more then what I thinke. Such compliment is on the very brinke Offlattery, and destroyes the very soule And essence of true friendship, makes't a foule Commerce of mutuall fordid ends, which is The Panacea of humane miseries. But whether now my Muse?'twas not my end To treate of friendship, but to praise a friend. This weary worke of thy unwearyed braine Shall doe't for me, and fave my further paine. But fost, that's onely for the Authour, shall I give nought to the Worke, which gives thee all Whatfoere th'haft here from us, because 'tis fuch ; As like good wine it doth require no bush? It were indeed not needfull, if that all Would enter in and tafte without a call, And gentle invitation: as in trade Chapmen passe by nor enter, if not made And ply'd, yearudely, with a violent hand. To such thy Customers, which come and stand, As twere at gaze. I promise here good ware. And cheape: all trees, all shrubs, all herbes, that are In the voluminous Dioscorides Theophrastus, Galenor Hipocrates: Cratevas or th'acute Arabians, who Retriv'd this Art first, and all th'other too. After the generall Deluge of the Goths, And swarme of other barbarous Nations, moths. And cankers of good Letters: nor here wants Whatfoere the diligent Modernes have of Plants Omitted by the ancients, out of which Gleanings thou here hast made a pretty, rich. And fruitfull harvest, neither dost thou spare Tinfert whatfoere the other world doth beare. Nor temperaments, or vertues dost thou misse, Names, faculties, or properties; and this

With such a perspecuity the while,

Order in dwethod that it does beguile.

The readers paines to charmingly, that he
Thinkes it compendious, though so vast it be
And calle for Endownealthe, and he has r.

And I my pumpose too saying this at last:

If any in this subject, seeke more now;

Nature must adde to what the hast done; not thou:

The properties shall follow.

I Hyspopu Vulgaria. Common garden Hyspope
The common garden Hyspope is so well knowne to all that have a garden, or that have beene in a garden, that I shall but seeme aitum agere to bestow my time in describing it to be a small bushy plant, that riseth up more than a foot high; with many wooddy branches, but tender; at the tops whereof are set at certaine distances, sundry small long and narrow greene leaves: at the tops of the stalkes stand blewish purple gaping slowers, in spiked heads one rowe above another: after which sollow the signal and blackish the records is somewhat wood. feed, which is small and blackish: the roote is somewhat wooddy with many threddy strings: the whole plant is of a strong fweete fent.

2. 3. Hysopus folius nineis: & folius aureis. White Hyfope, and golden or yellow Hysope.
These two forts of Hysope are both of the same kinde with

the common Hysope, but differre onely in the party colouring of the leaves; the white having diverse leaves parted white and greene in the midst, and some all or most part white, and some wholy greene, or with some stripes in the greene: for all these forts are seene together upon one Plant. The golden or yellow fort, hath the uppermost leaves usually wholly yellow in the summer time, parted with greene: the lower leaves often abiding

without discolouring.
4. Hysope folys cinerius. Russet Hysope.
This Russet Hysope also different from the former in no other chiefe matter, than in the colour of the leaves, which are of a grayish or all colour, which some call Russet; this is likely to be that fort that Banhinus faith was fent him from England,

1. Hilloprus Perculis denfis Double Hylope. This Hylone groweth lower, and thicker fet with slender and not fo wooddy branches, bending fomewhat downewards, and

much

6. Hyffopm latifolia.

7. Hy Jopus foliis crenatis.

TRIBE. I.

much more thicke fet with leaves of a darke greene colour: in the flower and other things it different not from 6. Hyssopus latifolia, Broade-leafed Hysope,

This also differeth not from the first here specified, but in having larger and broader greene leaves, upon more woody stalkes, keeping forme and substance.

7. $Hy||^2pus foliys crenaris$. Iagged or dented Hysope. This difference of the dented leaves, maketh me to set it downe as another species hereof, as others have done.

8. Hyffopus moschata vel de Cilissa. Musked Hysope. Gesner in Hortis Germania remembreth this Hysope to differre nothing from the ordinary Hyfope, but in the fent, which is fo gratious and pleasant, that it commeth neerest to the sent of Müske.

9. Hyffopus Arabum floribus rubris vel albis. White or red flowred Hylope.

The red or white flowred Hysope differ but a little from the garden fort, yet are diftinguished from it, in that they both doe usually beare red or white flowers, all on one side of the spike, yet continue not constant in that forme, but change into the forme of the ordinary kinde.

10. Hyslopus minor sive Hyspanica. Dwarfe Spanish Hysop. This Spanish kinde is a smaller and lower fort, whose branches rise not so high as the garden Hisope, but bend a little downewards, the leaves also being smaller and thicker, and of a sadder greene colour, and the heads or spikes are also shorter, this, Hyssops parva angultis solits.

11. Hyssops Coronata sive Comosa Cluss.

Tufted Hysope is in leaves, flowers, and manner of growing.

fomewhat like the common garden kinde, but a little smaller and lower, the leaves being of a paler greene colour, and the top branches spreading a little broader, have shorter spikes of leaves and flowers growing as it were in tuftes, which liath caused the name, and noted it for a difference.

12. Hysopus folius crispis. Curld Hysope.
Curld Hysope hath the leaves curled or crampled at the edges, that each leafe feemeth to be composed of many: and herein consiste th the chiefest difference.

9. Histopus Arabum. 10. Hyffapus minor fine 21: flanten! Derarfe Spanish Hysope.

13. Hystopus montana. Mountaine wilde Hystope.

Mountaine or wilde Hystope is very like unto the garden kinde, for the manner of growing: but that the leaves which are not so many at a joynt, are somwhat harder and rougher, and a little hairie, and somwhat narrower also which (as Matthiolus faith) being brought into gardens, and there cherished; will by time put off that roughnesses.

and become more milde and gentle, the taste whereof is much more bitter, and nothing so hor or sweete as the common kinde: the flowers and feedes are like the garden fort, both for forme and colour.

14. Hysopiu angusti solia spicata, Narrow leased Hysope.

Narrow leased Hysope is a fine kinde, and hath many slender hard stalkes, whereon are set at distances, as in the Narrow teared reyrope is a line kineckare has but longer and narcommon Hysope, many small greene leaves, but longer and narrower than they, and ending in a longer point: the flowers likeRound leafed Hysope.

Narrow kared Hysope. the middle of the stalke up to the topes, of a blewish purple colour like the ordinary kinde, but much smaller and so is the seede also: the branches hereof will take roote and grow being laid into the ground, the roote spreading much in the earth.

15. Hysopu felips origani. Round leased Hysope.

This Hyfope hath divers hard woody stalkes, whereon grow fundry small and almost round leaves, one against another, but pointed at the endes, the heads or spikes of flowers are like unto the common fort, of a blewish purple colour; the sent also differeth little from it.

Gerard hath fet forth an Hysope with the leaves of Nummui ria, Monymorte, which peradventure might bee this kinde, yet Is never faw fuch an one with him. The Place.

Pena faith that our common Hylope, groweth on the hills of Romania about Verona, and neere unto Mount Raidus: the dwarfe kinde in Spaine, and the mountaine wilde kind, on the hils in many places of Germany, and as Matthiolus faith on the hill Salvatin in the Country of Goritia: the rest, with these also when they may be gotten, are noursed up in the garden, of the curious.

The Time. They doe all flower in the fummer moneths of June and July, and their seede is ripe in the beginning or middle of August. The Names.

It is called in Greeke " 10 was , fic dici putant quasi vousvor (pro xubμετον) στην ο πο, quia super vultus affunditur, in Latine Hysopus & Hysopum, of the Arabians Cyfe, sufa and laves, of the Italians and Spaniard: Hisopo, of the French Hisopo, them, are futficiently expressed in the titles and descriptions of

them. But there is a great controverse among our later writers, what hearbe should be the true Hysope of Diefthem. But there is a great controverno among our many for that our common Hysope is not it, but is the true Hysope of the Ara-corider; and other the Greeke authours; for that our common Hysope is not it, but is the true Hysope of the Ara-bians, as all doe acknowledge except Matthiolus, who doth earnestly contend, that our garden Hysope is the same of Dioscorides, whose arguments are too weake, to perswade any to be of his opinion, for the description of Dioscorides his Hysope hath no face or true resemblance with ours, his bearing tufted heads like Chrysocome or Goldilockes, as he compareth it; and ours in spikes: the leaves also of his are like unto the Origanum Onitis, which are fomewhat round like Marjerome, as you may fee heere shortly after, and are not narrow and long, as those of our Hylope are: therefore Lugdunensis setteth forth a round leased Hylope, which he taketh to be the true Hylope of Dissertides, but neither are the leaves thereof whitish, as those of Onics, nor doe the heads much differ from the common Hysope: Lobel also propoundeth another, that is our pot Marjerome to be the right, in that it hath roundish leaves like Organum, and tusted heads of flowers that are spread abroad like it also, this he saith, is the likelieft hearbe, comming neerest unto the true kinde, unlesse as he faith, it may be referred unto an Origanum: but Fabius Columna confuteth that of Lobel and Pena, as well for that the tufted heads, are more like unto wilde Marjerome, then unto Chrysocome, or garden Marjerome, as Crasevas, Serapio, Maack, Mesus and others doe compare them, as also that the leaves of Dioscorides his Hysope, are whitish like unto Origanum Onitis which those of Lobels Mar jerome is not : besides this, that it is a kitchen hearbe, fit for meate and sawce, and so is our ordinary Hysope also, and not a Physicke hearbe as Dioscorides maketh his to be: and lastly, that neither Lobel his Marjerome, nor yet our Hyfope, are equall in the properties unto that of Dioscorides and others, how soever it is usually received in the steede thereof: thus faith Fabius Columna, and therefore by many reasons would perswade us to believe, that our ordinary Polium montanum is the true Hysope, as well for that the leaves are white, and the heades of flowers like unto Origanum and Chrysocome, as he faith, as also for that his vertues and properties by the bitternesse thereof are more effectuall in all the difease, whereunto Plinye applies his Hysope, which are nor remembred of Dioscorides; and that although Dioscorides maketh no bitternesse in his Hysope, yet Serapio doth as he saith: thus much Columns. But let me fay seeing he himself faith, that our Polism is answerable in all the parts thereof, unto the Polism um of the auncients, I fee no good reason, why it should be their Hysope also, and therefore I think, we may as well refuse his Polium, as he doth Lobelt Marjerome. Others also would make Gratiola to be the true Hysope, which hath leffe likelihood than any of the former. Baubinus in his Pinax would make our ordinary Rosemary, to be the Hylope of the Hebrewes, taking peradventure his ground from the Scripture, in Saint Johns Gospell, the 19. thap. and 29. verse, where the Souldiers bound a sponge wet in vinegar, to the end of an Hylope stalke, to put it

Rocke Sayory.

to our Saviours mouth when he was on the Croffe, in that our ordinary Hysope hath not so long a stalke, as might reachup so high; but both the Evangelists, Matthew and Marke say it was a reede, and it may bee that the Hysope stalke was bound therevnto, for Saint Iohn as an eye witnesse of what was done, calleth it as before: Now it is not likely that the Iewes had an other Hylope, divers both from the Greekes & Arabians; but rather that their Hylope was the same of the Arabians, being their neere neighbours, and as it should seeme, was so familiar to their Countrey, that it grew on mudde-walles, as the Scripture faith that Salomon spake of it; which I verily thinke Rosemary doth not. But Hysope is often mentioned in the Scripture, to bee used in the Iewes ceremonies, which was not without materiall fignification; for as Saint Paul faith, all was done among them in types and figures, and to bee rightly understood and well applied, were worthie of much observation and good use. Now although the true Hyfope of Dioscorides, and the other Greekes, is not yet certainely knowne, yet affuredly this which is knowne, and generally receaved may fafely be used in the stead thereof, until the true Hysope may be knowne, The Vertues.

Dioscorides faith, that Hysope boyled with Rue and Hony, and drunke doth helpe those that are troubled with Coughes, shortnesse of breath, wheeling, and rheumaticke distillations upon the lungs; taken also with Oxymel, it purgeth groffe humours by the stoole, and with hony killeth the wormes in the belly, and taken allo with fresh or new figges bruised, helpeth to loosen the belly, but more forcibly, if the roote of the Flowerdeluce and Creffes (yet some copies in stead of Cardamon have Cardamonum, which I never knew put into any purging medicine in our times, and Macer his verse doth intimate Cresses thus : Cardama si jungas his solves forting alvum) be added thereunto : it amendeth and cherifieth the native colour of the body, spoyled by the yellow-jaundife. helpeth the dropfie and the splene, if it be taken with figges and nitar : being boiled with wine, it is good to wash inflamations, it taketh away the blew and blacke spottes, and markes that come by strokes, bruises, or falles. being applied with warme water; it is also an excellent medicine for those, that are troubled with the Quinsie, or fwelling in the throate, to wash and gargle it, being boyled with Figges; it helpeth the tooth-ach, being boyled in vinegar and gargled therewith; the hot vapours of the decoction, taken by a funnell in at the eares, easeth the inflamations of them, Mesues saith the singing noyse of them; Pliny addeth, that it is an enemy to the stomacke, and provoketh casting being taken with figges: being bruised, and salt, hony, and cumminsede put to it, it helpeth those that are stung by serpents. Galen is very briefe herein and onely saith, it is not and dry in the third degree, and of thin parts. Matthiolus faith, that our Hyfope is of thinne parts, and that it cutteth & breaketh tough flegme. it rarifieth or maketh thinne that which is thicke or groffe, it openeth that which is stopped, and clenseit that which is corrupt, the oyle thereof being announted killeth lice, and taketh away the itching of the head, it helpeth those that have the falling sicknesse, which way soever it be applyed, but more especially being made into pilles in this manner. Take of Hysope, Horehound and Castoreum, of each halfe a dragme, of the roote of Peonye (the male kinde is most proper in this disaste) two drammes, of Assatida one scruple, let them all bee beaten as they should be, & made into seven pilles (or more if they be too great) which the juyce of Hysope, and one of the greater, or two small ones, taken every night going to bed is appointed; the best Physicians of our tymes, assured does account it, to be hot and dry in the third degree, and of thinne parts; for being sharpe and a little bitter withall, they apply it effectually, for all cold griefes or diseases of the chest and lungs, helping to expectorate rough slegme, that fluffeth or oppresset them, being taken either in a loboe or licking medicine, or in a Syrupe, or any other way, and in a decoction thus; Take an handfull of Hysope, two ounces of figges, and one ounce of Sugarcandy, boyle them in a quart of Muscadine, untill halfe a pin be consumed, which being strained, & taken morning and evening, availeth much for those that are troubled with an old cough, by causing the rough slegme the more easily to be avoided. leth much for those that are troubled with an one congrupy stating the tough negme the more camy to be avoided a it helpeth also to provoke wine being stopped, or that is made by droppes; it helpeth to breake winde, and to cause womens monethly courses, and easeth the sharpe fitts of agues; the greene hearbe being bruised and a little sugar put thereto, doth quickly heale any greene wound or cut in the hand, or else where being applied thereto.

CHAP, II

Thymbra sive Satureia. Savorie.

Here are Foure or five forts of Savorye, two most usually to be seene in many gardens, but there are three others that are more rare.

1. Saturcia vulgaris, Winter Savorie.

The common Winter Savory, is a smal & low bushie herbe, very like unto Hysope, but not much above a foote high, with diverse small hard branches, & hard darke greene leaves theron, as thicke set as Hysope, & sometimes but with foure leaves fet at a joynt, of a reasonable strong sent, yet not so much as the Sommer kinde : the flowers are of a pale purplish colour, set at severall distances at the toppes of the stalkes, and leaves also under them: the roote hath divers small strings thereat, and abideth with greene leaves all the winter, and is more using ally encreased by slipping then fowing.

2. Satureia Hortensis. Sommer Savorie. This also is a small tender herbe growing up with divers brittle branches, slenderly or sparsedly set with two long narrow leaves at each joynt, soft in handling, and of a stronger and quicker sent and taste: the flowres are small and purplish, set at the joynts with two leaves under them up to the toppes of the stalkes: the seede is of a darke colour, bigger then Tyme seede by the halfe: the rootes have fewer strings and perish every yeare, and must be new sowne every yeare.

3. Satureia Spicata S. Iuliani. Rocke Savorie.

Rocke Savorie hath many flender, hard, and woody brownish stalkes about a foot long, whereon doe grow at severall spaces, many very small and narrow leaves, very like to the leaves of the true Tyme, but somewhat longer, of a sharpe quicke taste, and of a strong sweete sent: at the toppes of the branches, come forth many spiked heads of small leaves, & out of them thrust forth purplish flowers, which afterwards give a small, brownish seede, more like Tyme then Savory, the whole plant will be sometimes of a sad purplish colour, dasht over with a white mealines, as for the most part all Sea plants are: this doth seldome endure a winter with us.

4. Thymbra five Satureia Cretica legitima. The true Savorie of Candie. The true Savory of Candie brancheth forth from the ground like Tyme, with many purplish square branches,

Somer Savory. 2. Satureia bortenfis.

3. Saturcia (picata

S. Juliani

4. Thymbra five Satureia Crezica legitima.

The true Savory of Candy.

coverd over with a rough or havrie downe: from the lower joynts of the stalkes come alwaies two branches, and two leaves fet at them, and so in like manner all along the branches two at every joynt, one against another on the contrarie side, and are very like unto the leaves of the true Tyme, but somewhat hairye, of a sweete sent and sharpe taste betweene Tyme and Savory; on the toppes of the branches at certaine distances one above another, grow forth heads or tusts of greene leaves, from among which itart forth many purplish flowers like unto Tyme, slanding in brownish huskes: the feede is of a blackish browne colour, very like unto Tyme; the roote is fomewhat long, hard and woody, with some small blackish fibers growing from it, and will as hardly winter with us as the last, although the lower branches that lie on the ground are apt to take roote, which sheweth, that in the naturall place where it feeleth no cold winter, it speadeth and increaseth.

5. Satureia Cretica Spinosa. Prickly Savory of Candv. Pona, in his Italian description of Mount Baldus maketh mention of this Savory, but without any description or further relation; whereby I gather that there is small difference betweene it and the last, saving that as in the Chamadrys (pino fa, the branches have small prickes on them at the ends, and therefore I cannot yet give you any further know-

ledge of it, having not seene it. Baubinius also hath made mention of another, received from Contarenus for Thymbra, and as he faith is the Satureia Dioscoridis by Matthiolus; but because I doe not thinke it to be a Savory, The Place and Tyme. I forbeare it here.

All these Savories are with us onely noursed in gardens, but they are as wilde hearbes in divers parts of Europe, especially in Groves very plentifully, and are intituled to their places; flourishing in the end of summer, some

not abiding the winter. The Names.

It is called in Greeke, θύμβεον το θύμβρα forte από το θύων ob fragrantiam, in Latine Satureia, aljis a saturando dicta, alijs, a Satrris nomen traxisse putant, eo quod, coitus marcessentes stimulat : some also call it Thymbr. in Latine, and some take Satureia & Thymbra to bee differing plantes. The Arabians call it Sabuter or Sabutar, the Italians Savoroggia Coniella & Peverells, the Spanyardes, Axadrea & Segurella, the French, Savoree, Saurictte & Sadree, the Germanes, Kunel, Zwibe Hylope, & Sature, the Dutch, Kenle, and winter Kenle, and we in English, Savoryc. There is much controversie among our moderne writers, what hearbe should certainely be the Thymbra of Dioscorides, which in his time as it should feeme was most familiarly known, & therfore giveth no further description thereof, then that it was like unto Tyme, but leffe and more tender, having heads of greene flowers, and that it grew inrough and ftony places. Matthiolus giveth us one, Lobel another, Clufini a third, and each entitle theirs.

The true Tyme of the

leaves are fet at distances, many growing together, but without either smell or talte utterly: The stowers are of a pale purplish colour, and grow like the common forts, at the toppes round about the branches. 6. Serpillum Narbonense. French wilde Tyme.

6. Serpillum Narhonenfe.

French wilde Tyme.

This wilde Tyme groweth with many hard or wooddy branches, fomewhat upright, leaning a little downewards, somewhat like unto our garden Tyme, set with many leaves together at spaces, which are somewhat longer then the rest, lesse sweet, & more strong and heady in fent formwhat like unto Southernwood, & lesse hot or thatpe also, in taste: the flowers grow in wharles or roun-ling by spaces towards the tops of the stalkes, with some leaves at them being of a purplish colour, very like unto garden Tyme: both stalkes and leaves are of a whitish hoarines, and abide all the winter.

7. Serpillum mains. The greater mother of Tyme.

- 7. Serpillum majus. The greater mother of Tyme. This greater Mother of Tyme groweth more upright then the common wild kinde doth, with two leaves for the

to be Vera & leoitima : Matthiolus, because it was sent for it, Pena because he founde it growing on Saint Inlians Rocke in the Florentine dominion, and Clusius, because Honorius Bellus sent him the seede from Candye, who saith. that the Candit Greekes call it to this day usually Thrubi & Thrumbi : but it is certaine, that neither our winter or fummer Savorv doe answere unto the Thymbra of Dioscorides, for that neither of them is like, or lesse then Tyme, although they are familiarly eaten by divers nations being put into brothes, meates, &c., as Diofeorides faith of his garden Thymbra, which as he faith is much lesse then the wilde sort of Thymbra, The first is generally called with us S. unreial yberna, Winter Savorye and by Camerarius, perennis; by Lobel Satureia sive Thymbra altera; by Casalpinus, S.timeia lyberna, Winter Savorye and by Camerarius, perennis; by Lovet Satureia give I nymora auterazoy Cajaipinus, Satureia Hortensis. By Brunselsius, Hyspopus Agressis; but Thymbras; by Anguilara, by Gesnerinboriis, Thymbra agressis; Satureia montana, by Baubinus: The second is generally called Surreis satureis soverenss, or Thymbra sativa, by most writers, but Tabermontanus & Casalpinus only call it sunia, and Thymbra agressis: Gesner in bortis, Tlymbra vera, and Baubinus, Satureia hortensis sive cunila Plinis: but I somewhat doubt whether Pliny means this Satureia to be Cunila in his 19. booke and 8, chap, or some of the other forts. And for the name Cunila, it is by him referred to divers other plants; for Origanum Heracleoticum is called by him Cunila gallinacea, Lib. 20. c. 16. and Origanum fluestre Cunila bubula (as Dioscorides hath it also, as shall bee shewed hereaster) Levisticum also otherwise called Panaces, is falsely called Cunila bubula by Cratevas, as Pliny sheweth both in the 8. chapter of his 19. booke, and in the 15. chap. of his 20. Againe, in the 10. chap. of his 32.booke, he nameth an other herbe Cunila copitata, which in the fourth chap. of his 24. booke hee seemeth to name Policemum, whereof also Dioscarides maketh mention; in an other place he saith, that Cunila is called Cunilago: Columella also calleth Satureia, Cinila, but he maketh Thymbra and Saturcia to be two fundry herbes, lib. 9. chap. 4. dereruftica; as also in this verse, Et Saturcia Thymireserens Thymbras, saporem: but Pliny in his 19. booke and 8 chap, maketh them to bee both one. The third sort is called by Lobel and Pena, Thymbra vera S. Inliani, Lugdonens and Tabermontanus, Tiymbra vera Pena; Bauhimu in his notes upon Lugdunensis saith, that the Saxifraga vera Dioscoridis of Matthiolus is this Thymbra vera of Lobel and Pena; which it is very probable to be, both figure and description answering well thereunto, as any that will compare them may see. The fourth is called by Clusius, Thymbra legisima, Prosper Alpimus, Thymbra Cretensis, and Pona, Thymbra Legitima Dioscoridis, and so doe I thinke also, no other that wee know comming neerer thereunto. The Vertues.

Our Savory of both forts is hot and dry in the third degree, especially the summer kinde, which is both sharpe and quicke in taste, expelling winde in the stomacke and bowels, and is a present helpe for the rising of the mother procured by winde, provoketh Vrine and womens courses, and is much commended for women with child to take inwardly, and to finell often thereunto: Some that from Satyris thinke Satureia to be derived, say it helpeth the difease called Satyriasis or Pryapismus, and to helpe dull or decayed coiture: others taking it to bee derived a faturanda, fay it is in familiar use with many to procure a good appetite unto mean, and to take away all manner of loathing to the same: it cutteth tough slegme in the chest and lunges, and helpeth to expectorate it die more easily: it helpeth to quicken the dull spirites of the Lethargye, the juice being snussed or easily into the notifils: the juice also is of good use to be dropped into the eyes to cleare the dull sight, if it proceede of raw thinne colde humours distilling from the braine: the juice also heated with a little oyle of Roses, and dropped into the eares, caseth them of the noyse and singing in them, and deasenes also soutwardly applyed with white flower in manner of a poultis, giveth ease to the Sciatica or hippe gowte, or paralyticall members, by heating and warming them, and taking away the paine: it taketh away also the stinging of bees, waspes, &c.

CHAP. III.
Thymum & Serpillum. Tyme, and Mother of Tyme.

Have joyned both these sorts of Tyme in one Chapter, for the neere vicinity they have together, both in name and nature, yet eache by themselves they having many sorts apart. 1. Thymum legitimum capitatum. The true Tyme of the ancients.

The true Tyme is a very tender plant, having hard and hoarye brittle branches, spreading from a small woody stemme about a foote and a halfe high, whereon are set at severall joynts, and by spaces many small whitish or hoary greene leaves, of a quicke fent and tafte: at the toppes of the branches frand small whirish greene heads, fomewat like unto the heads of Steeches, made as it were of many leaves or scales; out of which start forth small formewat like unto the heads of statement, made as it were of many leaves of reales; out of which that forth iman purplish flowers, not having any other feede (as Theophiraftm and form other of the old authors have fet it downe,) and therefore appoint the flowers only, to be fowne as if there were no feede in the heads, thinking it to fpring of the flowers alone, which was an errour in them by tradition not experience, for we have found it otherwise. 2. Thymum durius vulgare, Our common garden Tyme.

Our ordinary garden Tyme, is also a small low woody plant, with brittle branches, and small hard greene leaves out ordinary gattern 17ms, is an a man low woody panel, white purplish flowers, standing with some leaves in roundles round about the toppes of the stalkes; the seede is small and browner then Marjerome seede; the roote is woody and abideth well divers winters, if they be not too violent, and the plants not growne too great or woody, which then will perish therein.

3. Thymum durius Candidius. Hoarye Tyme. Among the feedes of the last recited Tyme, which I fowed in my garden, came up this hoarye Tyme, which is in forme like it, but that the branches are smaller, and the leaves whiter or more hoary, a littleals o more thinly or sparfedly fer on the branches; the flowers, feedes, and rootes are like the former, and so are both fent and taste, bor ra-

This Tyme groweth not so upright as the former, but rather lyeth and spreadeth upon the ground, small but many more branches, nothing fo woody; the leaves also are not so hard but broader; the flowers are of a purplish white colour, standing in roundles as the two first forts.: this better endureth the winters, and longer, yet giveth no feede, but is propagated by flipping: the tafte and fent is not altogether so quicke as the ordinary garden kinde.

This is a lowe small shrubby plant, very like unto the sirst kinde, with hard branches and hairy more then it: the

TRIBE I.

most part at a joynt like the other, but greater and not of so darke a greene colour, but rather resembling Marjerom leaves; the flowres grow at the toppes of the stalkes, of a redish purple colour like unto garden Tyme, but somwhat larger as the whole plant is and of a small, but somewhat hot sent and taste.

There is another of this kinde, that beareth white flowers and fresher greene leaves, else in other things like the

8. Servillum latifolium hirfutum. Rough Mother of Tyme.

This Nother of Tyme groweth in most things like the ordinary fort, speading on the ground in the same manner, but that the branches are more hoary or white, and the leaves somewhat rounder and rougher, or as it were hairic, finelling like unto Bitumen or hard pitch, which hath no good favour pleafing to any: the flowers and other parts thereof are like the common Mother of Tyme.

9. Serpillum Pannonicum Clusij. Hungarian Mother of Tyme. This finall Mother of Tyme creepeth upon the ground, taking roote as it spreadeth, with many square stalkes set

with leaves, two alwaies at a joynt, but more thinly or sparfedly growing on them, then the ordinary wild kinde, and are narflowers growe at the toppes of the branches not unlike the com-most kinde, and hath little or no fent at all.

There is an other of this kinde little differing but in the hoarines of the leaves from the other.

10. Serpillum Vulgare minus. The ordinary small wilde, or Mother of Tyme

10 Serpil.um vu'gare minus. Ordinary Mother of Tyme

This lesser wilde Tyme fpreadeth findry hard brow min longbranches rounde about the roote upon the ground, which take roote againe as they lye and fpread; the leaves are imall, and of a fad green colour, finelling like unto Tyme almost, but nothing fo ouicke either in incil or tafte the flowres grow at the toppes of the branches of a purplish or white

colour, for of both forts some are so found.

11. Serpillum Citratum. Lemmon Tyme.

The Lemmon Tyme is somewhat like the common wild kinde in the manner of growing, but flandeth more upright, bufhing thicke with branches, the leaves are small and of a darke greene colour like them, but have the fent of a Pomecitron or Lemmon: the flowers are more white then in the common forts.

12. Serpillum Moschatum, Muske Tyme.

The Muske Tyme also groweth somewhat upright, but with fewer stalkes and thinner fet with somewhat longer leaves, which are not of to fad a greene colour, whose fent is much neere unto the fent of Muske, and therupon tooke the name.

13. Scrpillum aureum five versicolor. Guilded or embrodered Tyme. In the variable mixture of greene and yellow in the leaves of this Tyme, confifeth the chiefest difference of this forte, from the common wilde kinde, for the greene leaves thereof are in some kriped, in others edged with a gold yellow colour, which hath caused the guilded or embroidered name.

The Place.

The first or true Tyme groweth plentifully about Sevill in Spaine, where they use and know no other Tyme, as also in Syria, &c. and vet as Cinfins faith all the rest of Spaine, neither use it nor know it, but use our common garden kinde, which groweth in old Castile veric plentifully & in divers other places in Spaine; the fourth we plane in our gardens ordinarily by flipping not fowing: the fift in the Kingdome of Valentia in Spaine neere the feafide at Alikanta: the fixt Clusius saith, hee found in old Castile, growing promiscuously with our common garden Tyme; and Lobell and Pens say it was found in Narbone in France : the feventh is planted in the gardens of the curi-

11. Serpillum Citratum. Lemmon Tyme.

ous, and the naturall place not well knowne to us: the eight Banhimus faith, groweth in many of the dry grounds ons, and the natural place not well known to us; the tight Summer rathing groweth it many or the dry grounds about Baffill: the ninth, Classia faith he found in Hungary: the tenth is common with us generally in most countries, and that with white flowers on Bushie heathe, in Digswell pastures by Hatfield: and the eleaventh in many places in Kent, between Southsleet and Longheld downes, and between Rochester and Sittingborne, even any places in Kent, between Southsleet and Longheld downes, and between Rochester and Sittingborne, even many places in the high way, where by the fent chiefly it is to bee knowne from the common: the two last are noursed up in gardens onely. The Tyme.

The first true kinde flowreth late with us, as not vntill August with the soonest: the rest for the most part in Inly or thereabouts.

Tyme is called in Grecke, θόμος ἀπότε θυμέ, quodiys qui animi deliquium patiuntur adhibeatur, ali, ἀπό τος θυμάσεος κὶ, τῶς Scons deducunt, quad hoc veteres in sacris, qua igne accenso fiebant, primum us sunt ; in Latine, Thymus & Thywign: the Arabians Haice, the Italians Thymo, the Spaniards Tomilho, the French Thym & Marjolaine d'Angleterre, the Germanes Quendel, & the true kind Romscher Quendel & welsher Quendel, the Dutch Thymu, & we in English Tyme, or garden Tyme, or as they are in their titles. Serpillum or Serpyllum is called in Greeke Ερπυλλος από το εκτείο a serpendo dictum, of the Arabians Hemen, of the Italians Serpillo, of the Spaniards Serpillo, of the French Serpoller, of the Germanes Huner Kol, of the Dutch Quendel, or wilde Thymus, & we in English wild Tyme, or Mother of Tyme. The first true Tyme is usually called by all that have written of it, Thymum legitimum, or Capitatum, or Creticum as Cordus & Camerarius do but it is not that which the old Gerard setteth downe for it: the second is called Thymus vulgaris & nostras by many authors, and Thymum durius & nigrum by others, & by Cafalpinus Pepolina: the fourth is called by Lobel Thymum latifolium, and Serpyllum hortenfe by others: but Bauhinus doth not number it among his Tymes, but calles it Serpillum; jus latifolium, and is the same with Mathiolus his Serpillum, although Bauhinus doth distinguish them: the sift is from Bauhinus; the sixt is called by Lobel Serpyllum Narbonense, and by Clusius Serpyllum Jylvefire Zygis Dioscorides: the seventh Camerarius calleth Serpyllum majus flore purpures, and that with the white flower flore candido, but both the old and new Gerard, have erred in the figure and discription therof: for this majus and the folijs Amaraci are both one; the eighth is of Baubinus his relation and denomination: the ninth of both forts, Clufius calleth Serpyllum Pannonicum, and Bauhinus, angustifolium glabrum of hirsutum: the tenth is called by most authors Serpyllum, or Serpyllum vulgare minus by others: the rest have their names in their titles, as whereby they may fitliest be called.

The true Tyme, or in the want thereof our garden Tyme, (as nearest thereunto, although not altogether so effectuall) doth helpe somewhat to purge flegme, if as Dioscorides saith, it be taken with hony salt and vinegar : the decoction thereof is good for those, that are troubled with shortnes or straightnesse of breath : it killeth the wormes in the belly, procureth the monethly couries of women, expeller the ferondine or afterbirth, after it hath holpen the delivery of the child, & causeth case expectorations of rough segme, being taken with hony in an Electuary; it dissolve the tumours or swellings when they are fresh; the juyce thereof being annoyated or bathed on the place with some vinegar, taketh away loose or hanging warts: it helpeth those that have the Sciatica, applyed with

The Vertues.

place with some vinegar, taketh away loose or hanging warts; it helpeth those that have the Sciatica, applyed with wine and meale: it helpeth those that are dull sighted, and is of good vse in meates and brothes, to warme and comfort the stomacke, and to helpe to breake winde as well for the sicke as the sound. Galen saith the same things almost. It is found by experience saith Living, that if 4, dragmes of dried Tyme in powrher, be given in Oxyme! fasting, to them that have the gowte it helpe the takens, that if 14 dragmes of dried Tyme in powrher, be given in Oxyme! fasting, to them that have the gowte it helpe the takens, the interpretation of the belly. It is profitable for those that have swellings in their sides, and paines in their loynes and hippes: it is the wise given sating to those that have greate paines in their eyes, and are bleare-eyed: it is with wine applyed to the cods that are swollend. Wild Tyme, or Mother of Tyme if it be boyled and drunke, moveth vrine, and the monethly courses, helpeth such as have griping paines in the belly, or that have cramps, or are bursten bellied, or are troubled with instanation of the liver: being taken inwardly, or applyed outwardly with Rosemary and vinegar to the head, it ceaseth the paines thereof, and is very helpefull to those, that are troubled with either Frensye or Lethargy: soure dragmes of the buyer drunke with a little vinegar, is very availeable to those that foilt or vomit blood taken with how, licosic. the juve drunke with a little vinegar is very availeable to those that spitt or vomit blood taken with hony, licoris and anifeede in wine, it helpeth a dry cough, and is comfortable both to the head, stomacke and reines, and helpeth to expell winde : the distilled water therof applyed with vinegar of Roses to the forehead, easeth the rage of Frenfye, & expelleth Vertigo that is the swimming or turning of the braine, & helpeth to breake the stone in the bladder?

> CHAP. IIII. Cuscuta, Dodder?

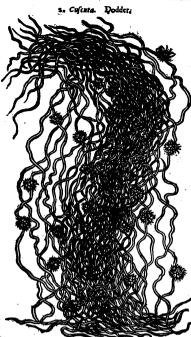

Nder this title of Dodder, I comprehend not onely Epithymum as the chiefest kinde thereof: but all the other forts of laces or threads, that grow either upon hearbes and shrubbes, &c. or upon the ground: and because I would not speake of them in many places, (as I shall doe of the plants whereon they grow, in feverall places of this worke) I though it more fittto include them in one Chapter, and give you knowledge both of their formes and vertues, in one place rather then in many: I acknowledge I might more fitly have placed this plant among the purgers, but that for the names fake I would fet it next unto the Tymes.

Epithymum. The Dodder of Tyme.

Pliny fetterh downe in the eigth Chapter of his 26. booke, two forts of Epithymum, (which Matthiolus feemeth to confute) the one to be the flowers of Tyme as Disforides before him did, both greene and white, the other tobe red haires growing without roote : now most of our moderne writers doe acknowledge but one kinde, & Tragus as I thinke, first mentioned both white & red strings, growing on severall hearbs, even as I have done alfo, which yet are but one and the same thing in it selfe, growing in the same manner upon Tyme or Savory, as it doth tipon any other plant being red on some hearbes, and white on others, as may bee observed on fundry plants on Hamplicad heath. It first from seedes giveth rootes in the ground, which shoote forth threadsor stringes, grosser or

r. Epithymum. The Dodder of Tyme;

finer, as the property of the plants whereon it groweth, and the climate doth fuffer, (although Mathician and others, have thought it to grow without roote) creeping and fpreading on that plant whereon it fafteneth, bee it high or low,

chaping the very graffe if it meete with none elfe, (although Ruellins saith it groweth not on the grounde, but on hearbes) as upon some vines also in Narbone as Pena saith he observed: these strings have no leaves at all upon them, but winde and enterlace themselves so thicke oftentimes upon a small plant, that it take the away all comfort. them, but winde and enterlace themselves so thicke oftentimes upon a small plant, that it taketh away all comfort (as one would thinke) of the Sun from it, and ready to choake or strangle it; after these strings are risen up to that height, that they may draw nourishment from the plant, you shall scarse see any appearance of strings from the ground, they being broken off, either by the strength of their rising, or withered by the heate of the Sunne, (and if they meete with no herbe or plant whereon to spreade, they will some perish of themselves, as I have tryed my spined, that it might grow as Mose upon trees, or like Misselves their springing) from whence divers have imainsensibly from the plants whereon it groweth, & thereby partaketh of the nature of the same plants: upon these strings of both forts, & upon what plants or herbe soever they grow, are found clusters of small heads or huskes, our as bigge as Poppye seede: thus much I thought good to let all others understand, by that experience and observation. I have had thereof: vet after this mine owne observation. I reade much to this purpose in Trans. In his chapter, the properties of the same purpose in Trans. In his chapter, the properties of the same purpose in Trans. In his chapter, the properties of the same plants in his chapter. on I have had thereof : yet after this mine owne observation, I reade much to this purpose in Trague, in his chapter of Androface or Cuscuta: by this which I have truely related, it may appeare plainely to any that neither Tyme, Savory, or any other herbe, doe naturally of their owne feede bring these stringes or faces, but that they spring from their owne feede, either fhed or feattered of themselves upon the ground, or comming among the seedes of other their owne recete, either them or reattered of themselves upon the ground, or comming among the recees or other hearbs that are fowne. The plantes whereon these laces doe grow, are observed by divers, to be Vines, as Pena and others that have observed them in France, and in some places of Turkey, upon trees and thornes, and some other things: Theophrassus in the 13. chap. of his second booke of the causes of plants, doth set downe, that Cadyras groweth on trees and bushes in Syria, which Pliny altereth to Cassias in the last chap, of his 16, booke, by which word no doubt they meant this plant, for it different not much from Cassia, as many others have it, or Cuscuta as it is generally called, the Arabian name being Chassian as Cassaut: the hearbs are Polium, Dictamus, Germander, Hysope, Mother of Tyme, Marjerome, Stabe, Wallwort, Rosemary, and others as Banhimus hath recorded, and also very plentifully in many places of our owne land upon Nettles, and upon Lin or Flaxe, and called Podagra and anovery pientifully in many places of our owne land upon Nettles, and upon Lin or Flaxe, and cancular conagra-lini, and Angina lini, upon Tares also more aboundantly in some places, where it destroyeth the pulse, or at the least maketh it much worse, and is called of the Country people Hell-weeds, because they know not how to de-stroy it; upon Fearne also and other hearbes upon Hampstead heath, as I lately found my selfethe strings & slowers being white, and upon the graffe likewise on Black-heath in Kent, on the very ground, not rising an inch or two

The place, Tyme, and Names are sufficiently as I thinke expressed before, yet in particular, Tragus and Angui-lara thinke it to be the Androsace of Dioscorides, but erroniously: for Epithymum as Matthions sheweth out of Actius, Actuarius and others, is the threads or laces growing upon Tyme, although Diofeorides calleth it the flower thereof: we doe generally call that Epithymum that groweth on Tyme, in English, laced Tyme; as the Epithymbra, laced Savory, and fo of Epiftabe, Epimajorana, Epimrica, Epimbas, and fo the reft; laced Steebe, laced Marje-

TRIBE I. rome, laced Nettles, laced Brambles: but wee call those strings generally by the name of Dodder, especially that which groweth on Fla xe and Tares, which are red and most frequent with us. The Vertues.

Epithymum by Dioscorides, Paulus, Etius, Actuarius, Mesues, and all others, is accounted the most principall and powerfull Dodder growing upon any herbe, (and that upon Savory or Steebe not to bee so effectuall) for all melancholicke disease, and to purge blacke or burnt choller, which is the cause of many diseases of the head and braines, as also for the trembling of the heart, faintings and swounings: it is helpefull in all the diseases or griefes of the spleene, and of that melancholy that rifeth from the windines of the Hypochondria, which is that part of the belly under the short ribbes where the spleene lyeth, & by slying up to the braine causeth a kinde of frensy or madnes: it purgeth also the reines and kidneys by Vrine; it profiteth them that have the Iaundise in opening the obnes: it purgettiano the remes and kidneys by Ville; it profiters that have the Zamarte in Opening the office further than the properties of Tyme being hot and dry in the third degree, & as Ruellius boserveth from the Arabian authors, that it hath by the astriction or drying quality, a strengthning property beside the purging, as it is also found in Rubarbe, and that it is a safe medicine for the obstructions as well of the liver as fpleene, purging the veines of flegmaticke & cholericke humours, & likewife as (Mefues faith; it helpeth childrens agues if a little wormeseed be put to it. The Dodder of all other plants & herbes in like maner pertaketh of the nature of them whereon they grow, be they not or cold, and is thought to worke more effectually for those diseases, whereunto the herbe it selfe is applyed: Lobel saith, that in the west parts of this kingdom where he found these laces upon Netles, the people had good experience, that it was a foveraigne remedy to procure plenty of Vrine, where it was a foveraigne remedy to procure plenty of Vrine, where it was fopped or hindred, & my felfe also have understood it from those parts: But that Dodder which groweth upon Tares, being the most frequent about London, and wherewith our markets are onely in a manner furnished, and our Apothecaries shoppes stored from thence, taketh his propertie from the Tares whereon it groweth, and can have no effectuall quality comparable to Epithymum: for as Galen saith, Tares are hard of digestion and binde the bellye, and that the nourishment of them engendereth thicke blood, apt to turne into melancholie, which qualities are cleane contrary to those of Epithymum, Epithymbra, or of other good herbes.

CHAP. V

Majorane vulgares exotice. Common, and Strange Marjetoms.

Here are divers forts of sweete garden Marjeroms, some growing onely in the summer; others abiding the winter, and one that groweth wilde: there are some other forts called Marum, that I have intituled strange Marjerom, all which shall be comprehended in this chapter.

1. Majorana vulgaris aftiva. The ordinary garden sweete Marjerome-

Our common fweete Marjerome, that is commonly fowen in our countrey, is a small low herbe, little above a foote high, full of branches, and small whitish and soft rounof a whitish greene colour, out of which come her and
of a whitish greene colour, out of which come her and there small white flowers, and after them small reddish feede: the roote is composed of divers small threads or strings which perisheth with the whole plant every

Majorana tenuifolia. Mar jerome gentle.
This Mar jerome likewise hath divers small branches growing low, and not higher then the former, but having finer and fmaller leaves, hoary and foft, but much fweeter; the heads are like unto the former, and so are the flowers and seede, the whole plant being more tender then the former, abiding but a Summer in like manner.

3. Majorana odorata perennis. Winter sweete Marierom.

Wee have also another sweete Marjerom that abideth greene all the winter, if it bee not two violent, growing in the same manner that the first doth, whose leaves are a little fmaller and greener then it, but with the like heads and knots: yet fome-take this to be but the ordinary Summer Marjerom, which by transplanting is made the more strong, and able to abide the winter.

4. Majorana latifolia sive major Anglica. Winter or

pot Marjerom.

The Winter or pot Marjerom, is a small low bushing herbe growing not much higher, but spreading the branches wider, whereon doe grow broader and greener leaves, fet by couples with some smaller leaves likewise at the severall joynts all along the branches; at the toppes whereof growe a number of small purplish white flowers, set together in a tuft, which turne into small & round seede bigger then sweet 1. Majorana vulgaru. Sweete Marjerome?

Marjerome feede: the whole plant is of a small and fine fent, but much inferiour to the other, being also nothing

8. Merum Supinum.

Creeping strange Marjerome

fibitter as the sweete Marjerome, and therby the fitter and the more willingly used for meates, the roote is white and threddye perishing not in the winter, but abideth many yeares, and is to be encreased by slip ping rather then sowing the seede.

5. Majorana latifola aurea. Yellow Marjerom.
This Marjerome is of the same fort with the last described, differing onely in the colour of the leaves, which are in Summer wholy yellow in some, or but a little greene, or parted with yellow and greene, more or lesse as nature listent to play, the sent being small like the other. We have also an other fort parted with white and greene.

6. Majorana filvestris. Wilde or fielde Marjerome.

4 Majorana latifolia five major Anglica.

Winter or pot Mar jerome.

6. Majorana sylvestris. Wilde or field Marjerome? The wild or fielde Marjerome sendeth forth sundry brownish hard square stalks, with small darke greene leaves set by couples on them, very like those of the sweete Marjerome, but harder and somewhat broader: at the toppes of the stalkes stand tusts of darke or deepe purplish red slowers, which turne into a small seede as the garden Marjerom scales but blacker; the roote creepeth under ground, and encreaseth much, abiding from yeere to yeere: the whole plant smelleth strong.

7. Marum vulgare. Hearbe Masticke.

7. Marum vulgare. Hearbe Masticke.

The neerer resemblance that this hearbe hath with Marjerome, then with Tyme, (as some have taken it) doth make mee joyne it in the same chapter. It riseth up with greater & more wooddy stalkes then any of the former Marjeroms, being two foote high or better in some places, where it liketh the ground and ayre branching it selfe on all sides towards the upper parts, leaving the stemme bare below if it be old, otherwise being yong, thinly surnishing the branches from the bottome, with small greene leaves bigger then the leaves of any Tyme, and neere the bignes of the leaves of the Marjerome gentle: at the toppes of the branches, stand small flowers on a head, which afterwards turne into a loose suff, of along white boarie matter like unto soft down, with some sleaves under and about them, which abide not long on the stalkes, but are blowne away with the winde: the seede is so some showne away with the winde: the seede is streaddy, the whole plant is of a sweet resinous sent, stronger then Marjerome, and abideth our winters, if it bee carefully planted and regarded afterwardes.

8. Marum supinum. Creeping strang Marjerome:
This strange Marjerome hath divers stender weake stalkes, lying upon the ground, and not standing upright as all the sweete Marjeroms & hearbe Masticke do, therin resembling the wild Tyme rather then Marjerome: the leaves are many

and; smaller than those of Mother of Time, growing at several distances upon the branches, the flowers are small and purplish, growing at the tops, with leaves among them, the small whereof is very sweet, and neerest unto Marjerome.

9. Marum Syriacum

TRIBE I.

vel Creticum.
The Syrian or Candye Mastick.

This Candye or Syrian Marjerome, bath fundry upright stalkes, not so wood-

dy as the hearb Maltick, but more tender and slender alfo, about a foot and a halfe high, whereon are fet divers
finall whitish greene leaves, very like unto the small sine
sweer Marjerome, but somewhat rougher up to the very
tops, which beare smaller heads or knots then the sweet
Marjerome, & white slowers out of them, all the heatbe
is of a most fragrant sweet smel, enduring a long time after it hath beene dryed: it is very tender to keepe, and
will not endure any of our cold nights that come in August or September, but will quickly perish by them.

The Place and Time.

The sweet Marjeromes grow wild on the mountaines in Spaine; and in other places, and the wild Marjerome, in the borders of come fields and patures in fundry places of this Land: the reft are all nursed up in Gardens, their naturall places being not well knowne to us, saving that the last, Lobel saith he had out of Syria, and Prosper Alpinus saith he saw it in Candye. The former seven sorts doe slower in the end of Summer at the surchest, but the two last much later if they come any yeere to slower with its.

The Names.

Marjerome is called in Greek Zdu-luxov & Audersov. in Latine Majorana a majori cura, Sampfuchum alfo, a nd Amaracus after the Greeke, of the Arabians Merfenius, or Morfangus, of the Italians Maiorana & Perfa, of the Spaniards Moiorana, of the French Mariolaine, of the Getmanes Maiaron & Myoran, of the Durch Marjerome. In Mariolaine, and of us Marjerome, and fivest Majerome. Marmin is called in Greeke unevis, and so in Latine: Sunt inguit Pena qui regi Thracia cui nomen Maroni effet, Mari herba appellationem acceptum ferunt: veruntamen potuit etiä ab Amaraca per apocopen dici, utpote cui Amaraci fiecie videaux Marone. The French call it Marone and Mafic and sures in Enolith Maltick ox hearbe Mafick, to

videntir Marum. The French call it Marone and Maflic, and wee in English Mastick or hearbe Mastick, to
make a diffiration betweene it and the Mastick Time. There is much controversic among the moderne Writers
make a diffiration betweene it and the Mastick Time. There is much controversic among the moderne Writers
make a diffiration betweene it and the Mastick Time. There is much controversic among the moderne Writers
make a difficult the first whether sampsuchus and Amaracus should be but one or differing heatbes, and
whether our Marjerome should be either: for Galen and Paulus Leginets in their records and centures of simples,
mention them both in severall chapters as differing heatbes, and the sampsuchus records and centures of simples,
mention them both in severall sampsuchus and Amaracus to be are
Dissorbed simples in the composition of his oyntments, maketh of least Sampsuchus that the Sicilians and
two names, as of two severall simples, although he had said in the chapter of Sampsuchus that the Sicilians and
those of Gyzicens call that Amaracus, which those of Cyprus and Egypt call Sampsuchus to Dissorbed thereby
rather showeth the diversitie of the compositions, and the more excellency of the one from the other, which hee
could not doe without diversitie of names, but especially because those of Cyzicen being the chiefest compositors
of such oyles, according to their Country name gave it that title? Some have thought that the Amaracus of Galen
is not the same of Dissordes or Theophrassus, but Parbenium, because Dissordes saith that by some in his time it
was called Amaracus, and the rather because he maketh no mention of Parthenium, switch hee callettia sweet
oyle, although not so sweet as Marum; and Dissordes termeth the smell of Parthenium, switch hee callettia sweet
oyle, although not so sweet as Marum; and Dissordes be our Marjerome, for I sinde that Lobelin saturlake Coriender: then whether the Sampsuchus of Dissordes be our Marjerome, for I sinde that Lobelin satur-

g. Marum Syriacum vel Creticum.
Syrian or Candye Maltick.

faria termeth his Marum supinum Sampsuchus forte Dioscorides, and Bauhinus in his Pinax entituleth our ordina-

ry Marum or hearbe Mastick Sampsuchus, sive Marum Mastichen redolens, which two authors thought Marum better to argue with his Sampsuchum then Marierome, because Dioscorides saith that his Sampsuchum is an hearbe

full of branches creeping on the ground with hairy round leaves, like the smaller or finer leafed Calamint, smelling

very (weet, and in the composition of the Oleum Sampfachium hee adviseth to chuse that Sampfachium that hath darke greene leaves, neither of which properties are in our Marjerome, nor-yet in either of Lobels or Bankiums

their Marum, for although Lobel his Alarum Supinum creepe on the ground, yet it hath not hairy round leaves

but small and long, and Banhinus his and our Marum creepeth not upon the ground, but standeth upright as Mar-

jerome doth. The next controversie is, whether the Marum of Dioscorides be answerable to any of those hearbes.

are called Marum by any of our moderne Writers: that none of them can be his Marum, this sheweth plainely.

that he faith his Marum hath whiter leaves by much then Origanum, and a fweeter flower, and neither the Ma-

rum lupinum of Lobel, no nor our ordinary Marum hath whitish leaves, or is sweeter then Marjerome. Clusius

therefore thought good to call our ordinary Marum, Tragoriganum rather then Marum, and faith that the feed

thereof was fent him by the name of Ambradulcis, and Bauhinus calleth the Marum Syriacum of Lobel Majorana

Syriaca, and yet by Baubinus leave, his Syriacum or Alpinus Creticum commeth neerer to Dioscorides his Marum, then to his Sampsuchum: most Writers call the sweet Marjeromes Amaracus and Sampsuchus, and some Maiora-

na vulgation, and the smaller or finer fort tenuion; but I doe not finde that any of them hath made mention of my

living weet fort, although both Camerarius and Bauhinus doe entitle the fourth Majorana perennia, as I doe the

next before it but they adde Sylvefiris as Trayus and Gefner doe, and Maiorana major, or latifolia as others doe.

and Anglica, and Camerarius faith he found a fort thereof about Bononia, going a simpling with Viifes Aldroane

dus that had larger and fofter leaves : the fixt is called by many Authors Origanum vulgare, and by others Origan

num (ylvestre ; Lobel, Origanum Onitis majus , and Agrioriganum, Casalpinus Origanum Italicum ; and Gerarde

in English, and as we doe the fourth and fift, this having leaves like Marjerome, but greener. Pliny as I faid be-

fore calleth it Cunila bubula, and fo doth Diofcorides his also. But take them here as wee usually call them, the

feventh is commonly called Marum by most Authors, yet Dodonaus, Gesner in hortis, and Camerarius take it to be

Clinopodium, Anguilara and Lobel to be Helenium odorum of Theophraftus, Clufius to be Tragoriganum, and Bambinus

to be Sampfuchus Dioscoridis, it is called Mastic both by the French and us. The eight is called by Lobel, Marum supinum, by Casalpinus, Marum ex Sicilia allatum, Sampsuchum Dioscoridis, Lobel in Adversariys calleth it Sampsuchum

shus Dioscorid Amaracus serpens, and Baubinus, Marum repens verticillatum. The last is called by Lobel, Marum Sy-

riacum, and fo doe after him Dodoneus and Taber montanus, but Alpinus calleth it Cretenfe finding it in Candye, and

diseases of the head, stomack, sinewes, and other parts, taken inwardly, or applyed outwardly; it diseases saith Matthiolus, attenuateth, openeth, and strengthneth: the decoction thereof, being drunke helpeth all the diseases of the chest, which hinder the freenesse of breathing: it is likewise profitable for the obstructions of the liver

and spleene, for it not onely cleareth them of those humours did stuffe them, but strengthneth also and confirmeth

the inward parts: it helpeth the cold griefes of the wombe, and the windines thereof, or in any other inward part it helpeth the losse of speech by the resolution of the tongue: the decoction thereof made with some Peletory of Spaine, and long pepper, or with a little Acorns or Origanum: Dioscorides and Galens Sampsuchum is hot and

dry in the third degree of thin parts, and of a digetting quality: the decoction thereof drunke is good for those that are beginning to fall into a dropsie; for those that are beginning to fall into a dropsie; for those that cannot make their water, and against paines and torments

in the belly, it provoketh alfo womens courses, if it be put up, being made into a peffary, and applyed with falt and

vinegar, it taketh away the venome of the Scorpions sting : being made into powder and mixed with hony, it ta-

keth away the black markes of blowes or bruiles applied thereto: it is good for the inflammations and watering of

the eyes, being mixed with fine flower, and laid unto them: the juyce thereof dropped into the eares eafeth the paines in them, and helpeth the finging noyfe of them: it is profitably put into those oyntments and falves, that are

made to warme and comfort the outward parts or members, the joynts also and sinewes, for swellings also and

places out of joynt : the powder thereof fuuffed up into the nofe, provoketh neefing, and thereby purgeth the

braine, and chewed in the mouth draweth forth much flegme. The oyle made thereof is very warming and com-

fortable to the joynts that are stiffe, and the sinewes that are hard, to molifie, supple, and stretch them forth. Our Marjerome is much used in all odoriferous waters, powders, &c. that are for ornament and delight. The great or pot Marjerome because it is more mild and lesse bitter than the former, is lesse used in Physicke, but more in

meates and brothes to give a rellish unto them, and to helpe to warme a cold stomack, and to expell winde; the

wilde Marjerome is more hot than it, and therefore more effectuall to heat, warme, comfort, and strengthen both

inwardly and outwardly in all things whereunto it is applyed; Hearb Mastick is more temperate in heat than Marjerome, and is used by our Apothecaties, in stead of the true Marson (which may well bee admitted untill a truer

may be knowne in the composition of the Trochifei Hedychroi which Andromachus thought sit to make a principal

part of his Treacle, accounting it effectuall against all poisons, especially of vipers, and other Serpents. Our dain-

The Vertues.

Our common sweet Marjerome is hot and dry in the second degree, and is warming and comfortable in cold

Bauhinus as I said before, Majorana Syriaca vel Cretica.

Anglicum: but I as you fee number it rather among the Marjeromes, as a wilde kind thereof, as we usually call it

feverall forts of Origanum, and in one place maketh three forts of Heracleoticum: but leaving these, I will show you those forts are knowne to us in these dayes.

I. Origanum Heracleoticum verius, Organie, or bastard

TRIBE I.

This bastard Marjerome riseth up with divers hard, round, reddish greene stalkes, spreading forth into other smaller branches, whereon are set sundry leaves by couples at the joynts, being somewhat round, and of a whitish greene colour, very kke unto Marjerome, but larger, whiter, and harder, or rougher in handling; at the toppes of the branches stand such like scaly heads or knots, as Marjerome hath, but longer, from whence come small whitish purple slowers, and afterwards small brownish seed. The whole plant riseth with us not much higher than Marjerome, but of a hotter and sharper scent and taste, yet somewhat pleasant withall.

2. Origanum Onitie Matthioli. White Organie of Greece.
This Organy differeth somewhat from the former, for it hath whiter and narrower leaves: the flowers also are white, and the heads more divided or separated into smaller tuftes: this is rather more tender to keepe than the former, hardly abiding the sharpnesse of our winter, although it be as well defended.

3. Origanum Onitis alindmajus. The greater White Organy,
This hath larger and whiter leaves than the former, the umbels
or tufts of heads are larger alfo, and more spread abroad than
they, which beare white flowers in the like manner. This kind is
somewhat more hardy, and will better abide a Winter, if there
be any care used to preserve it. There is also another with
somewhat longer leaves than this.

4. Origanum Sylvestre sive unique. Wilde Organy. This kind of wilde Organy (which is the ordinary kinde brought from Candy, and other places, and usually kept in our Apothecaries shops) rifeth up with divers round hard stalkes, whereon are set somewhat broader, lesser, and rougher leaves than the former; the slowers stand at the toppes of the branches in manner of an umbell, that is sin smaller heads, and more dispersed than the former, of a reddish purple colour, after which come small brownish seed: the root perisheth when it hath given seed, most especially with us.

All these kindes of Bastard Marjeromes have come to us from divers places, but which of them is more proper to this or that place, hath not beene truely signified vnto us; for some have named that Creticum which others have Hilpanicum, so that it is likely to be naturall in both those places.

The Time.

They flower or at least beare their toppes or heads about the end of August, or middle of September with us, so that their seed scarcely commett to maturity in our Country.

-The Names. It is called in Greeke of sarre vel sarre open montem efpanes gualdium, quad clivosos montososque locos amat, vel mad the com or parti id est to halumpuri, quad vissum illustres & acuat est a traisfit shaver & redundante o, disaror per antiphrasim, natura enim calidum oft, in Latine Origanum. The first is called Origanum Heraclisticum, by Matthiolus, Gesner, Castor Durantes, Label, Lugdunensis, Camerarius, Tabermontanus, and Dodoneus, & hath been fent me by the name of Creticum, and also Hispanicum. Baubinus saith it is the Cunila Galliwacea of Pliny, and Diescorides calleth it Cunila. The second Matthiolus calleth Onitis, and so doe Gefner, Caftor Durantes, Bauhinus, and Lugdunensis, who faith also that some called it Marum, and came to me by the name Italicum. The third Camerarius calleth Onites, whom Banhinus followeth. The fourth is the common Origanum as I said we have in shops, and is thought by Ruellius to be the Cunila Bubula of Pliny, whom Baubinus followeth. Dioscorides faith that this (if it be his wild kinde) was called also in his time Cnnils. But to discinse how fity each of these forts answere
unto those of Dioserides, I think it sitted to presize the text
of Dioserides, by which they may be compared. Originates,
Horaldanian Link Discourage and the link of the li Heracleotienm, (faith Diescurides) which is also called Gn1. Origanum Heraclesticum Verius. Organy, or bakard Marjetome of Greece:

CHAP. VI.
Origanum. Organy, or baltard Marjerome.

tiest women doe put it to still among their other sweet hearbs, to make sweet washing water.

Hespirafius, Dioscorides and Pliny do much vary one from the other, in setting down the forts of Origanium that were knowne to them in their times, for Theophrassius maketh but two sorts, a black that is barren, and a white that beareth seed. Dioscorides maketh, 5, sorts, three of Origanium, and two of Tragoriganium. Origanium Heracleoticum, Onizis, and Sylvestre, (which yet is not that which some with us call Sylvestre, and is fer forth in the foregoing Chapter, for his beareth a white flower, and so doth not that) Pliny is more consused, therefore thought not to be without error, for in divers places of his 20, and 21, bookes, he mentioneth

English, Organy, or bastard Marierome.

parts 1 the feed in the coppe branches is not great. That Origanum that is called Onitie, hath whiter leaves, and doth more resemble Hisope : it beareth seed in tusts, as it were joyned together, the force or vertue although it be like, yet is lesse essectivall by much. Wilde Origanum, which some call Panax, Heracleum, and others Canila, (as Nicander Colephonius) hath leaves like Origanum, and small branches not a foot high, bearing white slowers at the toppes in umbels, like unto Dill: the root is small, and of no use. These bee the words of Dioscorides, whereby comparing his first two sorts, we verily thinke, that how soever some Authors doe vary in their judgements concerning them, the first of them here set downe is the true (at least the truest bath beene knowne to be) Origanum Heraelesticum of Dissertides. The two next that follow, the one of Alasthisian, the other of Camerarian, are both in refemblance so neere his Onitie, that we may truely say, that either of them are the same, and that both of them differing but in largnesse of leaves, (which the fertility of the soyle wherein it grew might bee the cause) are but one Onitis. But that wild Origanum of Dioscorides, that hath an umbell like unto Dill is not to be found, unlesse the wilde Origanum, that is to be had at the Druggists and Apothecaries be his, for it is the neerest thereunto, baing the strangest and quickest in taste, which by Galens judgement is the best. The Arabians call it Fandenigi, or Fandenegi: the Italians Origano; the Spaniards, Oreganos: the French Origan, and Marjolaine, baltarde: the Germanes Volsemuth, quasi dicas animi bonitatem vel latitiam & Rott Dosten, or Costens: the Dutch Orega: and we in The Vertues.

The decoction of Organy or baltard Marjerome with wine, is good for those that are bitten with Serpents, or venemous beafts, and to be taken with fodden wine, for fuch as have taken Hemlecke, or Opinm: with Oxymel it is good for those that have taken poison, or the root of Colchicum Ephemerum. It is given with Figges to those that are Fursten, or have a rupture, convulsions or cramps, or have the Dropsie. The dryed hearbe taken in honyed water, purgeth downwards, blacke or melancholick humors. It helpeth to procure womens courses, and taken with Honey, is helpfull to those that have a cough, it profiteth those that have an itch, or are scabbed and mangy, and those that have the Iaundise, are much holpen by a decoction thereof taken when they are in a bath. The juyce of the greene hearbe healeth the swellings of the almonds of the throat, and the ulcers of the mouth; it draweth forth fleagme by the nostri's, if it be infused in the oyle of Flower-de-luces. It easeth the paines of the eares, being used with milke. A medicine purging by vomit is made with it, Onions, and Sumach, (such as is used to be eaten) being fet in the Sunne for 40. dayes, in a copper vessell, whilst the Dogge-starre lasteth. All Serpents will avoide the place where the hearbe is strowed. The wild kinde especially, healeth all bytings of venemous bealts, if the heads and flowers be taken in wine. And to this purpose Amigonus an ancient Greeke Author, in his Rhapfody or huddle of memorable reports, relateth a pretty fable of a Tortois eating Origanum, when hee goes to fight with the Serpent, which when one had heedfully observed, he cut up the Origanum where it grew, and sook it away; whereof when the Tortoise was deprived, he perished by the venemous force of the Serpent; which fable Plutarch in his naturall questions, relateth somewhat otherwise: that is, that the Tortoise having eaten of the flesh of a Viper, by eating the hearbe Origanum, was free from the danger. The fame Antigonus letteth downer there also another sable of Ring-doves, who by parting Origanum into their wounds, were thereby cured. As also that if the hills of Ants were stopped up with Origanum and Brimstone, they would quickly slie away: which 4. Tragoiganum Creticum.

ragoriganum Hispanicum. h Goates Marjerome.

4: Tragoriganum Matthioli.
Goates Marierome, with wilde Tyme leaves.

4. Tragoriganum Maithioli. Goates Marjerome, with wilde Tyme leaves. Matthiolus first fet forth this plant, calling it Tragoriganum, which he faith he doth affirme to be fo, having divers stalkes from a bushy root, and small leaves grow-

CHAP. VII. Tragoriganum. Goates Marjerome.

with the teeth being rubbed for fundry times, will make them whiter and firmer.

thing also Palladius reporteth. Galen faith all the forts are of a cutting, rarefying, or thinning faculty, and that in

the third degree, and that the Heracleoticum is of more efficacy than Onitio, and the wild stronger than either. The decoction of Origanum with a few Cloves and Sugar, helpern those that have the Hickock exceedingly. The powder thereof mixed with a little Salt-peter and honey, made into the manner of a thin Electuary, and there-

Ecanfe the Tragoriganum is joyned next unto the Origanum, I thinke it fitting for to shew you them in the fame manner, yet in a distinct chapter by themselves, for that their face and property is a little dif-1. Trageriganum Creticum. Goates Organy of Candy.

This small low Tragoriganum of Candy hath divers small low branches, not above a foot high, somewhat wooddy, whereon are fet at severall joynts two leaves, and sometimes more, which are somewhat broader, rougher. and harder than the leaves of Candy Tyme, and somewhat like unto Summer Savory, but of a sadder greene colour, the small hooded gaping flowers standar the top of the branches, in severall distances about the stalkes, of a purplish red colour, the whole plant and every part thereof tasteth very hot and sharp, and smellesth very sweet, but somewhat strong and quick, soone piercing the sences, and abideth greene all the Winter if it be carefully preserved, but left without defence, it seldome abideth, the roote spreadeth with many small sibres thereat.

2. Tragoriganum latifolium five Marum Cortus Martinole. Broad leasted Goates Organy, or Marjerome.

This other Goats Marierome is a fine small bushy plant, little above halfe a foot high, whose stalkes are not so wooddy, but tenderer like Marjerom, with many fmall fmooth gentle leaves, two for the most part fet together at a joynt, somewhat broader than our Mastick Tyme, of softrong, hor, and quick a scene, that being a little bruifed and smelled unto, it pierceth the sences more than the former, and commeth somewhat neere unto the scent of Calamint or Pennyroyall; the flowers are small and purple, growing up to the toppes of the branches, from betweene the joynts; this bideth greene also like the former, but requireth as much care in the preserving it in the Winter, as the former: the root is a blackish bush of many fibres set together like Marjerome.

3. Tragorigament Hilpanicum. Spanish Goates Marjerotne.
This Spanish kinde riseth up somewhat higher than the former, with whiter and harder stalkes, the leaves are whiter alfo, smaller, narrower, and longer than they, and more store usually at every joynt, smelling somewhat fweet, but nothing fo ftrong or quick, nor talting to hot arthey : the flowers are white, and grow at feverall diflances towards the tops of the stalkes, but larger and more gaping, standing in brownish greene huskess this also a-bideth green in the winter, but is more hardly preserved than tither of the former: the root is more wooddy, and leffe builty than they.

2. Ocimum

ing thereon at severall distances, which are like unto the ordinary wild Tyme, or mother of Tyme: the flowers are purple, standing in rundles, at the toppes of the branches. This smelleth somewhat like Pennyroyall. The Place.

18 CHAP. 8.

This first groweth in Candy and in Spaine also, as Clusius faith. The second is not knowne (being not set down by Cortufus, which fent it to Mattholus) where it groweth. The third Clusius faith he found in the Kingdome of Valentia in Spaine. The last, Mattholus saith groweth in the Country of Forejulium.

They all flower very late with us, and some so late, that we hardly see any flowers untill October, if we see any

The Names. It is called in Greeke 1927001)2006 (and in Latine Tragoriganum) quast hircum origanum dicas, quod pubulo gratum sit hircis, ut Onitu asimu, potius quam, quod hircum sateat. The first is called by Pena and Lobel in their Adversaria Tragoriganum Creticum; and tis likely to be the greater Tyme of Candy, that Proper Alpinus setteth downe in his Booke of Egyptian plants. The second is talled by Gesner, Tragoriganum alterum, and so doth Lobel, which is that Marum that Corinsus sent unto Matthodus for Thymum Creticum, and by that name of Marum, Durantes, Lugarithm and the sent unto Matthodus for Thymum Creticum, and by that name of Marum, Durantes, Lugarithm and the sent unto Matthodus for Thymum Creticum, and the sent units of the sent units o dunensis, and Tabermontanus doe call it, and Bauhinus, Tragoriganum latifolium. The third is the second Spanish Tragoriganum of Clusius, bearing white slowers, whom Dodontess and Camerarius in his Epitome of Mathielus upon Diescorides, Lagdunensis and Tabermontanus doe follow: The last is the Tragoriganism of Matthiolus. whom Durantes, Lugdunensis, and Tabermontanus doe follow, and Hanbinus calleth Traporiganum Serpillifolium. To show you likewife how aptly these plants are called Tragorigand, and how they dilagree, is were not smille to give you the text of Dioscovides thereon. Tragoriganum (aith he) is a small bush or shrub, with leaves and stalkes like unto Serpitum, or Origanum, in some places it is found more fresh and greene, with broader leaves, and fomewhat clammy. Another fort is found with flender branches, and finall leaves, which fome have called Prassium. All these Authors have delivered us these hearbs here mentioned, under the name of Transcriginum, as fuppoling them to come neerest unto one or other of those of Dioscorides, both for their forme, sweetherse of fcent, and hotnesse in taste : and Lobel faith that among all the plants that are entituled Tragoriganum, hee could finde none that came neeter to those of Dioscorides, than those two forts he alloweth of, and are the two first here fer downe, the one called by the Venetians Cretenfe, and that other small low plant that Martholus setteth forth. under the name of Marum, which he faith he had from Cortufus. But because they are more hot and sharp than under the name of Marum, which he saith he had from Cortusus. But because they are giore not and starp than I suppose Diojecrides his to be, for he saith the drinke made of them is both mild and pleasant, or delectable; fit to be taken of those that have loathing stomacks; and moreover, that Galem saith that Tragorizanum, besides the quality of Origanum, hath some aftriction or binding property in it also, which in my judgement abateth of the heate of them, making it the milder, but although I cannot absolutely subscribe unto them herein, yet I deay not any of them their due praises, nor their first founders their besitting honours. Tellomus at the latter end of the 62 chapter of his first booke of observations, saith that those of Canaly and Cythera, doe call our Winter Savory by the name of Tragarigoni, which is Tragoriganum. The Vertues.

Dioscorides faith they doe heate or warme the parts whereunto they are applyed, provoke urine, and are profitable to move the belly downewards, by purging choller, it the decoction thereof be taken inwardly; as also, that a decoction made thereof with yinegar, helpeth those that are troubled with the spleene; and taken in wine, helpeth those that have taken the venemous I will which is the roote of the black Chamzleon Thisse, having as he saith, the taste and smell of Basill) productly womens monethly courses, and given with honey in an Electuary, helpeth thole that have a cough, and are short winded : the drinke thereof is milde and delectable, fit to be given to those that loath their meane, and have weake stomacks, or such as have sowre belchings, and for those vomitings that are produced by the toffings and aire of the Sea, and also for the heart-burning. Galen faith in his eighth booke of fimple medicines, that it hath the same properties that the Origans have, but withall, hath a little astriction. Pliny in a manner hath the same things, for the saith, it provoketh urine, dissover the moore or swellings, and is especially good for those that have taken the poison of Viscum, (for so he termeth the Ixis of Disserides) in drinke, and for the biring of a Viper : for fowre belchings of the ftomack, the heart-birning, and for eaughes, Plurifies, and thortheffe of breath.

CHAP. VIII. Ocimum, Baffill.

Here are divers forts of Bafill, the most whereof are very great strangers to our Nation, and but entertained by a few that are curious and industrious.

1. Ocimum vulgare majus & minus. The great and imall common Bellill. The greater ordinary Basili riseth up usually but with one upright talke, diversly branching forth on all sides, whereon are set two leaves at every joynt, which are somewhat broad and round, yet a little pointed, of a pale greene colour, but fresh, a little snipt about the edges, and of a frong heady scent; somewhat like a Pomecitrion, as many have compared it, and therefore called it Citratum: the flowers are small and white, standing at the tops of the branches with two small leaves at the joynt, in some places, greened in others browne, after which come black feed the root perisheth at the first approach of winter weather, and is to be new sowne Minus every yeare, if you will have it. The leffer kinde called fmall, fine, or bush Balls, groweth not so high, but is thicker foread with branches, and fmaller leaves thereon, closer fee together, and of a more excellent pleafant fweet fcent by much : the flowers are white, and the feed black like the other, when it giveth feed withins, which is more feldome, for it hath not beene knowne to give ripe feed in our Country often, because it neither fpringeth nor feedeth so early as the former. Vnto these forts of Basill I must adde the dilind, which is as it were Medii. the meane betweene them, being greater than the small one, and lesser in leaves than the great, and not growing so high, in other things differing not.

TRIBE. 1.

Ordinary Bafill.

7. Ocimum Minus, 2 Ocimum Maximum The small Batill. The great Basill.

2. Ocimum maximum Citratum. The greatest Citron Bafill.

This kinde of Balill differeth not in the manner of growing from the greater ordinary garden Bafill : but brancherh forth like it, with leaves let by couples at the joynts, but much larger, and of a reddish colour in the hotter Countries. but not fo in the colder, a little dented about the edges, of a very fweet fcent, resembling a Citron pill, and therefore called Citratum; the flowers are white like the ordinary Basill, and the seed black like it, perishing also after it hath flowred and feeded.

3. Ocimum caryophyllatum maximum. The great Clove Rafill

There is another also of these greatest Basils that differeth not from the former, either in growing, or largenesse of leaves, or colour of the flowers, except that sometimes they are a little purplish, but in the smell of the whole plant, it hath a thronger and quicker scent, more neerely re-sembling Cloves, then the former, and is thereupon named Caryophyllatum.

4. Ocimum Anifatum. Anifeed Balill. This Basill is of the kind of our ordinary garden Basill, and of a middle kinde, whose leaves are neither so great as the greater, nor fo small as the small kindes, but of a middle size betweene them both, the difference whereof consistent chiefly in the smell, which is like the smell of Aniseed.

5. Ocimum Indicum. Indian Bafill.
The Indian Bafill hath a fquare reddiffi greene stalke, a foor high, or better, from the joynts whereof spread our many branches with broad fat leaves set thereon, two alwayes at a joynt one against another, as the Basils have, but somewhat deepely cut in on the edges, and oftentimes a little crumpled, flanding upon long reddish foot stalkes, of a darke purple colour, spotted with deeper purple spots, in some greater, in others lesse: the slowers stand at the tops of the stalkes, spike fashion, of a white colour, with reddish stripes and veines running thorow them, fet or placed in darke numbe colonied huskes the feed is greater and rounder than any of the former,

and fomewhat long withall: the root perisheth like the reft.
The whole plane femelleds ffrong like unto the ordinary Bafill and Camfire put together.

6. Ocimum Criftum. Curld Bafill. This curled Bafill is of the kinde of the Indian Bafill, having fuch like large leaves cut in somewhat deepely on the edges, and curled or crumpled as they are sometimes, as also with swelling bunches like bladders on them, but wholly of a greene colour, without any spot on them, as the stalkes are also : the flowers hereof are likewife wholly white, without any foot in them : the fmell hereof is fomewhat strong, resembling the spotted Indian kinde, and is very likely to be but a degenerate kinde, risen from the feed thereof, being gathered in these colder Countries,

7. Ocimum minu augustifolium, Small dented Basill. This imall Bafill groweth not to like any of the former Bafills, or the small sine buth Bafill, in the bushing branches thereof, but rather somewhat resembling the wild Bassill, or Climopolium, having fewer stalkes and branches, with small narrow leaves, a lintle inipt or indemed about the edges, two alwayes fet together at a joynt, but more sparsedly on the branches : the flowers grow at the tops of the branches, somewhat like unto Bassil of a white colour, but bending a little more backward, the fmell hereof is fmaller than any of the other Baffils,

The Place.

These plants grow onely in Gardens with us, as also in Isaly, and other places where they are cherished; their naturall being not knowne to us: onely the Indian and curld Bafill are faid to come first from the West-Indies into Spaine, and from thence into other places.

Indian Bafill.

TRIBE. 1.

The Time.

They all flower in the heate of Summer, and fome of them latter.

The Names.

There is some controversie among Writers concerning this plant, in three or source particular matters: first, for the crymologie or derivation of the word, some thinking it to be derived from the Greeke word such, and the Latine oryus, that is, a celevitate crescendi, from the speedy springing of the seed (which is usually within three or source dayes, if it be a hot and dry time without raine, for moysture turneth it into a gelly, as any one may see, that will looke on it after it hath taken wet) which is written with secondly, as some thinke, from the Greeke word soles, which signifieth, to smell, or give a savour, as commonly taken in the worst sence as in the best; and so would have the word to be Orimum; of the sweet smell thereof. Thirdly, whether it should be Orymum, as it is to be sound in divers ancient Writers, or Orimum. Fourthly, what Orymum is of the ancient Writers, for by divers it is taken to be that kinde of graine called Fagopyrum, or Tragopyrum, in English Buckwheate, or essentially of medley of Corne or Pulse sowne to gether, as many ancient Writers have set it downe, as shall be shewed in his proper place, whereunto I shall referre you. And lastly, about the vertues as shall be shewed presently. It is called by the latter Greeke Writers, sactions. Basilicum, because the smell thereof being so excellent, is sit for a Kings house. The first two sorts of these Basilis are by all Authors so called, as I doe. The second is the same Ocymum that Trosser Alpinus saith groweth in the Greens of Alexandria in Egypt. The third is so called by Lobel and others. The fourth is onely set forth in the great Booke of the Bishop of Eyster his garden: the fift is called Hispanicum, by Camerarius and Tabermontanus, and Indicum, by Consider and others. The fixt is as is said in the description, a degenerate kind of the last before it. The last is so called by Esternis, as is here expessed. The Aramanes Basilgen, and Basilgen, and Basilger, the Dutch Basilico; the Spaniards Albabaca; the French Basilic; the Germa

The Vertues. Bassill in all Countries for the most part is of little use in Physick, but rather used as a sweet smelling hearbe to sweeten or persume anything, or else used outwardly to comfort and warme cold members. Dioscorides saith that being earen in any plentifull manner, it dulleth the fight, maketh the belly foluble, ftirreth up wind, provoketh urine, with-draweth the milke, and is of hard digestion. Galen also faith it is accounted among those things that are not in the second degree, but because it hath an excrementitious moysture joyned with it, it is not fit to be taken inwardly : and in another place, that it is an hearbe for fawce, or meate, hurtfull to the stomack, breeding ill juyce, and hard to be digested. It is held by Crysippus (as Pling faith) who inveied bitterly against the use thereof, to be hurtfull both for the ftomack, urine, and eye-fight: and befides, caufeth a kinde of madnesse and lethargie, and other diseases of the liver, &c. And that those of Affrica say, that if any have eaten Bassill, that day he is flung by a Scorpion, that he cannot be faved: which faying is quite contrary to that of Dioferides, that faith, from those of Affrica, that he shall have no paine or danger, that is slung by a Scorpion, if he have eaten Bassill before. Pliny setteth downe, that in his time it was defended from such calumnies as Crisppus cast upon it, and was commended to be profitable against the sting of Scorpions, and some other venemous Serpents; and sound to be helpfull and wholfome for those are given to fwouning, used with vineger, and smelled unto: used with oyle of Roses, or Mirtles, and Vineger, is good against the paines of the head, it is profitably applyed to those are oyle of Roles, or Mirtles, and Vineger, is good against the paines of the head, it is prostably applyed to those are troubled with the lethargie, the jaundise and dropsie. It is good to be purinto the eares of young children with a little goose grease, to helpe them of paines thereof: the Jayee or the feed bruised put into the nostrils, procureth needing: it is good also for the trembling of the heart, it provoketh Venery, and therefore was given to horsest make them apt to breed. Some of the ancient Writers likewise have set downe, that the seed is good to kill the wormes of the belly, to lessen the speech, and that bruised and mixed with Oxegall, it taketh away the soule markes and scarres of ulcers, and other fores. And used with honey, it taketh away the discolourings and spots of the face. The Arabian Authors and Messes chiefly have used the seed among other Cordiall Spices, for the comforting of the heart in the trembling thereof, and the expelling of Melancholy or sadnesse, that riseth without manifest cause. And for these causes chiefly the seed is used by our later Physicians for the most part: the fragrant finell of this hearbe so comfortable to the sences, reviving them as it were, when they are dull or distempered, may evidently declare a fingular efficacy to be therein, and therefore not to be smally regarded. Theophraftis in his first booke, and eighth Chapter de caufis plantari, faith that Baffill growing in a place too much exposed to the heate of the Sunne, changeth into Serpyllum, or wild Tyme, by the overmuch drynesse thereof, for the lease becomment finaller, and the fcent the ftronger thereby : but these Metamorphoses or changes of hearbs one into another, is very frequent both with him, Fling, yea, and Gallen too, as well as divers others of the ancient Writers, which sheweth in what errours men of judgement and learning have beene conversant and confident in. Let me yet before I leave, relate unto you a pleasant passage betweene Franciscus Marchio, an Advocate of the state of Genna. fent in Embassage to the Duke of Willan, and the said Duke, who refusing to heare his message, or to agree unto the conditions proposed, brought an handfull of Bassill and offered it to him, who demanding of him what hee meant thereby, answered him, that the properties of that hearbe was, that being gently handled, it gave a pleafant finell, but being hardly wrung and bruifed , would breed Scorpions ; with which witty answer the Duke was fo pleased, that he confirmed the conditions, and sent him honourably home. It is also observed, that Scorpions doe much rest and abide under those pots or vessels wherein Bassill is planted.

CHAP. IX.

Clinopodium. Field Bassill, & Acinos. Wild or Rough Bassill.

Have as you see joyned both these together for the affinity, both of their name and nature unto the former Bassis, and betweene themselves, for that divers of our latter Writers doe consound them, the one calling that Alcinos, that another doth Clinopodium.

I Clinopodium minus five vulgare. Field Bassill, or Beds foote flower,
That Clinopodium that is taken by the best Writers and other Herbarists in these dayes, to come neerest unto the

description of Dioscorides, is a small low hearb not above halse a soot high, having divers hard round branches, rifting from a small wooddy root, with two small leaves set at every joynt, being somewhat like the small or sme Basill, a little dented about the edges; and in some plants, and places a little hairie and rough, and in other lesse, and places a little hairie and rough, and in other lesse, like as Horehound doth, standing in small greene rough cuppes, which are of a purplish colour, and parted as it were into soute equall short pieces at the end, like the foure square foote of a Bed-stead, and not hooded or open with severall leaves, like other hooded flowers: the seed is small and round, growing in small swollen huskes: the plant hath some small heate, but more drynesse in the taste thereof, sweetalso in scent, betweene Basill and Calamint.

2. Clisopodium Austriacum. Austrian wild Basili.

The Austrian wild Basili hath divers stender hard fource squares states, not a soote high, whereon are set two greene leaves at every joynt, somewhat like the former Field Basili, but smaller, being a little dented about the edges, which is sorgotten in the figure: the flowers stand at the toppes of the stakes, somewhat like unto the flowers of the former, but much larger, and of a violet purple colour, somewhat sad for the most part, (but some plants are found with white flowers) hanging downewards; and bending also backwards for the most part, in like manner as the former: the seed is enclosed in such like swollen huskes, blacke and round, three or source together, like Calamint, or somewhat resembling the other: the rootes are many, hard and black, with divers fibres annexed unto them.

3. Clinopodium Alpinem. Mountaine wild Bafill.

The Mountaine wild Bafill groweth with divers low and creeping foure-fquare rough branches, having two fmall rough leaves at every joynt, and fome fmaller also between them, growing all along the stalkes: the flowers are many growing in a head together; with the leaves among them;

I. Clinopodum minus five vulgare.
Field Bafill, or Beds foot flower.

3. Clisopodium Alpinum. Mountaine wild Bafil.

E. Clinepedium Auffriacum. Auftrian wild Bafill.

TRIBE. 1.

712

at the toppes of the branches, very like unto the flowers of the first, but of a darke red colour : the rootes are mamy small blackish strings, which shoot forth under ground new sprouts, thereby creeping about and increasing plentifully, abiding with his greene leaves, which perish not.

4. Acinos five Clinoped ium majus, Great wild Bafill, or Stone Bafill.

6. Acinos latifolia Columna. Broad leafed wild Bafill.

4. Acinos five Clinopodium majus. Great wilde Bafill, or Stone Bafill.

This wild Bafill harh foure-square hard, hairie, and hoary stalkes, a foote high, or more, fet with two hairie greene leaves at a joynt, being covered also as the stalks, with an hoary downe fomewhat larger than any of the former, comming neere unto the bignesse and fashion of the leaves of Origanum: the flowers grow in rundles, in more plenty than the former, of a purplish colour, and sometimes white, the husks whereof are somewhat larger and rougher: the roots are a bush of many strings fer together at the head , which shoot forth suckets round abour.

Of this kinde there is also another, whose stalkes are lower, the leaves leffer, and the huskes of the flowers smaller than the

former, not differing in any other thing from it.

5. Acinos Anglica Classy. Our English wild Basill.

The English wild Basill hath a few stender foure-square branches, not a foote long, lying on the ground, whereon grow divers small grayish greens leaves, two alwayes at a joynt set together, which are not much unlike the first Field Bafill, but smaller, shorter, and fuller of juyce, and not dented about the edges at all, very like unto the last wild Bafill, but smaller, of a certaine sweet scent , but not heady : from the middle of the branches up to the toppes, grow the flowers in rundles or spaces about the stalkes, being very like unto the first Field Basill, but of a more bluish purple colour, with a white eye or circle in every flower, and after they are palt, come three or foure small seeds like the first, in the huskes where the flowers stood : it perisheth every yeare in my garden, and rayleth it selfe from its owne

6. Acines latifolia Columna. Broad leafed wild Bafill.
The great leafed wild Bafill rifeth from a bufly roote, with a rough or hayrie stalke, spreading forth into divers other branches, whereon grow larger leaves below, and smaller upwards, two together; at the fetting on of the leaves, which are also rough or hairy, very like unto the leaves of the greater Bafil, but

formewhat smaller and longer, endented about the edges, and each of them standing on a long stalke, towards the tops the flowers grow much, and are many, spike fashion, of a purplish colour, very like unto the flowers of the garden Basill, after which come the feed vessels, containing within them fmall round blackish seed.

The Place. The first groweth most usually in the borders of fields even among the corne, as at Sutton in Kent, not farre from Dartford, at Thetford in Norfalke, and in other dry fandy and untilled grounds: The fecond groweth upon the hills that are neere the Baths at Baden in Austria, as Clusius faith, and up-on Mount Baldus, as Pons of Verons faith. The third also groweth upon Mount Baldne in Italy, as the fame Pona fet-teth downe, in the description of the hearbes growing thereon. The fourth is found sometimes in the come fields of our owne Countrie, but more often in the more open Woods, and in Copies that have beene field in many places of England. The fift Clusius faith he found likewise in Zent, while he flayed a while ar the Lord Cobbins, wayting for his paf-fage over Sea, but it is found in diversother: places of Kent, and other parts besides. The last Fabius Columns saith, grow-eth plentifully at Naples in their Gardens. The Times.

They doe all of them flower about the beginning of Iune; nd their feed is ripe in August, and sometimes sooner.

The Name.

Clinopedians is called in Greeke zarromilor quali lettipes qued farculi (alys ut Plinio, orbiculati florum ambiens) speciem edam letti prebeant, in English Bedstootslower because the branches fay fome(but Pliny faith, the round compasse of the Sowers) doe resemble the feet of a bed, whereupon I have

CHAPJO. fo entituled the first, as most agreeing thereunto A'x1005 nazóvos, by Dioscorides herba odorata coronaria, ocimo similis. Acinus is a fweet hearb fit for Garlands, and is like unto Bafill, Pliny faith Acinos that is called Epipetron never flowreth, therein confounding the Epipetron of Theophrastus, which he saith never flowreth with Acinus, but Diof corides faith no fuch thing, and therefore Pliny was much militaken herein, as he was in many other things. The of corners tauti no tuent thing, and therefore, and Clinopodium minus or outgave by Lobel and Elusius: and Acinos by Futhius in Iconibus, and by Podoneus: Clinopodium of Turner, and Anguillara: Chinopodium majus of Camerarius: Pulegium petrasm of Gefner, Clinopodium alterum, or pseudo-clinopodium of Matthietus. Ocemastrum of Fuchsius. Baubinus calleth it Clinopodium arvense ocimi facie, it is the Basslicum 3. of Tragus, who calleth it also Calamintha montana, but of all other most improperly; in English; Field Basill, because it is chiefly found in the Fields, the Country people call this as well as the fift where it groweth, Horfe Time, and Poley mountaine. The fecond Cluffus calleth Clinopodum Austriacum, and saith he might as well call it Acinos Austriacs. Bauhinus calleth it Montanum, in English Austrian wild Basill. The third, Pona calleth Clinopodium Alpinum, having found it onely upon Mons Balgilli Austrian wind Daini. The thind, to one cancell composition as approximation in aving tourist in the chapter of Tenerism, having come purpurocarules in his Chapter of Tenerism, having called it Clinopodium. Alpinum hir fut it, among the other forts of Clinopodium, I see no reason, in English mountaine wild Bafill. The fourth is the first Clinopodium unigare of Matthiolas, and called Clinopodium majus of Camerarius: Lobel and Dalechampius call it Acines, and Guilandinus Betonica Pauli, it is the first Calamint of Turner, Pulegium montanum of Lonicerus, and Polycnemon of Gesner. Baubinus calleth it Clinopodismo frigano fimile, in English great wild Basill. The fift is thought by Clusius to be the true Acinos of Diofcorides, Baukinns calleth it Clinopodium ocimi facie alterum. The last is called Acinos of Fabius Columna, in his Phytobasanos, and faith it is generally called Vrtichella of the Neapolitans, because it hath such like roughnesse and hairynesse, although not stinging as nettles have, and is an annuall plant to bee new sowne every yeare. But it is much to bee doubted whether any of these hearbs be the right Acinos or Clinopedium, that Dioscorides and Theophrass in have set domage material their temperature and qualities doe not agree as you shall heare presently, although Pena and Lobel thinks their Clinopodium to be the right. The Italians call it Clinopodio, the Spaniards Albabaca Sanvage, the French Befflieg Salvage, the Germanes wild Basilich, the Dutch wild Basilicon, and wee in English wild Basill,

The Vertues.

Of these hearbs I know no author hath set downe any tryed remedy found by them, for in regard that Galen saith Clinopodium is of thin parts, and may be accounted to be in the third degree of heate and drynesse, being somewhat Tharpe in tafte, and a little pitter withall, neither of which as faith Marthiolog can be found in these, yet because they doe so neerely in saccand shew resemble the true plants, they may beare their names untill they gaine truer and that the vertues are found out, whereunto they may be applyed. Diofeorides faith that his Clinopodium is applyed to those that are troubled with convulsions or crampes, ruptures or bardings, or strangury, that it is a remedy against the sting or byting of venemous Serpents, and that it bringeth downe the courses of women, and expellent the dead child, and taketh away those warts that are long, and hang downe, if it be drunke for certaine dayes together. It stayeth the loosenesse of the belly, if it be given after it hath beene boyled to the thirds in wine, to them that have no feaver, and in water to them that have a Feaver, Of Acinos, Dioferides writeth, that being frunke is frayeth both the fluxe of the belly, and the courses in women, and healeth hot swellings, and those are called Saint Anthonies fire. Where you may observe that Action thought not be Climpodium, both in regard Diofcount maketh them two distinct plants, and besides given them contrary qualities, for Action he saith stayeth the bossenses of the belly, and the overmuch slowing of womens courses, whereas hee saith Climpodium procureth the course, and expelleth the birth, yet he saith also that it stayeth the loosenesses of the belly, and as Galen saith, is hot and dry in the third degree, and of thin parts.

CHAP. X.

Polium. Poley, or Polemountaine.

Ethough Diofeorides, Galen, and Pliny have remembred but two forts of Polium, yet our later Writers have found out divers other forts, which they referre thereunto, some of them grow naturally necre have found out divers other fores, which takes referred the feetings, some of them grow naturally necre the Sea, and therefore called of fome Polium maritimum, others not onely necre the Sea, but upon the hills also, and therefore may as well be called more anima, as maritimum, and others fatre off from the Sea, upon hills and mountaines, and therefore called more properly Polium montanum, as shall be showed in this Chap-

This kind of Polium or Poley mountaine, that is much frequency poley mountaine.

This kind of Polium or Poley mountaine, that is much frequency our gardens, is a small limit plant, having divers white or heavy found and hard branches (rising from the root, which is somewhat long and hard, with a few fibres hanging thereat, not allow a forth which of the others that follow; two slwayes set together on the statistics that somewhat broader or greater than any of the others that follow; two slwayes set together on the statistics that for mountain the root, whether of grow forth whitish or heavy yellowish heads, thrusting out many small palk attorned flowers, and in logic places more yellow, standing in hoay sinckes the seed is small and thackish; the whole spine smallest, the statistics of the sta 1. Polium montanum vulgare. Our ordinary Poley montante.

2. Polium montanum minus. Small Spanish maright Poley mountaine. This second or small Poley mountaine, rifeth up with many small stender branches standing more upright than

TRIBE I.

1. Polium mentanum valgare. Our ordinary Poley mountaine.

2. Polium mentanum miane. Small Spanish upright Poley mountaine,

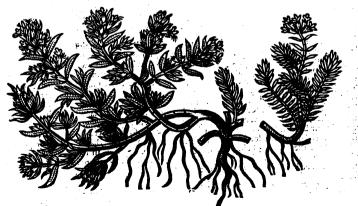

the next, and not leaning downewards to the ground like it, nor much higher, whereon are fet many heary leaves, smaller than the next that followeth, and some small ones together with them, a little dented about the ends onely, and as hoary or rather more than it, at the toppes whereof frand longer and smaller heads of whiter flowers than the next, comming forth of hoary cuppes, larger and more spread than it also: the seed is blackish and small, yet greater than the forme, although the plant be smaller; the roote is hard and wooddy like the former; the smell hereof is much more sweet than it. 3. Polium montanum Monspeliacum. Small French Poley mountaine.

This third and small Poley mountaine is very like the former, but that the branches stand not soupright, but leane more downewards, the leaves likewise are not fully so large, but as white and hoary, dented a little more about the edges: the hoary heads of flowers which are white, are imaller, and more closely compact, in other things this differeth not from the last.

4. Polium maritimum Supinum. Creeping purple Polcy mountaine.

5. Peliam wonrawam Supinum minim The smallest creeging white flowred Poley mountaine

4. Polium maritimum Supinum. Creeping purple Poley mountaine. Creeping Poley mountaine hath divers small weake hoary branches lying upon the ground, which as they foread

rake roote at the joynts, being not a foot long, whereon doe grow many small and long leaves, as white and hoary as any, a little dented also about the edges, but not easily to be seene, unlesse one marke them well, and in the younger growne not at all: at the toppes of the branches grow smaller heads of hoary huskes, out of which come purplish flowers, and after them small and blackish feed like the former.

Of this kinde there is another found, bearing white flowers, not differing in any other particular from it. Rollum montanum Supinum minimum. The smallest creeping white flowred Poley mountaine.

This small kinde hath many small weake branches, not halfe a foot long, lying creeping on the ground shooting forth fibres at the joynts as they spread, in the same manner as the last doth, whereon are tet in the same order, two leaves one against another, all along the branches, being smaller, harder, narrower, and greener than any of the reft, without any denting at all about the edges: at the ends of the branches come forth, three or foure small white flowers, like unto the other for forme and fashion, but much smaller : the feed is not unlike the other : this hath little or no scent at all.

6. Polium montanum lavendula folio. Spike leafed Poley mountaine.

This Poley mountaine from a hard woody roote, spreading out many small fibres sendeth out divers weake branches, not fully able to stand, but rather lying downe, whereon are set many small long leaves, two together, one against another, as in al the former, which are somewhat greene on the upper side, and hoary underneath, fomewhat like unto the leaves of Rosemary or Lavender, and not a whit fnipt about the edges; at the toppes of the branches stand forth many flowers, not bushing as in many of the former, but loosely spread, which are of a white colour, not differing in forme from the other, but comming forth of a grayish huske, not fo hoary as some of the former: the seed is black like the rest: this kinde hath a small sweet scent, nothing so pleasant as most of the other: Lobel faith it hath little or no fcent at all : Matthiolus faith that it smelleth well, though not so pleasant as his former, and that it is of lesse vertue and esticacy than it.

7. Polium latifolium incanum Creticum. Candy Poley with hoary broad leaves.

The branches of this Poley are round and hoary, about a foote high, foread into other fmaller branches, fet with two leaves at each joynt, which are somewhat broad and round, and dented at the edges like Germander, or the Ivie leafed Chickweed, of a yellowish greene on the upperside, and hoary underneath, without any manifest taste : the flowers have not beene observed.

8. Polium angustifolium Creticum. Vpright narrow leafed

Candy Poley.

This Candy Poley groweth almost two foote high with upright hard round wooddy stalkes, whereon are set small and long leaves almost round pointed, very like unto the common Polium, but much finaller, & not dented about the edges at all: the flowers and feed are like the common fort, the whole plant is very fweet. 9. Polium montanum pumilum tenuifolium Africum. The small

African dwarfe Polev.

This small excepting. Poley, bath many very small and hoary white leaves, set together at a joynt all along the stalkes by distances, the flowers are small and yellowish growing at the toppes; the roote is somewhat wooddy as all the rest of the plant is, and somewhat sweet also. The Place.

The first as I said being the most common in this Land, Clustus faith he found in the Kingdomes of Granada and Valentia. The second Clusius saith he onely found growing upon the hills in Spaine. The third he likewise saith groweth as well in the Kingdome of Valentia in Spaine, as at Mompelier in France. The fourth groweth also in a Province of Spaine, and neere unto Venice also, upon the Adriatick shore. The fift groweth neere Vienna in Austria, and on the hills in Savoy, necrethe Lake Lemanus. The fixt groweth in divers places of Germany, as upon the hills of Planborough, the hills neere Turin, and neere Novemberg alfo, as Camerarius faith. The feventh as Bana binut faith came to him from Honorius Bellus out of Candy, where the eight also groweth all along the Sea side, and upon Mount Baildus also, as Pona saith: the last was gathered neere Tunis in Barbary, by Beelius, and brought to Doctor Lobel and us.

They doe most of them flower in July and August, yet some later than others. The Names

Politin is called in Greeke abstorfic dictum proper canitiem noste, enim canitiem vel canum semificat, quiacapitulum habet canoril hominis inflar capillatum because it is like unto the Hoary haires of a mans head : but this is referred to the toppes or heads, and not fo directly to the leaves as Pliny would have it although the leaves also are somewhat white and hoary; in Latine Polium, & thereafter all other Nations call it according to their dialect. The first is called Polium montanum vulgare, and Polium montanum luteum by Lobel and Penain their Adversaria, as also in his ob-

6. Polium montanum lavendule folio. Spike leared Poley mountaine.

S. Poline

I. Dillamnus Creticus, 17, Dirtany of Candy.

8. Polium angustifelium Creticum. Vpright narrow leafed Candy Poley.

9. Polines montanum pamilum tennifolium Africam. African dwarfe Polcy.

ferrations, for they inswer one another, so that by the name of Lobel (where I name him alone thorowout all this pooke) I doe not drowne the name of Pena, nor the name of Lobel, when I name Pena alone: but for brevities like name onte in Itead of both. It is the first of Dodonave in his History or Pempiake in Latine, which I use one where also. And the third of Clusius in his History of more rare plants, which I chiefly meane, when I cite him though all this works, because both his Spanish and Pannonick observations are included therein, unless I recite his particular collervations. The second is the second kinde of Clusius, in his Spanish observations, and the recite his particular efficient attends. The second is the second kinde of Clussus, in his Spanish observations, and the first with Clussus, and the second with Dodonaus, called minus and moditiveraneum of Lobel, and contains a minus and moditiveraneum of Lobel, and contains a minus in his Pinax. The fourth is the first and sixt kindes with Clussus, the one with a white sower, and called of Lobel also Veneuum, of Bankinus in his Pinax, Marithmiss wenetum. The fift is the eight fort with Clussus, the fourth with Dodonaus called repeats and so likewisely Bushinus, and montanum supinum minimum of Lobel. The fixt is the seventh with Clussus, and called Polium recensionum seminal seventhese server and called Polium recensionum seminal seventhese server. dula folio of Banhinus. Banhinus first mentioned the seventh, and Pons in his Italian Baldus the eighth, and taketh it to be the second Polium of Dioscorides, the last is not mentioned by any Author before, Fabius Co. lumna, as I shewed you in the first Chapter, would faine make Polium to be the true Hisope of Diescaridet, but I know not that any doth confent unto that opinion, for by the judgement of the best, this hearbe is the true Pella um of all the ancients, as well in face as qualities, and therfore cannot be Hisope, besides, the taste hereof is very loathsome to the stomack, which Diescorides also remembreth, but Hisope as he faith doth helpe to experiorate flegme, &c. and no pectorall hearbe that I know doth trouble the stomack, by the loathsome hitternesse shereof, as this doth.

The Vertues. The decoction of this hearbe drunke while it is warme, as Dioscorides faith, helpeth those that are stung or hitten by venemous creatures, yea as he faith, the furnigation or smoke thereof driveth them away, and so doth the hearbe being strowed or layd in Chambers: and although it trouble the stomack, and cause some paines in the head, yet it helpeth the laundife, and those that are hydropick, or are troubled with the disastes of the spicene, it moveth the belly, and bringeth downe the feminine courses, and doth confolidate or foder, or cloze the lipses cate or wounds. Galen thus faith of Polium, in his eighth Booke of simples. It is bitter in talte, and sharpe or quick on the tongue also, and therefore it freath the inwand parts from all obtanctions, and provoketh both urine and the feminine courses: being greene and applyed to great cuts or wounds, it closeth them, especially that greater kinde; and being dry, it healeth grievous fores or ulears, and this the leffer kinde doch best performe. The leffer Polism which we use in Antidotes, or Counter-poysons (as Mithridanum, Vanice Treakle, and such like) is the more sharpe and bitter, and is accounted to be dry in the third degree, and hot in the second.

CHAP. XI. Dietamnus, Dittany, & Pseudodietamnus, Bastard Dittanie.

Have thought good in writing of the true Dittany, to make mention of the Bastard kindes thereof, in the same Chapter, both because the face of them, that is the forme and colour of the leaves are very like, and that other good Authors doe the like, reckoning them as kindes thereof.

1. Distamnus Creticus. Dittany of Candy,

Dittany of Candy hath divers hard and brownish, yet fomewhat hoary stalkes rising from the roote, set full of leaves, two standing together one against another, all along the branches, which are broad and thick, and almost round, fo hoary, white, and covered over with a woolly downe. that they have no shew of greenesse in them, as most other hoary or woolly hearbes have, at the toppes of the branches come forth fealy heads, made as it were of many thin leaves like unto scales, purplish on the outside, and paler on the infide, from among which come forth gaping flowers, of a pale purplification, and after them small brownish seed: the root consisteth of many blackish strings or fibres, from a harderlong root: the whole hearb is of a quick or firy fcent. especially if it be fresh, and likewise of a hotter taste, being new, then old, for it much decayeth in keeping: this is very tender, and hardly to be kept a winter in these colder Countries, so that it seldome commeth to shew any flower, but if you doe transplant some of the branches by slipping and fetting them in August, they will better endure the following winter, with a little coverture, and may happen to give flowers the yeare following.

a. Pseudodictamnus. Bastard Dittany. Bastard Dittany risethup much higher than the former, the branches are a foote and a halfe long many times, as I have observed in mine owne Garden, whereon are set such like hoary and round leaves, as the true hath, but neither fo thick in handling, nor so thick fet on the branches, but more fiparfedly, yet two alwayes together one against another: from the middle of these branches to the toppes of them, come forth the flowers round about the stalkes at the Joynts with leaves, which are gaping like the former (and as Penny-royall, Mints, Calamint, and diver the like hearbs have) of a delayed purplish colour, standing in hoary huskes, after

in the meane time.

which come the feed, which is greater and blacker than the former, the root hereof is not so black, but more hard and wooddy, shooting downe deepe into the ground, with divers sprayes spreading from it: this hearbe is somewhat hot and sharpe, but not by halfe so much as the former: this doin well endure with us in our Gardens, if the Winter be not too violent sharpe and long, or if there be some care taken of it at fuch a time; it groweth very well also of the slips being put into the ground about the middle of Aprill, and a little defended from the heate of the Sunne, for a time after the fetting, and now and thenwatered

3, Pseudoditlamnus alter Theophrasti Pona. Another Bastard Dittany.

This other bastard Dittany riseth up with many square hoary stalkes more than a soote high, set with two leaves at a joynt like the other, but some what larger and longer, toward the toppes whereof with the leaves come forth hoary huskes, like unto those of Melissa Molucca lavis, the great Assirian Balme, but shallower, out of which

thate gaping flowers mixed of white and red: the foote spreadeth many flores: this smelleth reasonable sweet, and abideth the Winter as the other, and is in like manner encreased by slipping.

As for that hearbe which is called by many Dillammus albus, and Dillammus album, and by Manthiolus, Bauhinus, and others, placed with these kindes of Dittamy together, although they doe all acknowledge that it hath no face of resemblance unto them, and is called Fraxinella, which hath some diversitie therein, as I shall shew you in another place.

The Place. The He of Creese or Candy hath beene thought by the elder Writers, to be the onely place in the whole world, where the true Dittany did grow, and that not generally through the whole He, but in one corner of Mount Ida, called Dillea, which supplyed the uses of all parts, as Theophratian as large hath set downe, in his ninth Booke, and sixteenth Chapter, the knowledge whereof was interly lost, and perished with our fore-fathers, and but within a small space of time, or few yeeres since revived and reflored to us staine: for Wohards of Ferrare writeth, that in his time it was not knowne, as he fetteth it downe in his minth Booke and third Epiftle : his words are these, Dittamno nife rurfus Venus ub'ida solva deporter omnino desicimus: But Clusus faith in his Appendix altera (which is joyned with his bookes of Exoticks) that it was fignified unto him, that it was found also in the Ile of Sardinia, having lesser and whiter leaves than that of Candy ; and exceeding fweet

Bastard Dittany.

2. Pfeudedillam nus a'ter Pones Another Baffard Dittany.

TRIBE. I

withall. The first Baltard Dittany groweth in many places, as Dioscorides faith, and as Lobel faith he understood by fome Italians on Mone negro neare Pifa and Ligorne in the Florentine Dominions. It is sufficient frequent in mamy places of Italy in their Gardens, for we have had the feed thereof among others very often from thence, and abideth well in our Gardens alfo : the last, as Pona in his Italian Baldus faith, groweth in the Iland Cerigo, and brought from thence to figurer Gentareno to Padoa to furnish his Garden. The Time.

The true Dittany (as I faid) hardly flowreth with us at all, and when it doth, it is very late, not bringing any feed, but Dioscorides (as it is found in the old Copies extant) writeth that it beareth neither flower nor feed, even as he had faid before of Nardus montana, but Matthiolus defendeth him, faying, that it was most likely to be the flippe or errors of the Writers that let downe over for oupoien that is fert or profert, for confert, as thus, nec flores, nee fruitum, vel semen fert, or profert, for nee stores, nee fruitum, vel semen consert, for Theophrastus faith, lib. 9. cap.
16. Vlus foliorum non ramorum nee fruitus oft, and Virgil and others (although Pliny following the corrupted text of Dioscorides, faith it beareth no flowers, nor feed, nor stalke, whereof it is a wonder, having borrowed fo much out of Theophrastus, which acknowledgeth it) doe remember the flowers of Dittany, and so doth Galen also in the Emplastrum de Dictamno, whereof Damocrates, as he saith gave him the receit. The first Bastard Dittany flowreth with us all the latter part of the Summer, but feldome giveth us any good feed. The last hath nor as yet beene seene in England.

The Names. It is called in Greeke γλόκων αγρία Pulegiums stuctes, by Diescovides Δίαταμιος, by Theophrassus Δίαταμιος, lome also Δίαταμιος and Δίαταμιος in Latine also Distamun and Distamun, από τα τίατον Cornerio dici vident, gind τιατιcon pureren Confesa mulierum faciles parens prometat and dolores penitus sedat Dioscoride & Theophrasto: the first is called by all Writers Distamus or Distamus Creticus, or Distamum, or Distamum Creticum: the second likewise is called by all Writers Pseudodistamuns, or Pseudodistamus, or Pseudodistamum: Anguilara saith it is called by the Greekes now a dayes Calini mathia : Pona would make it to be the Gnaphalium of Dioscorides : the last is onely fet out by Pona, who takethit to bee the Distannum alterum, of Theophrastus and Dioscorides. The Arabians call it Mescatramfir Anegen Araba or Buri, the Italians Distanto, and other Nations much thereafter according to their Dialect, and we in English Dittany, but not Dittander, as some too soolishly would make it. The Vertues.

It is availeable as Dioscorides faith, for all the purposes that the planted or garden Penny-royall is used, but with farre more efficacy, for it not onely expelleth the dead child being drunke, but being applyed unto the place (as in a Peffary or the fumes thereof taken hot, or burnt, and taken underneath; the juyce hath a purging quality applyed with Barley meale: It draweth forth thornes out of the feete, or any other part of the body being applyed to the place: for as it is reported that the wild Goates in (and), being wounded by the Hunters with arrowes, doe by eating this hearbe drive them forth, and are thereby cured. It is held to be very profitabe for those that are troubled

with the spleene, by lesning the swelling thereof. It hastneth on the birth, and as Theophrastus saith, causeth speedy delivery or at least easeth much of the paines in travaile: and the juyce thereof drunke in Wine is a present remedy for those that are bitten by any venemous Serpent. The hearb is so powerfull against the poyson of all beasts that arevenemous, as that it doth drive them away by the very smell, and killeth them if they touch it where it is hing : the juyce thereof is also a present remedy for all wounds made with Iron, if after the putting of it into the wound, some of it also be taken in drinke. The Bastard Dittany is used for all the purposes that the former is. but with much leffe effect. Pliny fetteth downe in a maner all that is formerly faid in feverall places of his books:
that it procureth the monethly courses of women, and is so effectuall to expell the dead birth, that it is dangerous to bring it into the chambers of women that are with child.

CHAP. XII.

Pulegium. Penny-royall.

Here are divers forts of Penny-royall, some that grow wilde in many places of this Land, yet are nurfed every where in Gardens; the other more rare, and therefore preserved onely by those that are

1. Pulegium vulgare. Common Penny-royall.

This common Penny-royall is fo well knowne to all, that I shall not need to spend much time in the description of it, having many weake round stalkes divided into fundry branches, rather leaning or lying on the ground, than standing upright, whereon are fet at severall joynts small roundish darke greene leaves: the flowers are purplish that grow in Gardens for the most part, yet some that grow wilde are white, or more white than purple, set in rundles about the toppes of the branches: the stalkes shoot forth small sibres or rootes at the joynts as it lyeth upon the ground, faltning it felfe therein quickly, and overspreading any ground, especially grow-ing in the shade or any most place; and is increased by breaking of the sprouted stalkes and thrust into the earth.

2. Pulegium regium vulgare majus. Great Penny-royall. There is a greater kinde than the ordinary fort, found wild withus, which so abideth being brought into Gardens, and differeth not from it, but in the largenesse of the leaves and stalkes, in rifing higher, and not creeping upon the ground so much; the flowers whereof are purple, and growing in rundles about the stalkes like the other.

3. Pulegium densis surculu. Thick or double Penny-royall. This fort differeth little from the former, the leaves are somewhat smaller and thicker set on the stalkes, and the branches grow closer together.

4. Pulogium mas flore albo. White flowred Penny-royall. This Penny-royall groweth more upright with his stalkes than the former, and sometimes a foor higher also, having leaves thereon fet by couples like it, and in some places other fmaller leaves likewise growing with them, the flowers also grow in rundles or wharles round about the stalkes at severall joynes, but are wholly white, and so abide being planted in gardens, the smell whereof, the taste and use is altogether like the other: the rootes likewise creepe under ground, as the former.

1. Pu'egium vulgare. Common Penny-royall.

5. Pulegium angustifolium sive Cervinum. French or Harts Penny-royall. This fine Penny-royall hath creeping rootes under ground, but shoot forth longer sprouts than the former, from whence spring forth many tall upright hard stalkes, whereon are set at equall distances many small long and narrow leaves, all along the branches up to the toppes: the flowers grow round about the stalkes at the joynts with the leaves, at many spaces up to the toppes, of a pale purplish colour; the smell and taste hereof is much more pleafing and stronger also.

6. Pulegium folis Nummularia. Round leafed Penny-royall. This round leafed Penny-royall groweth almost as upright as the last, with stender stalkes, having the leaves set by couples at each joynt, and are small and round like unto those of Hearb two pence, but farre lesse: the slowers stand in rowes compassing the stalkes as the other doe, of a pale bluish colour: the smell hereof is much more pleasant than the common fort.

The Place. The first is common in many moist and watry places of the Land, and for the use kept in Gardens. The second is found wild in Esex, in divers places of the highway between London and Colchester, and thereabouts, more abundantly than in other Countries, and from thence brought and planted in many Gardens of Effex. The third

TRIBE. I.

5. Pulegiam anguftifolium free Gervinam French or Harrs Penny-royall,

hath beene also found in some places of our Land, and brought into Gardens. The fourth Pena saith he found not onely upon a plaine in Piement, on the borders of the highway betweene Riolio and Taurinum; but in divers other places also. The fift groweth in abundance in the wet fields and moorish grounds about Mompelier, where they use almost no other fort, although they have them in plenty also. The last grew in the Garden of Pados, but where naturally, we have not understood.

They doe all flower in the later end of Summer, about the moneth of August and sometimes later.

It is called in Greek y hum of Bhimm a Bhund balatum concises, vel ut scribit Pena, Plinio & Dioscoride authoribus, quod pulmonibus pisuitans crassam farctamque excumus, that is, from bleating, because it causeth Sheepe and Goats to bleat when they are eating of it; but Pena saith, rather from the effect of causing thick flegme, to be expelled out of the lungs which stuffed them : in Latine Pulsgium and Pulejum allo, aund flos recentis berba incensus pulices necat others; because it killech fleas being burned. The first is well knowne every where : but the fecond being not knowne in other Countries, as I thinke hath no other name chen that which is fet downe in the title. The third is as little knowne out of our Country I thinke as the former. The fourth is the Pulegium man Pliny, which he faith hath white flowers, as he calleth the ordinary famina. The fift is called by them of Mompelier, and by Gesner Pulegium Cervinum, and of Dedoneus Pulegium alternum folige oblongis, of Lobel Angustifolium sive Cervinum Monspolionse, Bambinus calleth it Pulegium angustifolium: the last Baubinus onely maketh mention of in his Pinax and Prodromus. The Arabians call it Alman & Almagan, the Italians Pulegio, the Spaniards Poleo, the French Poulies, the Germanes Poley and Harre Poley, the Dutch Poley, and wee in English Penny-royall, Pudding grasse, and Pulioll-royall, and in the West pasts, as about Excess Organs,

The Verturs.

Dioscorides faith that Penny-royall rarifieth or maketh thin thick flegme, it warmeth the coldnesse of any page whereunto it is applied, and digesteth raw or corrupt matter, being boyled & drank, it provoketh womens monthly couries, expelleth the dead child and after-birth, and flayeth the disposition to vomit, taken in posset, that is waer and vineger mingled : it allayeth the gnawing of the fromack; being mingled with Honey and Aloes and drunke, it can the flegue to be avoyded forth of the lungs, and helpeth trampes, (which place is observed by Cor-narius in his third Booke, and 3 t. Embleine to be erromous, for who ever afed Aloes in any medicine that was to expectorate flegme, but in flead of wild asine it should be written wild asine and so Pliny expresses it in field a sine it should be written wild asine and so Pliny expresses it in field as some 14, Hepaticis cum melle & sale bibendum datur, pulmonum vitia excreabilia facit, with honey and salt, it is a safe and good medicine for the lunges) it avoydeth metancholy by the stoole: drunke with wine it helpeth such as are bitten or stung with venemous beasts: applyed to the nostris with vineger, it reviveth those that are fainting or sounding: being dryed and barnt, it strengthment the games: it is helpfull to those that are troubled with the gowt, applyed of it selbe to the place smill it was red: applyed in a vero to a plaister, it taketh away spots or markes in the face, it much profiteth those that are spleenetick or livergrowne being applyed with sake the decoction helpeth those that have itches, if the places affected bee washed therewith : being put into bathes for women to sit therein, it helpeth the swelling and hardnesse of the mother, and when it is out of its place. Some copies doe adde that if the greeze hearbe be braifed and put into vineger, it clenseth soule alcers, and causeth the matter to digest, it taketh away the markes or bruifes of b'owes about theeyes, which we call blacke and blue eyes, and all differlourings of the face by the fire, yea and the leprofie, being drunke and applyed outwardly: being boyled in wine

with honey and fait it helpeth the toothach: it helpeth the cold griefes of the joynts, taking away the paines, and warming the cold parts, being falt bound to the place after a bathing, or having beene in a hot house. Plan adderh hereunto that Mints and Penny-royall agree very well together in helping faintings or Iwonings being put into vineger, and put to the notifils to be smelled unto, or a little thereof put into the mouth. It easeth the headach, and the paines of the breaft and belly, it ayeth the gnawing of the stomack, and the inward paines of the bowels, being drunke in wine provoketh vrine, and womens courfes, and expelleth the after-birth and dead child; in helpeth the falling ficknesse being given in wine : put also into unwholsome and stinking waters, that men must drinke (as at Sea in long voyages)it maketh them the leffe hurtfull ; it lefneth the fatneffe of the body being given with wine, (but here P finy is supposed to have mid-interpreted the Greeke word, translating it Sufficient errors for the thought to be wise; that is anxietater, which Hipporrates in Aphorifin 56, lib. 9. saith, is taken a way by drinking it faith, equall proportion of wine and water) it helpeth crampes or the convultions of the sinewes being applyed with thoney, fait, and Vineger. It is very effectuall for the cough, boyled in milke, and drunke, and for the ulcers of Ress of the mouth. Thus faith Pliny, Galen faith that being that pe and formewhat bitter, it heateth much. and externateth alfo. And in that it heateth, much may be knowne by this, that it maketh the place red where it is applyed, and raileth blifters if it be fuffered to lie long upon it: And that it doth externane, is sufficiently seene by this, that it doth exuse thick and tough slegme to be avoyded forth of the lungs and chek; and that with ease as also that it procureth the feminine courses; Matthiolus saith (and so doth Custor Duranters also) that the decochionthereof drunke helpeth the jaundise and dropsie, and all paines of the head and sinewes that come of a cold

cause, and that it helpeth to cleare and quicken the eye-fight. It was used as Durantes faith, in stead of Bistamus Cretensis (for it should seeme in his time also the true Distance was not knowne, which was in Ama 1585.) who faith, that bruifed, and with vineger applyed to the nostrils of those that have the falling-sicknesse, or the lethargie, or put into the mouth, helpeth them much, and applyed with barly meale it helpeth burnings by fire; it bringeth the loofned matrix to its place, and dissolveth the windinesse and hardnesse thereof, easeth all panes and inflamations of the eyes, and comforteth and quickneth the eye-fight being put therein, as also put into the eares easeth the paines of them.

> CHAP. XIII. Mentha, Mintes.

TRIBE. 1.

Here are many forts of Mints, some chiefly nourished up in Cardens, others growing willie, either on the mountaines (which for their rarity and diversitie are brought also into Gardens) or the wet and overflowne marishes, or the Water it selfe.

1. Mentha Romana angustifolio sive Cardiaca. Hart Mint, or Speare Mint.

This Mint hath divers round stalkes, and longer and narrower leaves fer thereon, than the next Mine, and groweth fomewhat lower and smaller, and of a darker greene colour than it; the flowers stand in spiked heads at the tops of the branches, being of a pale bluth colour, the finell or feent hereof is somewhat neere unto Basill. It en-

creasesh by the root underground, as all the others doe.

2. Mentha (ruciata. Crosse Mint.

The Crosse Mint hath his square stalkes somewhat hoary, and the leaves thereon hairy also, rougher, broader, and rounder than the former, which stand on all sides thereof one against another, two at a joynt, so that they represent a crosse, thereby giving it the name: the flowers frand in fpiky heads, of a purplish colour, somewhat deeper than it.

3. Menthafulca five vulgaris. Red or Browne Mints.
This Mint hath square brownish stalkes, with somewhat long and round pointed leaves, nicked about the edges, of a darke greene, and fometimes reddifh colour, fet by couples at the joynes, and of a reasonable good scent: the flowers are reddiffillanding by spaces about the tops of the stalkes & the roots runne creeping in the ground as the rest doe, and will as hardly be extirped as the rest.

4. Memba Criffe. Criffe or Carld Mine.
The greatest difference in this kinde of Mint from the last, confidents first in the leaves, which are almost as round as the laft, but more rough or crumpled, or as it were carld; then in theflowers which are purplift ftanding in rundles about the toppes of stalkes: and in the smell hereof which commeth necrest unto Balme.

5. Mencha Crifpa Danica aut Germanica speciosa. The great Curld Mint of Germany.

This brave Mint creepeth with his rootes as the others doe, having divers high stalkes rising from them, which 1. Mentha Romana augustifelio five Cardiaca. Hart Mint, or Speare Mint.

2. Mentha Cruciata.

Creffe Mint.

4. Mentha Crifta.

Crifpe or Curld Mint.

5. Mentha Crifta Danica ant Germanica fpeciofa.
The great Curld Mint of Germany.

Meutaftrum ni-

veum An

el icum. Party co-

loared Mints.

foone divide themselves into branches with two leaves at every joynt, fomewhat broad and large, but more deepely cut in at the edges, and as it were curld or crumpled toge-ther, especially the lower leaves, for those that rise up with the flalke are not fo much torne or cut in on the edges, but are a little deeper dented than the former: the flowers stand in somewhat larger and rounder spiky beads than others, of a pale purplish colour: the stem whereof is pleasant, but not

fo quicke or hot as some of the former.

6. Mentastrumborsense sive Mentastylvestris. The Manued wild Mint.

This wilde Mint that is nursed up in Gardens hath cree-This wilde Mint that is nuried up in Gardens hath creeping rootes as other Mints have, and figuare fialkes which are hoary, and a little hairy also, whereon are fee larger and rounder leaves than in the former, of an hoary white colour covered as it were with downe; the flowers stand at the toppes of the branches, in longer and more flender spiky, heads than any of the former, and are of a pale purplish colour, the scent hereof is more strong, full, and heady, but no thing so pleasant as the others.

Of this kinde is the party coloured Mints which are kept in Gardens, having divers leaves parted, white and greene, fome more or lesse than others.

7. Mentastrum falio longiore. Long leased Wild Mints.
This Wild Mint hath square brownish statkes, and somewhat broad, but longer leaves growing on them than the last, and nothing hoary at all, but rather of a dull greene co-lour: the flowers stand at the tops of the branches in rounder tufts, of a pale purplish colour: the scent hereof is some-what more pleasant than the other.

8. Montastrum montanum sive Pannonicum. Hungarian Wild Mints.

This Hungarian kind hath square stalkes, and somewhat large leaves fer thereon by couples at every joynt, as the o-

TRIBE. 1.

ttaffrum mentanum five Pannonicum. Hungarian Wild Mints.

6. Mentaffrum niveum anglicum. White Mints, or Party colculed Mints.

thers are, which are more green than the last, & dented about the edges also: the flowers are more white than the last standing about the stalkes at several spaces, and ending in small long spikes: the root is hard, shooting forth many strings, more like unto Nep than Mint, as the whole face thereof doth refemble, according to the minde of Clufius, and is of an hot and sharpe taste, fmelling fomewhat like the wild Mints.
9. Mentastrum tuberosum Clusy. Clusius his knob-

bed Wilde Mint.

This kinde of wild Mint hath square hairy greene stalkes full of joynts, with two leaves set thereat, which are long rough dented about the edges, and which are long rough dented about the edges, and fomewhat hoary, or of a whitifu greene colour, and of an unpleafant finell, the toppes of the branches doe end in fpikes of hoary leaves, among the which the flowers fland at diffances, with two leaves at a space, of a whitish colour, after which followeth imall black seed, the root is somewhat like a reddish root, brownsh on the outside, having certaine tuberous heads joyned thereamto, which being separated, will grow into plants.

10. Mentafrum geniculata radice. Wilde Mints with joynted roots.
This kinde of Mint bath his roote formewhat thick, and fet with joynts of kines at certaine spaces, and shooting foorth sibres thereat; the stalke riset not a foothigh, being formores thereat; the traine men not a foothigh, being formewhat hard, rough and fourte whereon are fet at the flynns two fong darke greene leaves being foft in handling, but a little wrinkled and dented about the edges: the flowers stand at the tops of the branches in short tusts or spikes like unto Nep. of a pale purplish colour: after which come small round fweet smelling feed like unto the whole plant.

11. Men-

TRIBE. 1.

C H A P. 13.

9. Mentaftrum tuberofum Clusij. Clusius his knobbed wild Mints.

11. Mentaftrum hirfutum. Hairy wild Mints.

This wild Mint bith fquare hairy falkes with many branches rising from the roote, higher and greater than the ordinary wilde Mine, having hayric long leaves fet bifereon at a joynt, and many purplift flowers at the tone.

12. Mentaftrum rotundifolium minus. Small round leafed wild Mints.

The stalke hereof is square, hairy, and reddish, about a foote high, having reddin, about a foote high, having two leaves at a joynt, fomewhat long and round, foft, hairy, and dented about the edges, of a fad greene on the upper fide, and heavy under-neath; from the joynts rife form branches for with the like leaves, and round heads of flowers at the toppes, of a purplish colour: the frem here five the tend for the first part the feath for the first part the feath for the feath feath for the feath for the feath feath feath for the feath the scent hereof is not very pleasant, but rather strong and heady.

The first foure fores are easily found planted in Gardens with its, and the effewhere, but for effectall respects brought into gardens. The other forts were likewise wild by nature in their places, but now are cherished with the lovers of plantes in many places.

The Time.

All the forts of Garden, as well as wild Mints, flower not untill the beginning of August for the most part, but the garden Mints for the most part seldomedoe give any good seed, but recompense the defect by the increase of the root, which is so plentiful, that being once planted in a garden, they are hardly rid out agains, every small piece thereof being left in the ground increasing fast enough.

The Names.

Mentha was called by the old Gracians wiren as Pliny recordeth, but of the later Greekes is violent ab odoris bomitate vel jucunditate, because it is so sweet. The Arabians call it Nabae nabe : the Italians Memba : the Spaniards mitate vel jucunditate, because it is so tweet. In e aradians call it Nabab nabo : the Italians Chemina : the Spaniards for a buena : the French Menthe : the Germanes Muntz : the Dutch Mint, and so doe we. The first of these garden Mints is called Romana angustifolia sive Cardiaca, and called by Basilianu Mentha beriensis verticillata ocimi odore, (but how truely I cannot see, because it beareth spiked heads) who sixth also, it is the Desimoides repent that Gerard hath set out, for that no other Ocimoides of any other Author agreeth thereunty. The second is called Cruciata of Lobel, & rotundifolia altera spicate spore, in English Crosse Mint. The third is usually in our gardens by the name of red Mints : the south is called Mentha crista, and Salfamita of Camerarius, and Sissmirium Mentha crista averticillata and is the surface surface spore in Salfamica of Camerarius, and Sissmirium Mentha crista averticillata and is the surface surface spore in Salfamica of Camerarius, and Sissmirium Mentha crista averticillata and is the surface spore in Salfamica of Camerarius, and Sissmirium Routens of the Salfamica of the name of red Mints: the tourin is caused regented crips, and Daijamira of Camerarius, and Dijmortum nortenje of Mathinus, and called by Baubinus Mentha crips verticilate, and is the vulgata ferpent prundiere folio Pulegy fore of Lobel, in English Curld or Crips Mint. The fift is the best and truest Curld Mint. Which Lobel shewed, but did not set forth. The first is that kinds of wild Mints which is planted in gardens and called of some Horse Mint; (from whence hath come our white or party coloured Mints, to be feene in many gardens) and as I thinke is Mint; (from whence hath come our white or party coloured Mints, to be seene in many gardens) and as I thinke is called by Lobel Sigmbria Menta agressia, for it answereth very well thereunto, although Lobel saith, it is all one with the Mentha cruciata. The seventh is called by Lobel Mentalrum aliad & Manadrum Campense of Lugdanensis, it is the Sysimbrium spluestee of Manthiolous, very well set forth in his small toper. The eighth and ninth referreth trather to a kinde of Catterias tuberosa, and by that name I have often received it among other seeds to the second the sait of The Vertues.

The garden Mints in generall, yet the fwe ter forts, that is, the Speare Mint, and Hart Mint, are more usually raken for all the uses whereunto Mints doe serve; Dioscorides saith it hath an heating, binding, and drying quality, and therefore the juyce taken with vinegar stayeth bleeding. It stirreth up venery or bodily lust, and as hee faith killeth the round wormes, which hath not usually beene knowne to take effect with any, two or three branches thereof taken with the juyce of fowre Pomegranats staieth the hickock, vomitings, and allaieth choller, it dissolvesh impollumes being laved to with barly meale: it is good to represse the milke in womens breasts when they are fwolne therewith, or otherwise, for such as have swollen, flagging, or great breasts, applyed with salt, it helpeth the byting of a mad Dogge, with Meade or honied water it eafeth the paines of the eares: applyed to the privie parts of a woman before the act of generation hindreth conception, which is contradicted as you may read a few lines below, and rubbed upon the tongue, taketh away the roughnesse thereof. It suffereth not milke to cardle in the stomack, if the leaves hereof be steeped or boyled in it before yee drinke it. Briefly, it is very profitable to the stomack, and in meates is much accepted. It is of especiall use to stay the seminine courses when they come too fall, as also to stay the whites, for which purpose no other hearbe is more safe and powerfull, for by taking it often it hath cured many. Applyed to the forehead or the temples of the head it easeth the paines thereof. It is also good to wash the heads of young children therewith, against all manner of breaking out therein, whether sores or stabs and healeth the chaps of the fundament. It is profitable also against the posson of venemous creatures. The distilled water of Mints is availeable to all the purposes aforesaid, yet more weakely: but if a spirit thereof bee rightly and chimically drawne, it is more powerfull than the hearbe it selfe, in regard the spirit and strength of a great deale is brought into a small proportion; foure ounces thereof taken as Matthiolus saith, doth stay bleeding at the nose, which may be thought incredible to a great many. It is much commended to be available in venereous causes, although Pliny in his lib, 20 cap, 14. doth write to the contrary; but Galen in his sixt Booke of Simples, doth render a reason of the faculty hereos very worthily, where he saith, some doe call that Mentha odorata, sweet Mint, which by others is called it to true Hedyosmos: but there is another Mint which is not sweet, which they call Calamintha: both of them are sharpe in taste, and hot in quality, yea even in the third degree of hear, but Mentha oderata is weaker and leffe heating, so that I may well say that the one seemeth to be as it were the tame, and the other the wild : wherefore by that humidity it hath gained by manuring, it provoketh to Venery, which thing is common to all hearbes that have in them an humidity halfe digested and windy: by reason of which temperature being mingled with Barley meale it is used to ripen impostumes, which you cannot doe with Calamint because it heateth and digesteth more, then such things as should ripen impostumes doe require. It hath also in it a little bitternesse, and some tartnesse, by reason of the bitternesse it kille h the long wormes of the belly, and by the tartnesse it stayeth the vomiting of blood : while it is fresh, if it bee taken with Oxycratum (which some take to be fower milke, and others to be Posca, that is vineger and water mingled together.) It is of as great tenuity as any hearb whatsoever: these are Galens words. Simeon Sethi sairh it helpeth a cold liver, and strengtheneth the ftomack and belly, causeth digestion, stayeth vomitings and the hickock, is good against the gnawings of the heart, and stirreth up the appetite, it taketh away the obstructions of the liver, and stirreth up bodily lust; but thereof too much must not be taken, because it maketh the blood thin and whayish, and turneth it into choler, yea, and canseth the blood which is of very thin parts, after it is separated, to become thick and melancholick: and therefore cholerick persons must abstaine from it: it is a safe medicine for the byting of a mad Dogge, being bruised with salt and laid on; the powder of it being dryed and taken after meate, helpeth digestion, and those that are With talk and taite on; the powder of it being dryet and taken and fore travels in child-bearing; it is also thought to be good for bleare eyes applyed to them; and that the decoction of them being drunke, doth helpe the bleedings at the mouth speedily, or presently. It is good against the gravell and stone in the kidneys and strangury. It is also comfortable for the head and memory, not onely to be smelled unto, but chiefly to be applyed unto the head and temples, and eafeth the head-ach: the decoction thereof cureth the gums and mouth that is fore, if it bee gargled therewith, and mendeth an ill savoured breath, as also with Rue and Coriander, causeth the uvula or palate of the mouth that is downe, to returne to its place againe, the decoction thereof being gargled and held in the mouth.

Ariffule and other in the ancient times forbade Mints to be used of Souldiers in the time of warre, because they thought it did so much incite to Venery, that it tooke away, or at least abated their animosity or courage to fight, Divers have held for true, that Cheeses will not corrupt, if they be either rubbed over with the juyce or the deco-Ction of Mints, or they laid among them. And some againe, that if the juyce of Mints be put into the milke whereof you meane to make Cheefe, that although yee pur remiet thereto, it will never draw to curds whereby to become Cheefe. The vertues of the wild Mints are more effectially to dissolve winde in the stomack, to helpe the chollick and those that are short-winded, and are an especially remedy for those that have venerous dreames and pollutions in the night, used both inwardly, and the juyce being applyed outwardly to the testicles or cods; the juyce thereof dropped into the eares easeth the paines, and destroyeth the wormes that breed in them; they are good against the venemous bytings of Serpents, and as it is said, killeth them by the fume thereof, or by the stent of them being layd in any place, the juyce laid on warms helpeth the Kings-evill, or kernels of the throat, the decotion, or the distilled water helpeth as single proceeded from the corruption of the teeth, and fausted up into the nose purgeth the head. Pliny saith, that in the time of Great Pampey, it was found out by experience of one, to core the Lepry by eating the leaves, and applying some of them to his face, and to helpe the scurse or dandrosse of the head used with vineger.

Altera minor.

CHAP, XIIII. Calamintha. Calamint, or Mountaine Mint.

CL Lthough divers Authors doe confound Galamint (calling it Catmint) with Nep, which is more properly called Catmint, yet I thinke it better to intreat of them a part, then to joyne them both in one Chapter.

1. Calamintha vulgaris. Common Calamint.

1. Calamintha vulgaris. Common Calamint.

The ordinary Calamint that groweth usually abroad in the dry grounds with us, is a small hearbe seldome rising above a foot high, with square hoary, and wooddy stalkes, and two small hoary leaves fet at a joynt, about the bignesse of Marjerome, or not much bigger, a little dented about the edges, and of a very fierce and quick fcent, as the whole hearb is: the flowers fland at severall spaces of the stalkes, from the middle almost upwards. which are small and gaping like unto those of Mints, and of a pale blush colour, after which follow small round blackish seed: the root is small and wooddy, with divers small sprigs spreading within the ground, and dyeth not, but abideth many yeares.

There is another of this fort which is like unto it in all things. but somewhat lesser, differing chiesly in the slowers which are not so large by the halfe, which noteth it to be a differing species. 2.- Calamintha montana prastantior. The greatest Calamint.

or Mountaine Mint.

This sweet Calamint riseth up to be a foot and a halfe high, with his fquare hard, and hoary stalkes, which are many, and senderer than those of the wild Mints, whereon are set at every joynt two small and somewhat round leaves deepely dented about the edges, yet larger than those of the former wilde kinde. being somewhat hairy, and not so hoary, but rather of a sad greene colour, of a very fweet fcent, not firong or heady as the other : the flowers are gaping, and like the other, but larger, and of a purple colour, after which commeth the feed, which is black, fmall, and round, fomewhat like unto Purstan seed, the root is wooddy, but abideth and shooteth forth new branches every

3. Calamintha altera odore Pulegy folys maculosis. Spotted Calamint.

This footted Calamint differeth not much from our ordinary wild Calamint, but that it groweth not fo great and high, having fquare hard hoary stalkes, and hoary leaves thereon like it, but

spotted here and there, and of a strong scent like unto Penny-royall : the flowers grow in the same manner, but fmaller, and of a pale purplish colour.

. Calamintha minor incana. Small Calamint.

This hoary fmall Calamint hath fmall low and flender hoary stalkes not above a foot high, whereon are set two leaves at a joynt, as in the other forts, but smaller and more hoary, even smaller than the least bush Basill; the flowers are very imall, but like the last, and of a lesse heady scent.

5. Calamintha arvensis verticillata sive aquatica Belgarum Lobely. Field Calamint with whorled coronets.

This small Field Calamint sendeth forth divers square hoary stalkes stull of joynts, and two small and almost round hoary leaves fet thereat up to the toppes, somewhat like unto the leaves of Penny-royall, of a quicke and sharpe, yet sweet scent like thereunto also: towards the toppes of the stalkes and branches stand with the leaves many purplish flowers divers set together in a whorle or coronet: the root is small and abideth long, not per rishing after seed time.

The Place.

The first groweth on heaths and upland dry grounds in many places of the Land: the second on the Euganzan hills neere Padon, and on the hills neere Vicenza in Italy, and on the Rocky shadowie cliffes of Sevens in Pro-vince of France, as also in Germany, and other places, and in England also, as Label saith bee observed. The third Pena faith he found on certaine Hills in Lombardy, and in fundry places of our owne Land, yet feldome spotted. The fourth Camerarius faith he had the feed from Candy. The last groweth in divers fields of our owne Land, as well in moist medowes, as plowed grounds,

The Time? They doe all flower in Iuly, and their feed is quickly ripe afterwards. The Names.

It is called in Greeke rodauliron quasibona vel utilis Mentha, a good or profitable Mint. The first is called Calamintha vulgaris & montana vulgaris by most Authors: and the lesser of this fort Baubinus calleth Calamintha vulgaris exiguo flore The second is called of Lobel, Camerarius, and others Calamintha montana prassantior, as the best of all the forts of Calamints, in English as it is in the title, Gerard giveth the figure of this for Scorodonia, or Salvia 2. Calamintha montana prastantist.
The greatest Calamint, or Mountaine Mint.

TRIBE I.

3. Calamintha arvensis verticillata five aquatica Bel. Field Calamint with whorled coronets.

4. Calamintha minor incana. Small Calamint.

agrestis, for hereunto that figure is nothing like. Bauhinm calleth it Calamintha magno flore. Pona in the description of Mount Baldue in many places dont take it to be the Melissophyllum Fuchsi, The third is called by Lobel as it is in the title. Matthiolus and Camerarius call it Calamintha altera, and fay that the Italians doe call it Nepotella. Cordus upon Dioscorides calleth it Nepeta agrestis, and Bauhinus also calleth it Calamintha Pulegij odore sive Nepeta, Gerard giveth the figure of Calamintha montana prastantior for this: in English Spotted Calamint, for a distinction from the others, although it hath but sometimes small shew of spots with us. The fourth is called by Lobel Calamintha secunda incana, and by Camerarius Calamintha Cretica, but by Bauhinus Calamintha incana ocimi folijs, in English Small Calamint, because it is the least of all the rest. The last is called by Lobel Calamintha aquatica Belgorum an Polycnemon quasi multitibia. Calamintha aquatica Matthioli by Lugdunensis. Calamintha arvensis by Gesner in hortis, & Tabermontanus : by some Mentha aquatica exigua & Pulegium splvestre, and by Bauhinus Calamintha arventis verticillata.

The Vertues. Calamint is very hot and sharpe, the heatbe onely is used, the root is unprofitable. The decoction thereof drunke, bringeth down womens courses, and provoketh urine. It is profitable for those that are burften, and those that are troubled with convulsions or crampes, with shortnesse of breath, and with cholerick torments and paines in their bellyes and stomacks, it helpeth the yellowjaundise also, and stayeth vomiting being taken in wine, taken with salt and honeyir killeth all manner of wormes in the body. It helpeth fuch as have the lepry, either taken inwardly drinking Whey after it, or the greene hearbe applyed outwardly: if it bee applyed in wooll as a peffary to the privie parts of a woman, it draweth downe the courses, and easeth paines of the mother, but killeth the birth, and therefore to bee refused of women with child. It driveth away venemous Serpents, being either burned or strewed in the chamber. It taketh away black and blue spots and

5. Nepeta peregrina latifolia. Strange Neppe with broad legves.

markes in the face, and maketh black fearres to become well coloured, if the greene hearb and not the dry be boy. led in wine and laid to the place, or the place washed therewith being laid to the buckle-bone or haunch where the paine of the Sciatica resteth, by continuance of time it so healeth the place, that it draweth forth and spendeth the humours that were the cause of the paine. (This was a course held in Diosecrides time, but our Physicians and Chirurgians doe not fouse it now adays.) It killeth the wormes of the eares if the juyce be dropped into them. the leaves boyled in wine and drunke provoketh iweat, and openeth the obstructions both of the liver and ipleene: it helpeth also them that have a tertian ague (the body being first purged) by taking away the cold fits that see before tithe decoction hereof with some Sugar put thereo alterwards is very profitable for those that be troubled with the overflowing of the gaule, and that have an old cough, that are scarce able to breath by the shortnesse of their winde, that have any cold distemperature in their bowels, and are troubled with the hardnesse of the spleene. for all which purposes both the powder called Diacalamenthes, and the compound Syrupe of Calamint, which are to be had at the Apothecaries are most effectuall.

CHAP. XV.

Nepeta. Neppe or Calamint.

Here are divers forts of Neppe, some vulgar, and others more rare, which I intend to bring to your knowledge, which are thefe.

1. Nepeta major vulgaris. Common Garden Nep. The Common garden Neppe shooteth forth hard foure-square stalkes with an hoarinesse on them,a yard high or more, full of branches, bearing at every joynt two broad leaves, for forme and largenesse, somewhat like unto Balme, but longer pointed, softer, whiter, and more hoary nicked also about the edges, and are of a strong fweet scent, not offensive to any, but very pleasing to Cats, who will rub themselves thereon all over: the flowers grow in large tufts at the toppes of the brancher, and underneath them likewise on the stalkes many together, of a whit ih purple colour: the rootes are composed of many long strings and fibres, fastning themselves strongly in the ground, and abide with greene leaves thereon all the Winter.

2. Nepeta media. Middle sized Neppe. This other Nep hath likewise square hard stalkes, not so great as the former, but rather more in number, and fometimes as high: the leaves are finaller by almost the halfe, harder, greener, and nothing so strong in scent, set by couples upon the flalkes, which branch not in that manner: the flowers are fewer, smaller, and growing onely by spaces along them up to the toppes, of a faint purplish colour, gaping like the other, and after them such like small round feed in the huskes, the rootes are greater, longer, and more wooddy, abiding many yeares in the ground, but holding no greene leaves thereon in the winter.

3. Nepeta minor. Small Neppe.

This finall Neppe hath divers foure-square hard and hoary stalkes rising from the root, which dye not after seed-bearing, but shoote fresh branches not above a foote high, with two fmall long and narrow leaves, fnipt or dented about the edges, and hoary also, of a stronger scent than the common, and of a hotter tafte, the stalkes shoote forth into many branches, at the toppes whereof fland many finall gaping white flowers, spike fashion like the ordinary, after which come small blacke seed

Casper Bauhinus in his Prodromus Theatri Rotanici setteth downe a small Neppe, which he saith doth differ from this of Clusius, but the description thereof doth so neerely resemble it, that I am more than halfe perswaded it is the very same.

4 Mentha Catariaminor Alpina. Small Mountaine Neppe, or Catmint.

In the same place he setteth downe another Neppe, smaller than his former, with square brownish stalkes of a foot height, branching forth, whereon are smaller leaves set then the former, being somewhat broad, almost three square and hoary; the flowers are small and whitish, set or placed spike fashion at the tops, like unto the common kinde.

5. Nepeta peregrina latifolia. Strange Neppe with broad leaves.

This strange Neppe hath a square hoary stalke, spreading into branches on all sides from the bottome to the toppe, set with two leaves at every space, which are broader than the next that followeth, but yet are not much broader, but longer than the ordinary Neppe dented about the edges, and of an hoary greene colour: the flowers stand in spaces about the toppes of the stalkes, almost of a pure white colour like in forme unto the common Neppe, but larger: after which commeth the feed which is blacke like it also; the smell of the whole plant is stronger and sharper but more pleasing than it.

6. Nepeta

6. Nepta peregrina angustifolia. Strange Neppe with narrow leaves. This other Neppe is of the same kind with the former, and different from it onely, in that the leaves are smaller and narrower, but neither in colour or smell, or any other thing differing. The Place.

The first and second growe wild in other Countries, but are nursed up onely in Gardens in ours, as all the rest are : the third, the fift and the fixt doe grow in Spaine : for from thence the feed came that brought foorth thefe goodly plants. The fourth Bashinus faith groweth upon fome hilly grounds about Naples, from whence hee received feed.

They doe all flower in July, or thereabouts, with the ordinary fort.

The Names.

The ordinary garden fort is called of some Cataria, and Cattaria, and of others Mentha Cataria, and Mentha felina, because as I said before, Cats delight both to smell and eate thereof, and gladly rub themselves against it, but of most with us Nepera. Gerard saith that our Nepera is called Pulegium sylveffre, but hee is therein much mistaken, for Dioscorides faith that the Latines did call that in his time Nepeta, which he calleth his second Calamine, and was called also of some Pulegium sylvestre, but Dioscorides his 2. Calamint is not our Nepeta used in these dayes, as any of judgement may soone perceive, that readeth and marketh Dioscorides his description thereof. And Mathiolus also taxeth Brasavolus who fell into the same errour, he being chiefly deceived by the mistaking of the name; for the Italians call that manured kind of Calamint Nepotella, as Matthiolus faith, which was derived from the Nepeta, and Brafavolus would fasten it upon this hearbe which they call Herba Gattaria. The first of these is the Herba gattaria of Matthiolus: Gesner in hortis tooke it for a kinde of Calamint, Tragus, Cordus, and others call it Nepeta. Lobel Cattaria, and Mentha Cataria, and generally with us Nepeta, in English Nep, or Cat Mint: the second I doe not finde mentioned by any Author, but it is continued in my Garden to this day under that name. The third Clusius calleth (attaria tennisolia Hispanica, and Camerarius Nepeta minor, Baubiuus Men-tha Cattaria minor, in English small Neppe, or Catmint. The fourth he calleth Mentha Cataria minor Alpina, in English Small mountaine Nep or Cat Mint. The fift is called by Lobel Mentha Cataria peregrina latifolia of Tabermontanus Mentha felina satvia latifolia; of Gerard Cattaria altera, and of Beslerus in his garden of the Bishop of Eyflot, Nepeta peregrina, in English strange Neppe with broad leaves. The last is called by Lobel Mentha Cattaria percerina angultifolia, of Dodonaus Cattaria folio longiore : of Gerard Salvia Romana, for the figure thereof answereth thereunto, and not unto any Cattaria: of Baubinus himselfe Mentha Cataria angustifolia minor, in English as it is in the title.

The Vertues.

Neppe is generally used for women to procure their courses when they are stayed, to use inwardly, or outwardly, to bathe them in the decoction of it, with other hearbes convenient for the purpole, or with it alone, or to fit

over the hot fumes thereof, for it not onely warmeth and comforteth the coldnesse, but dryeth the overmuch mojflure of the mother, which may be one cause of sterility or barrennesse, and by the frequent use of it, to cause them to be more fruitfull that were hindred, and also for the wind and paines of the mother or rising of it. It is also used in paines of the head that come from any cold cause, as catarrhes and thin rheumes, and for swimmings and giddinesse thereof. It is also of especiall use for the windinesse of the stomack or belly. It is effectuall for any cramps or cold aches to dissolve the cold and wind that affecteth the place, and to bring warmth and comfort thereunto afterwards, It is used for colds or coughes, and shortnesse of breathing. The juyce thereof drunke in wine is profitable for those that have caught some bruise by any accident. The greene hearbe bruised and applyed to the fundament, there abiding for two or three houres eafeth the sharpe paines of the piles, the juyce also is effectuall for the same purpose, being made up into an oyntment and applyed. A Decostion thereof also is commended to wash the head, to take away the scabs thereof, and may be effectuall for other parts of the body also. Lobel saith the two greater forts of strange Neppe are more effectuall to all the purposes than the ordinary kinde is used for. The vertues of the former two leffer forts are not certainely knowne, but are thought to conduce to the like effects.

2.3. Meliffa Turcica flo. Car & albo. Turky Baul me with

4. Meliffophyflum Furbiy, Vnpleafant Baulme,

CHAP. XVI. Meliffa. Balme.

Efides the ordinary which usually groweth in all our gardens, there are some other forts of Baulme, as they are entituled by divers Authors for the sweet scent of them comming neerest, is that of our ordidinary Baulme, of all which I meane to entreate in this place.

1. Meliffa vulgaris. The common garden Baulme.

1. Meliffa vulgaris. The common Garden Baulme.

The common garden Balme hath divers square greene stalkes, with round hard darke greene leaves pointed at the ends, and a little dented about the edges, fet by couples at the joynts, of a fweet fmell, comming neerest to a Citron or Lemmon, the flowers are small and gaping, growing at the toppes of the stalkes, of a pale Carnation colour, almost white : the rootes fasten themselves strongly in the ground, and endureth long, the leaves and stalkes dying downe yeerely.

2. Melissa Turcica flore cornleo. Turky Baulme with a blue flower.

This Baulme rifeth up with one square brownish greene stalke, two foot high at the least in any good ground and higher sometimes, spreading with two branches from every joynt where the leaves are fet, up almost to the toppe: the leaves are narrower and longer than those of the ordinary Bauline, and more dented in about the edges, of as fweet a Lemon fept, or rather more than it, rough alfo, and of as fad a greene colour the flowers are gaping or hooded, growing at the toppes of the branches, at certaine diffances, of a blue or purplish blue colour. standing in rough sharpe pointed huskes, after which commeth the feed which is black and roundish, with a white spot in every of them, plainely to be seene while they are fresh, but not so easily discerned when they are dry. The root perisheth every yeare, and must be sowne a fresh in the Spring time, if any bee defirous to have it.

3. Melissa Turcica flore albo. Turky Baulme with a white flower.

This other Baulme differeth not from the former, either in growing, or height, or forme of leaves and flowers, or in the good smell thereof, or in the durability, for it is equall thereunto in all these properties: the onely difference is, in that the leaves hereof are of a fresher greene colour, and that the flowers are of a perfect white colour; the feed whereof doth not degenerate as in many other hearbes it hapneth, but keepeth

constantly his kinde, for any thing I could observe in it these twenty yeeres and upwards, since I first had it and

4. Melissophyllum Fuchsig. Vnpleasant Baulme.

Vnto the kindred of Baulmes I thinke good to adjoyne this plant more for the formes sake of the leaves from whence Fuchfiss first gave it the name, then for any other correspondence it hath therewith, but as it is at this time, take it with this description. It hath divers hairy square browne stalkes rising from the roote, halfe a yard high, whereon are set two leaves at severall spaces, at the contrary sides of them, ever up to the toppes of the stalkes, which are broader and somewhat longer than the ordinary Baulme, and of a sad greene colour, betweene which leaves at every joynt with them, from the middle of the stalke upward on each side thereof, commeth forth larger flowers, and longer than in Baulme, more like unto those of the yellow Lamium, or dead Nettles, as some compare them, or unto those of mountaine Calamint, as others doe, of a pale purplish colour on the lower part,

and whitifh above, this hath no fuch good feent therein as the Baulme hath, but is rather of a Gronger unpleafant fcent, for which cause I have so entituled it.

5. Meliffa Molseca levis five Syriaca lavis. Great Affirian Bauling. This hearbe Matthiolus and others make a kinde of Baulme from the forme of the leaves chiefly: it rifeth from feed with a round hollow stalke out of the ground, to bee two foote high or thereabouts, branching forth diverily on all fides up to the toppe, whereon are fet thorter and rounder leaves, at the end of long foote stalkes. formewhat leffe denred about the edges then in the common Bauline, and not at all fharpe on the edges, as in the next: at the joynts of the stalke from the middle thereof upwards, come forth round about it, certaine hard whitiffs kins small and round at the bottome, and wide, open at the brims like unto a bell, having five corners for the most part: from the bottome of each of these commeth forth one slower somewhat small, and like unto the slower of common Baulme, almost white, or with a small shew of blush therein, and after they are past, in the bottome of the fame skinny bells grow the feed (but feldome one of ten commeth to be ripe with us) which is whitish and cornered : the smell hereof is nothing like Baulme, but rather fulsome, the taste thereof is bitter : the roote peritheth every yeare.

6. Melissa Molucca asperior sive Syriaca asperior. Prickly Assirian Baulme. This other Affirian Baulme rifeth a little higher, and groweth somewhat greater than the former, but after the fame fashion; the leaves hereof are somewhat longer and sharper on the edges, the huskes likewise in which stand these skinny bells, at the corners of them are sharpe pointed, and of a paler white colour: the flowers and feed are all alike, and perishesh likewise at the first approach of any cold night; this hath a little better scent to commend it than the former.

7. Cardiaca. Motherwort.

As these three last had little likenesse with Baulme, more than in the forme of the leaves, and the properties as you shall heare anon; so this, besides the properties answerable to the rest in comforting the heart, hath no shew of affinity, no not in the leaves: but because some have put it to the kindred of the Baulmes, and others to Nettles, and others to Horehound. I have thought it best for the vertues sake (whereunto none of the Nettles or Horehounds are answerable) to set in the end of the Baulmes, and to be as it were a bridge to passe from them to the Horehounds, whereunto in face it hath the more refemblance. It hath a hard square brownish rough strong stalke, rifing to be three or source foote high at the least, spreading into many branches, whereon grow leaves on each fide with long south foote stalkes, two at every joynt, which are somewhat broad and long; as it were rough or crumpled, with many great veines that show themselves therein, of a sad greene colour, and deepely denied in about the edges, and almost torne or divided : from the middle of the branches up to the toppes of them, which are very long and small, grow the flowers round about them at distances, in sharpe pointed tough hard haskes, which are more purple or red than in any of the former Baulmes, or in any Horehound, but in the same manner and forme, and roughnesse as the Horehounds; after which come small round blackish feed in great plenty; the roote

TRIBE. 1.

5. Meliffa Molucca Levis five Spiaca levis Great Affirian Banlme

Motherwort.

fendeth forth a number of long ftrings, and finall fibres, taking firong hold in the ground, of a darke yellowish, or brownish colour, and perisheth not as the other, but abideth as the Horshound, the smell likewise is not much differing

The Place.

The first is onely to be found in gardens: the two next growes naturally in Moldavia, which is under the Turkish Dominion. The third at the foote of divers hills both in Germany and Narbone in France. The fourth and fifth as Alasthiolin thought in the Molacca Hands which are in the East-Indies, but therein he was much mistaken, yet he faith they came from Constantinople, others and that thore truely fay, that Martinellus Sequinus an Italian sent them to Venice out of Syria. The last groweth among rubbish, and by the fides of walls and hedges in many places beyond the Seas, but not with us that I have knowne or heard, but one, ly in Gardens where it hath, beene once sowne or planted.

The Time.

The three first and the last flower somewhat earlyer in the Summer, than the two Affirian kindes, which flower very feldome before the middle of August, fo that it hardly giveth any good feed, although the two former and the last doe plentifully.

The Names.

Balme is called in Greeke μελιασέρυλλος ή μελίουλλος Meliffophyllum, or Meliphyllum, id est aprim solium, quod aper av valde delectautur, in Latine Melissa. Cirrago, ab odore Ciere, Apistum quod apibus sit yratissima. & Melissaphyllum, of the effect being good for Bees. The first is called Melifa, or Melifaphy have generally by all writers: the fecond and third are called Melissa Moldavica & Turcica by most Writters; Bambinou calleth it Melissa Turcica peregrina folie oblenge : the third Cordon and Fuchfins take to bee the

true Meliffophyllum,& thereupon it is generally called Meliffa,or Meliffophyllum Fuchsiy by most writers, although it have not the smell of Baulme, nor good to rub hives withall, as the true Baulme : Lugdunensis saith it is the Calaminiba prastantior which Pena and Lobel have described and set forth more exactly but he is therein much deceived. for Forthiss faith his hath blacker and larger leaves than Baulme, Ethat Calamin hath smaller and whiter: only Ranhinm and Clusim referre it to the Lamia, Banhinm calling it Laminm Montanum Melissa folio, and sairh withall, that the varying thereof may be referred, to the variable forts of the Lamia Pannonica of Clufius: it is called in English as it is in the title, untill a more exact or truer name may be given it, for I cannot consent to Bana hinus and Clufius, to call it Lamium, seeing so many Authors call it Melissa. The fourth Matthiolus calleth Melissa Constantinopolitana, or Melissophyllum Constantinopolitanum & lave is added by Dodnneus, for hee maketh no mention of any prickles in that, which grew in the Emperours Garden, but that which Alphonfus Pantins of Ferrara fent him as he faith, the leaves were prickly: affuredly that kind that I have had growing in my garden at feverall times, had no prickles either on leafe or huske, although Bashinus faith hee never faw any that was without fome sharpe thornes, and therefore it should seeme, that Lobel maketh the one kind lesse sharpe or thorny than the other, and calleth it Cardiaca Melica five Molucca minus aftera, & Molucca Spriaca. Baubinus calleth ir Melissa Moluccana odorata, as he doth the fifth Melissa Moluccana fætida, making the one to be sweet, and the o-

ther stinking. Lobel calleth it Molucca asperior Syriaca, and faith moreover that it is called Maseluc of the Turkes: Casalninus would referre both these kindes unto the Alissum of Dioscorides and Pliny; and Bauhinus saith they are like to the Alissum of Galen. They have their English names over their heads. The last is called Cardiaca of most of our later Writers, for it is likely it was not knowne to them of ancienter ages, yet Dodonaus formerly tookeit to bea Sideritin. Tragus to bea wilde Baulme. Brunfelsius to bee Marrubium mas. Anguillara to bee Licophis or Branca lupina, & Bauhinus calleth it Marrubium forte primum Theophrasti: Casalpinus thinketh that it is the Alissum of Galen and Atius. We doe call it Motherwort in English, as truely from the effects to helpe the Mother, as they call it Cardiaca from the effects to helpe the heart, as you shall heare by and by: the Arabians call

Baulme Bederengie, Bedarungi, Cederenzegum, Turungen or Trungian and Marmacor: the Italians Meliffa, Codronella, and Aranciata: the Spaniards Torcnoil & yerva cidrera: the French Melisse & Poncirade: the Cermanes Melissen, Binenkrante and the Dutch Melisse & Honichbanm Consille degreyn, and we in English Bawme, from the fingular effects therein in imitation of the true natural Baulme.

The Vertues.

The Arabian Physicians have extolled the vertues of Baulme, for the passions of the heart in a wonderfull maner, which the Greekes have not remembred : for Serapio faith, it is the property of Baulme, to cause the minde and heart to become merry, to revive the fainting heart falling into swounings, to strengthen the weaknesse of the fpirits and heart, and to comfort them, especially such who are overtaken in their sleepe, therewith taking away all motion of the pulse, to drive away all troublesome cares and thoughts out of the minde, whether those passions rife from melancholly or black choller, or burnt flegme, which Avicen confirmeth in his booke of medicines proper for the heart, where he faith that it is hot and dry in the second degree, that it maketh the heart merry, and ftrengthnesh the vitall spirits, both by the sweetnesse of smell, austerity of taste, and tenuity of parts, with which qualities it is helpfull also to the rest of the inward parts and bowels. It is to good purpose used for a cold stomack to helpe digeltion, and to open the obltruction of the braine. It hath a purging quality therein also saith Avices, and that not fo weake, but that it is of force to expell those melancholly vapours from the spirits, and from the blood, which are in the heart and arteries, although it cannot doe so in the other parts of the body. Diof corides faith that the leaves drunke in wine and laid to, is a remedy against the sting of Scorpions, and the poison of the Phalangium, or venemous Spider, as also against the bytings of Dogges, and commendeth the decoction thereof, for women to bathe or fit in to procure their courses, and that it is good to wash the teeth therewith when they are full of paine, and that it is profitable for those that have the bloody flixe. The leaves also with a little Nier are taken in drinke against a surfect of Massirons, it helpeth the griping paines of the belly, and is good for them that cannot take their breath, unlesse they hold their necks upright, being taken in a Lohoc or licking Electuary: used with salt it taketh away wennes, kernels, or hard swellings in the selfs or throate, it clenseth soulcomes, and is an helpe to ease the paines of the gowt. Galen saith in his seventh Booke of Simples, that Baulme is like unto Horehound in qualities, but weaker by much, and therefore few will use Baulme when Horehound is fo plentifull, and neere at hand to be had every where. Pliny faith in lib, 20, cap. 11, that in Sardinia it is poyfon, wherein it is very probable that he was much mistaken, and for Sardonia herba, which is called of some Apium rifus, and of Apuleius Apiastellum, he tooke this Apiastrum or Baulmer the juyce thereof used with a little honey is a singular remedy for the dimnesse of the light, and to take away the millinesse of the eyes. It is of especiall use among other things, for the plague or peltilence, and the water thereof is used for the same purposes, It is also good for the liver and spleene. A Tansie or Caudle made with egges, and the juyee thereof while it is young, putting some Sugar and Rosewater unto it, is often given to women in child-bed, when the afterbirth is not throughly avoided, and for their faintings, upon, or after their fore travels. It is ofted in bathings among other warme and comfortable hearbes for mens bodies or legges in the Summer time, to comfort the joynts and finews, which our former age had in much more use than now-adayes. The hearbe bruised and boyled in a little wine and oyle, and laid warme on a Bile will ripen and breake it. There is an ordinary Aqua-vita of strong water stilled, and called Baulme water used generally in all the Land, which because it hath nothing but the simple hearbe in it which is too simple, I will commend a better receit unto you. Take two pound of Bauline while it is young and tender, of Mints and Sage, of each one pound, bruife them well in a stone-morter, and par them into a pot or Limbeck, and put thereto of Anifeeds four ounces; of Cloves of Nutmegs, of Cinatnon, of Ginger, of Cubebes, and of Galanga, of each one ounce, being all a little bruised and put into two gallons of good Sacke if you will have it excellent good, or else into foure gallons of Ale, and so still it as Aqua-vite is distilled, and let it diffill as long as you shall finde any strength in the water, yet so that the latter water bee not so weake, to make all the rest white: whereunto put a pound of Sugar, shaking it well before you set it away, and after it bath rested so one moneth, you may use of it as occasion shall require ; for it is of especiall use in all passions of the heart, swounings and faintings of the spirits, and for many other purposes, whereunto the hearbe is here declared to be availeable.

3. Marrubium Creticum.

The hearbe is often put into oyles or falves to heale greene wounds, and it is very probable the name of Baulme. was given to this hearbe, from the knowledge of the healing properties of the true and natural Baulme. It is also an hearbe wherein Bees doe much delight, both to have their Hives rubbed therewith to keepe them together, and draw others, and for them to fuck and feed upon; and is a remedy against the stinging of them. The Turkey Baulme is of as good effect to all the purposes aforesaid, as the ordinary. The Assirian Baulme is of excellent vertue to expell any poison or venome, as also against the plague or pettilence used inwardly and outwardly, it killeth the wormes, and helpeth the jaundise, and the paines of the Mother, for it openeth obstructions, warmeth the cold parts, rarifyeth and clenfeth. Motherwort is held of the later Writers, to bee of much use for the trembling of the heart, and in faintings and swounings, from whence it tooke the name Cardiaca: the powder thereof to the quantity of a spoonefull drunke in wine, is a wonderfull helpe to women in their fore travels, as also for the suffocations or risings of the Mother, and from these effects it is likely it tooke the name of Motherwort with us. It also provoketh urine, and procureth the feminine courses, clenseth the chest of cold flegme oppressing it, and killeth the wormes of the belly. It is of good use to warme and dry up the cold humours, to digest and disperse them that are fettled in the veines, joynts, and finewes of the body, and to helpe crampes and convulfions, &c.

CHAP. XVII. Marrubium, Horehound.

Orehound is divided into two forts by Dioscorides, Theophrastus, and Pliny: that is, into black Hore-hound, which they call Ballote, our stinking black Horehound, and into white, which is the ordinary Horehound that is in use in our Apothecaries shops, & with all others: but there are some other sorts found out, which doe well agree with them in the outward face, and peradventure in the vertues also, whereof I meane to entreate in this place, referring some of the other hearbs unto that Classis, that is, proper for them, where they shall be remembred.

1. Marrubium album vulgarc. Common Hore-hound

1. Marrubium album vulgare. Common Horehound.

Common Horehound groweth up with square hoary stalker, halfe a yard or two foot high, fet at the joynts with two round crumpled, or as it were rough leaves, of a fullen hoary greene colour, of a reasonable good scent, but of a very bitter taste, the flowers are small, white, and gaping, see in rough hard prickly huskes, round about the joynts with the leaves, from the middle of the stalkes upwards, wherein afterwards is found small round blackish seed: the root is blackish, hard and wooddy, with many stings thereat, which dyeth not, but abideth many yeares.

2. Marrubium Hispanicum Candidum. White Spanish Horehound. This Spanish Horehound hath divers foure-iquare stalkes, more white and hoary than the ordinary Horehound, whereon are fer the leaves by couples, which are somewhat longer, thicker, whiter, & more woolly also than it, & a little dented about the edgesthe flowers grow towards the toppes of the flakes in rundles, at the feverall joynts with the leaves, which are of a pale purplift colour like the common fort, standing in the like rough buskes : the feed is blacke like it also, and so are the rootes: the whole plant is of a stronger and better scent than ours. Gerard hath set forth this Horehound, and is the second with him : but his defcription doth wholly answere to his fourth, which is the Hore. hound of Candy.

3. Marrubium Creticum. Sweet Candy Horehound. Candy Horehound hath more crooked and slenderer stalkes than the last, being round and not square, whereon doe grow fometimes broader, and at other times and places, fmaller, longer and narrower leaves than it, for these are accounted but one kinde, more dented about the edges, fet by couples, more white or hoary than the former Horehounds, as the stakes are also, which branch forth into many stender branches, having slowers at spaces like the former, but smaller and set in smaller and sharper haskes, which are purplish also like it; the seed is like it also, and the root busheth forth with many sibres: the scent of this is

much better than ours, and equall, if not beyond the other.

4. Marrubium Creticum angufifolium insderum. Vnfavory Candy Horehound.

This Candiot differest from the last onely in these particulars: it hath shorter, narrower, and rounder pointed leaves than the former, and is without any good smell.

5. Marrubium album villes um. French Horehound.

This small Horehound rifeth not up above a foot high, with his wooddy round, white, hoary stalkes spreading into divers branches, whereon are fer thick leaves in the fame manner as the former, but smaller and rounder, a little notched at the edges, and so white, smooth and woolly underneath, so no Cotton weed is more, but some-

what blackish and sugged on the upper side: the flowers stand at distances at the toppes of the branches, of a pale purplish colour, in the like rough huskes.

6. Marrubium album Crifpum. Curld White Horehound.

Curld Horehound hath hard round white woolly stalkes: the leaves are smaller than the last, a little crumpled and curld at the edges, and a little dented also, of a grayish colour on both sides, but not so woolly as the last: the flowers stand in the same manner as the rest, in prickly huskes, but whiter than any of the for-

7. Marrubium nigrum Hispanicum, vel Ocimastrum Valentinum Clusy. Spanish black Ho ehound.

There are two other forts of hearbs, which although they bee no Horehounds, yet for their likenesse are referred by others therunto, as not knowing better unto what other Tribe or Family they should be joyned. The first of them riseth up with square hairy stalkes a foote high, the leaves grow by couples at the joynts, somewhat long and round pointed, thinner and fuller of veines than the wild blacke Horehound; like unto the middle kinde of Basill saith Clusius, but Lobel saith like unto black Horehound, but longer, and of no fcent at all (faith Clufius, but Lobel faith of the smell of Stachades or Cassidony.) The flowers grow at the toppes of the stalkes in wharles or rondels, of a white colour faith Clufins, standing in prickly huskes; but Lobel faith of a purplish colour (if that of Lobel be the same with this of Clusius,

7. Marrubium nigrum Hispanicum, &c. Spanith black Horehound.

8. Marrubium nigrum longifolium, &c. Black French Horehound with lon- leaves.

8. Marrubium nigrum longifolium, sive Herba Venti Rondeleti & Monspeliensum. Blacke French Horehound, with long leaves. This other plant that is referred by fome to the black Horehounds, hath many fquare rough stalkes, rifing to the

height of a cubit or two foote, spreading into divers branches, set with two long and somewhat broad leaves at every joynt, longer, and broader, than Sage leaves, and longer pointed; dented about the edges, of a fad over-worne greene colour, which in the Winter time remaining withered on the branches without falling away, are to be feene full of holes, as if they had beene eaten with wormes, all the ribbes and veines abiding as they grew until the frosts doe cause their stakes to fall away: the slowers are of a purplish colour greater than any of the Horehounds and more gaping; after which come the seed in hard prickly huskes like unto Horehound: the roote is thicke, fpreading with many blackish strings, whereby it taketh strong hold in the ground, and dyeth not, but shooteth a fresh every yeare, this hath no scent either good or ill to be found in it.

The Place.

The fir't is found in many places of our Land in dry grounds, and waste greene places: the second came from Spaine, and being sowne of the seed, abideth The third in like manner was sowne of seed that came from Candy, as the fourth was also. The fift was found growing about Paris in France. The fixth in Germany. The seaventh in Spaine, and the last about Mompelier in fat grounds, and sometimes in the wheate fields.

They doe all flower in Iuly, or thereabouts, and their feed is ripe in August.

The Names. Horehound is called in Greeke maner and in Latine erassum & Marrubium, videtur autem inquit Pena, Prassum vivor aus certe vinosus odor, appellationem dedisse Marrubio sam nigro fatido quod Ballote dicisur, quam albo odoro s Pliny hath committed many faults in translating the ree e word Prassum, setting downe Prassum id est porrum for it. The first is generally called Marrubium by most of our moderne Writers: but Prassum by Anguillara: the fecond is called by Lobel Marrubium candidum alterum Hifpanicum, Of Clusius Marrubium alterum Pannonicum, and of Camerarius Marrubium Creticum. Of Dodoneus Marrubium Candidum, and of Bauhinus Marrubium album latifolium peregrinum. The third is called by Lobel Marrubium (reticum angustiore folio, Of Camerarius Marrubium Creticum aliud, Marrubium Creticum of Dodoneus, Lugdunensis, and others. Of Baukinus Warrubium album angust ufolium peregrinum. The fourth is called in the great Booke of the Bishop of Exstor his garden, Marrubium (reticum angustifolijs inodorum, and by Baubinus Marrubium album peregrinum brevibus & obtusti folijs. The lifth is called of Baubinus Marrubium album villosum, and maketh a doubt if it should not be Prasum of Dioscorides, in English French Horehound, or white hairy Horehound. The fixth is also called by Baubinus Marrubium criffum, in English Crispe or Curld Horehound. The seventh is called by Clusius Ocimalirum Valentinum, because as he saith, the learned at Valentia in Spaine did so call it : by Lobel Marrubium Hispanicum odore Stachadis. Of Tabermontanus and Gerard Marrubium Hilpanicum; and of Bauhinus Marrubium nigrum latifalium. The last is called by the Apotheraries of Mompelier, Herba Vents & Rondeletij; others call it Sideritis Monspeliensum, A Parietaria Monspelienstum, as Lugdunensis saith, and so saith Cordus also. Lobel maketh a question or quære if it be not the Othonna of Dioscorides, rather than the flos Africanus which usually carrieth that title. Baubinus calketh it Marrubium nigrum longi folium, in English, Black French Horehound, untill a fitter may be given it. The Vertues.

The fecond and third forts of Horehound, because they are nearest unto the first, or wilde kinde, are found to bee as effectuall for the purposes whereunto the wild is assigned, having the same properties, and as Diescorides saith, a decoction of the dryed hearb with the feed, or the juyce of the greene hearbe taken with honey, is a remedy for those that are pursie, and short winded for those that have a cough, and for such as by long sicknesse, or thinne difillations of rheume upon the lungs are wasted and fallen into a consumption: it helpeth to expectorate tough flegme from the cheft, being taken with the dryed roote of Iris, or Orris: it is given to women to bring downe flegme from the chelt, being taken with the dryed roote of Iru, or Orris; it is given to women to bring downe their courses, and to expell the afterbirth, as also to them that have fore and long travels; it is also given to them that have taken possion, or are bitten or stung by any venemous Serpents or bealts, but it surrett the bladder and the reynes: the leaves being used with honey doe purge foule ulcers; stay running or creeping fores, and the helpeth of the step in the representation of the step in the representation of the step in th thion of Horehound, faith Matthiolus is availeable for those that have bad livers, and for such as have itches and running tetters, the powder thereof taken, or the decoction killeth the wormes; the greene leaves bruiled and boyled with old Hogs lard into an oyntment, healeth the bytings of Dogges, abateth the swellings of womens breafts, and taketh away the fwelling and paines that come by any pricking of thornes, or any fuch like thing. Vied with vineger it clenieth and healeth tetters. If faith Matthiolus, you boyle two ounces of fresh Horehound in three pints of good white wine, with the roots of Bugloss, Elecampane, and Agrimons, of each one dram and a halfe; of kubarbe and lignum aloes, of each one dram, untill halfe be confumed and frained, hereby is made a most excellent medicine to helpe the yellow jaundise, that commeth by the obstruction of the vessels, and overflowing of the gall, if two ounces thereof (having a little Sugar put to it to sweeten it) be taken fasting for nine dayes together: but he counselleth, that if they that shall take this medicine have an ague, the decoction must bee made with water, and not with wine : the decoction thereof is a fingular helpe for women that are troubled with the whites, if they fit over it while it is warme: the same also healeth any scabs, whether they be dry or moist, if the places be bathed therewith, being stamped and put into new milke, and set in any place overpestered with flies, it will foone destroy them all. There is a firope made of Horehound to be had at the Apothecaries much used, and that to very good purpose for old coughes to rid the tough slegme; as also for old men and others, whose lungs are oppressed with thinne and cold rheme to helpe to avoid it, and for those that are assumatick, or shortwinded. The other forts are not used, or their properties are not expressed by any.

CHAP. XVIII.

Stachys. Base Ho: ehound.

1965 Must needs adjoyne these Base Horehounds unto the former, for the neare affinity that some of theur especially, have both in face, smell and vertues, referring the Sideritides to another place, which some have

> 1. Staches Diefceridis. The true Baie Horehound.

1. Stachys Dioscoridis. The true Base Horehound. This kinde of wilde Horehound hath divers foft woolly greene leaves lying upon the ground, and abiding all the Winter, fomewhat broad and long, of about two inches in breadth, and three in length, smooth, and not dented at all, or very little about the edges : from the middle whereof rifeth fometimes but one stalke, and sometimes more, carrying divers fuch like leaves thereon, but leffer, fet by couples : about the middle of the stalkes and so upwards come foorth divers purplish flowers, standing in softer buskes than the former Horehounds have, at the joynts with the leaves compassing the stalkes, the tops whereof are small and long, ending as it were in a spike, after which come blackish round seed : the root is made of divers black ish strings which perisheth not after it hath given feed: the smell hereof is small with us, and not so pleasant as others say it is, for any thing that I ever could observe. Camerarius and Lobel say that there is of this kind that

beareth yellow flowers. which yet I never faw. 2. Stachys major Germanica. Great Dutch Base Horehound.

This great base wilde Horehound hath greater and longer hoary leaves, somewhat like unto great Sage leaves, for the colour on both fides, but larger and a little dented about the edges; the stalkes are square and hoary, set with such like leaves at the joynts, & purplish flowers with them round about the stalkes towards the tops, which are greater as all the rest of the plant is, and hath a stronger and worse scent than the other. 3. Stachys five Pfendo Stachys Cretica, Candy Base Horehound.

Base Horehound of Candy hath divers very hoary fouresquare stalkes rifing from a small wooddy roote, whereon are fee two small long and narrow leaves at the joynts, compassing the stalkes, without any foote stalke, of an hoary ash-colour, fomewhat hairy and hard in handling, but those that are next the ground are much longer, every one with a long foot stalke, which together with the leafe is an hand-breadth in length. when as they are scarce an inch in breadth, of little or no scent

at all for the most part, yet some have beene observed to be sweeter than others of this kinde: the flowers are small and purple, standing in prickly huskes round about the stalkes at severall distances: after which commeth the seed which is small, blackish and round,

4. Pseudo Stachys Alpina. Mountaine Base Horehound. The Mountaine Base Horehound from a hard brownish yellow roote, spreading into many long and thick strings; fendeth forth divers rough hairy and hoary leaves, covered with a foft white woolly downe, fornewhat like unto Horehound, but thinner, being three inches broad, and foure inches long, with long foot-stalkes, and a little dented about the edges, of a little heady smell; among which rise up source square hairy stalkes, a cubite and a halfe high; at the joynts whereof grow two such like rough wrinkled leaves, but longer than those below, whereat likewise spring forth small branches on both sides; at the toppes of the stalkes and branches stand the flowers in rundles, of a whitish red colour, placed in somewhat rough huskes, wherein after the flowers are past, grow the feed, which is small, blacke and round. This kinde hath beene observed to grow higher with larger leaves, and without that heady strong smell that is in the former.

5. Stachys Lusitanica. Portugall Base Horehound. This small and low Base Horehound weth for the most part, or at the least leaneth to the ground, having many fmall round hairy white branches, not above halfe a foote long, fet with two very small long, hoary and woolly leaves, almost round at the ends, and not dented at all, of a very sweet and pleasant smell, especially in the hot Country where it groweth: the flowers grow at the toppes compassing the branches, so hid under the leaves, that they can scarse be discerned: the roote is small and long, with some fibres thereat.

Thorny Base Horehound hath many small and long hoary white leaves lying upon the ground, somewhat like unto the small Sage, without any foote-stalke at them, and without any denting at the edges, which so abide the first yeare of the fpringing all the Winter: but in the Spring following, there shooteth foorth divers small and slender stalkes, not above a soote high, as hoary as the leaves, on which are two alwaies set at the joynts, much smallet than the lower-most: the stalkes breake out at the several, joynts with the leaves into divers other small bran-

TRIBE. 1.

Great Dutch Bale Horehound.

6. Stachys Spinofa.

Thorny Bale Horchound

ches, ending all of them in sharpe thornes, whereof the midthereof, hath no good scent to commend it.

The Place. The first groweth plentifully in Italy, as Matthiolus faith: and in the fields about Rome, as Caster Durantes faith: and in Germany also, as others have set it downe. The second is naturall of Germany, as Tragus, Lonicerus, Camerarius, Thalius, furall or yermany, as trapps, Lonicerus, Camerarius, 2 mins, Gespier, and others doe set it downe. The third from the seed that came out of Candy, did the plant spring. The sourch groweth upon a small hill in Germany, called Wasserfall. The fifth groweth in Portingall, as Lobel suffer telatesh it. The sixt and last Honorius Bellus found in Candy, and fent the feed to Clufius, who faith that hee had the figure and fome notes thereofalfo fent him from Iacobus Plateau, who had not thought that Clusius had seene any such plant before.

The foure first doe all flower about the middle or end of July, but the other two are very late, not flowring for the most part untill September, whereby no hope of seed could

dlemost is the biggest and strongest: the flowers are of the bignesse, forme, and colour of the flowers of Spanish Germander, or rather of Sage, but somewhat paler, and the upper part thereof somewhat more bowed downeward, standing thinly scattered on the branches, very quickly fading and falling away: it seldome beareth seed, in regard it slowreth fo late with us, but when it doth, it is black, and fomewhat uneven or rugged, and not round: the roote is very great for the smalnesse of the plant, and wooddy, dispersing it selfe into many sprayes under ground: the whole and every part

it Stachys floribus gratioris odoris. Lobel calleth it Stachys lychnitis, & Stachys fpuria Flandrorum. Cafalpinus calleth

it his Salvia sylvestris tertia, and Bauhinus Stachys Italica minor, in English the lesser, or Italian base Horehound. The second is called by Marthiolus Pseudo-Stachys, and so doth Lugdunensis, but divers others call this Stachys, and judge it contrary to Matthiolus his last opinion to be the truer Stachys of Dioscorides. Gesner calleth it Stachys Germanica, and Camerarius, major sive Germanica. Casalpinus calleth it Salvia sylvestria, Thalius in Harcynia sylva. Marrubium montanum album, Fabius, Columna, Sideritis Heraclea, and Bauhinus Stachys minor Germanica, in English Great Base Horehound. The third is called by Banhinus Stachys, and Pseudo-Stachys Cretica, and saithit was sowne for Marrubium Creticum. The fourth is called by Lonicerus Sphacelus forte Theophrasti. Cesalpinus calleth this Salvia sylvestris nigrior. Tabermontanus and Gerard call it Salvia Alpina, and Bauhinus Pseudo-Stachys Alpina, in English Mountaine Base Horehound. The fift Lobel calleth Stachys Lusitanica, and Lugdunensis doth the like, in English Portugal Base Horehound. The fixt from Candy, was sent unto Clusius by the name of Gaiderothymo,

The first Marthiolus in his latter Edition calleth Stachys, and judgeth it to be the true Stachys of Dioscorides, although in the former editions he had fet forth the fecond with an opinion that it had beene the right, and Dodonam. Lugdunensis, Tabermontanus, and Gerard call it Stachys, also Camerarius calleth it Stachys minor. Gesner calleth

which fignifyeth Asses Time, whereunto it hath no correspondency. Clusius first called it Stachys spuria, and Bauhinus Stachys spinosa Cretica, in English Thorny Base Horehound.

Dioscorides and Galen both speaking of this kinde of Horehound, called Stachys, say it is of a hot and sharpe quality, alittle bitter, and in the third degree of heat : and therefore the decoction thereof is profitable to procure womens courses, and to expell the after birth, and that it causeth abortion in women, that is, to miscarry in child-bearing, or to come before their time; it also provoketh urine being stopped, if the parts be fomented with the decoction thereof, or the party doe fit over the warme fumes.

> CHAP, XIX. Salvia. Sage.

Have to shew you here many differences of Sage worthy of observation, because other Authors have recorded some of them to other hearbes.

1. Salvia major vulgaris. Ordinary Garden Sage.

Our ordinary Sage is reckoned to bee of two forts, white and red (yet I thinke they both rife from one and the fame plant flipped and fet) both of them bearing foure-square wooddy stalkes, in some whiter greene, in others redder, as the leaves are also, standing by couples at the joynts, being somewhat long and broad, rough and wrinckled, of a strong sweet scent: at the tops of the stalkes come forth the flowers fet at certaine spaces, one above another, which are long and gaping, like unto the flow-ers of Clary or dead Nettle, but of a ibluifh purple colour, after which come small round seed in the huske that bore the flower: the roote is woody, with divers strings at it: it is more usually propagated by flips, pricked or thrust into the ground in the Spring time, than of the feed. Of this kinde are the two forts of party-coloured Sage, the one white and greene: the other whitish red and greene in most of the leaves.

2. Salvia maxima five latifolia. Great white Sage.

This great Sage differeth not from the common or ordinary great Sage for the manner of the growing; or the colour of the leaves, or sweethesse of the whole plant, the chiefe differences confilt first in the leaves, which are much larger, and a little dented about the edges, and sometimes much more, making them feeme curled; divers of the leaves being foure inches long, and three inches broad; and in the flowers, fome plants bearing purplift flowers like the ordinary, and others milke white flowers which is the more rare.

3. Salvia major Cretica latifolia, & angustifolia aurita, & non

aurita, pomifera & non pomifera.

Great Sage of Candy with broad and narrow leaves, and bearing cares and apples, and that beare none.

This great Sage hath many fquare hard hoary stalkes, especially when they are young, but turning almost round when they groweld, rifing both greater and higher in the hot Countries than with us, whereon are fet two leaves at a joyne, one against another, in some like our ordinary Sage but larger, in offices

fomewhat smaller and longer; in many plants of both forts there will bee small pieces of leaves growing on both sides at the bottome of the leaves, and in some plants or places there will be none of these pieces or eares to

1. Salvin major vulgaris. Ordinary Garden Sage.

TRIBEL bee seene, (which hath caused severall Authors to give severall figures) which are very hoary underneath, and more greene on the upperfide, having as it were the hoarynesse rubbed off from them, of a much fronger feent than the common: the stalkes branch forth on all sides, towards the toppes whereon stand the flowers at distances, like unto the flowers of ordinary Sage, but of a pale or whitish purple colour; after which come great heads of feed standing in the same huskes or cuppes that bore the slowers before, which are fo much swollen, that they seeme to be berryes, with three or foure great seeds in them. These kindes likewise beare in the hot Countries of Egypt, Candy, &c. at the joynts, and fometimes betweene the joynts of the stalkes, certaine excrescences like unto small Apples or berryes bigger than Pistack nuts, of an inch thicknesse at the leaft, and covered with much downe or cotton, fomewhat rough in handling, of a tafte not fo hot, but more binding than the Sage, and not unpleasant, which the people usually eate with bread, but in other colder Countries is

z. Salvia pomifera. Sage bearing apple se

Flore

4. Salvia minor pinnata. Sage of Vertue.

4. Salvia minor, five pinnata. Small Sage, or Sage of Verme.

This leffer Sage groweth like unto the fift great white Sage, but that the branches are long and sienderer, the leaves also whitish, and never red, and much imaller or narrower, having for the most part at the bottome of each leafe, on each side a small piece of a leafe, which maketh it feeme like finnes or eares : the flowers also are of a bluish purple colour, but lesser. Of this kinde there is one that beareth white flowers, differing in nothing else from the o-

5. Salvia minor aurita odorațissima Hispanica. The sweetest small Spanish Sage with cares.

This Spanish small Sage is in most things so like the ordinary small Sage with eares, called Sage of Vertue, that unlesse it bee well heeded or marked, it will bee thought all one with the other, but herein confliteth the difference, it feldome groweth to be so great, the leaves are somewhat smaller and greener, or not so white, it is more tender to keepe, and doth quicklier perish in the Winter. unlesse it be better desended than the other; and the smell hereof is farre more milde, sweet, and pleasant, yet somewhat quicker wirhall than the former, which is easily discerned by any that can judge of fcents; and lastly, some kinde hereof beareth white flowers, an other blue.

6. Salvia Cretica angustifolia non aurita. Small Candy Sage without cares.

This small Candy Sage riseth up with divers hard stalkes , of a brownish colour, having the leaves set thereon by couples, which are much narrower than in any other Sage, and without any eares at all fee unto them, of a whitish greene colour like the small Sage, at all let unto them, or a whittin greene colour like the imall Sage, and a little dented or crumpled about the edges; this brancheth forth plentifully, bearing purple flowers at the toppes in spikes, without any leaves among them, the roote is hard and wooddy, spreading under ground diversly.

7. Salvia minor altera flore rubente. Small red flowred Sage.

This small Sage different little in the forme of growing or bignes, and the same than the same sage to frequently with the leaves as it.

or colour of the leaves from the ordinary small Sage, but that it hath not eares so frequently with the leaves as it hath: the chiefest difference from all others is that the flowers are red, and that both smell and taste are like unto

8. Salvia lanuginofa angustifelia. Small woolly Sage. This woolly Sage bath divers round stalkes a foote and a halfe high, so hoary and woolly, that they are soft therewith, though underneath they be wooddy, which spread into many branches, with leaves set thereon like the other, which are thick, narrow, short, and very livary, white and rough, of two inches long, and halfe an inch in breadth, smelling like unto Tansye; the flowers stand in spikes at the toppes of the branches, of a purplish colour, like unto the flowers of dead Nettle or Archangell, with many small long threads in the middle.

9. Salva folio fubrorundo. Round leafed Sage.

This Sage hath many fourre hoary thalkes with leaves fer thereon in such manner as the others are, which are rough or crumpled like the leaves of ordinary Sage, but thinner, and much whiter, round also like unto the leaves of Violets, or round rooted Birthwort, yet ending in a point in other things it different not from the ordinary com-

10. Salvia frutuofa lute a angustisolia, sive Phlomis Lychnitis Dioscoridis Clusio. The greater yellow wilde

This kinde of Sage (for thereunto I thinke it fitted to referre it, and not to any Mullein as others doe. for which ally more than the upper, there and assessment also than the upper, there and national also than those of the small Sage, among which rise up square hoary and hairy stalkes about a footed ligh, whereon doe grow such like long hoary leaves as grow below, two alwayes the sage and hairy stalkes about a south a sage when the sage always sage when the sage as grow below, two alwayes the sage as grow below. fet together one against another at the joynts; where the flowers stand at spaces, about the toppes of the stalkes with two leaves under them, broad at the bottome, and compassing the stalkes, being shorter than the rest: the flowers are large, open, and gaping, like unto Sage, or somewhat more like unto those of the dead Nettle, or Archangell,

6. Salvia Cretica angustifolia non aurita. Small Candy Sage without cares.

10. Salvia fruticofa lutea anguitfolia five Phlomis lichnitis, @ c. Yellow wilde Sage with narrow leaves.

of a yellow colour comming forth out of hoary woolly huskes, covered with pale coloured haires, the toppes by reason of the length and weaknesse bending a little downewards, after which come brownish seed inclosed in

woolly huskes; the root is blackish and wooddy.

11. Salvia fruticasa lutea latifolia sive Verbascum sylvestre quartum Matthioli. French or yellow wilde Sage with broad leaves.

Although divers Authors doe account this hearbe a Mullein, and so doe number it among the kindes thereof, yet I thinke it more proper to put it among the Sages: for Lobel and Pena in their Adversaria lay, that it is called wilde Sage in the Gardens of Italy, France, England, and the Netherlands: and in regard that the leaves and flowers both of this, and the precedent doe rather relemble Sage than Mullein, this the greater Sage, and the former the leffer, I fee no reason why these should be called Mulleins, or referred unto them rather then unto Sage, seeing none of the Mulleins that are properly so called, have hoosed or gaping flowers like unto Sage, Archangell, and the like: but all of them are composed of five leaves, laid open like unto the Campions, and many other such like flowers. Take therefore the description thereof here in this manner. It hath divers square wooddy hoary stalkes, whereon grow at severall spaces, rugged hoary, broad, and almost round pointed leaves, many set together, very like unto the great Sage but greater: the flowers grow likewise in rundles or spaces towards the toppes of the stalkes, very like also unto the flowers of Sage, or Archangell, but of a yellow colour: the feed is greater than of any Sage, somewhat brownish and round like the last: the root is wooddy, with divers strings and fibres fastned unto it: the whole plant smelleth somewhat strong and heady. Gerard setteth downe another fort hereof, which hee saith is more fweet, but I mervaile where he had any relation of another, there being but one fort that ever I could heare of or know.

12. Salvia minor lutea Cretica. Small yellow Sage of Candy. This fmall Sage groweth with three or foure stalkes that are hard, square, and hoary, about a foote or more high, parted into other imaller branches, at whose joynts being separate farre in sunder, come usually two, and sometimes three or more, rough finall hoary leaves, very like unto the small Sage leaves, and at them likewise towards the toppes of the stalkes, stand divers small gaping flowers very like unto those of Sage, but of a gold yellow colour, the feed is small, black, and somewhat long: the roote is wooddy and slender, the whole plant is of little sweet scent, but stiptick or astringent in taste. Alpinus calleth this Verbasculum Salvifolium, and differing in the smallesse from the other Salvifolium, which is foure times bigger, and would referre it to Dieferides his Verdafeum fyloeffre, amending the rext which is somewhat faulty, in saying rames babes circum virgas velusi Marrubium: but Marrubi-um hath not ramules, but flores circum virgas; and so it is most likely the text should runne, but I sippose it is most like unto a small Sage, wheretunto I therefore referre it, because no Verbascum hath gaping flowers.

The Place. The first groweth in Spaine and Narbone etc. and so doe the fourth and fift. The second groweth well in England

TRIBE L.

11. Salvia fratticofa lutea latifolia five Verbafcum fylveffre, &c. French or yellow wild Sage with broad leaves

12. Salvia miner lutea Cretica. Small yellow Sage of Candy.

with many that have it, and is likely to be that fort which Clufius faith he found in Austria with white flowers, and may also be Gerards his Alpina, but that the figure doth better represent an Horminum than Sage, The third as is faid, is naturall to the hot Countries of Egypt, Candy, &c. but will not abide with us, nor ever beare those apples. The fourth is in many of our gardens, and as (Infins faith, groweth plentifully in Spaine, and so doth the fift, The fift came out of Spaine, and is the sweetest of all other, yet it different as I said, from the former small Sage, which groweth in Spaine likewise abundantly. The fixt was raised from the seed that came out of Candy, whereof Classias maketh mention, that he received the figure thereof set forth to the life in colours, from Iacobus Platean, as it grew with him. The leventh Bauhinns faith he first faw in an Apothecaries Garden in Bassil, and afterwards in the Duke of Wittenbergs Garden at Mont Belgard, but from whence it was brought to them, he doth not declare. The eighth Banhinus faith he received from Doctor Nendorfferus, and faith no more. The ninth hee faith likewise hee had from an Apothecarie at Smaleald: the two next throughout Spaine and Portugal plentifully: and the eleventh about Mompelier also: the last grew in Candy. All these forts will grow by the slippes taken from them, and planted in March or Aprill.

Most of these forts of Sage does flower in July, or about the time of the ordinary Sage, yet some of them flower not untill August. All of them also doe beare feed, but the small ordinary Pigge Sage, or Sage of vertue, which although I doe acknowledge to give feed in some places, and in some yeares, yet most commonly, and with many it doth not, nor the freet small Spanish kinde.

The Names.

Sage is called in Greeke Englishass. The pale ash-coloured dry and withered deformity of the leaves of Sage, espesage is called in Greeke and the for Countries where it groweth naturall, was the cause to give it that name, as if you should call it, scorched or consumed by blasting, for inadem doth fignisse interquere, and contrabere to bee drawne together, or wound within it selfe, and some or rather spanned doth fignisse that disease in plants, which the Latines call fideratio, a blafting, that is, when the hearbe or tree by the extreame heate of the Sunne in the Dogdayes, or otherwise piersing into it, and drying up the moissure that nourished it, seemeth to grow faint and dry, or as it were scorched. It might saith Penabe fitly so named, from the helpe this hearbe given to those parts of a or as it were corened. It might laten remove newly to named, from the neipe this hearbe giveth to those parts of a mans body, that seeme to be as it were dead by some blashing, in restoring the natural heat and vigout to the part, in which quality it excelleth, giving a friendly and beneficial comfort to the vitall spirits; and therefore the Latines called it Salvia, quia salvia shomines of incultances efficiat, because it maketh men sale and sound in health. And the Latine versifyer from hence tooke his occasion to say, Car moritur homo cam Salvia cress in horro. And Sage in English, from the property in comforting and strengthening the head and memory, to make men sage or wise, of the French word Sangesor from the Latine Salvia, to say safe, and altered into Sage. Phiny in his 21, Booke, 16, chaphath souled versed in missaking the Greeke word sangesor and translating income. hath foulely erred in militaking the Greeke word seare, and translating it eare which is Lens, for he there faith,

shar Eliliphacos, with the Greekes is phacos with others. The one is more gentle than the manured lentell. with a leffer, dryer, and fweeter leafe; and the other kinde that is wilde, is of a more grievous fcent, &c. too much here to recite and fer downe, and to little purpose. The first is generally called Salvia major & latifolia, by almost all Authors; the second Clusius faith he first saw in Austria, and Baubinus that he had it first from England, and called it thors: the second common and it in the second secon which he faith they ufully call ordenounces Phlascomelea: the fourth is called Salvia nobilis by Gefner & minor, by Whithill sand divers others, angustifolia, and semnifolia by some others, aurita also, or auriculata, or pinnata by others : the fift Camerarius calleth Salvia Hispanica odoratissima, but Bauhinus Salvia folio tenniore, the old Gerard calleth it Salvia Indica, but his Correcter confoundeth it with the feventh following as you shall heare: the fixt Clufins setteth forth with this title, Salvia Cresica angustifolia, and Banhinus Salvia angustifolia serrata: the seventh Baubinus onely hath remembred unto us by the name of Salvia minor altera, and I adde thereunto flore rubente, to make it the better knowne, for it is fearce knowne to many : this is that Sage that I faid before Mafter Iobnfon that corrected Gerard hath erred exceedingly, in confounding this with the fift, which is the same that Master Cannon shewed him and gave me, whose scent is farre sweeter than the small Pigge Sage, and much differing from the frent of Wormewood, if he had as duely enformed his smell thereof, as hee did his sight of the flower: the eighth Bashinus also giveth the name of Salvia angustifolia lanuginosa, and in English small woolly Sage: the ninth likewise hath his name in the title, Baubinus giving the Latine, and I the English : the tenth is called by Clustus Phlomis Lychnitis, and referreth it to the Lychnisis called also Thryallis by Dioscorides, and by the Castilians in Spaine Candilera, and those of Granado Menchera: Lobel calleth it Verbascum Sylvestre folys salvia tenuifolia, and Baubinus Verbascum angustis Jatvia folys, who saith it is also called of some Angarathi: but Gesner in bortis Germania calleth it Salvia (tivelirie Monspeliensium, and therefore I have placed it in the number of the Sages, and altered the title in Latine and call it thereafter, in English, the greater yellow Sage with narrow leaves: the eleventh is called by Marthiolus also Verbascum stuestre, being his fourth, and from him Anguitara, Castor Durantes, Clusius, and others do call it Verbascum a. Matthioli: Camerarius Verbascum stuestre foliys salvia, and Lobel Verbascum fruticosum liquosum of florelutes, who faith as I shewed you in the description, that it is called a wilde Sage in Italy, France, the Low-Countries, and England, for we call it French Sage, and why then he and they should call it, as the next going before this, Verbascum Mullein, I see no cause more than that the leaves in both are woolly like Mullein, and may serve as a weeke for Lampes, as the Spaniards doe with the last before this, and as Mullein leaves may doe, but that is not a fufficient cause in my judgement, to make them of the tribe of Mulleins, other things not concurring as the flowers whereof I have spoken before. Let others of knowledge bee judges herein. It is called in English as I said, French Sage, and wooddy Mullein, and this may as fitly bee called the great yellow wilde Sage with broad leaves, as the former is called the greater yellow wilde Sage with narrow leaves; The last is called Verbascum salvifolium by Prosper Alpinus in his Booke De plantis exoticis , but because the flowers of this are more like a Sage than a Mullein, as in the former I have rather referred it to these than to them. Baubinus would feeme to make our ordinary Sage to bee the Sphacelus of Theophraftus, (for Dioscorides maketh no mention of Sphacelus) fet downe in his 6. Booke and 2. Chapter: whereof he speaketh in this manner, Sphacelus & Salvia, differ one from another; as if you would call the one the tame manured Sage, and the other the wildo: the leafe of Sphaelus is innocher and narrower, and lesse unseemely, or not fo ill-favoured: but Sage is more rough. Lugdunensis doth make the ordinary small Sage to be it, and Matthiolus seemeth to say the same: Guilandinus as is fet downe in the Chapter going before, thinketh the great Stachys to be it. Dodoneus judgeth the Salvia agrestis, or Scorodonia, Wood Sage to be it, and some others thinke Colus Iovis, or Jupiters distasse, a kinde of wild Clary fet downe in the next Chapter to be it. So that among fuch variety of opinions among learned men it is very hard for me to fet downe which is the truest : yet I will make bold to fcan them all a little, and lastly shew you my judgement. First, for Banhinus that seemeth to judge our ordinary Sage to bee the Sphacelus, which if it should be so, I would faine have him set downe; what fort should be his Sage, that must be by Theophrastus judgement more ragged than Sphacelus; for I thinke none of the Sages is more rugged than the ordinary: For Dalechampins and others that thinke the finall Sage to bee Sphacelus, and fay it is peculiar to the Sphacelus to have eares; furely I thinke that if Theophrastus had meant that Sage, he would not have forgotten to specific the eares, which is fuch a manifelt diffinction from the other, and from all other hearbes almost, that he might foone have put it out of all question, if he had but so set it downe, besides his Sphacelus hath a smoother lease, and not so ill-favoured as the Sage, but the leafe of the small Sage, is almost as unsightly for the smalnesse as the greater : for Guilandinus that taketh the great Stachys or base Horehound to bee Sphaceius, the greatnesse of the leaves and whole plant, and the resemblance more neare an Horehound than a Sage, will make any the more to decline from this opinion; for it feemeth by Theophrastus that Sphacelus should be a kinde of Sage, in that it should no otherwise differ from it, but in the seemelinesse, smoothnesse, and smalnesse of the leafe. For Dodonaus who would make the Secrodonia or Salvia agrefis to be Sphacelus, and strengthneth his opinion with these reasons, that the leafe of the Sphacelus Is more narrow or fmall, (for fo I translate the word contractius) and lesse unseemely than Sage, such as the wooddy Sage hath, and maketh the Greeke word Aspirisher to fignific a more grievous smell, as well as a more rugged or crumpled leafe, that he might make the wood Sage to bee answerable unto Sphacelus, and to be lesse grievous in fmell, as well as lesse rugged in forme to the Sage: but although it be called Salvia & agress with him, and splee fris with Tragus and others, yet it is also referred by the best Authors unto the second scordium or scordois; water Germander of Pliny, and of Valerius Cordus, called Scorodonia, of the finel of Garlicke, whereof this wood Sage hath a imack, which even Dodoneus himselfe describeth to have larger, but shorter leaves than Sage, both which I thinks camot agree unto Sphacelus, for it is faid to have smaller leaves than Sage, and the smell hereof cannot be said to bee leffe grievous than that of Sage. Now for those that would have Colus lovis to be sphacelus, their opinions have farre leffe shew of reason than any of the other going before, for the forme and largenesse of the leaves and Raikes is greater than Sage, and is differing from any good scent, drawing neerer unto a wild Clary, (whereof good Authors make it a kind) than to any Sage. Now to thew you my opinion, which of these come neerest to the truth, I must a little before hand fcan the words of Theophrastus, which you may read in the same Booke and Chapter within a few lines after it; for in describing the next hearbe Marrubium, Horehound to be of two kindes; when hee hath

but else not.

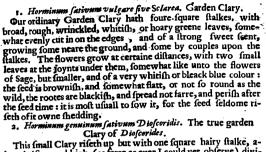

shewed you the first, he saith of the second alternm rotundins squallens websmenter sizes. Sphacelis, &c. which is, the other kinde, hath a rounder lease than the former, and of an exceeding foule unseemely, or ill-favoured forme or colour (for the word squallens may be referred to both) like unto Sphacelus: so that is seemeth that the leaves of the other Horehound should be as unseemely in shew as the Sphacelus, which words seeme to contradict the former concerning Sphacelus, to be smoother, smaller, and lesse unseemely than Sage, for thereby the leaves of Sphacelus should have a neater forme and colour than Sage, and hereby they should be worse, or as bad in shew as Horehound, which all know to be of no good colour or shew: to reconcile these descriptions it is is necessary, seeing an Author of so great learning and judgement, should not vary in his owne writing (but this is note observed or remembred by any Author that I have read) therefore it is the best way to say, that even Sphacelus is very deformed and unseemely, but in comparison of Sage, which is more dry and deformed, Sphacelus is smoother and lesse deformed. So that considering all these hearbes that the severall Authors doe makes to be Sphacelus, Is sind nons that can be more sitly referred thereunto than the Salvia minor, the lesser Sage: not withstanding that Theophrasius hath can be more fitly referred thereunto than the Salvia minor, the lesser Sage: not withstanding that Theophrasius hath can be more fitly referred thereunto than the Salvia minor, the lesser Sage: not withstanding that Theophrasius hath can be more fitly referred thereunto than the Salvia minor, the lesser sage: not withstanding that Theophrasius hath can be more fitly referred decembers contrarieth it, for that it is as deformed as the greater Sage, for both Mastibies in his last Edition upon more mature deliberation no doubt, and Dalechampius, or the Author of Lugdanensis hath expressly set it downess, and Theophrasius according to the Greeke name before shewed, which is Si

of the Dutch Savie, and by us in English, Sage. The Vertues. A decoction of the leaves and branches of Sage made and drunke, faith Diofcorides, provoketh urine, bringeth downe the feminine courses, helpeth to expell the dead child, and is a remedy against the prickes of the Puffen or Forkfish, and causeth the haires likewife to become blacke : it stayeth the bleeding of wounds, and clenseth foule ulcers or fores : the decostion of the leaves and branches made with wine, doth take away the itching of the cods. if they be bathed therewith. Gallen faith it is of a manifest heating quality, and a little binding, and Etius saith the fame also, but he further saith, that some report that the sumes thereof being taken when it is burnt, doth stay the immoderate fluxe of womens courses, and all other fluxes of theirs: Agripm saith that if childing women whose wombes be too moist and slippery, not able to conceive by reason of that default, shall take a quantity of the juyce of Sage, with a little salt, for foure dayes before they company with their Husbands, it will helpe them to conceive, and also for those that after they have conceived, are subject often to miscarry upon any small occasion, for it caufeth the birth to be the better retained, and to become the more lively : therefore in Cyprus and Egypt, after a great plague, women were forced to drinke the juyce of Sage, to cause them to be the more fruitfull. Orphens saith, that three spoonefuls of the juyce of Sage taken falling with a little honey, doth presently stay the spitting or casting up of blood: For them that are in a confumption, these Pills are much commended. Take of Spiknard and Ginger of each two drammes, of the seed of Sage a little tosted at the fire eight drammes, of long pepper twelve Ginger or each two drammes, or the tect. or Sage a little torted at the fire eight drammes, or long pepper twelve drammes, all these being brought into fine powder, let there bee so much juyce of Sage put thereto, as may make it into a masse, formable for pills, taking a dramme of them every morning salting, and so likewise at night, drinking a little pure water after them. Mathiolus saith, that it is very profitable for all manner of paines of the head, comming of cold, and rheumaticke humours, as also for all paines of the joynts, whether used inwardly or outwardly, and therefore it helpeth such as have the falling sicknesse, the lethargie or drowse evill, such as are dull and heavie of spirit, and those that have the palse, and is of much use in all defluxions or distillations of thin rheume from the head, and for the diseases of the chest or brest. The leaves of Sage and Nettles bruised together, and laid apon the impollume that rifeth behind the eares, doth asswage and helpe it much: also the juyce of Sage taken in warme water, helpeth an hoarfnesse and the cough: the leaves sodden in wine and laid upon any place affected with the Palsie, helpeth much, if the decoction be drunke also. Sage taken with Wormewood is used for the bloody fluxe; Plisy faith it procureth womens courses, and stayeth them comming downe too fast; helpeth the stinging and bytings of Serpents, and killeth the wormes that breed in the eares, and also in fores. Sage is of excellent good the to helpe the memory, by warming and quickning the sences, and the conserve made of the flowers is used to the fame purpose, as also for all the former recited diseases; they are persuaded in Italy that if they cate Sage falting with a little falt, they shall be safe that day, from the danger of the byting of any venemous beast t they use there also never to plant Sage but with Rue among it, or neare it, for feare of Toades and other Serpents breeding under it, and infecting it with their venemous spittle, &cc. the danger whereof is recorded in Boccace, of two Friends or Lovers, that by eating the leaves of that Sage under which a Toade was found to abide, were both killed thereby, and therefore the Poet joyneth them both together to have wholesome drinke, saying; Salvia character faciant tibi pocula inta. Sage hath beene of good use in the time of the plague at all times, and the small Sage more especially (which therefore I thinke our people called Sage of Vertue) the juyce thereof drunke with vineger. The nse of Sage in the Moneth of May, with butter, Parsley, and some salt, is very frequent in our Country to continue health to the body: as also Sage Ale made with it, Rosemary, and other good hearbes for the same purpose, and for teeming women, or fuch as are subject to miscary, as it is before declared. Gargles likewise are made with Sage, Rosemary, Honisuckles, and Plantaine boyled in water or wine, with some Honey and Allome put thereto, to walk cankers, fore mouthes, and throats, or the secret parts of man or woman as need requireth. And with on ther hot and comfortable hearbes to be boyled, so serve for bathings of the body or legges, in the Summer time, espedistribution that the state of the boyletists for ve for bathage of the body of legges, in the summer time, especially to warme the cold joynts or snewes of young or old, troubled with the Palsie or trampe, and to comfort and strengthen the parts. It is much commended against the strict or paines in the side comming of winde, if the grieved place be fomented warme with the decoction thereof in wine, and the hearbe after the boyling be laid warme

CHAP. XX. Horminum. Clary.

Here are divers forts of Clary, fome manured onely, called Garden Clary, others growing wilde whereof I shall here shew you many, collected from fundry parts.

'z. Housimum fatebum vulgare five Scharea. Garden Clary.

bout halfe a yard high, (as farre as ever I could yet observe) divided into severall square branches, whereon are set at every joyne two leaves one against another, which are somewhat broad and round, a little rugged like unto Horehound, but more greene than white, and of a reasonable good and small scent; at the toppes of the stalkes stand divers leaves, one row under another, of a very fine deepe purple violet colour, yet the lowest are paler than the uppermost, and seeme a farre of to be flowers, but nearer observed are discerned to bee but the toppe leaves, the flowers comming forth under them at spaces about the stalkes, of a whitish purple colour, smaller than any of the forts of Clary, standing in brownish purple huskes, which after the flowers are past, while the feed ripeneth, turne themselves downeward, whereby the seed is loft, if it be not gathered in fit time : the roote is small and perisheth every yeare, requiring to bee new fowne in the Spring, for it seldome commeth of the seed that it shed, the Frosts and Winter most likely killing it.

Affirian Clary is somewhat like unto Garden Clary, having a squarestalke about two soote high, very little hairy, divided towards the toppes into smaller branches, whereon doe grow at the joynts two rough leaves, those below being larger than those above, and somewhat smoother, as long and large as a mans hand, unevenly waved about the edges: the slowers are like unto Garden Clary, for the gaping forme, but smaller, and of a white colour, after which come small stag grayish seed, having red ribbes and black lines on them, when it is in flower, it smelleth pretty and sweet,

4. Horminum Germanicum humile. Low Germane Clary.

This small low Clary of Germany hath square and somewhat hairy stalkes, a cubit high, whereon doe grow large beaves, very like unto our garden Clary, two growing at a joynt on the contrary part thereof, one unto another, which are very rough and hairy, somewhat torne in on the edges, and deepely dented likewise, both lesse hoary, and of a lesse strong scent than it; the flowers grow at spaces about the stalkes to the toppes, bowing their spiky heads, which are of a purple colour, not much bigger than Lavender slowers, after which come small blackish seed; the root is of the thicknesse of a mans thumbe, blacke on the outside, with divers sibres set thereto, which perisheth not, but abideth many yeares.

The wild Clary (that groweth in many places of this Land) bath many fquare stalkes, two or three foote high, whereon doe grow broad darke greene leaves, dented about the edges, somewhat rugged and hard in handling, the sowers grow along towards the toppes of the stalkes, like unto the gaping or hooded flowers of the garden Clary, but smaller, and of a bleack blue colour, after which come round brownish seed: the roote is long, tough, and black with divers sore same action, as whereby it taketh fast hold of the ground i this hath a strong smell therein, but nodning so quick as our garden Clary. There is another kinde hereof, the toppes of whose stalkes are purplish, with sowers of a deeper purple colour, and somewhat larger leaves. And another likewise hereof, differing onely in that the tops of the stalkes are green; and not purple, the flower of a pale blue colour, and the leaves a little torne in on the edges.

6. Horminum sylvestre incasum store allo. Hoary wild Clary with a white flower.

This white Clary differeth little from the former, but onely that this hath more hoary leaves than it, a little deeper indented into the edges, and the flowers are wholly white.

7. Horminum 17 - Horminum 18 - Hormi

s. Horminum genumum fativum Dioscoridis. The true garden Clary of Diofiorides.

7. Horminum folveftre Italieum. Italian wild Clary.

4. Herminum Germanicum bumile. Low Germane Clary.

7. Horminum fylvestre Italianm. Italian wild Clary. This Clary groweth with such like square high stalkes as the former, whereon grow in the like manner two leaves at a joynt which are greene, but more rugged or fuller of wrinckles, & somewhat longer, ending in a longer point: the flowers likewise stand at the toppes of the stalkes and branches, in spaces or distances like the other. hankes and branches, in spaces or untances like the other, and hooded or gaping as they are, but smaller, and of a red colour: the seed is small and blacke, standing in the brownish huskes, that conteined the flowers, in the like manner as all the rest doe : the roote is living, and perisheth not after feed bearing.

8. Horminum Sylvestre Lavendula flore. Wild Clary with Spike flowers.

This wild Clary groweth like unto the ordinary wilde Clary, with square hairy stalkes as high as it, set with harder narrower and fmoother leaves, deeplier endented about the edges, and rounder pointed, the flowers are much esse than they; and neither in bignesse or colour, much differing from the flowers of Spike or Lavender, growing in spaces as the rest doe: the seed and rootes differ not, nor the finell hereof much, from the other wild kindes.

9. Horminum stuffer salvifolium. Sage leafed wild

Clary.

The Sage leafed Clary hath low square stalkes, not much above a foot and a halfe high, whereon grow two hard rugged leaves at a joynt, very like unto Sage leaves, hard rugged scaves at a joynt, very like unto page scaves, but not hoary at all, of a darke greene colour, dented about the edges: the flowers grow at spaces round about the stakes, of a faire purple violet colour in some, and more pale in others; or aimost of an ash-colour in others; the feed is black, and so is the root without, but yellow within, and shideth without perifling, as most of these wilde

TRIBE. 1.

9. Herminum fiveftre fatvifolium. Sage leafed wilde Clary.

kinderdoe, the smell hereof is more pleasing and lesse heady than most of the others.

There is another of this kinde that differeth chiefly from it, in that it groweth much higher, and hath thicker that the state of this kinde that differeth chiefly from it, in that it groweth much higher, and hath thicker that the state of both of leaves and flowers, there is no difference.

The low Clary of Candy hath divers leaves lying upon the ground, having every one a long foote-stalke somewhat small toward it, and growing broader to the middle, ending in a small point, and three or source inches long, roughlor rugged, or snipt about the edges: the stalkes are somewhat cornered on which doe grow such like leaves, set by couples as in the rest, and towards the toppes white flowers, very like for forme and colour unto the flowers of Garden Neppe, yet without any fweet fcent to commend it.

11. Horminum angustifolium laciniatum. Torne and narrow leafed Clary.

This Clary is small and low also, growing not above a foote high with his stalkes, which are square and hairy, seldome divided into branches 1 the leaves that are set thereon by couples, as in the other forts, are somewhat small and hairy, about one inch in breadth, and three in length, torne in deepely on the edges, especially the lowest; but those that grow up higher are but onely waved, or grosely endented like the leaves of Scolopendrium, or Milt waste, the flowers are small and white, standing in rundles about the toppes of the stalkes, ending in a long spike, which bendeth downewards with the length : after which come black feed.

12. Horminum luteum five Colus Iovis. Yellow wilde Clary, or Impiters diftaffe.

This kinde of yellow wilde Clary, hath divers large hoary, or whitish greene leaves, dented about the edges, standing upon long fooce-ftalkes, riling from the roote, which are broader at the bottome, smoother also, and somewhat fat or clammy in handling, as the square stalkes also are, and somewhat hairy, that arise from among them to the height of two or three foote, whereon are fet by couples such like leaves as grow below, but somewhat leffer: as the toppes of the stalkes the flowers come forth, set at spaces, which are gaping, and like unto Clary, but of
a faint yallow colour, after which come brownish black seed; the roote is composed of many long strings, whereby it taketh ftrong hold in the ground, and abideth many yeares : both leaves and flowers finell formewhat ftrong. 13. Sclarea Athiopica five Athiopis laciniatit, & non laciniatis foliss. Plaine and jagged Athiopian Clary.

The nearer refemblance that both these Ethiopian hearbs have, the one being fee forth in my former Worke, under i ne neaver reiemblance that both these Ethiopian hearbs have, the one peing set forth in my former Worke, under the mame of Echiopian Mullein, hath made me upon more reature cogitation and deliberation, to what genus or kind they ought to be belt referred, rather to Joyne them to this tribe of the Claries, and effectially to our common garden Clary, than to the Verbasca Mulleins, as all Authors before me have done; for although they may be Wollins in regard of their woollines, yet the whole forme and frame of leaves, flowers and faed are more like unto the garden Clary, as also the time of abiding and perishing, as the Clary doth altersfeed-bearing, which few of the other wild Claries doe: and firely Mulleins they cannot properly be, in regard of their hooded or gaping flowers, which no Mulleins properly so called have, as I have shewed more largely in the Chapter of Sage going before, and

TRIBE I.

12. Horminum luteum fire Colus lovis. Yellow wilde Clary or lupiters diffaffe.

13. Sclarca Aethiopica five Acthopis i on lacintat.a:

in this. The description hereof is in this manner. Each of them have divers very large leaves spread upon the ground; every one nigh a foote long, and almost halfer foote broad, ending in a point, in the one smooth, and in the other very much torne in on the edges on all sides, and depact the reabouts, both also of a whirtin hoary greene colour, with moth white hoar intelle or woollinesse upon them in the middle whereof rifleth up a hoary squarestalke, divided toward the toppe into this in the middle whereof with the small branches, whereon are set divers intalier reaves, and at the toppes divers large white hooded stowers, the one like the other, set at distances about the branches: after which come the seed, two alwayes joyned together in one seed welfell, which are brownish, the one like the other also. The plants doe both die after seed time, which is usually the income year after the springing.

The first is planted onely in Gardens, and so is the second in these Westerne parts of Europe, both on this side and beyond the Alpes, by the judgement of the best Authors. The third was first brought by a dudanta into these parts ont of Spain. The sourch is wild in many places of Garmany. The shift is wild in our owne Country, almost every where by the way sides; and so is the other of this kind with the purple stilkes, but the other with greene stalkes groweth in Hingary; and divers other places in Garmany. The first Classian similar sources of the second in the Medowes neare Sopronium in Plangary. The second in the Medowes neare Sopronium in Plangary. The second in the Country. The eighth grew with Classian of the second second in the second in

throughout al Hungary in great plenty; and in Antiria, & in many other places. The last as Dioscorides saith, on Mount Ida in Phrygia, and in Mellenia, but of late dayes gathered from some of the Hills of Greece and Illyria, that are neare the Sea, but is chiefly kept in Gardens.

The Time

They all flower in the Summer Moneths of Iune and Iuly, yet fome a little later than others, and their feed is ripe in August, or thereabouts.

The Names.

These are called in Greeke of miror and Te opuar qued moes the envesian mapegua ad venerem frimulat . 22 Dieserides faith : for one fignifieth imperu quodam ferri quemadmodum in venerem proni : because it provoketh to venery. And Gaza that translated Theophrast m into Latine, translateth the word into Geminalis, from the fruitfulnesse it capseth most likely in bearing twinnes, in Latine also Horminum. We call it in English Clary, of the Latines Scarles, or Sciarea, which as Anguillara faith, is fo called of the Ethiopians, and is alwayes taken for our ordinary Garden Clary, gaaf Cleere eye. The first ordinary Clary is Clufius his first kinde of wild (lary : with Matthiolas, Camerarius. Gefore and others called Sclares and Sclares hortenfis, with Lobel Scarles; with Tragus Gallitricum fatioum. and with Lugdunensis and Gerard Galitticum, Horminum, and Orminum with Cordus and others: but Ruellius and Fuchins take it to be the Garden Horminum of Dioscorides, which Matthiolus contrarieth, and Dodoneus taketh it to be Horminum (sluestre of Dioscorides, and Dalechampius upon Pliny, Scordium alterum Pliny: by Fracastorius Sideritis Heraclea; of Dodonaus and Durantes Orvala, and is called likewise by some others Centrum Galli, and Matrifalvia. It is taken of some to be the Scoparia whereof Pliny maketh mention among the Sideritides and some his Tuffilago altera; others take it to be Phorbion of Galen or Baccharis of Dioscorides, & some Alettorolophus of Pliny: Pliny as I shewed you before in the Chapter of Horehound, mistakethevery where the Greeke word against, which is Horehound, as if it were meason porrum Leekes, for here he faith that Clary hath the leaves of Leekes, reciting the words of Dioscorides, when as he should have said like unto Horehound. The second kinde here set downe, is called by Matchielus Hormisum domesticum, and by Lacuna, Anguikara, Dodonaus, Lobel, Casalpinus, Caster Du-rantes, Lugdunensis, Camerarius, Tabermontanus, and Baubinus, Horminum or Horminum sativum, or Herminum verum, (although Gerard against the authority of so many worthy and learned Writers saith, they are deceived without shewing his reasons how, and calleth it wild Clary with purple leaves) in English The true Garden Clary of Dioscorides and others. The third is called Horminum Syriacum, both by Camerarius and Banhinus, and was brought out of Syria by the name of Bifarmar or Rifermas, and called also Aman by some, in English Assirian Clay. The fourth is called by Clusius in his Pannonick observations, Horminum silvestre latifolium Pannonicum primum, and is his third Horminum fylvestre, in his Hiltory of plants: in English Germany Clary. The sisth is our ordinary wild Clary called Oculus Christi, and Horminum sylvestre vulgare: of Fuchsius, Cordus, Gesner, Lonicerus, Turner, Lobel, Camerarius, Lugdunensis, Clusius, and others. Gerard his figure of Colus Iovis is the true figure of this wilde Clary. Brunfelfins calleth it Salvia agrestis: and Bester that set forth the Garden of Eystot, Salvia agrestis flore purpureo. Tragus and Gesner Salvia sivestris & vera. It is likely also to bee Dodonaus his fourth Orvala silvestris. Cafalpinus faith, it is the common Gallitricum in Italy. Tabermon anus callethit Sclarea fluestris, And somewould make it to be Pliny his Alectorolophus, and others to be a kinde of Verbenaca recta, upright Vervaine: and of Banhinus Horminum pratense solys serratis. The fixth is called by Clusius Horminum solvestre 4 nives flore, and is the other for of his fourth wild kinde in his History of plants. Gerard his figure of Horminum strugger, is the true figure of this plant. Tabermone anns calleth it Sclares strugger of this plant. Tabermone anns calleth it Sclares strugger of the great Booke of Effects Strugger aerestis flore albo, in English hoary wild Clary with a white flower. The seventh is the fourth fort of the sourch kinde of wild Clary by Clusses, of Bashims Horminum majus felis profundins incife: in English Italian Clary with a red flower. The eight is Clusses his first fort of the fourth kind of wild Clary which hee had from Spaine by the name of Eaccharis, and groweth at Greenewich also. Tabermontanus calleth it Sclarea Hipanica, and Gerard Gallitricum alterum, of Bauhinus Horminum Slvefire lavendula flore: and Clusius saith it is the Sideritis quernosolio of Lusdunenfis, in English wild Clary with spike flowers. The ninth is the Horminum sylvestre of Matthiolus, Casalpinus, Caftor Durances and Lugdunonsis, Tragus, calleth it Salvia slvestris adriterina, of Lobel it is called Verbascum nigrum salvifolium purpureo flore: and so also of Lugdunensis, it is Dodonaus his Orunia altera, and Glusius his fift kinde of wilde Clary, whereof there are two forts, the one greater than the other, as is fet downe in the descriptions. Baubinus calleth them Horminum sylvestre salvifolium majus & minus. The tenth is Clusius his sixth kinde of wilde Clary which he called Horminum minus supinum Creticum, and in English Candy Clary. The eleventh is called by Banhinu Horminum angustifolium laciniatum & folijs Scolopendria at Alempelier, it was as hee said, sent him likewise by the name of Horminum Greticum album. The twefith is called by Lovel, Clusim, Camerarius, Lugdunensis, Esstetensis, and Gerard Colm Iovis. Dodonam calleth it Orvala tertia. Casalpinus Melinum, Dalechampius and Lingdonenfis Galeopfis lutea, and is Clufins his fecond wild Clary. Some call it Camphorata, some Sphacelus, and others thinke it to be Stachy: Plinij. Banhinus calleth it Horminum luteum glutinofum. Some others also call it Horminum lureum, and Horminum Tridensinum. The thirteenth is of two forts, the one called Ashiopis, and the other Ethiopis altera, and by Bauhinus who onely hath written thereof, Athiopis latinian folio, which I have called in Latine Sclarea Athiopica laciniata, as I doe the other Athiopis five Sclarea Athiopica mediciniata, for the reasons before alleaged in English Platine and jagged Ethiopian Clary: The Italians call Garden Elary Sclarea, Sclarea is Scharia, and herba di S. Giovanni, and thereon in Latine berba S. Ioanni; and the white Clary Horminis: the French call the garden kinde Orvale & toute bonne, and the wilde fort Orvale Santagia; the Germanes call the one Scarlack, and the other wilder Scarlack, the Dutch Scarley, and wild Scarley in English Caryand wild Clary, and Ocaline Santagia; the Germanes call the one Oculus Christi.

Our garden Clary (as I faid before) that Distinguish thinketh to be the right wilde Clary of District. Because it is of greater form and vertue than any of the other forts, which are called wild Clary, the Districts said that the wild kind is more effectuall than the tame of garden kinde) is of most see in all Christian Commiss. I thinke for any inward cause, for the true kinde of Disserties, and the relt of the wild kindes here see less owne are lesse used, as I thinke, and to lesse effect: but the seed thereof chiefly, as well as of our garden Clary, is used to be put into the

TRIBE L

eyes to cleare them from any moates, or other fuch like things are gotten within the liddes to offend them, as also to cleare them from white or red spots in them. The Muccilage of the seed of either fort made with water and applyed to tumors or swellings, disperseth and taketh them away, and also draweth forth splinters, thornes, or other things gotten into the flesh, the leaves used with vineger either by it selfe, or with a little honey, doth helpe hot inflammations, as also Biles, Felons, and the hot inflammations that are gathered by their paines, if it be apply. ed before they be growne too great. The powder of the dryed leaves put into the nose provoketh neefing, and thereby purgeth the head and braines of much rheume and corruption. It provoketh to venery, either the feed or the leaves taken in wine, It is in much use with men or women that have weake backes, to helpe to strengthen the reines, either used by it selfe, or with other hearbes that conduce to the same effect, and in tansies often, or the Table, is not unpleasant to any, but specially profitable for those, for whom, as I said, it is convenient. Lobel and Pena faith, that some Brewers of Ale and Beere in these Northerne regions (I thinke they meane the Netherlands for so Dodoneu, meaneth) doe put it into their drinke to make it the more heady, fit to please drunkards, who thereby according to their feverall dispositions, become either dead drunke, or foolish drunke, or madde drunke It bringeth downe womens defired ficknesse, and expelleth the secondine, or after birth. It is used in Italy to be given to women that are barren through a cold and moist disposition, to heate and dry up that moisture, and to helpe them to be fruitfull, and stayeth the whites, it helpeth also a cold stomacke oppresse, with cold slegme, purgeth the head of rheume and much corruption, the overmuch use hereof offendeth the head, and is hurtfull for the brainand memory. Yellow Clary, or Impiters distaffe is hot and drying, and the juyce is of especiall good use to clense and heale foule ulcers. The Ethiopion Clary is commended for the roughnesse of the throat, and to helpe to expe ctorate the rotten and purulentous matter in the Pluresie, or in other coughes, either the decoction of the root drunke, or made into an Electuary with honey. Diofeorides faith also, it is good for those that are troubled with the Sciarica.

CHAP. XXI.

Verbascum. Mullein.

Any of the Verbasca Mulleins that are properly so called, doe grow wild in divers and severall places in so rowne Country, and therefore are not usually brought into gardens, yet because some of them are more rare, and seldome met withall. I thinke it not amisse to shew you all of them here, with those also that have beene sent us from beyond Sea.

1. Verbascum album vulgare sive Tapsus barbatus communis.

The common white Mullein hath many faire large woolly white leaves lying next the ground, somewhat longer than broad, pointed at the ends, and as it were dented about the edges: the stake risch up to bee soure or five foote high, covered over with such woolly leaves as the lowest, but lesser, so that no stake can be seene for the multitude of leaves thereon up to the slowers, which come forth on all sides of the stake, without any branches for the most part, and are many set together in a long spike, in some of a gold yellow colour, in others more pale, consisting of sive round pointed leaves, which afterwards give small round heads, wherein small brownish seed is contained: the roote is long, white and wooddy, perishing ever after it hath borne seed.

2. Verbascum Danicum bumile. Dwarfe Mullein of Denmarke. This small Mullein groweth like the ordinary Mullein with yellow flowers, having such like woolly leaves growing thick together at the bottome, but much smaller: the stalke riseth not up above a foote high at the most, set with some leaves thereon from the bottome: the slowers are very large for the proportion of the plant, and yellow like the ordinary, differing in no other thing from it.

3. Verbascum mas folijs longiaribus. White Mullein with long leaves.

This Mullein hath many thicke white woolly leaves lying upon the ground, like unto the common white Mullein, but that they are formewhat narrower, and thereby feeming longer: from a mong which rifeth up a round hard woolly Italke, about the foote high, fet with the like leaves, as grow below, but finaller unto the middle thereof, where it beginneth to give flowers, and n forme plants and places to divide it felfe into branches, whereon refer many flowers, growing round about the Italkes or brait he thicke rogether, confilling every one of five ground pointed leaves, of a which the light which the confilling every one of five ground pointed leaves, of a which colour, and in fome plants and places more yellow,

with a few yellow threads in the middle: in whole places afterwards come round hard feed veffels, very like

unto the feed vessell of Foxe-gloves, or Finger-flowers, but not fo long, wherein is contained very faiall and brownish feed: the roote is formewhat long, thicke and hard, but not wooddy, with divers long fibres fet thereunto.

4. Verbascum famina flore also wel pallido. Sweet white Mullein.

The fweet white Multen hash white hoary and woolly leaves like the other, but longer, narrower, and more indented about the colors, and not formany growing below on the ground; the stalke is woolly, and riseth higher than the forman, having greater flowers growing at the toppes, much sweeter also than it, and of a white colour; wherein sometimes some reddish lines are to bee seene therein; in other things this different not from the former.

G. Kerhafcam nigram vulgare. Ordinary black Mullein. Our ordinary black Mullein hath leaves nothing woolly or hairy, but of a darke greene colour fomewhat large, longer pointed, and dented unevenly about the edges, the stalke rifeth almost as high as the common white Mullein, and usually parted at the toppes into some branches, bearing long spiky heads of gold yellow slowers, and in some tending to purple like the other, with some threads in the middle, which are reddish in some, and purplish in others: the seed is like the other: the roote perisheth after seed time as the other doth: the whole plant hath a stronger or

more grievous smell in it than the white kinde.

6. Verbascum nigrum adorasum. Sweete black Mullein.

This black Mullein hath foure or five leaves lying upon the ground somewhat long and broad, ending in a long point, somewhat hard, and as it were crumpled, of a darke greene colour, without any manifest dents or notchings about the edges: from among which riseth up a round hard greene stalke three stote high, oftentimes without any branches, but more often divided into two or three branches, whereon grow many yellow flowers smaller and thicker set together, that is, two or three at a place, than in any other, and smelling pretty sweet, which fall away without giving of seed in the most that I have observed, or very seldome bearing small seed in round small heads: the roote is somewhat great and long, with divers sibres annexed unto it, and perishet not, but abideth ma-

7. Verbascum laciniatum. Iagged Mullein.
This jagged Mullein hath large and long leaves unevenly cut in on the edges, seeming to bee waved, somewhat like the leaves of Horned Poppy, of a darke greene colour, and a little hairy withall: the stalke is small and greene, but high, and branched diversly, bearing smaller yellow flowers, and more sparsedly set than in the other blacke

forts, the feed and roote are not unlike the others. Lobel in Adversaria should seeme to set out this plant as Ban-binus and other doe intimate, and as himselfe doth demonstrate it to be Verbascum alind Matthioli: but his description both of the order, forme, and colour of the flowers in his, is much differing from this: for he saith the flowers are set under the salkes, as Sage or wild Clary are, and of the same forme and colour, and thereupon giveth it the title of Verbascum pupureum Erneafolium, as it is to be amended: and in his observations, Verbascum silvestre salvi-strumtum.

8. Verbascum Salvifolium exoticum Cistoides. Sage-leased Mullein.
This strange Mullein hath from a wooddy roote, divers white hoary leaves like unto Sage leaves, but whiter, thicker, and rounder pointed, every one having a long soote stalke, from among which rise up divers hoary white round stalkes, set here and there with such like whitish leaves, but a little smaller and narrower: at the toppes of the stalkes stand divers slowers, one above another, consisting of sive round pointed leaves, of a yellow colour, with a few reddish threads thereon.

9. Verbasculum folis Salvia tennifolia Syriacum. Small Sage-leased Mullein of Syria.

Although I never saw this plant, yet because Lobel who first set it forth, entimeth it Phiomos, and placeth it among the Verbasca Mulleins. I can doe no lesse then shew you it also with them, with this my note of Verbasculum, rather than Verbascum, from the polture of the slowers differing from all the other. Take therefore this short description of Lobels, untill a more exact may be given. It hath long, narrow, and pointed leaves like unto the lesser, or Pigge Sage, all hoary as the square stalkes are, which have also much woodlinesse on them: the slowers are yellow, mny standing together, at their toppes somewhat like to those, of the wild Campion, or Flower of Briston, called by divers Nonesiuch.

The Place.

The first groweth by the side wayes and Lanes in many places in this Land: the second in the fields betweene Croneaberg and Hafnia, neare Elsenere in Denmarks, there observed by Lobel. The third and sourth doe grow but in some places of our owne Country, so that one shall hardly sinde a plant in a great way. The sit in many places likewise, both in Kens, Surrey, Essex, and elsewhere, The six is sometimes also to be found wikd abroad, but

5. Ferbastum nigrum vægstre. Ordinary blacke Mullein.

ke

TRIBE. 1.

7. Verbascum laciniarum. Iagged Mullein.

9. Verbafculum folijs Salvie tenuifolie Syriacum. Small Sage leafed Syrian Mullein-

8. Verbafcum Salvifolium exeticum Ciffoides. Sage leafed Mullein.

yer scarsely to be met with, and indeed unlesse one well exercised in the knowledge of plants, doe light upon it, and know it, it will scarse be regarded of a great many others. The seventh Lobel sain he found neare the raines of an old Church, by the Bathes at Bathe in England. The eight is a stranger to us, we have onely the knowledge that it groweth at Padoa, or thereabouts, in a garden of a Signor Clarissmo of Venice, called Contareni. And the last is a greater stranger than it.

The Time.

All these Mulleins doe flower about July, except the eighth and the last of whose time we are as yet ignorant, but hope shortly to be so well informed that we may informe others.

The Names. Verbascum is called in Greek φλόμ@ from φλέρο μτο & φλόξ φλόρ@ flamma, for that it served as a weeke to put into lampes to burne; and of the Latines Candela regia and Candelaria, because the elder age used the stalkes dipped in Suet to burne, whether at Funeralls or otherwise, and so likewise the English name Higtaper, for Hightaper, the h being left out, used in the same manner, as a Taper or Torch. It hath also some other names in Latine, as Thap'm Thiap'm, and Tap'ms barbatus, and Lanaria, in English also some call it Torches, some Bullockes longwort, some Hares beard, and some Impiters staffe : The first is called Verbascum mas, and Verbascum mas latifolium of most Writers. The second hath no other name than is in the title. The third is called by some Verbascum ma and by some Famina & e converso, Lobel calleth it in his observations Verbascum famina, and in his Icones, he calleth it Phlomos alter, Verbascum lychnite Matthioli: of Fuchsius it is called Verbascum candidum mas : of Dodonaus in French, of Turner and Gefner, in hort, it is called Verbascum album famina : and of Dodonaus in Latine Verbascum angustins; in English, white Mullein with long leaves. The fourth is called by Lobel Tapsus barbatus maximus odorasus meridionalium (and not Septentronalium as Baubinus hath

it) flore albo, in English Sweet white Mullein. The sit is called Verbascum nigrum of all others. The sixt is not set forth by any other Author that I can finde than by Baubinus, who onely remembreth it, as a kind of his sirst yellow Blattaria, or peradventure that Blattaria of Pliny with many branches: for the common blacke wilde Mullein is not this, but another plant, and therefore the name in the title is sufficient for it. The seventh is called by Matthiolus Verbascum aliudand Lobel so sait also, and the serve of the sait also, and the sait allowed the serve of the sait also, and saith Lobel saileth it Verbascum laciniatum Matthioli, and Camerarius Verbascum sufformas alivia folio, and saith he had it out of Contarenus his garden, by the name of Verbascum Cificoides: in English I have called it sage, leased Mullein, because I saide it may be a Mullein, in regard the flowers are Cistus saltens which is answerable to the rest of the right Mulleins. The last is called by Lobel Phlomos lychnitis altern Syriaca, Lugdunensis & Baubinus, Verbascum jolio Saiviz tenuifolia. It is called by the Italians Verbasco, and Tasso barbasso: by the Spaniards Verbasco as is abovessid.

The Theater of Plants.

The Vertues.

Mullein is commended by Diofcorides against laskes and fluxes of the belly, if a small quantity of the root be given in wine : the decoction thereof drunke is profitable for those that are builten, and for those that have crampes and convultions; and likewife for those are troubled with an old cough; the decoction thereof gargled, eafeth the paines of the toothache. If the feed and flowers hereof, together with the flowers of Camomill, and the powder of dryed Venice Turpentine, be calt upon a few quick coales in a chafing-difh, or fuch like other thing fer into a Clofe-foole, and the party fitting bare over the fumes, that is troubled with the piles or falling downe of the fundament, or any the paines of that place, doth give much eafe and helpe : as also for those that have a great desire to goe often to the ftoole and can doe nothing, especially to such as have the bloody Flixe. An oyle made by the often mitulion of the flowers, is of very good effect for the piles alfo. The decoction of the roote in red wine, or in water, if there be an agrie, wherein red hot steele hath beene often quenched, doth stay the bloody flixe. The same also openeth the obstructions of the bladder and reines when one cannot make water. A decoctian of the leaves hereof, and of Sage. Marjerome, and Camomill flowers, and the places bathed therewith, that have their veines and finewes tarke with cold, or with crampes, doth bring them much ease and comfort. It is faid that there is not a better remedy found out for the hot gowt then to drinke three ounces of the distilled water of the flowers every morning and evening for some dayes together. Arnaldus saith, that if two drams of the juyce of the rootes of Mullein before it beare stalke, be taken in a draught of Muscadine at every time, for three or foure times one after another. an houre before the fitt of the quartane ague commeth upon any, it shall furely helpe them. The juyce of the leaves and flowers being laid upon rough warts, as also the powder of the dryed rootes rubbed on, doth easily take them away, as Marthiolus faith, although it will doe no good to those that are smooth: and that the powder of the drved flowers is an especiall remedy for those are troubled with belly aches, or the paines and torments of the collick. The decoction of the root hereof, and so likewise the leaves is of great effect to dissolve the tumors or swellings, as also the inflammations of the throat. The seed and leaves boyled in wine, and after laid to any place that is prickt with a thorn, hath a folinter, or fuch like thing got into the flesh, draweth the forth speedily, easeth the paines, and healeth them also. The leaves being bruised wrapped in double papers, and covered with hot ashes and embers, to bake a while, and then taken forth and laid warme upon any botch or boyle that happeth in the groine or share, by filthinesse or otherwise, doth dissolve and heale them. The seed hereof bruised, boyled in wine, and laid upon any member out of joynt after it is fet in againe, taketh away all fwellings and paines thereof. The leaves and toppes of the leffer white Mullein boyled in water, and laid upon the places pained with the gowt, doth wondroufly eafe them. The distilled water of the flowers hereof dropped into the eyes, taketh away the watering of them, as also taketh away that rednesse of the face, is called in Latine Gutta Rosacea, and in English, the Rose, if it bee washed therewith often, having a little Camphire dissolved in it. The water is likewise used against running or creeping fores, or any other deformity of the skin. The flowers bruifed and made up into an oyntment with the yolke of fores, or any other deformity of the skin. In howers bruned and made up into an oyntment with the yorke or an egge, a few crummes of bread, and the juyce of leekes laid upon the painefull piles when they fwell, doth eafe the paines exceedingly, and helpe to bring them into their right place. Country men doe often give their Cattell that are troubled with coughes, the broth of the hearbe to drinke with good fuccesse, as also to those that by casualty, or through loosenesse and weakenesse, yoyd out their guts behind them. The leaves also a little bruised, and laid or bound to a Horse foote that is grievously prickt with shooting, doth wonderfully heale it in a short space Dioseorides faith it was a report in his time, that if dryed figges were lapped in the leaves of female Mullein. which is that with large and white flowers, they will not putrifie at all. The golden flowers of the blacke Mullein boyled in lye, dyeth the haires of the head yellow, and maketh them faire and smooth. The leaves boyled in wine and a little honey put to it, is fit to wash and clenie foule ulcers, and boyled in vineger, doth helpe greene wounds. Taken also with Rue it is a remedy against the stinging of Scorpions.

CHAP. XXII.

Blattaria. Moth Mullein.

Lattaria is certainely a kind of black Mullein, and therefore to follow next, whereof there are fundry varieties as shall be shewed.

1. Blattaria lutea odorata. Sweet yellow Moth Mullein.

This sweet Moth Mullein hath sundry grayish greene leaves lying on the ground, somewhat long and broad, and little or nothing snipt about the edges, but pointed at the ends: the stalkes are two or three soote high, with some smaller leaves on them, branching forth from the middle upwards into many long branches, stored wish sharp small pale yellow slowers, of a small sweete scent, yet stronger than in the others, and seldome giveth seed, but abideth in the roote, which sew or none of the other doe.

L. Blattaria lutee odorata.

Fiore ca-

. Blattaria flore luteo. 5. Flore #to. Yellow Moth Mullein.

2, Blattaria lutea major sive Hispanica. The greater yellow Moth Mullein.

This Spanish kinds hath longer and greener leaves than the former, rounder also at the ends than the next that followeth the stalke is stronger and higher than it also whereon besides the leaves grow toward the roppe many gold yellow flowers, confishing of five leaves a piece, as all the refigion, not so purplish threads in the middle, formed fomewhat like unto a five, after which come in their places round threads, 3000 me. three, or more fometimes together, but most infually one wherein lye small dusky seed: the roote is not great, or full of fibres, but perisheth every yeare, after it hath given feed, except that it abide sometime in a milde winter. 3. Blattaria lutea minor five vulgaris. The ordinary yellow

Moth Mullein. This yellow Moth Mullein (that is most frequent in our Interpretation Moth Mulicin (that is most prepare in our gardens) hath fuch like long leaves as the laff, but narrower and roundly dented about the edges; the stake, is usually fingle, and without branches, whereon stand such like gold yellow showers, but lesser, with the like purple threads in the niddle: the feed vessels are fingle, and the feed, small, both fo like the last, that they cannot be distinguished: the roote likewise perisheth every yeare after seed time.

4. Blattaria flore succepturpurascente. Cloth of Gold Moth.

Mullein.

The greatest notes of difference betweene this and the last described, confilterh first in the flower, which is a yellowish purple, or the ground yellow, overshadowed with a bright crimfon colour, which is of much delight; the threads in the middle are not to purple red as in the former, but neare unto middle are not to purple red as in the former, our neare unto the colour of the flower: fecondly, it feldome beareth feed: thirdly, it doth longer abide in the roote, although in a hard Winter it will perish like the two last this out of doubt hath beene raised from the seed of the last. Lobel setteth forth a fort hereof with greene flowers which I never faw.

5. Blattaria flore albo. White Moth Mullein.
The leaves of this Moth Mullin are of a little fresher green The leaves of this Moth Mullin are of a little frether green colour, and tharper dented about the edges, in other things it different not from the ordinary yellow, but that the flowers are pure white, and hath the like purple threads like flyes creeping up as it were in the middle of the flowers.

6. Blattaria flore purpare. Purple Moth Mullein.

The leaves of this purple Moth Mullein are broader, thore are not purple to the flowers.

ter, and of a grayer greene colour than the former, and without any denting for the most part, yet pointed at the ends: the stake rifeth not so high as the former, but sometimes branched, bearing such like flowers: of a faire deepe blue or purple colour, tending to redneffe, the threads in the middle of the flower being yellow: the seed vessels hereof are smaller ler than in the former: the roote is long, thick, and blackish on the outside, abiding sundry yeares, and rifeth plentifully from the shedding of it owne seed.

The blue Moth Mullein differeth in nothing from the last, but in the colour of the flower, which is of a paler blush violet colour.

7. Blattarja Cretica incana rotundo laciniato folio. Hoary Candy moth Mullein with round torne leaves.

This Candy Mullein hath round hoary stalkes, rising upto the height of a foot and a halfe, whereon are fet divers leaves without order, which are long, and as it were torne into finaller leaves, for every leafe hath small pieces of leaves, for on each fide of the middle ribbe thereof, separated from the end leafe, which is fomewhat broad, round, and a little dented about the edges, the whole leafe is very hoary, covered as it were with a woolly downe (especially in the hot Country where it groweth, but here it is hoary, white; and not so woolly) from the middle of the stalke upwards it breaken forth fometimes into branches, whereon doe grow yellow flowers, very like unto the flowers of the vellow Blattaria,

6. Blattaria flore purpureo. Purple Moth Mullein.

TRIBE. 1.

7. Blattaria Cretica incana roundo laciniato foito.
Hoary Candy moth Mullein with round pointed leaves.

but smaller: after which come small round heads, containing small browne seed, both heads and feed being smaller than those of the other Blattaries : the root perisheth with us at the fitth approach of winter, and seldome giveth ripe feed, because it flowreth so late, whereby we are to seeke of new feed every yeare.

8. Blattaria Cretica incana longiore laciniato folio. Hoary Candy Mullein with long leaves. This other Candy Mullein is in manner of growing, hoarinefle of leaves, yellow colour of the flowers, and in other things like unto the former, the onely difference, in this from the other is, in that the end leafe hereof upon every stalke is more long than the former, (which is as broad as long, making it seems almost round) and the heads of feed are somewhat longer also.

9. Blattaria altera folio rotundo flore luteo. Round leafed Moth Mullein.
The first leaves of this Mullein are fomewhat long and pointed at the end, but those that are set upon the stalkes, are all round pointed, and not so long every one, compassing the stalke at the bottome of the leafe, and are of a darke greene colour on the upperfide, and grayish or hoary underneath : at the setting on of every leafe unto the stalke, come forth likewise two other smaller leaves, and from the middle of them shoot forth two or three slowers upon small long foot-stalkes, which are yellow, with purple threads in the middle of them, like unto the other Blattarias: the heads and feed are small like unto the other, and the roote perisheth after feed time, as most of them

also doe, and often groweth by the shedding of it owne seed.

10. Verbascum frutescens spinosum, sive Blattaria Cretica spinosa. Thorny Moth Mullein of Candy. I was in some doubt with my selfe whether this plant should belong to the Verbasca, as some would have it, or to the Blattaries, but finding ir more agreeing with these than with them, although it bee wooddy or shrubbie. I have here placed it in his proper place, as I thinke. It rifeth up with many finall heary, hard and wooddy branches, fpreading round about the roote, not above a foote and a halfe high, dividing it felle into many sender branches, which are tender and greene while they are young, but quickly after turne hard and hoary, every sprigge of the branches ending in a sharpe thorne; the leaves are many set together at spaces of the stalkes and branches, somewhat like unto the leaves of the Sea-Rockgilloflower; but much smaller and shorter, a little torne about the edges, but towards the toppes smaller and smaller, and not cut in at all, and of an hoary colour : towards the rops of the branches also come forth many flowers, dispersedly set thereon (and not as the Blattaries or Verbascas doe, in a long spike) but consist of sive round pointed yellowish leaves, with some purple threads in the middle of them, like unto the Blattaria: after which come such like round hard heads, containing small browne seed like unto them also: in Candy and other warme Countries, when it is growne old, it beareth a great bushy and thorny head, as it is here expressed: the roote is hard, long and wooddy, spreading much under ground, and abideth many yeares in the natural places of those warme Countries where it groweth, but must have some coverture or defence with us against the extremities of our Winters, else it will hardly endure.

10. Blattaria Cretica (pinefa. Thorny Moth Mulicia of Candy

10. Summitates Blatterie shimofa cum jam adoleverit planta. The tops of the thorny moth Mulkin when it is grown old.

The Place:

The first, third, and fift forts have beene found in severall places of our Land, as well in Kent on Black beath, and neare Detford, as in other places: the other 3. of the first fixe forts are onely nursed up with us in gardens, their naturall place being not knowne, but the other forts that follow, except the ninth, doe grow in fandy, and from the see have beene fent by Honorius Bellus, an Italian Phylition, in his time abiding in Candy, to divers persons in Italy, as to Iohannes Pona of Verona, and others there, and to Clusius, and Planteau in the Low-countries, and to Baubinus and others: The ninth Baubinus faith he onely found in his Apothecaries garden in Bafil. The Time.

They all flower in Summer, and give their feed prefently after. The Names.

The name Blattaria in Latine hath beene imposed hereon from Blattis in se contrabentibus, as Pliny saith (for it hath no Greeke name.) The first fixe or feven forts have their names in their titles, as most Authors call them, but the seventh being the first Candy kind, Honorius Bellus first wrote of, and called it Auturus, or Artiurus, and faith he is bold so to doe, not knowing better whereunto to referre it, (although it doth not throughly agree to the Auturns, or Archurus of Dioscorides) which he sent to Clusius. I finding it better to agree with Blatteria, than any o ther plant, have put it under that tribe, and have given it an English name, according to the rest of the Blattarias, Hoary Candy Moth Mullein with round pointed leaves. Banhinus in his Pinax calleth it Verbaseum humile (retieum laciniatum, and the Italian Pona, Verbascum fruticosum auriculatum. Columna saith it was sent unto him with the name of Marum Creticum, but he calleth it Verbascum Brassica solio, and referreth it to that Verbascum of Dioscorides, that hath the lease of a Colewort. The eighth Pond in his Italian Baldus calleth Arturi secunda species. The ninth Baubinus calleth Verbascum foliys subrotundis flore Blattarie, and I in English Round leased Moth Mallein. The last is called in Candy Galastivida quast lattea stivida, as Honorius Bellus saith, that sent it to Clusius (but Baubinus calleth it Glassivida) who thereupon finding the leaves to be like unto Sea Stockgilloflower, called it Leucoium spinosum Creticum, but withall saith it is in flower differing from them, because all the kindes of Stockgilloshowers have but foure leaves in every flower, and this hath five. Some others therefore would give it a more proper name as they thinke, and call it Verbascum frutescens spinosum Creticum incanum, from the hoarinesse of the leaves and stalkes, but I thinke it may more fitly be raunged with the Blattarius, as I said before, for the reasons there expresfed, in English Thorny Moth Mullein of Candy.

The Vertues. I can finde no Author hath spoken of any other properties belonging to any of these Blattaries, then those Fling doth ascribe to the ordinary fort, that is, to gather Mothes unto it, whereforer it is layed.

CHAP. XXIII. Stachas. Cassidony.

there are two kindes of Stachas, one with a purple flower, the other with a yellow, of each whereof there are divers forts; Heliochrysum also is added unto them, by Bashims and others, that entitle many forts of Christenie with that name, but I doe not fo thinke it fitt.

1. Stacha vulgaris. The ordinary Cassidony or French

Lavender.

The common Sticadove as we will it in fome places, or French
Lavender that groweth with us, it is note tender plant than lavender, and more tike an hearth, than a wifth or shrub, not above a foot der, and more like an hearth, than a thin or furth, not above a foot and a halfe high, having diany, narrow long whitifu greene leaves like unso Lavender; bus foiter and smaller, fer at severall distances about the stalkes; which special in fundry branches, at the tops whereoft and long and round, and meetimes foure-square heads, of a darke greenish purple course impact of many scales, from which come forth the stowers of a bluish purple colour, after which follow seed vessels, which are somewhat whitish when they are ripe, containing blacking browne seed within them; the core is former when woods? roote is somewhat wooddy, and will hardly abide our cold Winters, except in some places, or before it have flowred: the whole plant is somewhat sweet, but nothing so much as Lavender.

2. Stachas vulgaris flore albo. White flowred Cassidony. This Cassidony differeth not from our ordinary garden Cassidony in any other thing so much as in the flowers, for although the leaves grow thick together upon the branches, being a little greener, and not altogether fo white, and the heads short likewife, yet the flowers starting from among the scales, are larger than in the other, and of a pure white colour, which is very rare to meete with.

3. Stechas longioribus ligulis. Cassidony with long leafed heads. This Cassidony likewise differeth very little from the ordinary kinde : the chiefest differences noted betweene them are these; the toppes of the branches are bare, without leaves upon them, for an hand breadth in length or more, unto the heads: and the heads of these are not fully so large as in the other, but longer, and have divers hard, stiffe, and longer skinny purplish leaves rising a bove the heads of them, than at any time seene in the other, which in some places have a shew of some short pieces like unto thinne skinny leaves, of a purple or blue colour, the flowers, feed, and rootes are alike, and fo is the fmell.

1. Stachas Vargaris.
The ordinary Cassidory or French Lavender.

4. Stachas serrata folio. Cassidony with dented leaves. This dented Cassidony hath such like square brittle slender hoary branches, whereon are divers long narrow leaves let, many growing together, which are dented or notched about the edges, and as it were curled or crumpled, greene on the upper fide, and hoary underneath, of a hor taffe, somewhat bitter : the toppes of the branches end in somewhat long square stalkes, naked, and without leaves unto the spiky heads, which are scaly) slenderer and longer than in the other; the flowers are like unto the other, but of a more purple colour; at the toppes of the heads fland fuch like skinny leaves, of a bluish purple colour as the former hath, the seed and rootes doe not

5. Stachas viridis Dalechampiji. Yellow Cassidony with greene heads. I doe place this Cassidony betweene both these sores, because it doth in some things partake with both, the defcription whereof is in this manner. It hath many greene stalkes, and wooddy like the rest, whereon grow the leaves at spaces, many set together, whereof the two outermost are longer than the other, all of a pleasant greene colour, at the toppes of the branches stand such like scaly heads as the former, but longer, from which come forth

yellow flowers round about the heads, at the toppes whereof fland two long greene leaves.

6. Stachas Rofmarini facie Cretitä. Candy Rofmary like Cassidony.

From the seed sent out of Candy by the name of Stachas no chair in politics, to like in tace or forme unto the ordinary Stachas, or Cassidony, that any at the first fight would such fay to were the same string up with a stalke, not much higher than Cassidony, divided from the very ground into divers branches, and they againe and againe into many leffer, leaning downewards a little, befer at every joynt, fonetings with two and fometimes with three or foure small and narrow long leaves, of a grayish greene colour, smelling sometimes with three the leaves toward the toppes of the branches grow forth small showers, very like unto Rosemary, both for colour. forme, and bigneffe, after which succeed small round heads, or feed vessels, no bigger than Pepper-cornes, wherein are conteined small seed; the roote is stender and wooddy, divided into several sprayes, the whole plant is of an obscure gray colour, and smelleth somewhat like Stachas, but more weakely, taking a little bitter, with small heat, but more aftringency.

TRIBE I.

3. Stachas longioribus ligulis, Cassidony with long-leafed heads-

4. Staches ferrato folio. Callidony with dented leaves.

6. Stechas Rofmarini facie Cretica Candy Rolomary like Callidony

7. Stuchas Citrina free Coma aurea. Golden or yellow Cassidony.

7. Chrylocome surea & Stachas citrina vulgaris. Golden tusts, or golden Cassidony.

This golden Cassidony hath fundry hoary branched stalkes; with long and narrow whitish leaves, dispersedly statement on the toppes, where the sowers appeare in umbels, each branch bearing a large tust of scaly yellow showers, like a loose or sparsed umbell, keeping their colour long before they wither, and being gathered in a sit dry time when they are in their persection, will so abide, and be kept a long time afters: the seed is red, smaller than Marjerome, and sharper: the roote is small and black: the whole plant is of a strong sweet scent, will unbeasint.

8. Chrysocome sive Stachas Citrina Cretica. Candy golden Cassidony, or Goldslocks.

This Candiot groweth very like the former, but with smaller long le wes, all hoary, the howers are in larger umbels, greater also, and of a more shining pale gold colour, which will abide, being gathered in the beauty as the other. There is another fort called Elichrysum Orientale by Rankinus, differing little from this last sort, but in the Elichryscaly heads of flowers, which are greater and longer than they, and in the whole plant which is taller and more entate.

9. Chryfocome Cretica altera five Hifpanira.
Spanish Golden Callidong.

9. Chrysocome Cretica altera five Hispanica. Spanish golden Cassidony.

This other Candior or Spaniard, which you will, groweth fometimes but with one stalke, or else with more, halfe a yard high, covered with an hoary downe, having sindry long and narrow leaves on them, sometimes disperiedly set, and sometimes more together, greene on the upperside, and hoary underneath: at the topper grow small branches, bearing one or two fealy long heads of yellow slowers, somewhat like to those of Maudeline, consisting of many threds or thrums.

10. Stachas cirring altera odora. Sweet yellow Cassidony.

The yellow fuver Cassidony is a small low plant, not rising above a foote and a halfe high at the most, with divers slender branches somewhat hoary, whereon are set small long and narrow leaves, of a darke or more sullen hoary colour, then those of the former golden Cassidony, at the toppes of the long divided stalkes, stand single heads of yellow scales, nothing of so lively a yellow colour as they, not so roughly the lively a yellow colour as they, not so roughly the lively a yellow colour as they, not so roughly the lively a yellow colour as they not so roughly the lively a yellow colour as they not so roughly the lively a yellow colour as they not so roughly the lively a yellow colour as they not so yellow yellow yellow yellow so yellow so yellow so yellow yellow so yellow yellow yellow so yellow yello

lively a yellow colour as they, nor so round, but a little longer than round, with a few threads or thrums at the tops, whichbring forth small browne seed, wrapped in some downe: the roote is black, but smaller and slenderer than it: this hath a lesse heady scent than the other, yet not unpleasant.

I1. Steebas Citrina modora. Vníavory yellow Cassidony.

This small Cassidony hath divers low hoary stalkes, not aboue a foote high, whereon doe grow small long hoary leaves, broader and larger than the last at the toppes of the stalkes stand most commonly two heads, yet sometimes but one, which are greater and longer than the last, and the seales likewise longer, and somewhat of a brownish greene with the hoarinesse, from whence rise many pale yellow threads or thrums, which when they are pass, the seed ripening, is inclosed in downe, and blowne away with the wind: the roote is lesse than the last, and blackish, but not lesse wooddy: this whole plant and every part is utterly without any scent to bee perceived in it.

12. Steebas Citrina fylvestrior. Wilde yellow Cassidony.

This wilde Cassidony (for thereunto I referre it) hath a round hairy talke, stored with most pure white wooll, divided at the toppes into severall short branches, the leaves that stand on them are somewhat longer and larger than the last; greene on the upperside, and grayish, hoary, and woolly underneath, and a little endented about the edges, the ends of the branches are naked without leaves, for source inches long, bearing at the toppes of every of them one scaly head, with divers yellow threads or thrums in the middle, like unto the last, but somewhat larger.

13. Stachas Citrina Cretica flore ample. Candy unsavory yellow Cassidony with large flowers.

This brave silver-like plant groweth very high and tall, having a straight round stalke that is white or hoary, and of a singers thicknesse, for preading sundry branches, so thick set with small long and hoary leaves, many together at some set they cover and hide the branches almost wholly, and are more like unto Cassidony than Lavender-cot-on leaves, whereunto Aspinus doth liken them, but not dented about the edges: the upper part of the stalkes divide themselves into small sprigges, bearing each of them, on a long slender stalke, a large yellow shower, like unto a single Marigold standing in a greene huske, wherein after the slower is withered and past, groweth small long steed like unto Sow-thisse seed: the roote is long, white, and tender: this plant hath neither scent or taste much to be perceived in it, saving a little bitternesse, whereby the Natives sinde it effectuall to kill the wormes, to provoke unine, to open obstructions, and to helpe the jaundise, and the powder of the dryed hearbe, or the juyce thereofs, to cleanse and heale soule ulcers and sores.

I. A. Stachas purpures odorata. Sweet purple Caffidony.

I doe acknowledge that I doe not pleafe my felfe, but others, in the placing of this plant in this place, and by this name, for although it hath a face or fhew in some things like unto the yellow unfavory Cassidony, yet in other things is fo farre different, that I might in my judgement, more truely place it with the Income Knapweeds, than with these, as the description following will shew to any that will duely consider it, which is thus. It risets to the height almost of a cubite, leaning or bending downe the branches, whereby it spreadeth in compasse more than in height, from a long hardblackish root, shooting forth wooddy and hoary branches, whereon doe grow many long and narrow leaves, of a darke greene colour on the upperside, and a little hairy withall, but of an hoary white on the

TRIBE. 1.

CH A P. 23.

Candy unlayory yellow Caffidony with large flowers.

70 CHAP. 23.

14. Stechus purpurea edorata.

Sweete purple Caffidony.

underside, and very woolly, and a little dented about the edges : at the toppes of the branches come forth fometimes but one, but more often two long heads together, compofed of many scales, at the toppes whereof stand the flowers, which are nothing but long threads or thrums, of an excellent purple colour, as fweet in scent, as pleasant to the sight rafter the flowers are past, in those scaly heads grow the feed wrapped in downe, which is fomewhat like unto the mall Pine Thiftle feed.

The Place.

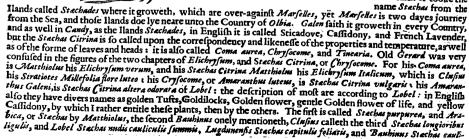

The first Cassidony or Stachas which is used by Apothecaries and others in Phylick, groweth in Arabia, as well as in France or Spaine, or upon Mount Garganus in Italy, which is called in the Italian tongue Monte Santto Angelo The second was sound in Morena, a place in Castile or Spaine. The third is found in many places, both in France and Spaine promiseuously among the other common sorts. The 4. Clusius faith is very rare to meet with, for that he onely found naturall on the toppe of the Calpe. The fifth Dalechampius only hath fet forth, without naming the place where it grew. The fixth as Lobel faith groweth in the Province of France, in Spaine also, and night the Rhine in Germany, but lesse sweet: the seventh and eighth in Candy and Spaine likewise : the ninth and tenth Lobel setteth forth to grow about Mompelier in France, and Clufins faith hee found them in Spaine and Portugal. The eleventh grew on the Hills neare Terraeinum in Italy: the 12. was found among the low Skarlet Okes and Strauberry trees in the Mountaine Canim neare Mompelier: the 13.in (andy: and the last in France. The Time.

Although divers of these have beene observed to bee in flower in March and Aprill, according to the climate where

they grow naturall, yet in our Gardens of these more Northerly countries the former three forts flower not untill May or Iune, and the rest flower not untill August for the most part, if they doe abide. for they are all of them very tender, and must bee kept with great care and looking to.

The Names It is called sounds in

Greeke, and Stuches in Latine, and most commonly Stichados by the Apothecaries, and Stechas Arabica, because the best was brought out of Arabia. Dioscorides faith it tooke the

culis non foliatis, in English Cassidony with long leased heads. The fourth is called by Clusius Stachas crispo folio; by Dodoneus and Bautinus Stachas folio serrate, of Gerard and his Corrector Stachas multifieds, but the figure is that of Lavendala multifide folio, as Clufius giveth it, for there are not two Stachades with divided leaves. Inedunentis of Lavendula multifido foio, as Clufius giveth it, for there are not two Stachades with divided leaves. Lugdunenfis fetteth it downe for Succudus of Avicen, according to Myconus judgement, in English Cassidony with dented leaves. The fift besides the name in the title, is called by Banhims Stachas viridis capitulo oblongo. The fixth is called by Alpinus lib, de plantis exoticis Rosmarinum Stachadis facie, but because it doth come nearer to Stachas than to Rosemary in my opinion, I have referred it thereunto. The seventh is called Stachas Cisrina by most Authors, by Lobel Chrysocome, and Coma aurea sive Amaranthus luteus by Fuchsius, and others, and taken by those of Mompelier to be the right Chrysocome of Dioscorides, excepting one small word wherein there might be a fault also, Casalpinus, and Banhimus entitle it Elichrysum, whereas Dioscorides his Elichrysum, whereas Dioscorides. his Helichry um, differeth from his Chry ocome, in having Southernewood like leaves, (and therefore I referre Helichrysum rather to the Milfoiles, as you shall finde it there among them. The eighth is called Eliochrysum by Honorius Bellus, and the other fort thereof, Elichry fum Orientale by Banhinus, and by Camerarius in Epitome. Stechas Citrina comis grandioribus. The ninth may be as well the Chrysocome peregrina secunda of Clusius, as his quitta Cresica, for he saith they are very like. The tenth is the Stachus Citrina altera, and altera odora of Lobel, by Clusius Chrysocome peregrina prima, by Lugdunensis Ageratum alied quorundam, and by Banhinus Elichrysum sylvestre angustia folium capitulis conglobatis. The eleventh Lobel calleth Stechas Citrina altera inodora, and is Clusius his Chrylocome peregrina tertia, which Lugdunensis setteth downe, for Gnaphalium marinum Dalechampy, and Bauhinus calleth Elicoryton (slueftre flore oblingo. The twelfth Baubinus calleth Elichryfo fylveftri flore oblingo similis, in English it wild yellow Cassidony. The thirteenth Alpinus lib. de exoticis plantis, calleth Santulina Cretica, but I, as it is in the title, for the reason expressed in the description. The last was sent by Pilliterius from Mompelier, by the name of Stachas purpurea odorata, who faid it was to be referred to the Stachas Citrina altera inodora, because it was fo like it, but yet was a differing fort from it : the causes that make me discent from that opinion, whereof I said fomething before in the description, I will here set downe: by the description you finde it hath a scaly head . and purple thrummes rifing in the midft of it, which is the flower (and fuch have the flowers of all the Incens) and the feed like wife inclosed in the heads among the downe, are like unto the feeds of the small low Pine Thistle, which are like the feeds of other Thistles, that is flat, hard, and shining, and such are most of the seeds of the Iaceas Cyanus, and fome others: but none of the Stachades have thrummes for their flowers, and none of the other Stachades purpures, or Citrine, have fuch like feeds, and these two things cause me to thinke it fitter to be referred to the Paceas whereunto it is like both in flower and feed. There is a controversie betweene Moliness the Author of the great Herball named Lugdenenis, and Pena and Lobel which should be the true Chrysocome of Dioscorides. Lobel and Pena in their Adversaria, thriving to make Stachas Citrina vulgaris, called Coma aurea, and of some Tinearia and Amaranthus luteus, and taken of Dodoneus to be Eliochryson of Theophrastus, and Agerasum of Dioscorides, to bee the true Chryscome of Dioscorides: and Molinaus, in folio 780. contradicting and confuting them. Lobel and Pena in the description of Stechas Cirrina, say that the golden yellow toppe or head of tufted flowers thereof hath caused the name of Chrysceme, which our age could not hitherto know, in wanting the knowledge of the true Hisope, unto whose tufted toppes it was by Disserides compared: but now that the true Hisope is declared and set forth which whole three topies it was by Disjurius' compared to the low that the true ringe is declared and the rioring which they make to be the Winter or Por-Marjerome of our Country, as I have shewed you in the first Chapter of this Booke) with whose tusted toppes or umbell of flowers, they compared the flowers of the yellow Cassidony, they are perswaded that the Scachas Cirvina is the true Chrysocome of Dissocorides, but yet asterwards they say that one word or two in Dissocorides description of Chrysocome doth hinder it, and that is that the rootes of Chrysocome Word of two in Disjourness description of the state of Black Hellebor, and the talle thereof refembling Cyperus, of a sweet, but author easily are small like unto the rootes of Black Hellebor, and the talle thereof resembling Cyperus, of a sweet, but author easily are small the tall the state thereof resembling Cyperus, of a sweet, but author easily are small the tall the same and the tall the same and the same and the same and the same are small the same and the same are same as the same are small the same and the same are same as the same are same are same as the same are same as the same are same as the same are same are same as the same are same are same as the same are same are same are same as the same are same are same as the same are same ar and drift of their reasons to be, that because few did know what hearb was the true Chrysocome of Dioscorides (who copared the tusted heads of flowers thereof unto Hisope) & that thereby it was manifest, that our Hisope not having any tusted head or unbell of flowers, but a spiked head was not the true Hisope of Disserrider, and therefore they having shewed what was the true Hisope, would also declare this yellow Cassidony, whose tusted head of slowers is like unto that of their Hisope, to be the true Chrysocome of Dioscorides: Vnto all which allegations Molinans thus answereth. That first he would examine whether our ordinary Hisope be the true Hisope of Dioscorides, and What part thereof is compared or referred to the Chrysocome, and then whether this Stachus Citrina bee the true or no. There are faith he, two forts of Hisope well knowne to us, the one tame, or of the garden, with a spike of blue flowers, which is the more bitter: and the other wilde with a red flower, which is lesse bitter. Now they that deny either of these to be the true Hisope of Dioscorides, are led by this reason : that the leaves of each of them are long and narrow, not like unto any of the kindes of Origanum, which are round, and by Dioferides compared to the leaves of Marjerome, Pennyroyall, and Dittany. This faith he, hath troubled many that did not know a third kind, (which is the round leafed Hisope (declared in the first Chapter of Hisope) set forth by him, and like the other two forts, but that the leaves are round like unto Origanum or Marjerome. If this kinde of Hisope had beene knowne to them, they would not have called for an hearb out of England to supply the place of the right Hisope, seeing it hath a place of it owne, even among the forts of wild Origanum or Marjerome, whereunto it is like, but somewhat altered by manuring from that which is common. But this their Hisope or Pot-Marjerome hath no corymbi tufts or umbells, they are rather a heape of flowers gathered together, as the wild Origanum or Marierome hath, for no man did ever attribute any fuch heads or tufts as are called corymbi, unto any of them. This knot being untied, it followeth (faith he) that we try whether the Stachas Citrina be Chrysocome. In this their plant there is no likenesse of leaves, of neither of the forts of Hisope to bee seene, to wit, either of the long or of the round leased fort, besides the bushy toppe of leaves and stalkes of flowers of this Stachas Citrina, loosely set together, is not a close tust of heads, such as Corymbus (which is a close umbell or tust of heads or seeds, such as the Ivie hath) is usually faid to bee; but are onely a few yellow golden round fining bullers, or heads at the toppes: the roote also thereof hath no thicke and small strings as Helleborns niger hath; nor is like to Cyperus, nor hath an austere sweet taste, all which Chrysocome hath: He therefore (I meane the foresaid Molinums) saith that hee hath often in revolving these doubts, suggested to those Herbarists that have knowledge in plants, that hearbe which the French call Targon, and some in Latine Targun , Tarshon, Tragum, and Dracobortensis, in English Tarragon, and which Ru-

Flore

albo.

TRIBE !. ellius too credulous of fables, thought was produced from the feed of Flaxe put into the roote of an Onion to bee very agreeable to the description of Chrysecome, in the toppes set with many corymbi or tusted heads t in the leaves Very agreeable to the deteription of coryscome, in the coppe at will many corymite to the colour of the colour of Cyperni, like unto the ordinary long leafed Hisope: and in the roote branching as Helleborns niger, of the colour of Cyperni, of a tafte not unpleasant, which is somewhat austere with the sweetnesse, by which quality it is profitable to the difor a take not unpleasant, which is formewhat anticle with the Iweethene, by which quanty it is promisine to use and eafes of the liver and lungs. This (faith he) feemeth probable to me, and therefore I could not bee filent therein, feeting forth the nature of Chryfocome, leaving it to the judgement of those that are more learned. I have, I confesse beene a little too prolixe or tedious in this narration, but I was rather willing to set forth the whole minde of the man, then to abridge any of his reasons, that comparing both his negatives and affirmatives, yee may agree or the man, then to abridge any of his reasons, that comparing both his negatives and annumentary, yet may agree of differnt from them: For my owne part feeing Clufius and others, doe account the Stachas (irring, to be Chrifton of Dieforides, and mil-like of this opinion of Targum; I can doe no leffe, and thinke there is farre leffe reason in any to suppose Targum to be Chrysocome, than Stachas Citrina, for Dieforides in the description thereof, mentioneth no likenesse of leaves, but of the toppes of tusted heads to be like unto Hisope, and the small rootes unto those of Hekeborus niger, equalling Ciperus. The Arabians call Stachas Aftechodes, and Aftechodes: the Italians Stachas and Stechade : the Spaniards Cantueffo : the French Stichades : the Germanes Stichas krant : the Dutch Stichas cruss : and we in English Sticadove Cassidony, and French Lavender. The Stachas citrina is called by the Italians Anna rantho giallo, by the Germanes Motten blumen, and Rhein blumes.

The Vertnes. The decoction of our garden Cassidony is as effectuall as Hisope for the diseases of the breast, that is, for coughs and colds. It is put into Antidotes, that is such medicines, as are remedies against infection and poison. It is of a mixt temperature, as Galen faith, to wit, of a small earthly cold essence, from whence it hath the quality of binds ing; and of another more earthly extenuated, from whence it is bitter, by the mixture of both which, a openeth oblituctions, and freeth the body from them, it extenuateth, cleanfeth, and strengthneth all the inward parts and bowels, as also the whole frame of the body. We have faith it cleanseth, purgeth, and resolveth all obstructions of the liver; spleene, and of the other inward parts; it hindereth pure faction, and corrected their intemperature we by that small astringent quality that is in it, it strengthneth the braine and sinewes, the heart, and all the other inward parts: It purgeth black choller and flegme, as well from the head and braine, as the finewes, and other the instruments of the sences, and comforteth them also. It is very effectuall in all cold griefes, used in drinkes, baths, ming and comforting them. Taken with vineger of Squilles, it helpeth the falling ficknesses, and swimming of the ming and comforting them. Taken with vineger or squales, it neighbor the raining fickinents, and Iwamining or the head, and is helpfull for all other paines of the head and ftomack; with Lapis Gyanent, or Sal Indicans, it helpeth those that are melancholick, whom feares and terrours doe accompany. Taken with the juyce of Buglosse and of Pipins, it helpeth the sadnesse of the heart, and melancholy; it easeth the paines of the since say, arteries, muscles, and joynts, taken in what manner you will : the fumes thereof taken into the notirile, openeth them when they are closed: Taken in a Syrupe or any other forme, it helpeth the quartane ague, and all other day agues, especially are cloted: 1 axen in a syrupe or any other forme, it helpeth the quartane ague, and an other day agues, especially in those that are flegmatick. It is especially hurtfull to those that are hot, dry, and cholerick, because it troublesh the stomack, and provoketh both thirst and fainting: but because it worketh slowly, some Sal genusa is added unto it to quicken it, or else sometimes the Myrobalani Indi, or Chebuli, to make it the more forcible, and sometime Squilles are added, especially in the griefes of the head; It is made the stronger, if it be steeped or boyled in whey? it is the lesse hurtfull if it be boyled with wine, the juyce of Pipins, and a few Raisons of the Sunne. Cassidony and a little Spike or Lavender, steeped in old oyle, is of much good use, and of great effect for all the cold causes aforefaid. The heads of Cassidony are of more force than the leanes; Pliny faith it provoketh womens monethly courfes and urine: It is of especiall good use for the cold griefes of the mother, and for women with child. The other yellow Stachas or Cassidony, is much about the same temperature and vertues, serving very well for most of the yellow Stechas or Cassidony, is much about the same temperature and vertues, serving very well for most of the affects before specified, as you shall heare: It is somewhat bitter and binding, and therefore it warmeth, dryeth, openeth and cleanseth, where cause requiresh. The toppes or slowers steeped or boyled in wine, openeth all obstructions of the liver and gall, and therefore helpeth the jaundise and dropsie; and is very profitably taken of those that have the falling sicknesses, and for all other the diseases of the braine, proceeding of a cold cause, as cararrhs, the same and distillutions and also all old griefes of the head that are continually and the Palife also whether the rheumes, and distillations, and also all old griefes of the head, that are continuall; and the Palsie also, whether yee take the decoction of the hearbe, or the powder thereof in Oxymel or Rhodomell; it likewife killeth the wormer of the belly: It being boyled in lye is very profitable for all those diseases of the head, to wash it there-with, and besides cleanseth the head of scurffe, dandrasse, and such other things as offend it, and killeth lice therein. The decoction of the hearbe openeth and cleanfeth the reynes, and uritory parts, caufing abundance of urine, esperie decocrin of the nearoe openeth and cleaneth the reynes, and untory parts, cauning acondance of urine, eige-cially in them whose urine was stopped before. The slowers are very profitably used in all those bathings, that are applyed to the obstructions, and cold griefes of the mother. Pens saith he hath by good experience found it effe-ctuall in the diseases of the liver, which proceed from the bad concoction therein, by reason of clammy humours, and thick vapours, that passe thorow the unicles thereof; it is not without danger given to those whose lungs are enslamed: but is especially good for all thin, sowre, and sale slegme oppressing them. Clustus saith that they of Spaine used the decoction of the Spanish fort against the wind collick with good effect.

> CHAP. XXIIII. Lavendula, Lavender,

Here are two forts of Lavender or Spike, or Lavender Spike, that is a leffer and a greater, of each whereof there are some diversities, as shall be shewed.

Our ordinary Lavender rifeth up with a hard wooddy ftemme above the ground, parted into many small branches, whereon are fet whitifh long and narrow leaves by couples, one against another, from among which rise up naked square stakes, with two leaves at a joynt, and at the toppes divers small huskes standing round about them, formed in long round heads or spikes with purple gaping flowers springing out of each of them : the roote is

wooddy, and spreadeth in the ground: the whole plant is of a strong sweet scent, but the heads of flowers much more, and more piercing the sences, which are much used to bee put into linnen and apparell. There is also a kinde hereof that beareth white flowers, and somewhat broader leaves, but it is very rare, and kept but with a few with us, being more tender, and not so able to endure our cold Winters.

2. Lavendula minor five Spica. Small Lavender or Spike. The Spike or small Lavender is very like unto the former, but groweth not so high, neither is the head or spike so long, but shorter and smaller, and the flowers of a deeper purplish blue colour : the leaves also are a little harder, whiter, and shorter than the former: the fcent also is somewhat sharper and stronger. This is nothing so frequent with us as the first, and is nursed up but with few, that take delight in rare hearbes and plants, and kept in a warmer place.

3. Lavendulammor flore albo. Small white Lavender or Spike with a white flower.

This small Lavender is in all things like unto the other small Lavender, but that the whole plant is smaller, and the flowers are white, which maketh it to differ from the other.

4. Lavendula folio multifido. lagged lavender.
This small Lavender riteth up with square rough and hoary branches, to the height of a foote and a halfe, bearing thereon many hoary whitish leaves, very much jagged or torne on the edges, into many parts unto the middle ribee, and each part cut or jagged, of a sharpe taste, and a pleasant scent, yet much weaker than in the other small Lavender: from among which rise fourefquare hoary stalkes, without any leaves on them unto the toppes, where they beare small spikes of purple flowers, like unto the small Lavender or Spike, but that the flowers seeme to stand fquare, or in foure parts or corners : the roote is hard and wooddy like unto the other.

The Place? The three first forts are found naturally in many places of Spaine and Narbone in France, where the other groweth, although both forts with white flowers, are much more rare, and feldome, and nursed up as I said with us in their Gardens that are curious. The last was found by Clussus both about Malaca in Spaine and Mur-cia in the Realme of Granado: it groweth also sometimes in the gardens of those that are curious of all rare hearbs and plants.

The Time. These all flower about the end of Iune, and beginning of Iuly, and although Clusius faith hee found the last about Malaca in flower in February, and in March about Murcia, yet it doth not flower in these colder Countries untill Iune at the soonest, or Iuly. The Names.

Layender is called in Latine Lavandula, and Lavendula, and of some Lavanda, quia lavacris expetitur, because it was much used in washings. The ordinary great Lavender is called by Marthio-lm, Nardau Italica, and Pseudonardau. Tragus calleth it Spica, Nardus Germanica, but most other Authors Lavendula major mas: as they doe the smaller, minor & famina. Dalechampins upon Pliny would make it to bee Caffinalba, as hee would also have Rolmary to be Cassia nigra, and of some to be the Iphium of Theophrastus. It is thought of many, to be the Cmerum that Pliny saith Higinus called Cafa, which was frequently planted in the gardens of Italy for their Bees to feed on, and was also used in garlands, whereof Virgil in his Georgicks and Bucelicks, maketh mention, before Higinus or Plinies time, in these verses

> Tum Casia, atque alys intexens suavibus berbis Mollia luteola pingit vaccinia caltha. and againe Vix humiles apibus casias, roremque ministrat, and Nec circum casia virides, & olentia laté Serpylla, & graviter spirantis copia thymbra Floreat, irriguumque bibat violaria fontem.

4. Lavendula f olio multifido. lagged Lavendera

TRIBE 1. Anguillars is of opinion that Lavender should be the Cneorum album of Theophrastus, and that Rosmaty should De his Cnearum nigrum, which Mathiolus confuteth sufficiently, from the description of the parts, which can be no wayes like them; viz, that both forts of Cneorum have flexible branches, fit to binde other things withall, which neither Lavender nor Rosmary can doe; that the one fort of Cneerum hath a good scent, and the other without feent, although Anguillars would pervet the word, to make the blacke have a good feent, as well as the white, which cannot fland with thesecope of the text; and that both of the Cuers doe flower after the Autumne quarter, which Lavender doth not; and Rosmary, although it doe so, yet it flowreth first in the Spring; and lastly, that the which Lavender doth not; and Rolliany, that the rootes of more made and descend deepe into the ground, whereas neither Lavender nor Rosmary doe so. The lagged Lavender is called by Clusture, as it is in the title, and others fince his time, doe so entitle it likewise, yet, as I said bevender is called by Cinjust, as it is in the time, and outsts time institute, due to entitle it incewire, yet, as I laid before, the figure of Stachau multifida in Gerard, both old and new is the true figure of this Lavendula folio diffetto, as Tore, the figure or statement posses in our new, could be a fine and the figure of this Lavermann forces, as Baubinus callech it, and therefore I mervaile that Master Johnson did not see, or would let passe such an error, that

The Vertues. Lavender is of especiall good use for all the griefes and paines of the head and braine, that proceed from a cold cause; as the Apoplexie, falling sicknesse, the drowsie or sluggish malady, crampes, convulsions and palsies, as also those that are given to faint often. It strengthneth the stomack, and freeth the liver and spleene from obstructions, those that are given to faint often. It strengthneth the stomack, and freeth the liver and spleene from obstructions, provoketh womens courses, and expelleth the dead child, and the secondine or after-birth. The flowers of Lavender strength with the spleeth them to make water that are stopped; as also that are troubled with the winde or collick, if the places be bathed therewith. A decoction made with the flowers of Lavender, Horehound, Fennell, and Asparagus rootes, and a little Cinamon, is very profitably used, to helpe the falling sicknesses, and the giddinesse or turning of the braine. It is good to garble the mouth with the decoction of the flowers, against the paines of the teeth. Two spoonefuls of the distilled water of the slowers taken, doth helpe those that have lost their speech or voyce, resto ing it them againe. It helpeth also the tremblings and passions of the heart, and the swomnings and faintings thereof likewise, not onely drunke, but even applied to the temples, or to the nostriis to be smelt anno, as also tyed to the arteries: but where the body is repleate with blood and humours, it is not safe to use it, because of the hot and sabtist some arteries is but where the body is repleate with blood and humours, it is not safe to use it, because of the hot and sabtist some arteries is but where the body is repleated with blood and humours, it is not safe to use it, because of the hot and sabtist some safe to use of the lefter some commended in all the difference of the hot and sabtist some safe to use of the saf the hot and fabrill spirits wherewish it is possessed. The lesser Lavender is much commended in all the diseases of the hot and motin ipirits wherewith it is policified. The tener Lavelage is much committed at all the difference of the mother, as the firangling or fuffocation, the difference of diplacing, &c. for women to be bathed therewith, as also to helpe forward their travaile; The oyle chimically drawne from Lavender, which is usually called oyle of pike is of fo fierce and piercing spirits, that it is to bee used with great respect, and but some few drops used with other things, either for inward or outward griefes.

CHAP. XXV. Resmarinum. Rosmary.

Here was formerly but one fort of Rosmary knowne, but we have now more diversity, than hath beene extant before, which shall be declared in this Chapter.

1. Libanotis coronaria sive Rosmarinum vulgare. Ordinary Rofemary.

Our ordinary garden Rosmary is so well knowne I thinke, to Our ordinary garden Kolmary is 10 well knowne 1 kninke, to all manner of persons being continually in their hands, that I shall starfe need to describe it, yet not to passe it over so slightly it is well observed in our owne Land in divers places (as Noblemens gardens, &c.) where it hath stood long, as well as in the naturall places, that it groweth in time to a great height, with a great and wooddy fremme, of a close firme substance, and whitish fret and wooddy tremme, or a close in the translative, and would fit to make Inftruments of, &c. being cut into long thin boords for the purpose) branching forth into sundry armes, and from them againe into many other smaller branches, at the joynt whereof, are set as severall distances, many long and very narrow whereof, are set as severall distances, many long and very narrow leaves, greene above, and grayish underneath, and with them all all along the stalkes towards the toppes, divers small gaping flowers, of a pale bleake bluish colour, standing in whitish huskes: the feed is finall and reddifh, but feldome doth any that is fowne in our Country endure the first Winter without extraordinary care, and therefore is usually encreased by slipping: the whole plant doth finell exceeding fweet.

2. Resmarinum friatum five aureum. Gilded Rosmary. This Rolmary differeth not from the former in any thing but is the leaves, which are edged or striped, or pointed with a fairt gold yellow colour, which so continueth all the yeare through out, yet fresher in Summer than in Winter.

3. Rofmarinum lasifolium. Broad leafed Rofemary.

This also groweth like the former, but wee have not seeneit growne fo great in our Country, nor with fuch wooddy branches, and is more tender to keepe : the leaves are larger, and of a more deepe shining greene colour on the upperside, and little or no-thing whitish underneath, more thinly also or sparsedly set on the stalkes: the flowers likewise differ not from the precedent

4. Rosmarinum flore duplici. Double flowred Rosemary. The double flowred Rosemary this farre different from the former, that it hath stronger stalkes while it is young then the last, or not so easie to breake, fairer also, and larger leaves than the first, and the slowers double like as the Larkes heele or spurre: and all this parration is but by information, not sight.

5. Ledum S lefiacum clufis.

5. Rosmarinum Slvestre Bahemicum Matthioli sive Ledum Silesiacum Clusy. Wild sweet Silesia Rosmary, This wild sweet Rosemary of Silesia riseth with wooddy ash coloured branches, two foote high or more, which shoote forth other branches of a purplish colour covered with a brownish yellow hoarinesse, on which are fer many narrow long greene leaves, like unto those of Rosemary, but covered with the like hoarinesse as the stalkes are, especially in the naturall place, but not so much, being transplanted and folding their sides so close together, that they seeme nothing but ribbes or stalkes, of an excellent pleasant and sweet scent: at the ends of the branches grow certaine brownish scaly leaves, out of which spreadeth a tust of many flowers, consisting of five white leaves a piece, with ten white chives or threads in the middle, and in some plants with fixe leaves and 12. threads or chieves, after which follow long and five square heads, spotted with filver like white spots while they are greene, but grow brownish when they are ripe, and turne downe their toppes, opening their huskes at the stalkes, lest the feed which is as small as dust, should suddenly fall out : the roote is wooddy with fhort fprayes.

6. Rosmarinum sylvestre assur. Vnsavory wild Rosmary. Because this plant doth so nearely resemble Rosmary, I have thought it meete to joyne it with the rest, although it be not sweet like them: It groweth above a foote high, having divers reddish branches which divide them felyes into other smaller, of a whitish colour, see consused with long and narrow leaves, greene on the upperside, and hoary underneath, like those of the dwarfe willow, of no pleasant scene at all, but of an aftringent taile; at the toppes of the branches stand divers heads, composed of many short scales, out of which thrust forth fundry flowers, standing on long footestalkes made of five leaves a peece, of a fine delayed reddish, or fleshcolour, after which rife short five square heads with blunt points, containing small pale coloured seed.

Our wilde North-Country Rosmary groweth not so high, with smaller leaves, nothing so great and long as Rosmary leaves, but thicker and shorter, of a darke greene shining colour above, and somewhat yellowish greene underneath, set very sparsedly on very slender and pliant blackish greene twigges, at the toppes whereof grow the flowers, not out of scaly heads as in the former, as farre as I could perceive by those plants, that were fent me and others out of Lancashire, of a reddish colour; the whole plant hath as little scent as the last, which is none at all that I could perceive.

TRIBE I.

6. Kofmarinumfylveftre doome. Vnfavory wilde Rolemary.

The Place and Time.

The ordinary Rolemary groweth in Spaine abundantly neare the Sea fide, the fcent whereof is many times felt by those in the Shippes that passe by many leagues off from the Land, in Prevince also of France, and tinder other those hor Countries, but will not abide (unlesse kept in stowes) the Winter in divers places of Garmany Commarke, and those other Northerly Regions: the fift in Silefia, Bohemia, and the parts there abouts: the fix in the fame places with the fift, the last in divers places of Lancasbire, and Torkesbire, bordering there. The first flowfieth in Aprill and May with us, and fometimes in August againe, the others not untill August. The Names.

It is called in Greeke Manorns Libanotis, & separouarini Stephanomatica is added thereunto, to distinguish it from the other Libanotides, that are umbelleferous plants ; in Latine Rofmarinus & Rofmarinum quafi Rofa marina. from the other Lieuwines, that are unintenererous plants; in Latine Rojmariums & Rojmarium quap Roja marma, Cordus on Diofeorides calleth it Libanois Coronaria according to the Greeke: Dalechampius on Pliny taketh it to be the Cafia nigra of Theophrassus, and Anguillara to bee the Casia of Hyginus acceptable to Bees, and therefore sowne neare their Hives, as also to be the Cucorum nigrams of Theophrassus, and Lavender to be his album, but Manthiolus hath confuted that errour, as is shewed in the Chapter before: some as Banhinus noteth it, would make it tobee the Hebrewes Hisope, as if their Hisope differed from the Hisope of all other Nations, but without true judgement. Gefuer in horse calleth the first Rosmarinus minor free remission, as he doth the third Rosmarinus aler ignobilior, and Cordus in historia, Rosmarinus syl. seu major: the fift is called Rosmarinum stuestre & Bobenicum, by Matthiolus Rosmarinum sylvestre; by Dodonaus in his Durch Herball, Ledum Silesiacum by Clusius; Ledum solije Rosmarini alterum by Lobel, and Chamepence by Cordus on Disservides, and in his Hiltory also, because the narrow long leaves being folded together, do represent the Pine or Pitch tree leaves. The fixt is called by Clusius as it is in the titles the last is not remembred by any before. The Arabians call it Elkia gaber, the Italians Rosmarino, the Spaniards Remero, the French Romarim, the Germanes Rofzmarin, the Dutch Romfmaryn, and we in English Rosmary.

Rosmary is an hearbe of as great use with us in these dayes, as any other whatsoever, not onely for Physicall, but civil purposes: the civil uses as all know, are at Weddings, Fanerals, &c. to bestow upon friends the Physical remedies, both for inward and outward diseases are many and worthy, for by the warming and comforting heats thereof it helpeth all cold diseases, both of the head, stomack, liver, and belly: the decoction thereof in wine helpeth the cold distillations of the braine into the eyes, &c. and all other cold diseases of the head and braines, as the giddinesse or swimming therein, drowsinesse or dulnesse of the minde and seuses like a stupidnesse, the dumbe pallie, or losse of speech, the lethargie and falling sicknesse, to be both drunke, and the temples bathed therewish it panie, or tone or speech, the setnargie and raining sicknesse, to be both drunke, and the temples bathed therewas is helpeth the paines in the gummes & teeth by theume falling into them, or by patrefaction causing an evil smel from them, or a stinking breath: it helpeth also a weake memory by heating and drying up the cold moistures of the braines, and quickning the senses: it is likewise very comfortable to the storage kin all the cold griefes thereof, and to ftay the pronenesse to casting, cansing the stomack the better to containe and to digest the meate, either the decoction or powder taken in wine : it is a remedy for the windinesse in the stomacke or bowels, and expelleth it

powerfully, as also the hypochondriack passion, and winde in the splene : it helpeth also those that are liver-grown. by opening the obstructions thereof, by warming the coldnesse extenuating the grossnesse, and afterwards binding and threngthening the weaknesse thereof: it helpeth dimme eyes, and to procure a cleare sight, if all the while it is in flower, one take of the flowers fasting with bread and salt : both Dioscorides and Galen say, that if a decoction be made thereof with water, and they that have the yellow jaundife, doe exercise their bodies presently after the taking thereof, it will certainely cure it, the flowers and the conserve made of them, is singular good to comfort the heart, and to expell the contagion of the pestilence, to burne the hearbe in Houses and Chambers in the time of the infection to correct the aire in them a both the flowers and the leaves are very profitable for women that are tronbled with the whites, if they be daily taken: the dried leaves shred small and taken in a Pipe like as Tobacco is taken. helpeth those much that have any Cough or Tisick, consumption, by warming and drying the thinne distillations, which cause those diseases: the leaves are much used in bathings, and made into oyntments or oyles, is singular good to helpe cold benummed joynts, finewes or members. The chymicall oyle drawne from the leaves and flowers, is a foveraigne helpe for all the diseases aforesaid, to touch the temples and nostrils with a drop, two or three for all those diseases of the head and braines, spoken of before, as also to take a drop two or three, as the cause requireth for the inward griefes, yet must it be taken with discretion, lest it doe more harmethan good, for it is yery quick and piercing, and therefore but a little must be taken at once. There is another oyle made by infolation in this manner : take what quantity you will of the flowers and put them into a strong glasse close stopped, and digest them inhot Horse dung for 14. dayes, which then being taken forth and unstopped, tye a fine linnen cloth over the mouth, and turne the mouth downe into another strong glasse, which being set in the Sunne, an oyle will distill downe into the lower glasse, to be preserved as precious for divers uses, both inward and outward, as a soveraigne Baulmero heale the diseases before spoken of, to cleare a dimme sight, and to take away spots, markes and scarres in the skin. The Rosmary of Silesia is by often experience found to bee good for the shrinking of the sinewes, for the Patient to fit often in the decoction thereof, and to bathe the affected parts.

CHAP. XXVI.

Ledum Alpinum sive Rosa Alpina. The sweet Mountaine Rose.

Ecause both Cluston and others, referre this plant for the sweetnesse thereof, to the family of the Ciston Lethe sweetnesse thereof, to the family of the Cipiu Le-dum, as he did the last in the foregoing Chapter, and called it Silesiacum, neither of which I dare doe, not thinking them (although sweet) to belong thereunto, else I had not placed them here, but with the other forts of Ledum. I thinke it meet to speake hereof among the sweet hearbs, whose description is thus. It hath fundty slender hard stalkes, 2. foot long

or thereabouts, lying for the most part on the ground, covered with an ash coloured barke, at the ends whereof are set without order many hard leaves, like anto those of the Italian dwarfe Bay with an afth coloured barke, at the ends whereof are fet without order many hard leaves, like mno those of the Italian dwarfe Bay of a finining greene colour on the upperfide, and paler underneath, fomerimes pointed, and sometimes round at the ends, and sometimes pointed, and sometimes round at the ends, and sometimes pointed, and sometimes round at the ends, and sometimes pointed, and sometimes round at the ends, and sometimes round at the ends, and sometimes of the brimmes into five parts, of a deepe red colour on the outside, sprincipled with many silver like spots, as the stalkes of them as all pointed with many silver like spots, as the stalkes of them as all pointed with many silver like spots, as the stalkes of them as all pointed, which being mibbed while they are greene, are of follows a scale of a paler red colour on the in-side with divers threads withe middle, and of a pretty sweet seene, after which come sive parted beads, containing within them very small brown in the selling as a state of the side of the state of the side of the state of the side of the side of the state of the side of the

There plants being lately found and made knowne to us, have received fundry mines; as every one in his opini-

I. Ledum Alpinum five Rofa Alpina. The lweet Mountaine Rofe.

on thought fittest, Viisses Aldrovandus calleth it Norium Alpinum, Gesner and Camerarius in borto, Balsamum Al-pinum, and so doth Lobel also, who also calleth it Chamerbododendros Alpina adora, as hee doth the other sort hereof Chamalae solio; seve leutisci solia minus odora: Clusius Ledam Alpinum: Casalpinus Rhododendron Alpina quibusdam, Gesner himselse calleth it in his Booke de lunarys Nereum Alpinum, in bortie Germanie, and in Descriptione montie fratti, Rosa Alpina from the vulgar, who call it Alprosen and Bergrosen, he maketh it also in the Chapter of Change. rium, to be his third fort. Lugdunensis would referre it to the Evonimus of Theophrafts, but Clusius sheweth the error of that opinion ; but it is very likely that Lobel his, differeth from this of Clufius, as I shall shew you in the The Vertaes.

Glusius saith he could not understand, of any other use that this plant might be put unto, then that the Diers there, used the small galles that grow on it, to dye a black colour like unto other galles.

CHAP. XXVII.

Costus hortgrum major. Coastmary. And Costus bortorum miner sen Ageratum. Maudeline.

Must joyne both these sweet hearbes together, both for the likenesse of their slower, and necrenesse of their names : of the former there is but one fort, but of the other there are divers, whereof I doe intend to thew you the knowledge in this place.

1. Coffus hortorum major. Coftmary or Alecoaft.

1. Costus hortorum major. Costmary or Alecoast.

Costmary or Alecoast hath many broad and long pale green leaves, dented or nipped about the edges, every one upona long foot-stalke, among which rife up many round greene stalkes, with such like leaves thereon, but lesser up to the toppe, where it spreadeth into three or foure branches, every one bearing an umbell or tuft of gold yellow flowers. somewhat like unto Tansie flowers, ibut lesser, which afterwards are the heads containing small flat long feed : the roote is somewhat hard and stringie, which being divided with the heads of leaves, may bee replanted in the Spring for in-

2. Ageratum vulgare sive Costus hortorum minor Common Mandeline.

Common Maudeline hath somewhat long and narrow leaves fnipt about the edges, the stalkes are two foote high, Learing at the toppes many yellow flowers fet round toge-ther, and all of an equal height, in unbels or tufes like unto Tanfie, after which followeth small whirish seed, almost as great as Wormfeed : the whole hearbe is fweet and bitter.

great as wormiced: the whole hearde is tweet and outer, being as well gained by flipping as fowing.

3. Ageratum flore albo. White Maudeline.

This Maudeline hath wooddy stalkes, and many finall leaves thereon like the other, but somewhat smaller and lesses thereon like the other. dented or notched in on the edges, at the toppes of the fialker grow many flowers, as it were in a tuft together, like unto the common Maudeline, but wholly, white, except a little flow of yellow in the middle; the Gent of the whole plan is not foltrong as the other; the roote is small and strings like the other alfo.

This other small Mandeline hath divers hoary stalkes, nor rising much above a foote high, beservas thick with leaves as the former or fuller, upon all sides of the stalkes, which are smaller, longer, narrower, and whiter than the other, and not dented at all about the edges, somewhat like unto the leaves of yellow or golden Cassidony, here before described: at the toppes of the stalkes stand many yellow showers, thicke thrust together, in an umbell or rist, very well resembling the first or common garden Mandeline, of a reasonable good and quicke scent, which turns into downe, and is carryed away with the winde, the roote is small and white with many sibrer amexed unto it.

1. Ageratine purpurems.

Purple sweet Mandeline.

Ageratine purpurems.

5. Agerative purpureus. Purple (weete Maudeline.

This rare and dainty plant hath many small leaves lying upon the ground, round about the toppe of the roots, formewhat like unto the leaves of the fast Maudeline, here set forth, nicked on the edges towards the points of them. and not backwards, somewhat bitter in tafte, yet not so much as the common, from among the leaves arise many and not backwards, to mewhat offer in tarte, yet not to much as the common, from among the leaves arife, many finall stalkes, befer with such like leaves as grow below, but somewhat smaller unto the very toppes, where many slowers stand one above another, every one upon a short spot-stalke, consisting of sive small greene leaves, of an excellent violet-like purple colour, comming, forth of small greene buskes, of so excellent a dainty sweet scent, that it passes the Violet in scene, and to be compared with Muske: after the slowers are pass, there arise small long seed vessels, bearing small seed therein: the roote is yellow, small and short, bushing forth many small sibres, whereby it taketh saft hold of the ground. 2. Ageratum vulgare five Coffus borturan.

. Ageratum minus. Smal' Maudeline.

Ageratum Fernleteun. Fennell leafed Maudeline

80

6. Ageratum Ferulaceum. Fennell leafed Madeline.

This rare hearbe is to be lovned with the Maudelines, for that the flowers decay not being gathered, and kept for a long time. It hath many Fennell-like leaves lying upon the ground, round about the roote, which shooteth forth divers crefted or cornered stalkes, a foote and a halfe high, whereon doe grow at corraine distances, on each side one above another, such like leaves compassing the stalke at the foote of them, as Femali, doth: at the toppes of the stalkes stand large umbels of flowers, some of the stalkes rising lower than others, set all making a round compassed tust of yellow slowers, very like unto the slowers of Groundsell for the forme, but of a more excellent gold yellow colour, which being gathered before they grow to full maturity, will abide a long time in their perfect beauty, which hath canted the name, and to be joyned with them: the roote is formewhat long, black and wooddy, rugged alfo, and a little writhed with divers fibres growing to it. The Place.

The first three forts have beene found naturall in divers rough untilled places of Tax cone in Italy, and Narbone The hift three forts have beene round natural indivers round infinite praces of Assessing individually, and Narbone in France, but in gardens onely withus. The fourth groweth on dry grounds, and open our of old mid and ftone walks. The fift groweth upon the rockes in clifts, where it hath but a small cruft of earth apon it, the roote growing fometimes into the chinkes, and moistned onely by the vapours of tome wasters, justing neare it, or the dew and moisture from the rockes. The last groweth in dry and hungry grounds, and among the Pine tree.

They doe all flower in Iune and Iuly in most places where they are planted and profeer The Names.

The Name:

Coastmary or Alecoast in English, is called in Latine by some Cossum bortorum major, and by others Balsamita major, Mentha Graca, Mentha Romana, Mentha Corymbisera major, Mentha Saracenica, the Isty Gesner in hortis, Herba Maria by Cossum and Luglulata by others as the Italians doe, the same frequent manne, the French Cog & Baume, as the Durch doe Balsome. But Ageratum is called Agenation was the Galpina frequent, or sentitudes non sentient, because significant the flowers gathered in a fit time) was the Galpon of decay by age:

Matthiolus, Gesner, Lacuna, Castor Durantes, Lugdunensis, Camerarius, and Tables.

Dodonaus Belsamita famina of minor, and of sus bortensis minor by Gesner, Montha course of aminor by Cordus, by Casalpinus Campborata, Herba sulia by Anguilara, Gesner in hortis Germania; and Fibra sun Mesnes by Tragus Gesner in hortis, Matspholus and Loncerus; in briefe most of the best later Writers, and Fibra sun Mesnes by Tragus Gesner in hortis, matspholus and Loncerus; in briefe most of the best later Writers, and the content of Mesnes, although fome would disprove it: and likewise the true Empator. Of Mesnes, although and that of Avicen and Dissorving rare both of them but one plant, even the officent of Mesnes, although the content of the feet of the content of the feet of the sun of Mesnes, to be the Agenatum of Dissorving and the Agenatum with Matthiolus and Lugdunins and Lugdunins, and Camerarius: the third is the third Agenatum with Matthiolus and Lugdunins, Ageratum foilus and called Ageratum minus by Lobel Camerarius: the third is the third Agenatum with Matthiolus and Lugdunens, and Camerarius: the fourth is the derrating parphram of Lugdunins. the third is the third Ageratum with Matthiolus and Lugdunensis, and called Ageratum minus by Lobel Camerarius, and Tabermontanus, and by Bunbinu, Ageratum foliy non servatic: the sourch is the depending purphrenum of Lugdunensis, which as he saint some Cermanes called Moschatella carulea, yet is not the Professional of Cordus. Baubinus calleth it Ageratum servatum Alpinum: the last is called by Lugdunensis. Geratum servatum, but Baubinus referreth it to the Achillaa montana Arthemista tennifolia facie of Lobel, to the Achillaa montana of the same Lugdunensis and Tabermontanus, and to the Chrysanthemum Alpinum secundam of Clusius by opinion it is not that Chrysanthemum of Clusius, for we have had it growing in our gardens from the second of the substitution of the same second second of the same secon

The Vertues.

The ordinary Costmary as well as Maudeline (as some of the other are sure in the first the same quality) as well as moulding the hardness of the mother. Galen saith it is not in the inst degree, & drying become that it digesteth, and afters a fort gently dissolvent instantations, it gently purgets choler and dryine that the control of the pure states of the mother is grown and gluunous, deanseth that which is grown and gluunous, deanseth that which is the pure states of the pure states in the pure states of The Vertnes. t'e Waxe, Rollen, and Turphitias, to bring it into a convenient body.

> CHAP. XXVIII. Tanacetum. Tanfic.

Here are two forts of Garden Tanties, whereof the one is called ordinary of common Tantis and the other carld or double Tantie: but there are some others also to be spoken different this Chapter.

Our garden Tantie hath many hard greene leaves, or rather wings of leaves, for (although they bee

I. Tanacettus valgare & criffain. Ordinary and curld Tanlie.

two forts, ver one description may serve them both) they are many small ones set one against another all along a middle ribbe or stalke, and snipt about the edges; in one fort the leaves stand closer and thicker, and somewhat crumpled, which hath canfed it to becalled double or curld Tarifie; in the other fort thinner and more fparfedly fet i it right up with many hard falkes, wherein grow as the toppes of the branches gold yellow flowers like buttons, which being gathered in their prime, will hold the fresh colour a long featon: the feed is small, and as it were chaffet the roote creepeth under ground, and shooteth up agains in divers places: the whole hearbe both leaves and flowers are of a sharpe strong bitter smell and taste, but yet pleasant and well to be endured,

2. Tanacetum versicolor. Party coloured Tanfie. The party coloured Tanfie is in roote, leafe and flower, altogether like the other common garden Tansie; the onely, difference berweene them, confifteth in this, that upon the first shooting up of the heads of leaves, they are almost all white, and after they are growne great, there will bee many leaves. remaining white, among the greene, which maketh it the more delightfull, feeming like unto a party coloured Feather, in regard of the fine cut leaves of white and greene.

3. Tanacerum laniginosum. Woolly Tansie, Woolly Tansie from a thick blackish spreading roote, sendeth forth divers winged leaves, somewhat like unto the former Tansie and neare unto the leaves of Yarrow, (whereof fome would make it a kinde) of a very sweet scent, and withall very woolly, fer close together about the roote, among which spring up divers woolly stalkes, having a few such like leaves upon them, and at the toppes many tufts of yellow

4. Tanacetum minus flore albo. Small white Tanfie. Small white Tantie hath divers winged leaves lying upon the ground found about the toppes of the roote, very much cut or divided into parts, somewhat resembling both Tansie

and Yarrow, of a pale greene colour, being both lesse bitter from among which leaves rise divers low stalkes, beset with smaller leaves up to the toppes, where the flowers stand in tufts, the borders being of a white colour, and the

with infaller leaves up to the toppes, where the nowers trang in turts, the borders being or a winte colour, and the middle thrum yellow, the roote is long and wooddy, fivoting divers wayes.

The Mountaine Tanke hath many winged leaves lying upon the ground, comparing the toppe of the foote, very like unto the ordinary Tanke; in the division of the leaves, and of a deepe greene colour, as bitter in talke, but more pleasant in scent than it : from whence rise up the stalkes, little above a foote high, here and there set with the like leaves, but smaller; the flowers at the soppes are like unto Camomill flowers, with a border or pale of white leaves, and a yellow thrumme in the middle : the roote is small and short, somewhat thicke at the head and smaller downewards, with divers small fibres thereat.

6. Tanacetum inodorum. Vnsavory Tansie. Vnfavory Tansie hath his large winged leaves, very neare resembling Tansie, lying upon the ground, and among them round hard greene stalkes, with very few and shorter leaves thereon, at the toppes whereof stand divers flowers, spon short foote-stalkes, very like unto the flowers, of the great white Daily, and as large, consisting of foureteene or fixteene leaves, as a pale or border, about a yellow thrumme in the middle : the roote foreadeth unfor the upper part of the earth, and goeth not farre downe: the whole is altogether without any from therein at all, yet the leaves are of a hot and fhatpe taffe, quickly piercing the tongue:

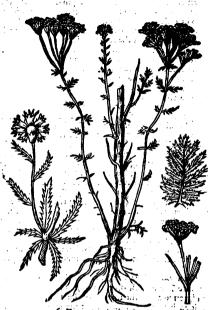

There is another of this kinde of unfavory Tanfie, whole leaves are more loofely foread, althought as such divi-

ded, and the flowers being white, are as small as Fever few.

The ordinary Tantie groweth in some places beyond Sea by the hedges and ditches sides, and in the borders of fields, the curld Tantie is peculiar to our owne Land, and so is the second, and likely to be a degeneration from the ordinary sort by accident, and nursed up in our owne Country, where the flips doe often look, and sometimes keepe their kinde. The third groweth about Mompelier in France, and in other places. The foilth groweth as well in Germany as in Itely, in divers places. The fift groweth on the high and fnowy Hills on the Alpes, among the Switzers. The last groweth in Hungary, Austria, Germany, and about Valentia, and in the Country of Daulphine in

They doe all flower in the Summer Monethes of June and July.

The Names. Tansie is called Tanaceiuse, corruptly taken, as Fuchfiss thinketh, from Lagres, on Apaleius his Aribenisia Tragence, and Aribenisia peradventure of Arbanaes fine morre, or non motions of because the yellow flowers gathered in due time, due not of a long time after, like as divers of the other heaptes last remembred; Takermon3. Tanacetum lanuginofum. 4. Tanacetum minus flore albe.
Woolly Tanlie, Small white Fanlie.

6. Tanacerum imcdorem.

5. Tanacetum Alpinum Mountaine Tanfic.

tensu calleth the ordinary Tanfie, Arthemifia Dioscorida, and the double Tanfie Arthemifia saiva Anglica. The iscond hath no other name then is in the tille, except the some doe cail it white Tansie, because many of the tome doe can it write ranne, occasie many or me leaves will bee white. The third is called Transections Langington of Lugdonensis; Bankinus in his Pinax would referre it to the Strationes Millefolian states of Lobel, but I thinke he is therein mistaken, for the leaves of Stratiotes being much smaller, and having no scent declar it so. It may be also the Heliochrysum Italicum of Matthi. olus, but not any Achillea, whose descriptions yee shall have in another part hereafter. The fourth is called by Dedonaus Tanacesum minus flore albe, of Lobel Tanacesum minus candidate floribus: (but it is not likely to be the Achillea of Matthiolus, Cafter Durantes and others, who follow the description of Dioscorides and Matthiolus; the flowers of whose Achylles are of a whitish purple, with fome yellow spots in them) for that it hath both the forme and the smell of Tansie, but somewhat weaker. The fift by Lugdunensis is called Tanacetum parvum Alpinum, and faith that the people in the Mountaines where it groweth. call it Iva Moschata, and some Anthemic Alpina: Gesut in hort, calleth it Tanaceto cognața berbula, in English Mountaine Tansie. The two last are called Tanacetum a edorum of most, yet some doe adde Bellidis, majore flore, and some Bellis Tanacetifolio: some have thought it to be Siderisis Italorum, but Pena contradicteth it, Clufius theweth the differences of the greater and the leffer. Wee call it in English according to the Latine, Vnsavory Tanse, and I place it here among the rest of the sweet Tanses, for the names fake, rayfed from the likenesse of the leaves, although it hath no fcent. The Italians call it Tonacoto, and Dianels: the French Tonaife, and Athanafis ithe Grand manes Reinfarn, because the leaves resemble Ferne, and the Dutch thereafter Reyn vaer, wee in English Tansie.

The Vertues.

The decoction of the common Tantie (and some of the rest come neare in effect thereunto) or the juyce drunke in wine, is a singular remedy for all the griefes of the wrine, to provoke it being stopped, to helpe those that have the strangury, and have weake reines and kidneies, and that cannot make their water but by drops. It is also very profitable to distolve and expell winde, whether in the stomack, belly, or bowels; and to procere women monethly course, and to expell windinesse in the mother. If it be bruised and smelled unto often, as also applyed to the lower part of the belly, it is assured from the mother. If it be bruised and smelled unto often, as also applyed to the lower part of the belly, it is assured from the interior swith good successes their sull time, without danger or losse; it is used also against the stone in the reines with good successes, especially to men. It is much used both in Lent and in the beginning of the Spring, while the hearbe is young and tender, to make cakes thereof with egges fried, which are called Tansies, and are very prositable for those shomackes, that are troubled with bad humours cleaving thereunto, both to helpe to digest them, and by clearing the shomack of them, to carry them away downeward. The feed is much commended and very prositably applyed to comfort the sinewes that are shrunke by crampes, or are in paines through cold: It is said also, that the roote preserved in Sugar, is a remedy for them that have the gowt, if they take thereof fashing for a certaine time together.

CHAP. XXIX.

Mairicaria. Featherfew.

Here are divers forts of Featherfew to bee entreated of here, as shall hereafter follow.

1. Matri aria vulgaris simplex. Common Featherfew.

Common Featherfew hath many large fresh greene leaves, very much torne or cut on the edges: the stalkes are hard and round, set with many such like leaves, but somewhat smaller, and at the toppes stand many single flowers, upon severall small soot-stalkes, consisting of many small white leaves, standing round about a yellow thrumme in the middle: the root is somewhat hard and short, with many strong sibres at it: the scent of the whole plant is very strong and studing, and the taste very bitter.

2. Matricaria flore plane. Double Feathersew.

This different very little from the former but in the flowers, which are very thicke and double, with white leaves, fo that onely a little yellow fpot is to be seene in the middle.

1.3. Marricaria vulgariu fințlen & bullatis 2. Flore pleno. foribus aureu. Ordinary & naked Featherfeye. Double Featherfeye

3. Matricaria bullatu floribus aureus. Naked Featherfew.
This kinde differeth not from the former, but that it hath

his flowers, without any of the pale or border of white leaves about it, and therefore being naked, and without those leaves, I have named it naked Peatherfew, as an especiall difference from the former.

4. Matricaria grati odoris. Sweet Featherfew.

This other Featherfew differeth not from the first, either in roote, leafe, or flower, being in all things so like, that there can be no difference perceived betweene them, untill you smell thereunto, and then it is soone found to bee of a more pleasant softer smell, which so abideth in the kind, and is not so made by art, or degenerated by any casualty, but the worke of nature onely.

3. Matricaria inodora. Vnsavory Feathersew,

The Vnfavory Featherfew is a small low plant, rather spreading than rising high into many branches, whereon are many leaves set, here and there without order, every one being smaller, shorter and thicker than the leaves of the common leathersew, but cut in on both sides, somewhat like unto it, of no smell at all: the slowers are white with a yellow thrumme in the middle like the other, which have a certaine heavie dull scent, but very weake, the roote is bushy like the former.

6. Matricaria sive Parthenium tenuisolium. Fine-leased Feathersew.

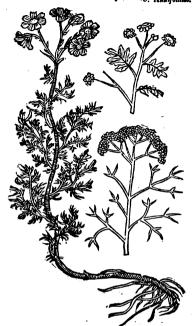

This Featherfew hath a few leaves below, rifing from the roote, as small and fine as Fennell, and very like unto Sothern-wood, but smelling so like Feathersew, and bitter withall, that even thereby it may easily be knowne, to what stocke or tribe it doth belong, from among which rife divers brownish round and hard stakes, to the height of halfe a yard or more, whereon grow dispersedly such like leaves: at the topper of the stakes stand many small white slowers, in an umbell, thicke set, or close together, very like unto the sow-

ers of Yarrow, that they may foone deceive him that heedfully doth not marke them s the roote is fmall, white, and wooddy, with force small fibres at it,

7. Matricaria

7. Matricaria five Parthenium Alpinum Clusij. 8. martinum.
Mountaine Featherfew of Clusius. 6. tenuifolium.

7. Matricaria five Parthenium Alpinum Claffic Mountaine Featherfew of Cluffus.

Mountaine Featherfew hath many flender weake green branches trayling on the ground, and taking roote as they creepe thereon, very like unto Camomill, and not rifing a bove a foote high, about which are let many leaves, almolta fine as Camomill, but cut in after the manner of Maywed or Featherfew, and very neare of the same smell as Featherfew, being of a hot taste, but not unpleasant: at the topperof the stalkes stand many showers together, very like unto the former, but that the middle thrumme is smaller and pale, and the circling leaves not altogether so white, but as large, and somewhat rounder or closer fet, of the same scent with the hearbe: the roote is composed of many small sibres shooting downe from a small head.

8. Parthenium maritinum minimum. Small Sea Featherfew.

I have thought fit to place this Sea plant, with the rest of the same tribe, as I meane to doe with as many as will abide the culture and manuring, to prosper in this garden, entending to shew you the rest in their convenient places: The roote is small spreading abroad many long fibres, from whence rist small spreading abroad many long fibres, from whence rist structure which we have ground, diversly set without order, with many small whitis greene leaves, cut in or dented on the edges, very like in forme, unto the leaves of the great white Daisie, but much lesser and more full and stessy, or thicker, of a strong street seens, somewhat like unto Feathersew, or rather unto stinking Maithes or Mayweed at the toppe of every branch stand one or two slowers, somewhat like unto those of Feathersew or Mayweed, but smaller, and the bordering leaves also smaller, having a whitish greene head or huske of leaves under them.

The first is found wilde in some places of this Land, as well as in others, yet for the most part it is nourished in garden

as well as the second, which as Clusius thinketh, is peculiar to us: the thing grew in Essay, and was there found by a Gentleman called Master William Coys. The fourth grew in an Iland called Nos in the Levant Seas, as Cameratius saith, but it hath beene sound wild in our owne Country, as it hath beene assumed unto mee, as well as the other naked kinde. The fit groweth in Egypt, as Prosper Alpinus saith, and is onely naturall to that Country. The sixth was found in Spaine, by Myconus a learned Physician of Rarcinona, and sent to Molineus who composed the great Herball called Lugaunensis. The seventh Clusius found upon the Mountaines of Stiria, which are part of the Alpes. The last Pena saith grew plentifully neare the Fishermens Cottages, at the foote of Mons Catius in Narbone in France.

The Time.

They all flower in Iune and Iuly, but the Sea plant is the latest.

The Names.

It is called in Grecke machinov. Parthenium quasi virginalis quia mulierum morbis uterinis medetur, & inde vulso Matricaria. It is called also febrifuga, from whence I thinke our English name Feathersew, or Feaversew is derive i, it being good to expell feavers or agues. It is held by most of the later Writers to be the true Parthenium of Diefeor des, yet Lobel and Pena (even as Brafavolus and Fuchfins before them, whom Matthiolast doth confute) by many reasons alleadged doe shew, that both the face or forme of the leaves, compated by Dioscorides to Coriander but lesser, as also the properties given to Parthenium, can by no meanes be found in this Matricaria : but may all most ruely and plainely be found in Cotula fetida, or stinking Mayweed : the discourse is too long here to recite, I, therefore referre you to the place where you may read it at large, in the description of Parthenium in their Adverfaria, as also in Lugdunensis in the Chapter of Marricaria. Parthenium, as Galen faith was called in his time, Anthemis, Helxine, Linozoftis and Amaracus; and Pliny affirmeth, that Helxine was called Perdicium and Parthenium. and in another place he faith, that it was called Leucanthemam and Tamnacum, and that Celfus called it Perdicium and Muralium, so that hereby it may be seene, that Parthenium was a word applyed to many hearbes. Fuchsius would make Mairicaria to be the second kinde of Dioscorides his Arthemisa, called Leprophyllos, that is tennifolia, and Parthenium to be Cotula fetida, which as I faid before, Matthiolus disproveth: the second is so called by divers Authors as it is in the title, and by Tabermontanus Arthemisia tennifolia store pleno: the third is a species not spoken of by any Author before, as I take it. The fourth fort Camerarius calleth Matricaria altera ex Ilva, of Tabermontanus Arthemisia tennisolia odorata, and Banhinus Matricaria odorata; and we Matricaria grati odoris, because it is of so good a scent. The fifth Profeer Alpinus faith is called in Egypt Achaovan, and he thereupon called it Parthenium inodorum: in English Vnsavory Feathersew. The sixth was judged by Myconus that sent it out of Spaine, (as is before said) to be another Parthenium, oursessevor, and it may be that of Hippocrates, which many judge to bee Cotula settle. B. unbinu. calleth it Matricaria solys Abrotani. The seventh Clustus calleth Parthenium Alpinum. Camerarius Matricaria sive Parthenium Alpinum, and Baubinus Matricaria Alpina (hamameli foliys. The last Lobel and Pena call Cotula five Parthenium marinum minimum, and Lugdunensis Parthenium maritimum minimum, and is

likewise the Chamamelum maritimum of Dalechampius, set out in the same place of Lugdunensis, for they are both one, as may be gathered both by the sigure and description, although the slowers in Lobels sigure be more obscured: in English small Sea Feathersew. The Italians call it Matricaria, and Amarella: the French Espargousse: the Germanes Musterkraut, and Melsram: the Dutch Modecrust, and we in English as I said before, Feathersew, or rather Versus.

ther Feaverfew. It is chiefly used for the diseases of the mother, whether it be the strangling or rising of the mother, or the hardneffe of inflammations of the same, applyed ontwardly thereunto, or a decoction of the flowers in wine, with a litnette or innammations of the fame, applyed of the fame, and drunke often in a day, is an approved remedy to bring downe womens the Nutmegge or Mace put therein, and drunke often in a day, is an approved remedy to bring downe womens courfee speedily, and to warme those parts oppressed by obstructions or cold, as also helpeth to expell the dead birth course affect of the hearbe, made in water or wine, and the afterbirth. For a woman to fit over the hot fumes of the decoction of the hearbe, made in water or wine, and the afterbirth. is effectuall also for the same purposes, and in some cases to apply the boyled hearb warme to the privile parts. The decotton thereof made, with some Sugar or honey put thereto, is used by many with good successe, as well to helpe the cough, and stuffing of the chest by cold, as also to cleanse the reines and bladder, and helpe to expell the from in them. The powder of the hearbe, as Dioferrides faith, taken in wine, with fome Oxymel, purgeth like to Epithymum both choler and flegme, and is availeable for those that are short winded, and are troubled with melancholy and heavinesse, or sadnesse of the spirits: It is very effectuall for all paines in the head, comming of a cold cause, as Camerarius saith, the hearbe being bruised and applied to the crowne of the head; It is also profitable for those that have the Vertigo, that is, a turning and swimming in their head. It is also drunke warme (I meane the decoction) before the accesse or comming of an ague, as also the hearbe bruised with a few cornes of Bay-salt (and forme put beaten glaffe thereto, but I fee no reason wherefore) and applyed to the wrestes of the hand, to take away the fits of agues. Some doe use the distilled water of the hearbe and flowers, to take away freckles, and other spots and deformities in the face. And some with good successe doe helpe the winde and collicke, in the lower part of the belly, (and some say it is good also for the winde in the stomack) by bruising the hearbe, and heating it on a tyle. with some wine to moisten it, or fryed with a little wine and oyle in a Frying-panne, and applyed warme outwardly to the places, and renewed as there is need. It is an especiall remedy against Opium, that is, taken too liberally. It is an hearbe among others, as Camerarius faith, much used in Italy, fryed with egges, as wee doe Tansies, and eaten with great delight; the bitternesse, which else would make it unpleasant, being taken away by the manner of dreffing.

CHAP. XXX.

Chamamelum. Camomill.

TRIBE. 1.

Have divers forts of Camomill to shew you in this Chapter, some common and well knowne to most, others more rare, and heard of but by a few, and unto them I thinke it not amisse to joyne the Mayweeds, because they are as well the like stinking, as lesse or not sweet.

I. Chamamelum vulgare. Ordinary Camomill.

Our ordinary Camomill is well knowne to all to have many small trayling branches, set with very fine leaves, bushing and spreading thick over the ground, taking roote still as it spreadeth: the toppes of the branches have white slowers with yellow thrummes in the middle, very like unto Feather-few, but larger, and not so hard, but more soft and gentle in handling, which give a small white feed, not observed by many, and being cast in the ground, will bring forth plants as other seed doth: the whole hearb is of a very sweet scent.

We have another fort of fine small Camomill. We have another fort of fine small Camomill in our gardens, although very rare, like unto the former, but with whiter, finer, and shorter leaves set on the stalkes, that rise somewhat higher, and beare naked small slowers, that is consisting enely of the yellow thrummy heads, without any pale or border of white leaves, smelling almost as sweet as the former.

3. Chamemelum flore pleno. Double flowred Camomill. The double Camomill groweth very like the fingle, but a little higher, and more upright, having fresher greene leaves, the flowers being composed of many rowes of white leaves, making them double, as we call them, & with a yellowish spot in the middle of each flower for the most part, which is of a sweeter scent than the single, but spreadeth on the ground in the same manner, and is more tender to bee kept in Winter: this also hath seed in the middle of the flowers, which being broken and cast into the ground, will produce double Camomill, even as double Feathersew will doe the like.

4. Chamenelum pumilum Africum. Small Camomill of

This small Camomill growerh lower than the former naked Camomill, with as fine small leaves, but longer: the flowers being yellow thrummy heads like it, but bigger, and without any pale or border of white leaves, smelling as sweet as the best Camomill.

. 1. Chamemelum vulgare, Ordinary Camomill, & flore pieno. Double Camomill.

z. Chamemelum nudum.

Naked Camomill.

4. Chanemelum pumilum Africum.

5. Chamamelum Hilpanicum amplo flore. Great Spanish Camomill.

This great Camomill groweth in the fame manner as the ordinary Camomill doth, with greene striped stalkes, of a cubite high, branching forth into many parts, whereon doe grow fuch like leaves, and as finely cut in or divi-ded, the ends whereof are blunter, and divided into two parts, and not very thicke fet on the branches; at the tops whereof fland the flowers, each being four times larger than the flower of the ordinary fort: confifting of about twenty waved or endented leaves, of a very pale yellow colouralmost white, for a pale or border, about a pale yellow thrum in the middle: after the flower is past the feed ripeneth in these heads, which is small and yellowish like the ordinary fort: the roote confisceth but of a few fibres, which dye every yeare, the plant being but annuall, and must be new sowne in the Spring; it is of a good scent, somewhat resembling the garden Camomill,

and must be new towne in the Spring; it is or a good itent, tomewhat retembing the garden Camomili.

6. Chamemelum Hiffanicum luteum odoratum, Sweet yellow Spanish Camomill.

This yellow Camomill is like unto the garden Camomill in all things, faving the flowers which are wholly yellow, both the bordering leaves, which are of a shining yellow colour, about fourteeens in number, and the middle thrum, but the whole flower is at least twice as bigge as the flower of the ordinary fort, and almost as fweet, but lesser almost by the halfe than the former.

7. Chamamelum Hilpanicum incanum parvum. Small hoary Spanish Camomill. This small Camomill groweth not to be above an hand breadth high, having some sew hoary whitish greene

finely cut leaves, lying upon the ground, being as small and fine as those of Southernwood, or fine Wormewood, from among which rifeth up a bare or naked stalke, without any leaves thereon, and one somewhat large flower, standing at the toppe, having many white leaves, standing about a pale yellow middle thrum; the whole plant and every part thereof, is as well without scent as without taste. 8. Chamamelum Alpinum inoderum. Vnfavory Mountaine Comomill.

Vnsavory Mountaine Camomill hath many hoary stalkes rising from the roote, without leaves for a certaine difrance, and then having many fet together, small toward the bottome, seeming to bee but as stalkes to the leaves, which are somewhat narrow, and deepely cut in on both sides, as it were into deepe notches, being more thicke and full of juyce, then other forts are by much, among which rife ap divers other weake stalkes, without any cut leaves on them, and one somewhat large flower at the toppe of each, like unto a Camomill flower, but larger, the border of leaves being white, and the thrum yellow in the midde : the branches fpread farre, and take roote in divers places : the roote is composed of a few whitish strings, the plant hath little or no smell to commend it, and is a little bitter in tofte.

9. Catula fasida, & non fasida. Mayweed with a strong, and no scene. Mayweed is so like unto Camomill, that I must needs joyne them together: but that which stinketh growth more upright than either that which smelleth not, or the common Camomill, and neither of them creepe or runne on the ground, with the branches taking roote as Camomill doth; the leaves thereon are longer and greater than

8: Chamemetum Alpinum tuodorum. Vafavory Mountaine Camomill,

9. Colula felida & non fatida. Mayweed with a ftrong and no fcent.

Camomill, yet very like, but of a paler greene colour, the one fort smelling strong and unpleasant, the other having no scent at all : the flowers of them both are very like unto Camomill, but larger both the white border and the middle yellow thrum, whereby and by the scent thereof they are onely to be discerned from Camomill for many doe gather the flowers of that which smelleth not, in stead of Camomill flowers, either of ignorance or wilfulnes, and so sell them promiscuously to the Apothecaries, that know not this note of distinction.

Of this kinde there hath beene found oftentimes, and in divers places of this Land, a fort with double flowers Flore almost as large as double Camomill flowers.

The Place. Small Camomill groweth familiarly wilde in many places (on greenes as they are called) of this Land, and with the Mayweed oftentimes that flinketh not, which groweth also among corne, as the flinking fort doth: the naked and double fort grow onely in gardens: the fourth was found by Guillame Boel in Africa by Tunis: the fifth, fixth, and seventh in divers places in Spaine: the eighth in sundry places of the Alpes: the last plentifully in our owne

They all flower in the Summer, yet some earlier than others. The Names.

Camomill is called in Greeke A'rifius, Anthemis of Dioscorides, and A'rifius of Theophrastus, and this for a di-Stinction Asuraissius of the whitenesse of the flowers: and Xauraius As quad mali adorem babeat, of the scent of an Apple or Quince. It is called by some in Latine Leucanthemum, and Anthemis, but most generally Chamamelum, and of some Chamomilla, as it is also in the Apothecaries Shops Some call the garden Camomill, both single and double Chamamelum Romanum & odoratius & nobile, thinking them to be sweeter kindes than the wilde, when as that which groweth wild is usually brought into gardens, and will by manuring become of as good a scent, or any other before in the garden. The relt have their names in their titles, both in Latine and English, as much as is convenient, and that others have called them: but Mayweed as is before said in the last Chapter, is more truly taken to be Parthe. nium of Dioscorides, yet generally called Cotula, taken as it is thought from the Thussans Causa, the diminutive being Causula, corruptly called Coula; by the Greekes xuvàrbeus; & xuvoscraine Cynanthemis & Cynobotane, that is, Camomilla canina & Canima herba; the Germanes Krottendill: the Arabians call Camomill Debonigi & Babunegi; the Italians call it Camamilla: the Spaniards Manzanilla: the French Chamomille: the Germanes Chamillon, and the Mayweed Krottendill : the Dutch Camille : and we in English Camomill.

The Vertues. A decoction made of Camomill, and drunke, taketh away all paines and flitches in the fides. The flowers onely of Camomill beaten, and made up into balls with oyle, driveth away all forts of agues, if the party grieved bee an-noymed with that oyle taken from the flowers, from the crowne of the head, to the foles of the feete, and after hald to sweat in their bed, with sufficient coverings upon them, and that they sweat well; this is Nichessor an Exprians medicine; which Galon seemeth to confirme, for he saith that the Sophi of the Egyptians confecrated this hearbe to the Sunne, as a remedy for all forts of agues ; but therein faith Galen they were deceived, for it hea-

TRIBE. 1.

leth onely those that are already digested; but it is very profitable for all other forts of agues, that come eyther from flegme or melancholy, or from an inflammation of the bowels: for these (saith he) Camomill is a soveraigne remedy to be applied, when as they shall be concocted: and therefore there is nothing can be more acceptable and profitable to the Hypochondria; that is, the fides, and that part where the liver and splicene lye, then it. The bathing of a decoction of Camomill taketh away wearinesse, and easeth paines to what part of the body soever it be applied besides, it comforteth the sinewes that are overstrayned, mollifieth all swellings, and those that are not overhard. and rarifyeth those that are bound together. It moderately comforteth all parts that have need of warmth, and digesteth and dissolveth what soever hath need thereof, by a wonderfull speedy property. It easeth all the paines of the collick and frone, as also all paines and torments of the belly, and provoketh urine gently. The flowers boyled in posset drinke, provoketh sweat, and helpeth to expell colds, aches, and paines wheresover; the same is an ted in policitarinke, provoked tweat, and neighbor confess, actions and paints whethere is an excellent helpe to bring downe womens courfes; A Syrupe made of the juyce of double Camomill, faith Ban-binus, but of garden Camomill say Pena and Lobel, with the flowers and white wine, is a remedy against the jaundife and dropfie, that commeth by the evill disposition of the spleene. The flowers boyled in lye is very good to wash the head, and to comfort both it and the braine. The oyle made of the flowers of Camomill is much used. against all hard swellings, and paines, or aches, shrinking of the sinewes, or crampos, or paines in the joynts, or any orthor parties the body; and helpeth to dissolve wind, and paines in the belly, used in glisters for that purpose: any novinces also, it helpeth flitches, and paines in the fides. Mayweed is often with good fuccesse for the fame purpofes that Camomill is, both to diffolve tumours and winde, and to cafe paires and aches, in the jowns, &c. especially the stinking fort, which is stronger in operation than the other.

> CHAP. XXXI. Ambrosia. Oke of Cappadocia.

Lethough there be extant with some Writers, two sorts of Ambresia, as Matthiolis in his last Edition, and three forts with Lobel in his observations, and so likewise with Gerard yet finding both the forts in Matthiolus, and the later fort in Lobel and Gerard, to be other hearbes, the I shall shew you in the sixth place amonighte Arriana, and not Ambrofia: I have here only shewed you one, as Dodonaus before me hath done also, which is the first both with Lobel and Gerard, as the truest, and is the state of the first both with Lobel and Gerard, as the truest, and is the state of the state

Снар. 31.

1. Ambrofia hortenfis. Oake of Cappadocia.

The Oake of Cappadocia from a long slender roote, bushing forth with many fibres, fendeth forth one hoary white striped, or straked stalke, rising to be two foote high at the least in any good ground, divided or spread into many branches, from the very bottome, whereon are fet without any certaine order, fomewhat large leaves, upon pretty long foot-falkes, very much cut in on the edges, fomewhat refembling the division of Mugwort leaves, especially the ends of them, but much smaller than they, being all whitish or hoary upon the greene, and of a very pleafing fcent, not fo hot or refinous as Botrys or Oake of Ierufalem: at the toppes of all the branches both great and final, stand the flowers, which are small round yellow mossie buttons, never opening abroad, nor bringing any feed, but fall away as idle chaffe : but under these flowers from among the leaves, come forth small shortstalkes, bearing two or three, or foure small rough and pointed heads, without any flowers before them, wherein is contained small round blackish seed, almost like the kernels or stones of Raisons or Grapes.

The Place. This is fald to grow naturally in Cappadecia, but Bellenini fetteth it downe to have found it in many places of Afia miner, and is onely to be found in gardens thorowout all Europe.

The Time.

It flowreth not with us untill August, and hardly giveth us any perfect feed, for the least cold night comming before it can feed taketh it away, making it presently to perish, so that for the most part wee are to seeke for seed, from Italy, or other places.

The Names. It is called in Greeke duberria quafi ro rar dear Brata. Deermi cibus, the meate of the Gods: for so Gentilisme accounted of

it, for the excellent fragrancy it yeldeth, and that mortall men did not make it their food, or because, as they supposed, it did make men that did eate thereof, to bee of so less life, that they might be held to be immortall. Anguillara, Gesuer in bort, and Camerarius suppose it to bee Compa Hyppocratis. Lugdunensis calleth it Artemisia monoclones, but giveth two figures thereof, one with an upright stalke without any branches, and the other branched. Gesmer likewise calleth it a kinde of Artemisia, and some dot take it to bee the second Artemifia of Pliny, but Dodonaus, Camerarine, Lobel, and Tabermoneanas, doo all call it

Ambrolia, or sativa & agrestin : Banhinus calleth it Ambrolia maritina : in English Oake of sappadocia, The Vertnes.

The properties referred by this ancient Writers to this hearbe are scarce answerable to so glorious a title: for Discorides faith onely, it hath a property to repell, stay and bind those humours, that fall into any part of the body, being annoynted or outwardly applyed, and so saith Galen also, and more is not said by any Author thereof: onely Pliny in writing the words of Dioscorides, in stead of repelling, hath set downe discussing, as mistaking the Greeke word, and mif-interpreting it.

> CHAP. XXXII. Botrys. Oke of Ieruialem.

EE have generally knowne but one fort of Bostrys, which is a small low hearbe, but of late dayes there hath come to our knowledge, another fort more tall, and like unto a small shrubbe, because it is more wooddy.

1. Botrys vulgaris. Common Oke of Ierusalem.

The ordinary Oke of forufalem is a small bushy hearbe, full of branches, a foote and a halfe high, with some few, and not many leaves thereon, which at the first springing are reddish on the underside, and after grow to be of a yellowish greene colour, especially when they grow old, and in the time of the flowring and feeding; which are much cut in on the edges, like unto Grunsell but larger: the toppes of the branches, and so downe to the halfe of their height, is fully stored with small pale yellow flowers like unto the blossomes of Vines, which turne into small brownish feed: the roote is long and hard when it hath given feed, perishing yearely: the whole plant is of a resinous sweet scent, and while it is greene is fomewhat clammy in handling.

2. Botrys Americana. Indian Oke of Ierusalem. This Botry, or Oke of Ierusalem riseth up higher, and the branches are more wooddy and durable : the leaves are fomewhat like unto wild Arrache, but larger, and much cut in on the edges, like unto the former, the whole plant, both flowers and feed, is most like unto the former; and doth most likely abide the Winter of his naturall warme Countries, which are nothing to violent as ours, but will not doe so with us, without much care to preferve it; but doth fpring of the feed fowne, as well as fpilt, at, or before the gathering : the fcent whereof is fomewhat firong, but not unpleasant, very neare unto the other. The Place:

The first groweth in Italy and Narbone in France, in divers places, as well by the water sides, as in the dry sandy grounds. The second is naturall of Mexico & Virginia, from whence it hath bin brought. The Time.

They both flower and feed in August and September, and doe often raise themselves, of their owne sowing, especially the former.

The Names.

It is called in Greeke Corevs and Botrys in Latine, a floribus & seminibus in betryos formam ramulis insidentibus, because the slowers, and so the seed also groweth like unto a bunch of Grapes. All Authors call it Borrys, yet Eystetensis calleth it Artemisia Turcica, and Camerarius faith that the Italians call it Patientia, Cordus upon Dioscorides calleth it Ambrosia altera species, and moreover saith, that in some Apothecaries shops in Germany, the seed thereof was taken for Amomum: Dioscorides saith, that in his time, the Cappadocians called it Ambrofia, and some others Artemifia. Banhinus calleth it Botrys Ambrofioides vulgaris. And the other he calleth Borrys Ambrosioides Mexicana, and faith the feed was sent by the name of Parote: wee doe generally call it Botrys fruticosa Americana, as a distinction from the other; in English Shrubby Oke of Ic-

The Vertues. Dioscorides applieth it not to any other thing, then that it helpeth those that cannot take their breath, unlesse they hold their neckes upright, being taken in wine; but others have found out more especiall properties therein; for in that it both heateth and dryeth, attenuateth, cutteth, cleanfeth, purgeth, openeth, and expectantel tough flegme. It is very profitable for all the diseases of the chest or breast, troubled with flegme, whether it bee thin or tough, or rotten silthy corrupted matter to spit forth, as also for those that are short winded, or have the cough of the langs, either the hearbe it selfer alone being boyled, and the decoction taken with Sytupe of Violets, or with Liquoris added into the decoction, and taken for divers dayes together. The greene hearbe is of especiall good use in the paines of the mother, to be heared on a tyle, and moilthned with Muscadine, and laid hot to the belly. As also if wasters to the best of the offence of the o also, if you take Oke of Iernsalem, Feathersew, and Camomill slowers, and fry them together with some oyle of

1: Botres vulearis. Common Oke of terulalem.

2. Artemifiaminor.

TRIBE I.

Small Mugwort.

3. Artemifia tenuifolia montana, Fine Mountaine Mugyvort:

Lillies into a cake, and apply it warme to the belly, is an approved remedy for women in childbed, that feele any paines of the mother, after their delivery. The fumes of the decoction thereof also taken underneath, by sitting over it, helpeth to bring downe the courses, and to expell the dead child. It is much used to be laid into Wardrobes or Presses, not onely to kill or drive away the mothes, but for the sweet scent to persume the garments.

CHAP. XXXIII. Artemisia. Mugwort.

Here are three or foure forts of Mugwort to be here declared, besides a stranger lately come from Virrinia, although Pling and others doe reckon but two forts, one with broader, and another with smaller leaves.

1. Artemifia vulgarů.

1. Artemisia vulgaris. Common Mugwort.

The common Mugwort hath divers leaves lying upon the ground, very much divided or cut in deepely about the brims, somewhat like unto wormewood, but much larger, of a sad or darke greene colour on the upperfide, and very hoary white underneath: the stalkes (doe grow in some to be purplish, and then the flowers are deeper coloured) rise to bee soure or five somewhat smaller, branching forth very much towards the toppe, whereon are set, very small pale yellowish slowers like buttons, which fall away, and after them come small feed, inclosed in small round heads; the roote is long and hard, with many small fibres growing from it, whereby it taketh strong hold in the ground, but both slalke and leafe doe die quite down every yeare, and the roote shooteth anew in the Spring: the whole plant is of a resonable good scent, and is more easily propagated by the files, then by the feed.

2. Artemifa minor. Small Mugwort.

This fmall Mugwort is fomewhat like unto the former, ha-

ving fuch like leaves, divided or cut in on both fides, greene above, and whitish underneath, but much smaller than they: the stalke likewise (for oftentimes it hath but one) riseth not so high, nor is so great, but bearing the like flowers, yet paler: the scent whereof is also a like.

2. Artemisia tenuifolia montana. Fine Mountaine Mugwort. The Mountaine Mugwort, is also not much unlike the for-mer, having divers square brownish branches, not above a foot and a halfe high, whereon doe grow fuch like leaves almost, but longer, narrower, and much more crumpled, or finely jagged on the edges; the flowers are pale and small like the former: the roote is long and blacke, fpreading in the ground,

4. Arcemila Polyfermos. Fruitfull Mugwort.
This kinde of Mugwort rifeth up ulual but with one stalke, dividing it selfe from the bottome thereof into ma-This kinde of Mugwort rifeth up utual out with one italke, dividing it seite from the portrome thereor into many branches, whereon are fet somewhat sparsedly, somewhat longer and larger leaves than the small Mugwort, but more sinely cut in on the edges, unto the middle ribbe, and ending in a longer point; the toppes of the branches, are more plentifully stored with flowers than the other forts, which turne into small seed, bearing abundantly.

7. Artemisia Virginiana. Virginian Mugwort.

This Virginian being so lately come to our knowledge, that we can scarce give a perfect description thereof unto you rifeth up, somewhat higher and larger spread, with much divided leaves like the first but greater, the flow-

ers hath not beene yet thorowly observed.

The Place. The firstgroweth plentifully in many places of this Land, as well as in others, by the way sides, as also by small water courses, and in divers other places. The second likewise is found in some of those places, but farre lesse streets quent. The other three are strangers, and nursed up with us onely in gardens.

They all flower and feed in the end of Summer.

The Names.

It is called in Greeke devenious, and Arremifia in Latine also, and recorded by Pliny, that it tooke the name of Artemifia, from Artemifia the wife of Manfolm, King of Caria; when as formerly it was called Parthenis, quaf Virginalis Maidenwort, and as Apuleius faith, was also called Parthenium: but others thinke it tooke the name from sprius, who is called Diana, because it is chiefly applyed to womens diseases. The first is generally called of all Writers Ariemifia & vulgaris, because it is the most common in all Countries. Some call it also Mater berba-

4. Artemifia Poly rermos. Fruitfull Mugwort.

4. Attemifia Monoctones. Fruitfull Magworts

rum. The second is called by Matthiolus and others Artemisia minor, and so doe we. The third is called by Lugdunensis Artemisia leptophyllos incana, and in English Fine Mountaine Mugwort. The last is called by Baubinus Arte. misia Polyspermos, and the other by Lugdunensis Artemisia Monoclonos quorundam aligs Ambrosia, in English Fruitfull Mugwort.

Dioscorides faith, it heareth and extenuateth. It is with good successe put among other hearbes, that are boyled for women to fit over the hot decoction, to draw downe their courses, to helpe the delivery of the birth, and to expell the secondine or afterbirth, as also for the obstructions and inflammations of the mother; it breaker the stone, and canfeth one to make water where it is stopped: the juyce thereof made up with Myrrhe, and put under as a peffary, workern the fame effect, and to doth the roote also, being made up with Axungia into an oyntment, it doth take away Wens and hard knots, and kernels that grow about the necke and throat, as also to ease the painer about the necke, but especially and with more effect, if some field Daisies be put with it. The hearbe it selfe being fresh, or the juyce thereof taken, is a speciall remedy, upon the overmuch taking of Opium: three drammes of the powder of the dryed leaves taken in wine, is a speedy, and the best certains helpe for the Sciatica. A decodion thereof made with Camomill and Agrimony, and the place bathed therewith while it is warme, taketh away the paines of the sinewes, and the crampe. It is said of Pliny, that if a Traveller binde some of the hearbe about him, he shall feele no wearinesse at all in his journey; as also that no evill medicine or evill beast shall hurt him that hath this hearbe about him Many such idle superstitious and irreligious relations are set downe, both by the ancient and later Writers concerning this and other plants, which to relate, were both unseemely for me, and unprofitable for you. I will onely declare unto you, the idle conceit of some of our later dayes concerning this plant, and that is even of Baubinus, who glorieth to be an eye witnesse of this foppery, there won Saint Iabns eve, there are coales to be found at mid-day, under the rootes of Mugwort, which after or before that time, are very small or none at all, and are used as an Amulet to hang about the necke of those that have the falling sicknesse, to cure them thereof. But Oh the weake and fraile nature of man! which I cannot but lament, that is more prone to believe and relye upon fuch impostures, than upon the ordinances of God in his creatures, and trust in his providence.

CHAP. XXXIIII. Abrotanum. Sothernwood.

F Sothernwood (which is the Abrotanum mau, as the late and best experienced Authors doe hold; the faminate bethe Lavender often, which shall be set downe in the next Chapter, there are many some strey shall be declared in their order: of which number I have taken some from those hearbes going before, as also from Wormewood that shall follow, because I suppose they rather belong to this Tribe, than to any of the other, from whence I have taken them.

1. Absotanum mas vnigare, Common Sothernwood.

1. Abrotanum mas vulgare. Common Sothernwood.

Our ordinary Sothernwood (which is the most common in gardens with us, and generally called Sothernwood : for the other forts are called by other names, for the most part, and not acknowledge to be of this kinde) rifeth up with maand not acknowledge to be or this kinde? First in p with ma-ny weake and wooddy branches bending downewards, if they be not held up, specially white they are small; for the elder stems are more strong and great, rysing in time to bee higher than any man, from which doe grow one many small and long branches, whereon are fer many small fine and short and long branches, whereon are textuary small fine and short leaves, as sine as Fennell, but not so long, of a grayish or ruffet greene colour, somewhat throng; but not impleasant in smell, and fra strong and somewhat bitter taste. from the middle almost to the toppes of the upper sprigges, stand small round yellow flowers tranging like little buttons; which never open much, but hadle away, and after them come the seed, which is distilluted that of the strong the seed,

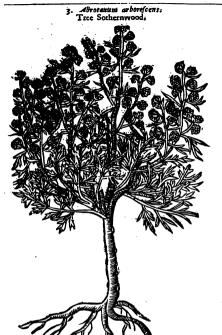

round yellow nowers training like little buttons; which never open milch but paffe away, and after them come the feed, which is finisher than that of Wormewood: the root groweth not viry deep, that is wooddy, with divers strings annexed undite: this foldshall the sever on the stalkes and branches curry years; and shoot forth anew, in the Spring.

3. As a summary of Great Sothernwood.

This great Sothernwood is altogetier like the former; growing as high our after higher, and with leaves like thereunto, but to say in the range of a though refinous feen, not supplied high give and growers, of a though refinous feen, not supplied high give and growers and feed different from the other, nor the mane, which is wooddy and runneth under ground in the same manner.

2. Abrotansum arbitraction. The Sothernwood.

This rare kinde of Schernwood groweth upright, with one stem or stalke, to the highest of man, if the lower small springes bee printed on all sides, on which doe grow many branches on all sides, on which doe grow many leaves, very much cut in and divided, but are nothing so since

4. Abrotanum inodorum. Vnfavory Sothernwood.

and small as the former, but yet a little quicker, and nearer resembling Wormewood, as it is also in the taste, and more aromaticall than Sothernwood: the flowers stand at the toppes of the branches, being more plentifull and larger than the former, but yellow like them, after which come the feed, which likewife is formewhat larger: the roote is wooddy, spreading many strings and sibres : the plant is more tender than the others, and will require fome care to preserve it in the Winter more than they.

4. Abyotannen inodorwa. Vnfavory Sothernwood.
Vnfavory Sothernwood fpringeth up with many flender, but wooddy whitish stalkes for the most part, leaning or lyingupon the ground, yet sometimes standing somewhat upright, upon which at severall places, come forth many small whitish leaves, not so small or finely cut or divided as the common Sothernwood, but greater, of little or no finell at all, but of a hor tafte, drawing rheume into the mouth, to bee fpit forth: from among which fpring forth small greenish purple branches, set with the like leaves, but smaller, and many small pendulous greenish purple heads, along the fprigges to the toppes, which when they open, shew out small pale purplish flowers; the roote is somewhat wooddy, and brancheth forth divers wayes, with many small strings or fibres.

This small Sothernwood shooteth forth many small weet Sothernwood.

This small Sothernwood shooteth forth many small wooddy branches, rifing seldome above halfe a yard high, but very thickly spreading into other smaller sprigs, set full of small leaves, somewhat longer, greater, and greener than the last the toppes of the stalkes are stored with many small round heads, which shew forth small yellow greenish flowers : the roote spreadeth like the other : the whole plant as well leaves as flowers, and the sprigges yeeld a very good feent and pleasant savour, more than the other, somewhat inclining to Wormewood.

6. Abrotanum campestre. Field Sothernwood. The Field Sothernwood hath many small fine leaves, rising from the roote, very like unto the leaves of com-mon Sothernwood, but of a darke greene colour, and likewise many wooddy stakes, about a foote high or more (yet sometimes but one) divided diversly, having such like leaves growing thereon, as are below: the stender iprigges are stored with plenty of small round greene heads or buttons, which contains small yellowish flowers like Sothernwood, and plenty of small seed following them: the roote is long, thick, blacke, and wooddy, with diversibres annexed thereunto: the smell hereof is more neare unto Mug wort, than Sothernwood.

7. Abrotanum campestre incanum. Hoary Field Sothernwood.

This other Field Sothernwood, is in all things like the last described wild Sothernwood, but that the leaves are of a whitish or hoary colour, and of a sweet aromatical scent and taste, and that the roote is of a darke reddish colour on the outside, with divers fmall fibres growing from it. The Place.

The first is usually found in gardens but his originall is not fet downe. The second groweth in Germany, and brought into their gardens. The third came out of the Levant into Italy, from whence it hath beene fent to divers other places, as well here, as to German, the Low-countries, Sec. The fourth Clufin faith he found in Austria,

TRIBE I.

. Atrotanum hamile odoratum. Small fweet Sothernwood.

6. Abretanum campejire. Field Sothernwood.

7. Abrotanum campestre incanum. Hoary field Sothernwood.

Hungaria, and other parts thereabouts. The fifth is onely found in the gardens of Herbaritts that are curious. The fixth groweth in Harcynia fylva Sazonothurungica, as Iohannes Thalium fetteth it downe. And the last about Listz in Austria, from whence, Bankhinus in his Prodromus saith, it was brought to him.

Most of them doe flower in Iuly and August, yet some later, so that we seldome see them beare seed, especially the greatest.

The Names.

It is called in Greeke Aspertoror Sid to apole of radipor in analy palvedui, anase n', to Daniverrai, hoc est quod conspettu tenerum melle & delicatum appareat : aut quod gravem acremue & difficilem balitum spirat : in Latine after the Greeke Abrotonum, but more usually Abrotanum. Pliny calleth this mu Campefre, and the femina montanum. The first is called generally by all Authors Abrotanum ma, and by Cordus nigrum, except Dodonam in French, and Anguillara who call it famina, in English common Sothernwood, The second is called by Camerarius Ambrotanum magnum camphoratum quibusdam Incensaria, and by Bauhinus Abrotanum mas an gustifolium maximum: in English great Sothernwood. The third is called by Anguillara Absinibium del Comasco, and Absinibium arborescons of Lobel, Lugdunensis, Tabermonianus, and Gerard: but Dodonans calleth it Abrotanum famina arborescens, and Banbinus in his Pinax, Abrotanum latifolium arborescens, in English Tree Sothernwood. The fourth is called by Dodonaus Absiminam indorum of inspidum: by Lobel, Lugdunensis, and Gerard, Abroranum indorum: but Clusius calleth it his second Arthemisa tenuifolia: all these Authors doe give one and the same figure for this plant: Dodoneus for Absinthium, Lebel and others for Abrotanum, and Clusius for Arthemisia. Banbinus calleth it Abrotanum lasifolium inodorum : in English Ynsavory Sothernwood; for wa have a Wormewood that is unfavory, differing from this, as fhall be shewed you among the Wormewoods. The fift is called by

Dodonans and Lobel Abrotanum odoratum humile & dense frusicosum: by Tragus Abrotanum tertium, and by Baubinus Abrotanum mas angustifolium minus: in English Small sweet Sothernwood, The sixth is cased by Matthiolus in his later Edition Ambrosa altera; whom Lacuna, Lonicerus, Castor Durantes, Lugdanensis and Camerarius doe follow, and Lobel Ambrosa tennisolia. Gesner calleth it Ambrosa Leptophyllos, and Clusius Arthemisa ternia tennifolia, it is Tragus his Abrotanum sylvestre quartum: and Tabermontanus, Gerard, and Bauhinus Abrotanum campestre, in Fnolish Field Sothernwood. The last is called by Rushimus Abrotanum.

in English Field Sothernwood. The last is called by Bauhinus Abroranum campestre incanum Carline odore: in English Field Sothernwood. The Arabians call it Cathsum Kesum, or Gaissum: the Italians and Spaniards Abroranus: the French Auronne & bou de S. lean: the Germanes Stabmuriz: the Dutch Averonne: and wee Sothernwood.

The Vertnes.

Dissociates faith, that the feed bruifed, heated in warme water and drunke, helpeth those that are burften, or are troubled with crampes, or convultions of finewes, with the Sciatica, and with the difficulty in making water, and to bring downe womens courses: the same taken in wine, is an antidote or counterpoison against all deadly poison, and driveth away Serpents, and other venemous creatures, especially against Scorpions and polionfull Spiders; as also by the smell of the hearbe being burnt, or laid in places where they come : the oyle thereof being announted on places convenient, especially the backe bone, before the fits of agues taketh them away: it is profitably laid to the eyes to take away the inflammation of them, if it be put with some part of aroasted Quince, and boyled with a few crummes of bread : boyled with barly meale, it taketh away pimples, pushes, or wheales, that rise in the face, or other parts of the body. The feed as well as the dryed hearbe, is often given to kill the wormes in children: the hearbe bruised and laid to, helpeth to draw forth splinters, and thornes out of the flesh: The ashes thereof dryeth up and healeth old ulcers, that are without inflammation, although by the sharpnesse thereof it biteth fore, and putterh them to fome paines, as also the fores that happen in the privie parts, of men or women. The ashes likewise mingled with old Sallet-oyle (for we have neither the oyle of the seed of the Mastick tree, which is much commended, nor the oyle of Cherua, or the great Spurge, called Palma Christi, nor some other that are used in other Countries) helpeth those that have their haire fallen, or their heads bald, to cause the haires to grow againe, either upon the head or beard: Some say the juyce thereof with oyle doth the same. Durantes saith that the oyle made of Sothernwood, and put among other oyntments, that are used against the French disease, is very effectuall, and likewise killeth vermine in the head. The distilled water of the hearbe is said to helpe them much, that are troubled with the stone, as also for the diseases of the spleene and mother. It is generally held by all both old and new Writers, that it is more offensive to the stomacke than Wormewood, because it hath not that astriction in it. The Germanes commend it for a fingular wound hearbe, as their name of Stabwart given unto it doth testifie.

Снар. ХХХV.

Abretanum famina. Lavender Cotton.

Here are divers forts of Lavender Cotton, to be here remembred.

1. Abrotanum famina vulgare. Ordinary
Lavender Cotton.

The ordinary Lavender Cotton hath fundry wooddy brittle hoary branches, whereon are fet many long foure-fquare hoary or whitifh leaves, dented about the edges: at the tops of the branches stand naked stalkes, bearing every one a large yellow head or flower, like unto Tansie or Maudeline, but greater, of a gold yellow colour, abiding so a long time upon the stalkes, and being kept dry likewise: after which commeth small darke coloured seed: the roote is wooddy, and spreadeth sundry hard sibres: it is of a strong sweet scent, but not unpleasant.

2 Abrotanum famina magnum. Great Lavender Cotton. This Lavender Cotton is very like the ordinary Garden kinde, but not bulhing so thicke with stalkes, growing to have a great high and thicke stemme or stalke, not set with so many branches thereon, but somewhat bigger than the other, whereon grow soure-square dented leaves like thereunto, but somewhat larger, thicker and greener: the slowers stand in the same manner every one upon his song stalke, being as yellow and large as they, which give the like seed: the roote spreadeth in the ground with hard wooddy branches, like the other; and endureth the extremities of Winter as well as the other: the smell of the whole plant, and every part thereof is strong, but not so pleasant to a great many, as the other: this will be propagated by slipping, as well as the other.

3. Abrotanum famina Narbonense magno store. French
Lavender Cotton.

The French Lawender Cotton groweth not to bee so high as the ordinary garden kinde, but hath many wooddy short little branches, not above halfe a yard high, diversly spread into many other small ones, whereon are leaves like the o-

TRIBE I.

2. Abrotanum femina Narbonenfe magno flore. French Lavender Cotton.

CH A P. 25.

ther, but somewhat smaller, and more thinly or sparsedly see on the branches, of a greenish white colour, neither so green as the last, nor fully so white as the ordinary, of a strong fcent, fomewhat like the ordinary kind : the flowers stand upon the toppes of the smaller sprigges, every one by it selfe, upon a bare or naked stalke, without leaves for a good space, which are of a paler yellow colour than they, and much larger, which give feed somewhat of a darker colour than it: the roote is as great and wooddy, and spreadeth much in the ground.

Abrotanum famina Erica folys. Fine Lavender Cotton. This Lavender Cotton growth not fo great or high, as the French kind, but hath many short wooddy branches, whereon doe sparsedly grow smaller, shorter, and finer whitish greene leaves, very like to the leaves of common Heath; the flowers are yellow standing in the like manner as the others doe this hath a fine small scent to commend it, some what refinous, not very faintish or weake.

5. Abrotanum famina folys Rorifmarini majus. Rosmary leafed Lavender Cotton.

This kinde of Lavender cotton, shooteth forth from his wooddy roote, many stender hoary stalkes, little above a foote long, whereabout grow many very narrow small and flat leaves, like unto the leaves of Rosmary, which while they are young are more hoary white, and have but a small thew of denting about the edges: but when they are grown old, they are more greene, and the denting about the edges is more apparant, of a fweet scent, and bitter taste: from these stalkes come forth divers short sprigges, with very few leaves on them, on the toppes whereof stand severall yellow flowers, like unto Lavender cotton, but much larger, which die downe to the stalkes every yeare, after it hath borne feed, as the other kindes doe.

6. Abrotanum famina folis Rorismarini minus. Small Rosmary leafed Lavender cotton, There is no difference betweene this and the last, in the leaves and flowers, but in the smalnesse thereof, being more flender, low and small in every part, which is not by reason of the place (as being more dry and barren) where it growing, but growing in the fame place, with the former, is smaller, and the seed being sowne, retaineth still the fame forme it had, in the naturall place.

7. Abrotanum famina viridis minor. Small greene Lavender cotton. This small kinde of Lavender cotton is very like unto the last small kinde, but that it groweth somewhat greater and higher, having greene and not hoary stalkes at all, as the leaves also are, and a little longer, being as bitter in taste as it, but not of so sweet a scent: the flowers stand in the same manner upon slender stalkes, and of the same fashion, but of a paler yellow colour: the roote is wooddy like it, and full of small sibres.

8. Abrotanum famina repons. Creeping Lavender cotton. This creeping Lavender cotton also, is a small low hearbe, whose branches stand not upright, but lie downe, or as it were, creepe upon the ground, and are as white and hoary, or rather more than the ordinary, and so are the fmall dented leaves also, but they are somewhat thicker and fuller: the flowers likewise are yellow like thereumo. but somewhat smaller; and the smell is not much unlike unto it also.

9. Aboreasum peregrisum Lobely (upress) foligs. Strange Lavender cotton.

This strange plant I have here inserted among the rest of the Lavender cottons, presuming it to be his right place, although Lobel giveth it the name of Sothernwood, with the face of Cypresse: but hee maketh no mention of any flowers, whether they are answerable thereunto, which might affure us of the truth, and put the rest out of all doubt but as he fetteth it downe, so doe I give it you here, the description thereof, untill I see the face thereof my selfe. to contrary or confirme the title. From a small roote rifeth up many black hard slender stalkes, about a foote, or foote and a halfe high, bearing many long, narrow, and flat leaves, interlaced or brayded like unto the leaves of the Cypresse or Savine tree, and dented about the edges: the flowers as I said, he doth not expresse, nor can I give you any further knowledge hereof as yet. The Place.

The first groweth in Germany. The second in divers places in Narbone in France. The third is not knowne to us, whence it is naturall. The fourth, fifth, and fixth, Clufius found about Salamanca in Spaine. The feventh is unknowne whence it is: and the last it is likely by the title whereby it was fent, came out of Egypt. Many of them grow in the gardens of those that are curious Conservers of rare plants.

They doe all, or most of them flower in July and August. The Names.

There is forme controversite among Writers concerning the true Abrotanum famina of Dioscorides, forme holding that which others refuse and confine but by Matthiolus, and the most judicious of the later Writers, this is taken to bee the true Abresamm famina of Diescerides, although Fueblins and Dedonaus doe deny it, unto whom also

Clustus doth agree, saying that it cannot be that of Disserides, which hath as hee saith, divided leaves like unto Sea Wormewood, and yet setteth downe both it and the rest of that kinde, under the name of Abrotanum famina. which I thinke he would not doe, if he thought they had not some nearer esemblance; but Matthiolus doth shew against Fuebfius, that the plant which he setteth forth for Abrotanum famina, is farre unlike it (being the Abinthium Ponticum of Dodoneus and others, whereof I shall speake in the next Chapter) and that although Fuchlius doth fer forth the true Abrotanum famina of Dioscorides, yet it is under the name of Chamacyparifin, not knowing it to be the right: Dedoness also (whom Gerard followeth in translating his words, and his Corrector letteth them passe as currant) contesteth that this Lavender cotton cannot bee Dioscorides Abrotanum famina, but would make his greatest and his smallest Sothernwoods to be it: which as all may well observe, differ very little either in leaves or flowers, from the ordinary mas; and therefore I the more mervaile that hee should refuse this, for the flowers Take onely, seeing his mas and famina are so like in flowers: but Dioscorides in describing his Abrotanum famina faith, floribus referta est, comantibus in summe fulgore auri, which doth most lively expresse the flowers hereof, and cannot be referred to either of his Sothernwoods, and therefore he setteth forth this plant, and the divers kindes thereof, under the name of Sanglina, which he would referre to Eliochrysum, and Stathas Citrina, but how truely let others judge. The first is the Abrotanum famina vulgare by Matthiolus and divers others, and Santolina by Anquillars, as they call it in some places of Italy, and Crespolina by Casalpinus, as they call it in other places of Italy, Some of the later Writers would make it to be the Chamacypariffus herba of Pliny, which may well be doubted of, feeing he is so briefe therein, giving onely the bare name, and a few properties the second is called by Camerarius Abrotanum famina folius magis viridibus; whereunto Clufius feemeth to agree, making it his fecond Abrotanum famina. Fabius Columna maketh it to be an other fort of Polium, but not so hoary as our ordinary Lavender cotton, in English great Layender cotton. The third is called by Cordus Santonicum majus, by Tabermontanus Absentium marinum primum: by Pena and Lobel it is taken to bee the true Seriphium of Dioscorides, yet say it hath the face of Abrotanum femina. Dodoneus calleth it his first Santolina: it is Clufius his third Abrotanum femina, which he calleth Narbonense : Columna his Poly altera species major, and Baubinus his Abrotum famina flore majore : in English French Lavender cotton. The fourth is Dodonaus his third Santolina and Baubinus his Abrotanum faming folips erica, and called by some Vnquentaria Lutetianorum, Baubinus judgethit to be Chamacyparissus Dalechampy, as it is set downe in Lugdunensis, but by the comparison of the description thereof, I finde that that Chamecyparisus doth better agree with the second Spanish Abrotanum famina of Clusius, called Salmanticensis secunda, in his Spanish observations. The fift is Clufius his fourth kinde of Lavender cotton, and the first of his Spanish kindes, and called by Bauhinus Abrotanum famina folys Rosmarini majus: the sixth is the second Spanish Abrotanum famina of Clusius, which Baubinus calleth Abrotanum famina Rofmarini folys minus : the seventh is the third Abrotanum famina Salmasicensis of Clusius, called by Baubinus Abrotanum famina viridis. The eighth is Dodonaus his fifth Santolina, which Baubinus calleth Abrotanum famina repens canescens, in English Creeping Lavender cotton. The last Pena and Lobel in their Adversaria say, they received both the plant and seed from Bolonia, under the name of Sabina Ægyptia, and referring it hereunto, call it Abroianum peregrinum Cupressi foliys, which Baubinus thinketh to bee Dodonaus his fourth Santolina: but there is some doubt thereof, as I said before in the description, for Dodonam giveth flowers to his fourth Santolina, with the leaves of Cipreffe: but Baubinus maketh two forts of this plant of Lobel, the one he calleth Abrotanum famina folis Cupressi, and the other Abrotanum Sabina folio, and quoteth Lobel for both, when as Lobel doth acknowledge but one plant, although it be fet downe in two feverall places of the Adversaria, but not in his observations, as Baubinus saith: Gerard his figure of Chamacyparissus, which he calleth Lavender cotton, is utterly false, being the figure of Muscus terrettris clavatus, and his whole Chapter a meete transcript of Dodoneus in most things thereof. The Italians call it in some places Santolina, and Crespolina in others, as is before said, the Spaniards Yerva lombriguera : the French Petit Cyprez, and Cyprez de jardin, and Guarde robbe : the Germanes Garten Ciprez: the Dutch Cipres, and we in English Lavender cotton.

The Theater of Plantes.

Dioscorides, and so all other Writers doe generally say, that the vertues hereof and of the former Sothernewood are alike, working the same effects, and applyed to all the diseases it is appropriate unto : but particularly it is obferved by Matthiolus, that halfe a dramme of the pouder of the dryed leaves of Lavender Cotton, taken in a little of the distilled water of Fethersew, every morning fasting, for ten dayes together at the least, and afterwards every other day, is a very profitable medicine for women troubled with the whites to flay them. Pling faith that his Chamecypariss (which as I said before, is taken by some to be this Lavender cotton) is good against the poison of all venemous Serpents and Scorpions being taken in wine. The feed is generally in all our Country given to kill the wormes, either in children or elder persons, and accounted to be of as great force as Wormeseed: the leaves also are good when seed cannot be had, but are not of so great vertue. Clusters saith, that in Spaine they use the decoction of the Spanish kindes, to take away the itch and scabbes, in whomsever have them, but he adviseth, there should be caution used in giving it.

CHAP. XXXVI. Absinthium. Wormewood.

Lthough Diofcorides (and Galen also) make mention but of three forts of Wormewood, the one a common fort, well knowne as he faith, the best growing in Pontus and Cappadocia. The other Sea Wormewood or Seriphium, and the third Santonicum of the Country beyond the Alpes in France, yet there hath fince beene found out many hearbes, accounted to be kindes or forts of them, for fome likenesse of face, or vertues, or both, as shall be declared hereafter.

1. Absenthium vulgare. Common Wormewood. Common Wormewood is well knowne to have many large whitish greene leaves, somewhat more hoary underneath, much divided or cut into many parts, from among which rife up divers hard and wooddy hoary stalkes, Arboref-

TRIBB. I

1. Abfathium zulgare. Common Wormewood.

3. Absmtbium Ponticum five Romanum vulgare. Common Roman Wormewood.

two or three foote high, befet with the like leaves as grow below, but smaller, divided at the toppes into smaller branches, whereon grow many small buttons with pale yellow flowers in them, wherein afterward is conteined small feed. the roote is hard and wooddie, with many strings therear; the stalkes hereof dye downe every yeare; but the roote holdeth a tuft of greene leaves, all the winter shooting forth new againe, which are of a ftrong fcent but not unpleasant, and of a very bitter taste. There is a Tree Worme. wood like hereunto, but growing greater and higher in the warme Countries.

2 Absinthium Ponticum verum. True Roman Wormewood. This Wormewood hath more slender and shorter stalkes. by a foote at the least than the former, and reasonable large leaves, yet smaller, and more finely cut in and divided then it, but as white and hoary both leaves and stalkes: the flowers also are of a pale yellow colour, standing upon the small branches in the same manner; so that, but that it is smaller in each part, it is altogether like it : the rootes likewife are fmaller, lesse woody and fuller of fibres: the smell thereof is somewhat aromaticall sweete, and the bitternesse is not so loathsome to taste: Vnto this answereth the Absenthism Ponticum Creticum of Bauhinus, but that it is in his owne Country more fweet in fcent, and little or nothing bitter in talle, but somewhat altereth in another soyle.

3. Absinthium Ponticum sive Romanum vulgare. Common Romane Wormewood.

This is a small low hearbe (if I may call it a Wormewood) with much more slender & short stalkes than the last, whereon grow very final and fine fhort hoary white leaves; smaller and finer than those of the fine Sothernwood, which grow at severall joynts, many comming forth together, at the tops of the stalkes grow small yellowish flowers, neither so many nor fo great as the last: the roote from a short head shootest forth many long fibres, whereby it is nourified in the ground, fending forth divers fprouts round about it, where by it is much encreased the smell hereof is faint, and fare weaker than the other, & the taste thereof much lesse bitter.

4. Absinthium tennifoljum Austriacum. Five leafed Wormewood of Austria.

This small Wormewood, hath many small hard and stiffe hoary stalkes, whereon are set without order, small and fomewhat long hoary leaves, very like unto the leaves of Sea Wormewood: which stalkes are divided towards the toppes, into many other small and slender branches rising from the joynts, where the leaves doe grow with many small heads, which shew forth many small whitish flowers.

5. Absinthium inodorum. Vnsavory Wormewood. The Vnfavory Wormewood is in leafe so like the first common Wormewood, both for the whiteneffe, largeneffe, and divisions thereof, that it cannot be knowne from it at all, unlesse you make your nose the judge of the scent, whichin this is so small, that it is generally faid to be without any at all : yet it hath in the heate of Summer, a small weake smel, fuch as is found in some of the Sothernwoods: the flower and all things else are alike: but this is somewhat more tender to be preserved in the Winter than the former.

6. Absinthium album sive Vmbelliserum. White tusted

Wormewood.

This white Wormewood hath his roote composed of many small blacke fibres, which shooteth forth many heads, of long somewhat thick and broad hoary white leaves, cut in about the edges, in fome places more than in others, narrower at the bottome, and broader at the point, made fomewhat like unto the leaves of the great field Daifie, but smaller: from some of these heads doe shoot forth, stender hottry stalkes, about a foote and a halfe high, see here and there with fach like leaves as grow below, but smaller: at the tops whereof sland many scaly filver white and greene heads, in a tust together, out of which breake forth silver white small

4. Abfinthium tenuiselium Austriacum. Fine leafed Wormewood of Austria.

6. Absentium album sive Umbelliferum . White insted Wormewood.

Abfatbium umbelliferum tenuifolium. White tuited Wormewood with fine leaves.

flowers, made of many leaves standing in a double row, in the middle tipt with a little yellow (the whole tust of flowers doth somewhat resemble the flowers of Yarrow: but much more pleasant to behold) which stand a great while in flower, and afterwards turne into small chasty seed: this holds them heads on the leaves all the Winter, but are very small untill the Spring begin to come on, which then shoote forth, and become as large as is expressed before, having little or no smell at all, but exceeding bitter.

7. Absinthium umbelliferum tenuifolium. White tufted W.ormewood with fine leaves.

This other white Wormewood, hath much smaller and finer cut leaves than the former, but as hoary white as the other : the stalkes are shorter, not rising so high: the umbell or tust of flowers is somewhat smaller also, but as white, so that it differeth in nothing from the former, but in the smalnesse of the plant, and in the small and fine divisions of the leaves, neither hath it any more smell or lesse bitter taste Baubinus maketh two sorts more of this kind, when as himselfe saith in his Prodromus, that all the differences arise onely from the soyle and climate, which he hath observed both by fight of the divers plants, and examining of them.

Absinthium album Vallesiacum. The Vallesians white hearbe or Wormewood.

This white Wormewood hath many foft woolly and very white leaves, small, long, and narrow, made very like unto our Sea Wormewood, in so much that Camerarine in horto, taketh it to be the very fame, but that it hath a fweeter fcent, and not fo ungratefull a take: the flowers are yellow that grow towards the toppes of the Italkes, which afterwards give small feed like the other finall kindes.

9. Absinthium Alpinum incanum, Hoary Mountaine · Wormewood. From a reddiff fibrous roote ariseth divers small bending

Ralker

TRIBE. 1.

Снар. 26.

Снар. 36.

stalkes about a spanne high, set very sparsedly, with very sine cut hoary leaves, like both for forme and colour to our ordinary Romane Wormewood: from the middle whereos upwards to the toppes, at the severall joynts with the leaves shoote forth slender stalkes, bearing at the ends of them scaly heads, out of which come pale coloured flowers, and after them small blacke seed, smelling like Tansie, the whole plant smelleth and tasteth like Wormewood.

Baubinus setteth forth another sort, which he calleth Absinthium Alpinum candidum humile; which should bee here inserted, but that I thinke it rather a species of the Absinthium umbelliferum, becanse hee faith it beareth heads like the Stachas lutea, or curina, and therefore I forbeare to recite it.

The Place.

The first groweth as plentifully in England, in many places wild, as in other Countries. The second is found upon divers high Mountaines, and not elsewhere wild, but is nursed up in many gardens, both in Italy and Germany and with some lovers of rare plants with us. The third Classes faith groweth plentifully in many places of Hunga ry and Austria, and in other places also, as other Writers doe fee downe, it is much esteemed in our Country, and therefore found in many Country gardens of our Land. The fourth Clusius faith, he onely found in Austria, where women gather it and bring it to Vienna, for the use of the Apothecaries, or any else, promiscuously with the other. Ponticke or Romane Wormewood. The fifth is not knowne whence his originall was, but is onely kept in gardens as a rarity, and variety among others. The fixt Clusius faith he first found, onely on the high cliffes of Austria and Stiria, and afterwards on the Mountaines. The seventh growth on Mount Baldus, and on Strva one of the Belluni Mountaines. The eighth groweth on the hills, among the Valefians, as the last doth also. The Time.

They doe all for the most part flower in August, yet some earlier, or later than others. The Names.

Wormewood is called in Greeke a Liv Sieve quasi amenor importabile ob amarigudinem, vel ingustabile, quia illud non tangunt animalia in depascendis herbis. Dioscorides calleth it also gastanteer a profundo amarore. The first is generally called Absinthium vulgare, and of some latifolium, yet Ruellius calleth it Ponticum, and Baubinus saith it is the Ponticum five Romanum officinarum, meaning his owne Country : for I am fure it is not so called by any of our Apothecaries in their shops. The second is scarce knowne to any in our Land, Gesner in bortic calleth it Absinthium commune minus sive Alpinum, Camerarius upon Matthiolus Absinthium montanum, and so doth Tabermontanus who calleth it also Romanum, Baubinus calleth it Absinthium Ponticum Montanum, and Gerard Absinthium tenuifolium Ponticum Galeni. The third is more frequent as I said before, and usually called Absimthium Ponticum, or Romanum, of most Writers, judging it to bee the true Absinthium of Pontus, that Dioscorides and Galen doe commend : yet Gefner and Lacuna call it Abrotanum famina, and so doth Fuchsius, for which as I said in the Chapter before, Matthiolus taxeth him of an error. Tragus calleth it Abrotanum minus, and Cordus upon Dioscorides Abrotanum album. Ruellius and Cefalpinus take it to be Absinthium Santonicum ; and Lobel and Pena in their Adversaria fat it downe for the Absimblum Gallatium Sardonium of Dioscorides, in English every where almost, Romane Wormewood, or Tot the Exception Chaustines Des authorities Absimblem tensifolium Austriacum, and by Lobel and Lugdunensis Absimblem Ponticum Tridentinum berbariorum, by Dodonaus Absimblem Scriphium, but his figure is the same, with Clufins his Austriacum, Lobel his Tridentinum, and Gerard his tenuisolium fen Romanum, in English fine leafed Wormewood of Austria. The fift Gefner in hort, and Lobel in his observations call Absenhium inspidum, and Baubinus Abfinthium insipidum Absinthio vulgari simile, in English Vnsavory Wormewood. The sixth Clusius calleth Absinthium Alpinum umbelliferum. Camerarius Absinthium Pannonicum flore albo, and Lobel and others Absinthium album; in English white tufted Wormewood. The 7 is another kind hereof growing in other places, as Bashinas hath well observed, and so setteth it downe in his Prodromus, for Ponessetteth forth a 3. species in his Italian Booke, differing in nothing but the smalnes of leaves and flowers, Lobel calleth it Vmbelliferum alterum Italien. The 8. is called by Gester in horris, Absinthium Seriphiu famina, & in his Appendix Absinthiu album eValesia: for he saith in the said Country of Valessa it is called herba alba, Weishraut: Camerarius saith it is called by some Absinthium Santonicum, & thinketh it may better be called Santonicu femina Vallesiana, than Seriphium as Gelner doth, Baubinus calleth it Absinthium Seri-phium montanum candidum. The last Baubinus calleth Absinthium Alpinum incanum, and saith it is the Alpinum 2. of Pona, in his Italian Baldus, because Pona there saith it is very like that of Gesner & Camerarius, which is the last before this, but I cannot so thinke, for that of Pona is a species of the umbelliferous kinds. There is a controversy among many learned men, and Writers, as you may here well perceive, by their names they give to the severall Wormewoods are extant : which should be the true Absinthium Ponticum that Dioscorides preferreth, and Galen so much commendeth and preferreth before all others, both for the good smell, and aromaticall taste, others being excessive bitter and lothfome, and that it hath leffer leaves and flowers, but especially for the astriction it hath more than others, which is so effectuall for the liver and stomacke. Lobel and Pens in their Adversaria have scanned the matter, and answered all objections as I thinke at large, the summe whereof in briefe I will here set downe for all to understand. First, for the kindes. Diescorides and Galen make but one kinde of Abstratium, and not many, and but onely fay, that the best in property groweth in Pontus, as they doe in divers other hearbes, shew in what place the most vigorous of that kinde doth grow, which property it obtaineth, more by the goodnesse of the place, injoying the commodity of a free and cleare ayre, and other things correspondent, then by the nature of the hearbe it selfe. Then for the scent, that it is more aromaticall than others, yet hereby they intimate that others are sweet, although not so much, which is well knowne likewise to be the benefit of the place where it groweth, for some hearbes are more or leffe fweet, or more or leffe flinking, which transplanted doe alter; as Agrimony and divers others are sweet in fome place, and nothing at all in others. Then the leaves have troubled many learned men, for they thinke it is a fault in the transcribers, to ser downe lesser for greater or longer, as it often hapneth in Theophrastus. But more often in Dioscorides, as in the Chapters of Helenium Meum and others, & may be also in Galen, not by his owne fault, but by the transcribers: but Galen himselfe in his Chapter of Abrotanum taketh away all these doubts, where he faith thus, there are three species or differences put under the name of one kinde of Wormewood, that which is called Ponticum, the second Santonicum, and the third Seriphism and Santonicum are enemies to the stomacke, and trouble it: Wormewood onely among them named Ponticum, that is growing in Pontus, is pleasured to the second Santonicum and Santonicum are enemies to the stomacke, and trouble it: Wormewood onely among them named Ponticum, that is growing in Pontus, is pleasured to the second Santonicum and Santonicum are enemies to the second Santonicum are second santonicum. fing to the stomacke. From which place we may well gather that the strife is appeared, concerning this matter, that

our common Wormewood is that Wormewood of Disscorides, the best whereof as he saith, is that which groweth in Postes, without naming either species or genus : so that it is for certaine that our common or Romane kinde. eth in Forum, without maining entire press of genus, to that it is not another from the Ponicum, and by reason of the place is more vigorous and effectfull, but not differing in property. Galen acknowledgeth that in this there is bitterneffe, and an altriction gravefull to the stomacke, necesfary for cholericke vometings, and to clenfe it from obstructions, by which it giveth strength and comfort thereinto i which things we fee by infinite and daily experiments, even of the common people, as well as of Physitians, to. be effected by our common Wormewood, used either inwardly or cutwardly : none findeth fault with the smell for it is of an aromaticall feert, and is very fit and apt to refresh the spirits of any : Galen in appointing that of Pontus to be used, doth it rather to exclude the Santonicum and Scriphium then that which he simply calleth Absiminum: Thus much I thought good to relate out of Pena and Lobel, referring the reft to the learned, to be further fatisfied. if they please to read the whole tractate: but by this is said you see, that the vertues of our common Wormewood are to excellent, that we need not feeke for another kinde to performe those, that are commended in Wormewood. and therefore I the more mervaile at our Apothecaries, that take the Sea Wormewood, in ftead of the Romane or Ponticke, anduse it rather than the common, onely because there is less editerresse therein, than in the common. and therefore more pleating to the tafte, when as the properties are no way answerable. Neither can I commend the use of that fine leafed Wormewood, which is commonly called Romane Wormewood, to bee used in Read of the Ponticke, not having either that bitternesse or that astriction, which are both so comfortable to the liver and stomacke. Our common Wormewood hath beene observed to grow in Pontus, and the Countries there abouts, by Rellonius in his travels, as he setteth it downe in his 76. Chapter of his first Booke of observations, and elsewhere, and brought to Confantinople for their use there. And it is generally held, that the Arabian Physitians did first name it Romane, which Dioscorides named Ponticke, and from them, all others fince have held it in so great account, imagining it to be a lort differing from the common. The Arabians call it Affinthium, the Italians Assenting it to be a lort differing from the Common. The Arabians call it Assenting the Italians Assenting the Spanniards Assenting the French Alvine and Absinie, or Absinie: the Germanes Wermuet, the Dutch Assenting the Common and Week. Wormewood.

The Theater of Plants.

The Vertues.

Dissorrides faith that Wormewood is of an heating and binding property, that it purgeth choller, that cleaveth to the stomacke or belly : that it provoketh urine, that it helpeth surfeits, and that taken with Sefeli and Spica Celtica, it eafeth the paines of the stomacke, and the hard swellings of the belly the decoction or the infusion thereof taken, doth take away the loathing to meate, and helpeth those that have the yellow jaundise: (for which purpose Camerarius in his hortus medicus, giveth a good receite. Take saith hee of the flowers of Wormewood, Rosemary, and blacke thorne, of each alike quantity; of Sastron halfe that quantity: all which being boyled in Renish-wine, let it be given after the body is prepared by purging, &c. A small draught thereof taken for some few dayes together, bringeth downe womens monethly couries: being taken with vinegar, it helpeth those ther by Mushroms, are almost strangled: being taken in wine it is a remedy against the poison of Ixia (which as I faid before, is the roote of the blacke Chameleon, and with Pliny translated viscum, Milletoe or Birdlime) of Hemlocke, the biting of that small beath or Mouse which we call a Shrew, and of the biting of that Sea fish called Dracomarium, which is called a Quaviver: it helpeth the Quinsie being annointed with it, and Niter mixed together: and taketh away wheales and pushes used with water: it taketh away the black and blue markes in the skinne, that come after bruifing or beating, if it be mingled with honey and announted; as also it helpeth the dimnesse of the eyefight being used in the same manner; it helpeth fore and running eares, as also easeth the paines of them, if the hot vapours of the decoction, bee taken in thereat by a funnell or other wise; it easeth the toothach: a decoction made thereof with cute or boyled wine, and annointed, easeth the paines of the eyes; it helpeth the paines of the heart and liver, being beaten and mixed with the Ceratum Cyprinum, and applyed to the place affected; as also applyed to the stomacke with Rosewater, it giveth much comfort to those that have lien long sicke : it helpeth those that are troubled with the (welling and hardnesse of the spleene, or those that have a hot sharpe water, running betweene the flesh and the skin, if it be used with figges, vineger, and the meale of Darnell : The wine that is made thereof, called Wormewood wine, is availeable for all these purposes, restoring many to health that have beene troubled with those diseases; so that they have no agues that take thereof. Being put into Chests, or Presses, or Wardrobes, it preserveth them from wormes and mothes, &c. and driveth away Gnats or Waspes, and such like. from any part of the body, if the skin be announted with the oyle thereof : the juyce is of like effect, but is not used fo much in drinkes, for it troubleth the stomacke, and causeth headach; being put into the Inke wherewish Bookes are written, (or printed) it keepeth them from being eaten with Mice. Galen in his fixth Booke of simples maketh mention of Wormewood in this manner. Wormewood hath a binding, a bitter, and sharpe quality, it likewise heateth, cleanseth, strengthneth, and dryeth. It therefore purgeth downewards the cholericke humours of the belly, and avoideth them also by urine, especially those that are in the veines : but helpeth no flegme that is contained therein, or in the chefts or lungs : for the astringent quality therein, is stronger than the bitter: but by reason of the sharpnesse it partaketh more of heate than of cold, so that the temperature thereof, is hot in the first degree, and dry in the third, yet the juyce is farre better than the hearbe it selfe: and speaking of Sea Wormewood called Seriphium, he faith it is like unto Wormewood both in kind and in taste : which qualities Dioscorides giveth to Santonicum; for of Scriphium he faith it is more agreeing to Sothernwood, than to Wormewood: whereby it is thought by divers, that the place in Dioscorides, or in Galen, is perverted by some Writers faults, for they cannot be so farre differing in judgement one from another : It is often used, and by most, either inwardly given, or outwardly applyed for the wormes, in children or elder persons: Pliny faith, it healethold fores or ulcers in the head, and cureth the itch also: the decoction thereof with Cumminseeds taken warme, easeth the paines of the belly and chollicke by winde : the feed thereof helpeth the bloody flixe, and all other fluxes ; it is faid, that if a few leaves of Wormewood be eaten, it defendeth one from furfeiting and drunkennesse. The vineger wherein Wormewood is boyled, is especiall good for a stinking breath, that commeth either from the gums or teeth, or from corruption in the stomacke. It is likewise much commended in tertian and other lingring agues, by opening obfunctions and purging by urine, and by strengthning the liver and stomacke : The conserve thereof much used, preserveth them from the dropsie that are fallen into it, or are in danger to fall thereinto, so as there be a fit course held before, by purging the offensive humours, and such other helpes as the learned Physitian may appoint. The

102

diffilled water is somewhat effectuall, but is much weaker to all the purposes aforesaid: yet the temples being bathed therewith, it helpeth the paines of the head that come of a cold cause, and dropped into the eyes helpeth to cleare the eyefight. The other Wormewoods, although they have some properties, yet by how much they want of the bitternesse and astriction, by so much weaker they are for the diseases aforesaid.

CHAP. XXXVII.

Absinthium Seriphium seve marinum, & Santonicum. Sea Wormewood, and strange Wormewood.

Ecause I would not overburden one Chapter with too many forts of Wormewoods, I thought it convenient to entreat of the Seakindes, and other strange sorts, in a Chapter by themselves, which are as tol-

1. Absinthium Sersphium sive marinum Anglicum. English Sea Wormewood.

The English Sea Wormewood riseth up with many hoary round wooddy stalkes, three or source foote high at the least, having thereon divers hoary white long and narrow leaves, broader and longer than any Sothernwood leaves, or the common Romane Wormewood, but nothing so large as the true Romane Wormewood, of a kind of faltish, but not bitter taste, and of a kinde of unpleasing savour: the flowers are small and yellow standing at the joynts with the leaves, towards the toppes of the branches, as the former common Wormewood doth, and give the like small sted: the roote groweth somewhat deepe and wooddy.

2. Absinthium Scriphium Narbonense. French Sea Wormewood.

The French Sea Wormewood groweth not so high as the former, nor so white and hoary, the leaves are small long, and finely cut like them, but thicker, and of an evill coloured greene colour, and strong unpleasant savour, and evill taste: the flowers are yellow, growing as the former doe, and the feed that follow in the small round heads alike.

3. Ab Inthium Seriphium Germanicum. Germane Sea Wormewood. This Germane Sea wormewood is also very like the last, but with fine hoary white leaves, somewhat finer or fmaller, and groweth not so high: in other things there is little or no difference.

4. Absinihium maritimum Laven ule solie. Lavender Lafed Sea Wormewood

This Wormewood shooteth forth many slender weake wooddy and brittle stalkes, bending a little downewards, whereon doe grow divers hoary white long leaves, somewhat broader than Lavender leaves, having fometimes fome cuts or divisions at the bottomes of them, which is but seldome seene, and in a very few of the lowest next to the ground : those that are set on the stalkes are smaller, and fometimes are cut or divided at the ends, of areasonable weake scent, betweene Lavender and Sothernwood, but unpleasant taste: the flowers grow after the same manner that the common Wormewood doth, and of a yellow colour, and the feed is not unlike thereunto

Absinthium Santonicum Agyptiacum. Egyptian Wormewood. I must here remember also this plant (that is set forth by Matthio-lus first, and from him Dodonaus, Lugdunensis, Tabermontanus, Gerard, and Bauhinus, doe all number it among the Wormewoods, as I Label and Penalikewise doe, yet much doubt whether it be a Wormewood or no, for that they say they saw it growing with Gesner about a fingers height, and the dryed plant with Valerandus Donres, was in thew like unto Maidenhaire, with white leaves fet on both fides, of a middle stalke) rather to incite others to obtaine it, that it may bee better knowne, than that I have any knowledge thereof my selfe, whose descrption Matthiolus who had it from Cortusus, setteth forth in this manner : it is (faith he) a small low hearbe, growing in Egypt, with fmall leaves, almost like unto I avender cotton, and many slender short branches set full of leaves: the seed is small and bitter in talte, but not extreme : some faith he would make it an Abroranges mas, but they might better, as he faith, call it a famina: Some also thought that the Wormeseed that commeth from the Levant to us, should be gathered from this plant, but as he faith, he is doubtfull thereof himselfe, yet withall faith, that it hath all the vertues that the Italian Wormewood hath.

6. Absinthium Santonicum Alexandrinum sve Sementina & Semen Santtum. Wormeseed Wormewood, or Levant Wormewood.

This Wormewood likewise is a plant set full of branches, and with very few, and those very fine small leaves on them, at the bottome like unto the finer forts, of an ash colour, but stored so plentifully with seed upwards, that it seemeth to be there without leaves, and wholly to consist of seed, which as Rannolfine saith, are somewhat bitter in the naturall places, and of a reasonable good and quicke scent with us, especially if they be fresh and not

TRIFIE I.

old, but much stronger, as it should seeme by his relation that tafted it, where it grew and moved one to cast very forci-

The Place.

The first groweth neare our Sea Coasts in many places of our Land, as also of the Low-countries : the second neare the Sea at Marfelles, and by Venice also: the third in Misnia in Germany: the fourth about the Coasts of the Venetian Gulph, and in the lland of Sio likewife: the fifth is faid to grow in Egypt, but Pena and Lobel doubt thereof: the last groweth in Stria and Arabia, from whence being brought into divers Christian Countries, it hath there sometimes growne, and there from the figure taken and fet forth. Rauwolfins as it is fet downe in the Appendix to Lugdunensis saith, hee saw it growing about Bethlebem, in the Land of Jury.

The Time. These all flower and seed when the former forts doe, saving the two last, which comming out of warme Countries are later than the rest with us.

The Names.

The names of Esciptor x Santonicum Seriphium & Santonicum are confounded by many Authors; for the first is called Absinthism Seriphium, or marisum by the best Authors, who call it either Belgicum, or Anglicum, yet Camerarius in horto calleth it Absimbium Santonicum; the second is called by Dodonaus and Clusius Absinthium Scriphium Narbonense, but Lobel his Absenthium Xantomicum in my judgement is the same, although Baubinus make them different, calling the one Absin-thium Seriphium Gallicum, as hee doth the other Absinthium Santonicum Gallicum: the third Clusius faith hee faw in the garden of Aicheltzins in Vienna, being fent him from Mifnia, and thereupon he calleth it Absinthium marinum Misnense, and Baubinus Absinthium Seriphium Germanicum, and saith it is

Absinthij Seriphi, sive marini diversa genera. Diversiorts of Sea Wormewood.

TRIBE I.

104. CHAP. 28. the Absinthium Seriphium of Gesner in hortis: the fourth is called by Lobel, Tabermontanus, and Gerard, Artemifia marina, by Clusius Artemisia folio Lavendula, by Dodonaus Absinthium angustifolium, but Camerarius Wondring why he should so doe, calleth it Absinthium latifolium marinum, and by others Absinthium Seriphium & marinum Camerarius thinketh it is Matthiolus his Absinthium marinum, but furely his figure doth much differ from it : the fifth is called by Matthiolus and Lugdunensis, Absinthium Seriphium Agyptium, by Dodonaus and others Absinthium Egyptium, by Lobel Absinthium aliad sive perceptium. Egyptium, and the Baubinus Absinthium Santonicum Egyptium, and the State of the Latin Santonicum Egyptium, and the State of the Latin Santonicum Egyptium, and the State of the Latin Santonicum of the State of th somentian, (as the Italians call it, and the French Barbotim) and 10 doe Tournaus, and I accommissions, and Semen Santium by him, Lobel, Lugdunenfis, and others, Scheha Arabum by Rauwolfus and Lugdunenfis in Apendic, Santonicum by Lonicerus, Semen Zedoaria by Lobel, and Abfusthium Seriphium Alexandrium, and Zine semen by Condus upon Dioscorides, and in his History of plants also, by Bauhinus Abstraction Santonicum Alexandrium & Indiaeum, for they are both but one plant, although he setteth them downe for they by divers others Semen Lumbricorum & ad Lumbricos, whose seed is generally called Wormeseed, and therefore I have called the plant rather Worms. feed Wormewood, than Holy Wormewood, not thinking any more holinesse in this than in others. The Vertues.

The Sea Wormewoods are of nothing that goodnesse in quality, as the common and aromaticall bitter forts are: they are as Dioscorides and Gales (ay, adverse and hurtfull to the stomack; yet because it hath not that bitterness therein as the common fort, it is more accepted and used by many, that there to please their palate, than to be cured of their diseases by bitter medicines, our Physicians and Apotheceries, feeding this humour for their owne profix, and to please their patients. The Wormseed is chiefly, and as I may almost say, onely spent for the wormse in children, and to smaller effect if elder persons take it.

CHAP. XXXVIII. Chamadrys. Germander.

Might have joyned both Chamadrys and Teucrium in one Chapter, because divers Authors both ancient and moderne have not distinguished them, some naming that Chamedrys which others call Tencrism, and contrarily some call that Tencrium that others call Chamedrys: yet I thinke it fit to sever them into two Chapters, and speake of them both true and false, as they are now generally reteived.

1. Chamadrys vulgaris. The common Germander.

1. Chamadrys vulgaris. The common Germander.

Common Germander shooteth forth fundry stalkes with fmall and fomewhat round leaves, endented about the edges, the flowers stand at the toppes of a deeper purple colour than the next, the roote is composed of divers sprigges, which shoote forth a great way round about, quickly overspreading

2. Chamadrys major. Great Germander.

The great Germander riseth up with bigger and harder square stalkes, halfe a yard high, spreading into divers branches from the very bottome, whereon are fet two leaves at a joynt, somewhat larger than in the ordinary, and more dented about the edges, greene above, and somewhat grayish underneath : the flowers doe fland in a longer fpiky head, and are larger, but of a paler purple, and gaping like the other: the roote is more bushing with threads, and creepeth lesse than the other. Prosper Alpinus saith in his Booke of Egyptian plants, that in Corcysa, hee faw a Germander almost two cubits high, with leaves twice or thrice as bigge as any that grew

Chamadrys Apula unicaulis. Germander of Naples. The Germander of Naples never rifeth up with more than one whitish square stalke, about a foote high, at each joynt whereof grow two long and narrow hairy thicke leaves, dented about the edges, round at the ends, and of a whitish greene colour: the flowers grow at the toppe in a long spike with smaller and rounder leaves set with them, and are hooded as the former are, with whitish beards, and a long yellowish point in the middle, but standing in prickly huskes: the feed is small, long, and round headed, yet greater than the proportion of the plant would feeme to give.

Chamadrys laciniatis folys. lagged Germander, or with fine cut leaves.

This fine Germander rifeth up usually but with one weake slender square stalke, divided into other smaller branches, ri-

fing not above a foote high, whereon doe grow divers leaves, two alwayes fet together at a joynt, on each fide of the stalkes, which are very much cut in on both sides, making no shew of the forme of any Genmander leafe, unlesse

one heed it very well : from the middle to the tops of the flalkes. at the joynts with the leaves, come forth purplish flowers like the former, after which follow small blackish seed: the roote is fmall and fibrous, and dyeth every yeare after it hath given feed, but will come oftentimes of it owne fowing and shedding,

5. Chamadrys spinosa Cretica. Thorney Germander of Candy. This Thorney Germander is a small low plant, having many square hairy and hoary stalkes, not above a cubite high, full of founts, whereat grow forth divers fomewhat round and long leaves, dented about the edges, in the lower much more than in the upper, which seeme to be without any denting at all: a ceach joynt with the leaves fland forth most usually two thornes, and fometimes more, which are in some small and short, in others bigger and larger, and fonetimes shooting forth from those joynts small branches, which end also in a thorne: from the middle of the stalkes upwards, come forth the flowers at the joynts among the leaves, standing in small hairy and hoary huskes, very like for forme unto the flowers of Germander, but of a yellowish red or brownish colour : after the flowers are past the feed groweth in those huskes, which is blacke and round.

6. Chamedrys sparia montana Cifti flore. Mountaine

Germander. The Mountaine Germander riseth up with many weake and slender brownish wooddy stalkes, about a foote high; whereon are fet without any order as in the former, many small leaves dented about the edges, very like the leaves of the common Germander, but somewhat smaller, greene on the upper side, and gray or hoary underneath: at the end of every salke of leaves, there shooteth forth a long slender and hairy soote-stalke, without any leafe thereon : on the toppe whereof standeth one large white flower, consisting for the most part of sixe leaves, yet sometimes it will have eight or ten, according as nature lifteth, and the fertility of the foyle is ready to produce, with many small threads in the middle : after the flowers are shed, there come up in their places large tufts or bufhes, of long hairy feed, like unto those of mountaine Avens, but greater i the roote is hard and wooddy, shooting long strings and fibres under ground, and divers strings like-wife above the ground, which take roote as they lye, the stalkes that bore feed dying downe to the ground every yeare, and the roote renewing then againe in the Spring: it hath little fcent to

be perceived therein, but of an altringent or drying tafte.
7. Chamadry: Alpina faxatilis. Rocke Germander.
From a hard knobbed roote shooting forth many blackish fibres, spring up divers round stalkes, about a foote high, not there, in order up to the toppe, the lower being larger than those above, somewhat dented about the edges, but not so much as those of Germander, of a shining greene colour on the upperfide, and yet covered as it were with a little hoarinesse or downe, but very grayish, almost white underneath : the toppes of the stalkes end in a long spiky head of flowers, with leaves among them, every one confilting of foure or five, and sometimes of fixe or feven small pointed leaves, of a pale blue colour, with some threads in the middle: after which come small round blackish seed in small huskes: this loseth not his greene leaves or stalkes in Winter, but being of small or no scent at all, but of an austere and harsh talle.

Chamadrys spuria major frutescens. The greater bastard Germander.

This Bastard Germander (for so I esteeme all of them, rather than true Germanders, which have not hooded and gaping flowers, as the true Germander hath, but confifting of foure or five, or more leaves as these doe, however their leaves bee like to make them beare the names of Germander) hath many square and somewhat hairy stalkes rising from the roote, beset with two large leaves at a joynt, somewhat like unto Germander leaves, but larger, and deeper dented in at the edges; towards the toppes branching forth into spiky heads of blue flowers, consisting of foure leaves apeece, whereof the uppermost is the largest, with some

4. Chamedrys laciniatie folijs. Iagged Germander, or with fine cut leaves;

TRIBE. 1.

105 CHAP. 28.

stripes or veines therein, and two small threads and a long pointell in the middle: after which arise small flat two forked huskes, containing small feed: the roote creepeth a little under ground, sending forth here and there some stakes; but the stakes also as they lye on the ground, will take roote and shoote forth sibres: the take of the leaves are bitter.

6. Chamedrys fourta montana Cifti florc. Mountaine Germander.

8. Chamedors Spuria major frutefcens.
The great ballard Germander.

Chamadrys Alpina faxatilis. Rocke Germander.

Chamedrys fouris miner latifolis.

Clusius giveth two other forts of this kinde, one as tall, but creeping and shooting forth branches abundantly, species whose leaves are smaller, and the flowers paler: the other somewhat lower, having narrower and larger leaves, alle due: but not differing in any thing elfe.

9. Chamedrys spuria minor latifolia. The smaller bastard Germander.

This smaller bastard kinde hath many weake purplish, or brownish branches, lying rather on the ground, than standing upright, and not above a foote high, whereon are set two leaves at a joynt as in the rest, very like unto Germander leaves, and dented about the edges also, but somewhat lesser: the toppes of the stalkes are likewise branched forth into spiky heads of flowers, consisting of foure leaves, whereof the uppermost also is the longest, of a more excellent deepe blue than in the other, yet foractimes it is found with flowers of a paler blue, or almost of an ash-colour, and in some pure white the seed following the flowers is small and reddish, growing in a small huske: the roote is buthy and spreading under ground as well as above, like the other, and abideth like it. shooting forth new stalkes every yeare: the taste hereof is a little bitter like the other, but more astringent.

10. Chamadrys spuria minima. The least bastard Germander.

This little bastard Germander (for the manner of the growing, and height of the plant is very like unto the small Gentian of the Spring, fet forth in the Chapter of Gentian or Felworts in my other Booke) hath two or three small short stalkes rising from the roote, not above two or three inches high, whereon doe grow two small dented leaves together, as in the former, but much smaller, rounder, and thicker, and standing so close one joynt unto another, that they can hardly be discerned to grow severally, but all together : from the toppes whereof shoote forth naked thort foot-stalkes, every one fustaining betweene two small leaves, one large flower in comparison of the plant, made of four leaves like the other, of a pale blue or ash-colour : after which come flat and larger huskes than in the other, containing such like small seed: the roote is of many fibres shooting forth here and there some other plants.

11. Chamedrys spuria sylvestris. Common Wild Germander.

The common wilde Germander that groweth every where in the Medowes, fendeth forth divers square upright stalkes, yet sometimes a little bending, having two leaves set at each joynt, one against another, the lower ones somewhat large, and almost round, yet pointed at the ends, and dented about the edges, but smaller up higher. the tops of the stalkes are spiked with divers blue flowers set about them, made of 4. smal round leaves apeece, with a little white eye in the middle, fmall pointed, and some threads also, after which come small flat pouches, containing small seed: the roote in small and thready.

12: Chamedry: spuria minor angustifolia. Narrow leased wild Germander.

This small Germander hath divers round reddish stalkes, somewhat rough, hard, and hairy, an hand breadthshigh bending downewards, whose lower leaves are somewhat long and broad, round at the ends, and not dented at all about the edges: but those that grow up higher upon the stalkes, are shorter and narrower pointed also at the ends. and fnipt about the edges: the flowers grow spike fashion, being either of a pale blue colour or blush, made of foure leaves like the other, and so are both heads and seeds : the roote is blackish, hard and stringy.

13. Chamedrys Austriaca laciniata. Iagged base Germander of Austria.

The leaves of this jagged Germander that grow upon the round rough stalkes, are hard and somewhat hairy, divided into many small long pieces, the flowers are blue standing in a long spike, as many other of the former doe, and round biforked heads, after them with very small feed in them.

14. Chamedrys Hispanica folys tennissime divisis. Wilde Spanish Germander with fine cut leaves.

The round stalke hereof is more slender than the last and hairy, set with many joynts, and shorter and narrower leaves thereat, full of small leaves at the toppe, where it breaketh forth into two small foot-stalkes, whereon stand

the small flowers, with each a small long pointell in the middle.

The Place. The greater Germander is found in many Countries, as well as in the upper Germany, as Clusius faith, and the lesfer in the lower, as Lobel faith, they are onely found in gardens with us. The third groweth in the fields of Naples. The fourth groweth in Saxony, as Iohannes Thalism faith, and is onely preserved with those that are curious confervers of rare simples. The fifth we have often had among other seeds out of Italy and Spaine from Boelins, and did grow in Cardinall Bembus his garden, as Bauhinus faith. The fixth Clufius faith he found on the highest toppes of the Alpes in Austria and Styria, and Camerarius faith it is found plentifully on the Hills, both in Savor and Smitzerland, and in Daulphine in France, as Lobel faith. The seventh Pona setteth downe in the description of Mone Baldus that he found there. The eighth and the two lesser kindes thereof, Clusius saith he found in Hungary, Austria, Bohemia, and other places thereabouts. The ninth Clusius also saith hee found in the lower Austria, about Vienna and Newstadt. The tenth Clusius also saith he found in the toppe of the snowy Mountaine in Austria called Sneberge. The cleventh as I faid, in every Medow thorowout the Land almost, as also by ditches and hedges sides: The twelft in the Medowes by Bassill: The thirteenth in Austria, and the last in Spaine,

The Time. These doe all flower in Iune or Iuly at the furthest, except the Thorney Germander, and the Spanish and Candy kindes, which come later.

The Names.

Germander is called in Greeke xaiuziogus, Chamadrys, quasi humilis aut parva quercus, a foliorum similitudine and Xauaided Chamedrops as Dioscorides faith, in Latine Trixago & Triffago, and Querenla minor, and of some Tenerium. The first and second are generally called of most Writers Chamedrys, and of some mas; and of some as I said Trixago, and Trissago major or minor, repens is added according to the kinde, and of some Serratula minor, and of some also as Matthiolus saith, berba Febrium, and Febrifuga, from the effects. The third is called by Columna Trixago Apula unicanlis, & forte Verbena recta Dioscoridis, and by Banhinus unicanlis. The fourth is called by Matthiolus Chamadrys altera, and so doe Durantes, Lugdunensis, and Camerarius, who accounted it an errour in them that would make it a Chamapitys, as if it smelt like Rossin. Fuchsius and others Chamadrys famina. Tragus calleth it Chamacyparissus agressis, and first also tooke it to be Chamapitys altera Dioscoridis, whom Dodonaus and Clusius follow, for he calleth it Chamapitys multifidis folys, and also Ajuga, and Tabermontanus Ivamoschata. Lobel calleth it Chamadry: laciniatis folys, and by that name it hath continually beene sent to us. Banhinus calleth it Borrys Chama-

CHAP. XXXIX. Tencrium. Tree Germander.

remaineth that I thew you in this Chapter the rest of the Germanders called Teneria Tree Germanders to diflinguish them from the former forts, whether they be true or false.

T. Teneriummajus vulgare. The more common Tree Germander.

Tree Germander groweth like a little shrubbe, with hard wooddy, but brittle stalkes, a foote or two, and sometimes a vard high, if it be well preserved and desended from the injuries of the Winters, branching forth on all fides from the very bottome, bearing alwayes leaves by couples, smaller, smoother, and thicker than those of Germander, of a darke thining greene colour on the upperfide, and grayish underneath, and dented also about the edges like them; the gaping flowers stand about the toppes of the branches spike fashion, one above another, of a pale whitish colour saith Clusius, of a purplish faith Lobel, of both which I have had plants, somewhat larger than those of Germander, and without any hood above, having a few threads standing forth : the seed is small blackish and round, contained in small round, but pointed huskes: the roote is somewhat wooddy, with many blackish fibres: the whole plant is of a fine weake scent, but somewhat stronger, if it be a little bruised, holding the stalkes and greene leaves continually, if it be not exposed to the sharpnesse of the Winter season.

2. Teucrium Creticum. Tree Germander of Candy This shrubby Germander of Candy, rifeth up with such like wooddy brittlestalkes as the former, but somewhat smaller and whiter, whereon doe grow fuch like leaves, and in the fame manner, but somewhat lesser, lesse greene, and shining above, and more hoary underneath, two alwayes fet at a joynt, but on the contrary fide: with the leaves towards the toppes come forth five or fixe flowers standing in a buske, like unto the former, but a little !esfe, and of a purple colour, after which come small round seed like the other: the whole plant is fomewhat fweeter than the former.

3. Tencrium Baticum. Tree Germander of Spaine. This Spanish shrubby Germander groweth in some places of Spaine, to the height of a man, but usually much lower with one wooddy grayish stemme or stalke, dividing it selfe

into fome branches, but fewer than the former, two alwayes fet at a joynt : the leaves ftand likewife two together. somewhat greater, and waved a little at the edges, of a fad greene colour above, but not shining, and more hoary underpeath, the flowers frand at the joynes with the leaves towards the toppes of the stalkes, of a white colour, without any head above; and with fundry threads in the middle, the lower leaves hanging downewards: the smell hereof is lefte fweet and more bitter than the former, but abideth with stalkes and leaves thereon, greene like the reft, but will require a little more care for the Winters provision in our Country.

Tempisum Alpinum inedorum. Vnlavory Tree Germander of the Alpes. This small low shrub hath divers hairy and wooddy stalkes, not above an hand breadth high bending downewards, and dividing it felfo into many smaller branches, whereon are set very small hoary leaves, somewhat rugged or wrinckled and depred a little about the edges, like unto the uppermost small leaves of wood Sage, the flowers are very large for the proportion of the plant, being like unto Germander and hooded, of a pupilih blue colour, flanding fpike fashion at the toppes of the stalkes, the roote is stringy and white: the whole plant hath little or

The first groweth in the rocky places of fundry hills in Italy, and other Countries: the second came from Candy to Clasius, the third Clasius faith be found neare the Sea coasts in Spaine, not farte from Hercules pillars, as also in the Hand of Cules : the last as Benbinus faith, was found on the greater hill of Saint Bernard in Switzerland. The Time.

These fores of Germander doe flower somewhat later than the former. The Numes.

The Greekes calbit rounner, and the Latines Tenerium also, a Tonore inventore tafts Plinie, some also call it Quercula major. In the last Chapter the opinion of Dodonous is fet downe concerning Tenerium and Chamadrs, but he doth not in my opinion declare the whole truth, which from the rest of Dioferridge test may bee gathered : for of Chamadys he saith falia habet efficie co devisura quereus, it bath leaves like the Oake, both for shape and divisions,

drivides. The fifth Baubinus hath onely fet forth and given it the name in the title. The fixth is called by Clufius Chamadrys montana, and so doe Lugdenensis and Tabermontanus, who saith it is also called Argentina Monspeliaca, Chamedrys Alpina by Camerarius, who faith fome called it Hirizwortz, and thereupon Gefner called it Cervaria & herba Cervi quibusdam. Lobel calleth it Chamedrys montana frutescens durior. Luedunensis saith, some call it Lencas of Dioscorides, Baubinus calleth it Chamadrys Alpina Cifti flore. The seventh is called by Pona in the description of Mons Baldus Veronica petrea semper virens: Baubinus saith it is Clusius his sixth Tenerium pumilum, in his History of plants, and calleth it himseife Chamedrys Alpina saxatitis. The eighth is called by Clusius Teucrism majus Pannonicams, in his Pannonick observations, and maketh it the fourth Tencrium in his History. Bankinus calleth it Chamadrys (puria major altera frutescens. The ninth is Clusius his fifth Teucrium in his History of plants or Teucrium Pasnonicum minus, which Bauhinus calleth Chamadrys spuria minor latifolia. The tenth Clusius calleth Tenerium minimum, and Bauhinus Chamadrys Alpina minima hirfuta. The eleventh is called Chamadrys unlearis famina, by Fuch. mins, and Baumins Chamach's Asymmetric management is the transfer of the first Turner, Lonicerus, and Loudanenfis, Pfendochamach's by Thalius, Tenerium practicelle by Lobel, and by Cluffus, and commonly with us Chamachys spiria minor angustifolia, and commonly with us Chamachys spiria minor angustifolia, who taketh it to be the third fort of the fourth kinde of Clusius his Tencrium. The thirteenth and the last are remembred onely by Baubinus. There is some controversie among our latter writers, what hearbe should be the true Chamadry; and Tencrium of Dioscorides, Galen and other ancient writers: for Dodonaus by comparing both the Texts, faith that our common Chamedrys doth more properly belong to the descriptions of Dioscorides and Plinies Tenerium, and so contrarily Teucrium unto Chamadrys, for Dioscorides setteth them downe in this manner, Xapaispusis Bajurion & and anaist, ideft Chamedrys exiguus est frutex dodrantalis, that is, Germander is a small shrubbe of a span height, and of the other he faith, Teuzeior Mozesi paldoudis. Tenerium herba eft virgata, five virgulas plares ferens, Teucrium is an hearb bearing many stalkes, and hereby he faith it is evedent, our common Germander is not a shrub, which doth raife it felfe up as Teucrium doth ; and besides that, Pliny in describing Teucrium faith, it spreaderh branches like rushes, which doth more fitly agree to our common Germander, thereby transferring the Chamadry; to be the taller fhrub, and Tenerium the leffer and lower : yet as he faith, feeing Diofeorides himfelfe faith, that in his time they were transferred, for the likenesse of their leaves, one unto another, it is not absurd to call them as they are usually entituled : but as I shall shew you in the next Chapter, the Tenerium of Diosecorides is better to bee explaned than Dodonaus doth. It feemeth also that Dodonaus having beene in an errour in his former worker concerning Hierabotane mas & famina, giving the figures of the Chamedrys sylvestriu thereunto, reclaimed himselse in his later History or Pempeades, and left them both out, as not allowing of his former opinion. The Arabians call it Damedrios Chamedrius and Kemadrius: the Italians Chamedrio and Quercivola, and some Calamandrina: the Spaniards Chamedrios: the French Germandree: the Germanes Gamanderle and Bathengel: the Dutch Gamandree, and we in English Germander.

The Vertues.

Germander is hot and dry in the third degree, and is more sharpe and bitter than Tenerium, and as Dioseoridee faith, is a remedy for coughes taken with honey, for those whose spleene is become hard, for those that can hardly make their water, and helpeth those that are falling into a dropsie, in the beginning of the disease, especially if a decoction be made thereof, when it is greene and drunke. It doth likewise bring downe the termes, helpe to expell the dead child, and taken with vineger doth waste or consume the spleene : it is most effectuall against the poison of all Serpents, both drunke in wine and laid to the place; used with honey it cleanseth old and foule ulcers; and taketh away the dimnesse and moistness of the eyes, being made into an oyle and annoynted. It is likewise good for the paines in the fides, and for crampes. The decoction thereof taken for some dayes together, driveth away, and cureth both quartane and tertian agues. The Tuscans, as Marthiolus saith, doe highly esseeme thereof, and by their experience have found it, as effectuall against the plague or pestilence, as Scordium or water Germander. It is also as he faith good against all the diseases of the braine, as the continual paines of the head, the falling sicknesse, melancholicke fullennesse, the drowsie evill, those that are sottish through the dulnesse of the spirits, and for crampes convulsions, and palies : a dramme of the feed taken in powder, doth purge choller by urine, and is thereby good for the yellow jaundise : the juyce of the leaves dropped into the eares, killeth the wormes in them : It is also given to kill the wormes in the belly: which a few toppes of them when they are in flower, laid to steepe a day and a night in a draught of white wine, and drunke in the morning will doe also. Theophrastus in setting downe the properties of Germander faith, that the one part of the roote purgeth upwards, and the other part downewards; whereof there is more wonder than for Thapfia and Ischias, that is bliftering Fennell, and tuberous or knobbed Spurge to doe so: Andreas Vesalius, pag 49. speaking of the China roote saith, that if a decoction hereof bee made in wine, and taken for 60. dayes continually foure houres before meate, it is a certaine remedy for the gowt. Durantes giveth the receipt of a Syrupe very effectuall for the spleene in this manner. Take saith he, Germander Chamapitys or Ground Pine, Ceterach or Milt waste, and Madder, of each one handfull : the barke of the roote of Capers, the rootes of Smallage, Elecampane, Orris, or Flagge Flower-de-luce and Liquorice, of each halfe an ounce. Of the leaves and barke of Tamariske, and of Cyperus, of each three drammes, of the feed of Anife, Fennell and Smallage, of each one dramme, of Raisins stoned one ounce. Let all these be boyled according to art, in a sufficient quantity of Posset, (that is of vineger and water equall parts.) Vnto each pound of this decoction being strained, put sixe ounces of Sugar, and three ounces of Cinamon water, which being made into a cleare Syrupe, take foure ounces every morning falling. The decoction thereof is good to stay the whites in women, if they fit therein while it is warme, and likewise easeth the passions of the mother; being boyled in vineger and applyed to the stomacke with a little leaven, stayeth vomitings, that rise not from chollericke or hot causes: the leaves hereof and the seed of Nie gella quilted in a Cap, flayeth the catarrhe or distillation of raw cold and thinne rheumes: being boyled in lye with some Lupines or flat beanes, and the head washed therewith taketh away the dandrasse or scurfe thereof. The mountaine Germander is used by those of the Alpes, where it groweth; to stay all manner or fluxes, whether of the belly, or of the blood, the feminine courses, and the bloody flixe, as also to stay vomitings.

Tencrimm

1. Toucrium majus vulgare.

3. Teucrium Beticum. Tree Germander of Spaine

which argueth them to bee greater than of Tencrium, whereof hee faith Triffavinis est similitudine, tenuifolio, non multum a Cicere alieno : so that Ten crium hath leffer leaves than Chamadrys, yet like the leffer ones thereof, and not much differing from those of Ciche pease, and with such leaves is the Tex in the description of Tencrium, where he saith it is called Hemionitis, or H_n. mion (as Matthiolus hath it) having neither flower nor feed, which fome would call Asplenion or Splenion, as he hath it, and then telleth fables how the vertue thereof was knowne to be good against the spleene, in that the Swine vertice thereof were found to have no milt. And againe, that the intrails of beafts being cast upon the hearbe, the milt or spleene of them onely lying nearest was consumed, scilicet, of the dead beast, and then addeth by and by the true description (although somewhat varying from that of Disserties) of Tenerium, so that he consoundeth both Hemionisis and Tenerium together in one descripcion. Matthiolus saith that some did take Tenerium to be Erassiam major, or Fabainversa, called by others Telephium. The first is simply called Tencrium by Matthiolus, Lobel, and many other Authors, and by Clufius Ten. crium vulgare fruticans, but by Dodonaus Chamadrys altera fen affurgens : the second Cinfins calleth Tencrium Creticum, faying it was sent by the name of Chamedrys major, and Baubinus Tencrium Creticum incanum: the third Clufus calleth Tencrium fruticans Baticum, and so doe Lugdunensis, Tabermontanus and others, that have taken it from him, Baubinus calleth it Teucrium percent num folio sinuoso, and maketh a quere, which Clusius had made before an Pe derota Paulania: the last Baubinus in his Pinax and Prodromus calleth Tencrium Alpinum inodorum magno flore, and yet is the same with his Tencrium folin Scorodonie, as any may well fee that will compare them together, for Camera rius who had his from (andy, by the name of Scordium verum, sheweth that it hath the leaves of Scorodonia, but leffe.

The Vertues

Galen maketh Teucrium to be not in the second degree, and dry in the third, and of thinne parts, and cutting also, whereby it is helpefull for the spleene; it is saith Dioscovides used either greene or dry, and is good to consume the

pleene, being inwardly or outwardly applyed : it is also used against the sting of venemous creatures.

CHAP. XL.

Scordium, Water Germander.

S

P Sordium being a kinde of Germander mult be next entreated of, yet for that it smelleth of Garlick, it mult be separated from them, and with it the other of his kinde, and some also for the affinity in name or smell a arenot unsit to be joyned together in this Chapter.

1. Scordium legisimum. Water Germander.

Water Germander (from a small roote full of white strings spreading in the ground, and creeping or running about also, shooteth forth divers weake square hairy branches, which take roote in divers places, as they lye and spread, whereby it encreaseth much; whereon doe grow many leaves, two alwayes at a joynt, which are some what larger and longer than garden Germander leaves, of a sad or darke greene colour, whereon yet there is a shew of hairinesse and hoarynesse, somewhat soft in handling, full of veines, and dented about the edges, of a scent some what strong, resembling Garlicke: the slowers are small, red, and gaping, standing at the joynts, with the leave towards the toppes of the branches: we have not observed what seed it beareth.

2. Scorodonia sive Scordium alterum quibusdam, & Salvia agressia. Wood Sage-

Wood Sage rifeth up with square hoary stalkes, two foote high at the least, having two leaves fer at every joynt thereon, which are somewhat like unto Sage leaves, but smaller, softer, whiter and rounder, a little dented about the edges, and smelling somewhat strongly: at the tops of the stalkes and branches stand the flowers on a stender long spike, turning themselves all one way when they blow, and are of a pale or whitish colour smaller than Sage, but hooded, and gaping like unto them: the seed is blackish and round, some usually set in a huske together: the roote is long and stringy, with divers sibres thereat, and endureth many yeares.

3. Scordotis Plini primum. The first Garlicke Germander of Pliny.

Because Dodonans, Lobel, Pena, and Dalechampins, have set forth divers hearbes for the true Scordotis of Pliny, as some Scordonia or Salvia agressis, some Stacips, and others Gallisricum, none of them having the smell of Scordium, or the vertues that Pliny giveth to his Scordotis at therefore Honorius Bellus a Physitian in Candy, a diligent searcher, and of great knowledge and judgement in hearbes. Sent to his friends in divers places, the true Scordotis of Pliny, with the leafe of Wild Mints, or water Mints, whose description is as followeth: It hath from a long great and shorous roote, abiding long, and not perishing every yeare, many square hairy white branches, lying round about it on the ground: whereon are set two leaves at a joynt, broader and rounder than the former Scordium, and all hoary white, being somewhat like unto the leaves of Horebound, or water Mints: at the toppes of the branches

1. Semdum legitimum, Water Germander.

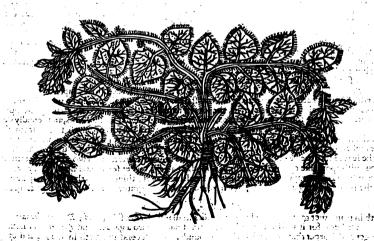

TRIBE. 1.

3. Scordetie Pliny primum.

The first Garlicke Germander of Pling.

come forth the flowers, flanding as it were in a long fifthy head, with leaves among them, which are of a very pale purplish colour, almost white like more Porchand, after which comments small found blacke feed: the whole plans smelleshof Garlicke, as much as Northam, and thereby to be knowne as well as by the leaves, to differ from those balland sinder that other Authors have fir think.

4. Scordotis alterum Pliniy Pona. Another Garlicke Germander of Pliny.

The other Scordotis rifeth up with his stalke more upright, and more branched than the former, bearing the like L 2

4. Scordotis alterum Plini Pone. Another Garlicke Germander of Pliny.

Снар. 40.

112

them.

5. Alliaria. Sawce alone or lacke by the hedge.

I eaves, but somewhat larger, and roundly dented about the edges, two at every joynt, and two branches with them likewise, having spiked toppes of reddish flowers.

5. Alliaria. Sawfe alone, or Tacke by the hedge. The lower leaves of Sawfe alone are rounder than those that grow towards the toppes of the stalkes, and are set singly one at a joynt, being somewhat round and broad, and pointed at the ends, dented also about the edges, and somewhat resembling Nettle leaves for the forme, but of a fresher greene colour, and not rough or pricking the flowers are very small and white growing at the toppes of the stalkes one above another, like unto Rocket, which being past, there follow small and long round pods, wherein are contained small round feed somewhat blackish: the roote is stringy and threaddy, perishing every yeare after it hath given seed, and raiseth it selfe againe from its owne sowing: the plant or any part thereof being bruised, smelleth of Garlicke, but more pleasantly, and tafteth somewhat hot and sharpe, like almost unto Rocket.

This is fometimes found with larger and rounder leaves, in nothing else differing.

6. Scordio affinis Elephas Columna. The Germander-like hearbe of Naples.

This Germander-like hearbe hath a square tender hollow stalke, somewhat hairy, and of a whitish greene colour as the leaves are likewife, two alwains fet at a joynt, the lowest being smaller than the other that grow upward to the middle of the stalke, being somewhat like unto Mint leaves, but rounder at the points, and roundly dented athe middle of the traine; being inhermat into unit heaves, our rounds at the pointes, and roundry deficed about the edges like Germander, but more sparingly; from the joynts with the leaves on all side; from the very bottome almost of the stalke, spring forth branches set with the like, but smaller, longer, and more pointed leaves, towards the toppes whereof come forth gold yellow gaping or hooded flowers, every one upon a stender stote stalke, between the leaves like the head of an Elephant, with the bowed snowt, and two crooked teeth on each fide thereof, and purplish spots like eyes under the upper hood, of a very sweet scent, and flowring by degrees one after another, after which come grayish seed contained in heads, with very thinne skins that they may be discerned thorow them : the roote is long and white, with some translucid graines like wheate cornes growing at

The Place. The first groweth in many wet grounds, and by water sides in many places of England; Dioscorides saith, as well on the Hills, as by water fides, for it will abide well if it be transplanted into a garden, and Comerco in faith that it is found to be stronger and sharper that groweth on high grounds. The second groweth in woods and by wood sides, as also in divers fields and by-lanes in many places with us t the third as is faid groweth in Camby, whereas Honorius Bellus saith, the people gather it promissuously with the former fort, and so use it, or sell it to others the fourth doth grow also in Candy, and fent to Signer Contarini, from whom Pona faith he had the knowledge thereof. The fift groweth under walls, and by hedge fides, and path-wayea in fields in many places : the last on the hill Came poclari in Naples, as Columna faith.

The Time

They doe flower in June, July, and August, somewhat before which time the most usual manner is to gather the water Germander, and dry it to keepe. The Names.

Water Germander is called in Greeke Zziger, and in Latine Scordium, from orageofor which is Allium Garlicke. because of the smell : the likenesse of the Greeke name, did much deceive the former ages before us, for as Matshiols writeth, it begun to be knowne but a while before his time, and that all men both Phylitians and Moothecaries used the wild Garlick called Ophioscoridon in stead of the true Scordism in their medicines; the occasion whereof (befides their owne ignorance and negligence in not diltinguishing of the words) was Avicen, as it is most likely or his Translator that appointed Scordism in one composition of Treakle, and wild or crow Garlicke in another: and the Physitians of the former ages, thinking that Avices had interpreted himselfe, expounding one place by another, continued the error by tradition without further feareti, untill learning & all other feiences began to be more fought into, and refined as it were from the groffe puddle of ignorance and barbarifme, which brought the knowledge of this to light, as it did of many other things; fo that now our curiofity doth not reft in medys & milibus, but transcendeth adimes or minimas etiamsi inutiles; It is called also Trixago palustris, Water or Marsh Germander, both for the likenesse thereof unto Germander called Trixago, and for the growing thereof in marshes, &c. Some also call it Nisosper from the strong scent so unpleasant to the sences. Pliny faith that Cratevas did ascribe one of the sorts hereof unto Mithridates, and called it Mithridation; and it may be from hence as well as from Garlicke: was called poore mens Treakle, and by our Country people English Treakle. The first is called Scordium, or Trixago paluffrie of all Writers, and although Tabermontanus and Gerard that fo: loweth him, doth make two forts thereof, as major and misses, a greater and a lesser, yet I never could observe any other difference then in the place which produced them, being one more or lesse fruitfull or barren than the other. The second is called by Lebel and Cameraview Scordium alterum; and Scordium majes Pling by Gefner; who calleth it also Salvia montana, and Ambrofia quibuldam : Trapis, Lonicerus, and Tabermontanus, call it Salvia Sylvefiris, and Salvia Bosci, and Bosci Salvia, and Lugdunensis Salvia agrestis, as Dodonaus also doth, who taketh it likewise to bee Sphacelus Theophrass; as I have formerly shewed. Cordus, Thalius, and Gerard call it Scordonia, and Scorodonia, although his figure thereunto is not right. Cafalpinus calleth it Melinum alterum, Atius, and Raubinus Scordium alterum Salvia Sylvestris. The third is called Scordoris Levitimum Plinu, both of Bellus and Pona in his description of Mons Baldin, and it is very probable that Camerarius doth meane this fort, which he calleth Scordium Creticum lanuginofum: for as I said before. Bellus faith, the people of Candy make no difference betweene them, but in gathering put them together. It is probable alfo, that Anguillara called this Scordium alterum, which hee faith was found about the banke of the River Pifcara, with leaves as large as Baulme: and that fuch is found in Candy alfo, in Greece and other places, nothing differing either in scent or quality from the first. The fourth is called by Pons in his Italian Baldus Scordois secundum Pliny, The last is called by most Authors Alliaria, yet Cosper in horsis calleth it Alliassum, and Erkins Cordus.
Rimamarina, but Anguillara Rimamaria, Dalechampius upon Pliny takath it to be his Alectorolophus; and so doth Lobel alfo, some alfo take it to be Thlassidium Crateva, and Trague chieft it De insertect obspans, and to doth Lobel alfo take it to be Thlassidium Crateva, and Trague chieft it Thlassidium consusum. The last Columna calleth it Elephas Campotlarensium, and Banhinus Scordio assissing the Spaniards Camedreos de arroyes, the French Scordion and Chamaras, the Germanes Wasser Robbengel, and Lachen K soblauch, the Dutch Water Gamadree, and we in Figith Water, or Marth Germander. The Italians call Sawce alone, or Iacke by the hedge Alliaria, the French Alliarie, and Herbeaux anks, the Germanes Knoblanchs krant, and Saltakrant, the Dutch Look fonder look.

The Vertues.

Diescorides and Galen doe both agree that water Germander is of an heating and drying, or binding quality, bitter alfo, and a little fowre and sharpe, whereby it is effectuall to provoke urine, and womens monethly courses: the decoction thereof in wine being either greene or dry, is good against the byrings of all venemous bealts or Serpents, and all other deadly poilons; and also against the gnawing paines of the Stomake, and paines of the side that come either of cold or obstructions, and for the bloody flixe also: made into an Electrory with Cresses, Rossin, and Honey, it is availeable against an old cough, and to helpe to expectorate rotten flegme out of the chest and lungs: as also to helpe those that are bursten, and troubled with crampes. Galen in libr. Antidot. (which Matzbiolus and others also set downe) recordeth that it was found written by sundry faithfull and discreet men, that in the warre of the bondmen, where the bodies of the flaine had lien upon Scordiam any long time, before they were buried, they were found to be lesse putrified than others, that had not fallen thereupon, especially those parts that were next the hearbe; which observation bred a perswasion of the vertue thereof to bee essectuall, as well against the poilon of venemous creatures, as the venome of poilonfull hearbes or medicines. It is a speciall ingredient both in Mithridate and Treakle, as a counterpoifon against all poisons, and infections either of the plague or pestilentiall or other Epidemicall difeases, as the small pockes, measels, faint spots, or purples: and the Electuary made thereof, named Diascordium, is effectuall for all the said purposes: and besides is often given, and with good successe before the fits of agues, to divert or hinder the accesse, and thereby to drive them away. It is often taken also as a Cordiall to comfort and strengthen the heart. It is a most certaine and knowne common remedy to kill the wormes, either in the stomacke or belly, to take a little of the juyce thereof, or the powder in drinke fasting. The decoction of the dryed hearbe with two or three rootes of Tormentill sliced, and given to those that are troubled with the bloody flixe is a fafe and fure remedy for them. The juyce of the hearbe alone taken, or a Syrupe made thereof is profitable for many of the forenamed griefes. The dryed hearbe being used with a little honey cleanseth soule users, and bringeth them to cicatrizing, as also closeth fresh wounds: the dryed hearbe made into a cerateor pultis, and applyed to excrescences in the flesh, as Wens and such like; helpeth both to constraine the matter from further breeding of them, as also to discusse, and disperse them being growne. It being used also with vineger or water, and applyed to the gowt, easeth the paines thereof. The greene hearbe bruised and laid or bound to any wound, healeth it, be it never fo great. Wood Sage is hot and dry in the second degree, the decostion thereof is good to bee given to those whose urine is stayed, for it provoketh it and womens courses also. It is thought to be good against the French poxe, because the decoction thereof drunke doth provoke sweat, digesteth humours, and dissolveth led poor a nic as

lateric et all Write

ar in the contract of the

fwellings and nodes in the flesh: the decoction of the hearbe rather greene than dry made with wine, and taken, is accounted a fafe and fure remedy for those who by falls, bruifes, or beatings, doubt some veine to be inwardly broken, to disperse and avoid the congealed blood, and to consolidate the veine, and is also good for such as are inwards ly or outwardly bursten, the drinke used inwardly, and the hearbe applyed outwardly; the same also, and in the same manner used, is found to be a fare remedy for the palsie: the juyce of the hearbe or the powder thereof dryed is good for moit ulcers and fores in the legges, or other parts to dry them, and thereby to caule them to heale the more speedily: it is no less effectively also in greene wounds, to be used upon any occasion. lacke of the hedge is eaten of many. Country people as fawce to their falt fifth, and helpeth well to digest the crudi-ties, and other corrupt humours are engendred by the eating thereof, it warmeth also the Romacke, and canfeth digestion: the juyce thereof boyled with honey, is held to be as good as Erysmann, hedge Mustard for the cough, to belpe to cut and expectorate the slegme that is tough and hard to rife; the seed bruiled and boyled in wine is a good remedy for the wind collicke, or for the stone, being drunke warme, the same also given to women troubled with the mother, both to drinke, and the feed put into a cloth, and applyed while it is warme, is of fingular good use : the leaves also or feed boyled, is good to be used in glisters, to case the paines of the stone : the ground leaves are held to be good to heale the nicers in the legges, the roote tafteth sharpe somewhat like unto Raddish; and therefore may be used in the same manner, and to the same purposes that it is. अध्यक्ति ज्ञानिक विद्यालय

> CHAP. XLI. Baccharis. Bacchar.

Lthough fundry Writers have set forth divers hearbes, for the true Baccharis of Disserties, and other learned men have refused them : yet these hearbes come nearest thereunto, the one the learned of Mon. pelior account the truest, and with them many others doe agree: the other Ranwolfins Setteth forth which are therefore here proposed unto you.

3. Baccheria Monfpelienfinm. French Bacchar.

114 CHAP. 41.

1. Baccharis Monspeliensium. French Bacchar.

This hearbe hath divers somewhat long and large leaves lying upon the ground full of veines, which make it feeme as if it were crumpled, foft and gentle in handling, and of an overworne greene colour, feeming to be woolly: from among which in the Summer time, rifeth up a strong stiffe stalke, three or foure foore high, fet with divers such like leaves, but smaller up to the toppe: where it is divided into many branches, at the ends whereof come forch divers flowers, three or foure for the most part, at the end of every feverall branch, and every one on a small foote-flalke which flowers confift wholly of small threads or thrums, standing close and round; and never laid open like other flowers, that consist of leaves, of a dead or purplish yellow colour, out of greenish scaly heads, which thrums turne into a whitish downe : at the bottome whereof is the feed; fmall and chaffy, which together with the downe is carried away with the winde, and rifeth up in fundry places of a garden, where it is once planted, and beareth feed : the roote confifts of many strings and fibres, bushing somewhat thick, not running deepe into the ground, but so taking hold of the upper face of the earth, that it may eafily be pulled up with ones hand the finell whereof is somewhat like unto Aven, but lesse in gardens than growing wild , even as Avens doth in gardens, and divers other sweet hearbes that are of thin parts and subtile.

2. Baccharis Dioscoridis Rauvolso. Syrian Bacchar. The Syrian Bacchar, brancheth forth from an hoary stalke, about a foote high, into many smaller sprigges; bearing somewhat long and narrow leaves thereon, as white, hoary, and woolly as Mulicin leaves, without any foot-stalke arthe bottome, but compassing the stalke about: these being larger below, yet lessessing Mulicin, and those above smaller, and smaller to the tops s where on fland the flowers very thicke fet together, fomewhat like un? to golden Tufts, or Mountaine Cotton weed, called also Cate

foote, of a pa'e purplish colour : the roote was not fully observed, but seemed by some parts thereof, to be sibrots like blacke Hellebor, and fweet alfo.

The Place. The fast groweth plentifully neare Mompelier, and nany other places also. The other in Syria. The Time.

The first flow reth with us about the end of Iuly, or beginning of August. The other time is not expreffed.

The Names.

TRIBE. 1.

It is called in Greeke Bannapis, Baccharis, or as some would have it manuels, Pacebaris, as though it should bee named Turnseis Pancharin, from the excellent fmell it hath. Pliny faith that some in his time called it Wardusruftica; but faith hee. they were in an errour that did so call it, for Alarum is most truely and properly called of the Greekes Night apple Nardus rultica, and therefore Gerard in following the old error reprehended fo long agoe, giveth it the English name of Plowmany Spikenard, whereunto it hath no refemblance, neither for forme nor venues, and his figure also is rather the figure of Marchiolas Baccharit, then of this and although in former times divers did thinke, that Afarum and Baccharis in Diolcorides were all one hearbe, and thereupon came the name of Afanhacera; ione taking Afarum to be Baccharis, and fo contravily some taking Baccharis to be Afarum; for Cratevia contractly some taking or the state of the s time and diligence have expelled those errours. The first of these is called Backbaris Monspaliensium, whereunto it doth more fitly agree, than any other hearbe that others have fee forth; as Possa and Label, Cluffut; and others doe agree; although Dodoneus calleth it Conyes major alcora, and faith it hath little or no likenesse unto Diescorides his Baccharis, Matthiolus his Conyza major, is faid by the Author of Lugdanenfis, to be this Bacebaris Monspeliensium: and Lobel and Pena fay that the plant which Matthiolus fet forth for Baccharis, cannot agree unto that of Diefeorides, but is a kind of fweet Mullein, or a kinde of Moth Mullein : yer Banbinus in his Pinax, calling this Conyes major vulgaris, shewing thereby that many did call it fo, referring it as well to Matthiolus his Conyza ma. jor, as to his Baccharis; which Lugdanensis faith, are so conone plant as in the Chapter of Baccharis he sheweth. They of

Salmanos in Spaine, as Cluffus faith; called it Helenium, and di-vers hother women and Monkes, used both the roote and the hearbe, for scabs and itches, which is one of the properties whereunto the true Helenium ferveth. The other Rauwelfius onely finding in Syria, feemeth to referre unto Dieferidet his Battharis : which Clasius thinketh rather to bee a kinde of that Mountaine Cotton weed, which Fushfus: calleth Pilosella minor, and therefore Bauhinus calleth it Gnaphalio montano affinis Egyptiaca.

The Vertues. Dissocrides saith, that the rootes of Baccharis boyled in water and drunke; helpeth those that are troubled with convultions and crampes, as also those that have ruptures and are burften, such as have bruses by falls or otherwise. and those that can hardly draw their breath, or are short-winded, as also for old coughs, and the difficulty in making water: it also procureth the feminine courses, and is very profitable against the bytings of venemous creanures being taken in wine: the greene roote being bound or hanged to, expelleth the birth, and is good for women in travell to fit over the warme fumes of the decoction thereof. For the sweet smell thereof it is put into Wardrobes to perfume: and the smell thereof procureth sleepe: But the greene leaves by reason of their astriction are good to ease the paines of the head, the inflammations of the eyes, and the watering of them in the beginning, the hot (wellings of womens breaths after childing, and those hot inflammations called Saint Anthonies fire, being applyed to the places affected. Pliny faith further, that it helpeth to breake the flone, and to take away these and prickings in the fides. Paulus Eginets faith moreover that the decoction of the roote openeth obliructions, and that the leaves are beinefull by their aftringent quality to flay fluxes: Virgil in his feventh Ecloque faith, that is was used in his time as a garland to secure one from witchery and charmes, in these verses.

At fi ultra placitum landarit, Bacchare frontem Cingite, ne vati noceat mala lingua futuro.

> CHAP. XLII. Nardus. Spiknard.

Lthough it is not my meaning to shew you the Indian Spiknard in this place, in that it is a plant peculiar to the Easterne parts of the world, and was never brought to grow in these Christian Countries; yet there is a bastard kind thereof found nearer hand, very like unto it, which I mad set forth unto you, and fome others alfo, that for the affinity either of fcent or property, or both, have beene called Nords.

1. Nardus Gaugitis Spuria Narbonensis. Ballard French Spiknard. In imitation of the true Indian Spiknard (which Fens faith doth grow indivers places of Syria and Egypt, which relation is his onely; for we never could understand by any of our Merchants that trade into those parts, that is

2. Baccharis Diefcoridis Rauwolfim. Syrian Barchar.

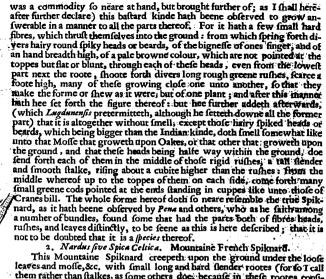

116

. Hirculus Clafit

Vnlavory Spiknard

1: Nardus Gangitis fourta Narbonenfe. Baftard French Spiknard.

This Mountaine Spiknard creepeth upon the ground under the loofe leaves and mosse, sec. with small long and hard slender rootes (for so Teall them rather than stalkes, as some others doe; because in these rootes consifteth the whole vertue and efficacy of the plant, and are by the best Aporhecaries used onely in Mithridatum, &c. and no part else) covered with many short small dry leaves like scales: sending forth in divers places as it cree-peth and spreadeth, here and there small blackish fibres into the ground. whereby it is nourished: at the head whereof stand sundry small buttons

or heads, from whence (pring many finall narrow, and fomewhat thicke greene leaves, not divided or dented at all, finallest at the bottome, and broad toward the end, which thange vellow in the end of Summer, or beginning of Autumne : among these leaves rife up sometimes more, and sometime but one flender stalke, without any leaves thereon, at the toppe whereof stand many small whitish flowers, like unto the smaller forts of Valerian, every one on a slender foote stalke: which afterwards bring small seed like unto them also t the whole plant is sweet and aromaticall, more than the Indian Spiknard, hotter also, and tharper in talte, than either of the other.

3. Nardus Celtica altera. Mountaine French Spiknard with tufted flowers. This other French Spiknard differeth in nothing from the last but in the stalke with flowers, which is branched at the toppe, bearing three or foure flowers in a tuft together, on the end of every small branch. Baubinus in his Prodromus fetteth forth another fort hereof like thereto in most things, but that it is wholly without fcent.

4. Saliunca Neapolitana five Nardus ex Apulia. Italian Spiknard.

This small plant hath a thicker and yellow roote than the last recited, somewhat rugged, but not scaly like it, and fomewhat resembling the garden Valerian, but lesse, having fibres at the bottome, and in divers other places at severall fraces, where it shooteth forth also upwards divers heads or small knobs, and from them many small long leaves, tomewhat larger than the other, narrower likewife below, broader upwards and pointed at the ends what flowers, stalkes, or feed it beareth is not expressed : it bath the sweet scent of garden Valerian, and likewise the sharpe talte thereof, and this is all is declared of it; but that they of Naples use it in their medicines in stead of the Malabathrum of Dioscorides, for the excellent sweetnesse of the leaves.

5. Hirculus veterum Clusy. Vnsavory Spkinard. This small plant (being found dry amongst many bundles of Spica Celtica, or French Spiknard, by Clufius in Antwerpe) is set forth to have a blackish hairy roote, like unto it, but without any smell at all, and smaller, shorter, and whiter leaves, rather grayish, and of an ash-colour: it was found without any stalke, and so Diescorides and Pliny fay it was found in their time : but theirs (as they fay) had a strong scent, but not sweet, and growing with it was uttered among the true; and by the smell as well as colour and talte was to be knowne from it; for it tooks the name Tpayor or Hirculus, of the finell thereof like unto that of a goat.

6. Nardas montana tuberofa. Knobbed mountaine Spiknard.

This kinde of Valerian or Spiknard, call it which you will, hath his first leaves lying on the ground, without any division in them at all, being smooth and of a darke greene colour, which so abide all the Winter: but those that fpring up upwards, when it runneth up to flower, are cut in on the edges, very like unto the jagged leaves of the great garden Valerian, and to the edder they grow, the more cut and jagged they are: the stalke and flowers are very like the stalke with flowers of the garden Valerian, but of a darke or deep red colour, and more store of them thrust together: the seed also is not unlike it; the roote is subgroup to shooked, both above and below, and round

3. Nardus Celtica altera. Mountaine French Spiknard with tufted flowers.

TRIBE I.

6. Nardi montane taberofe fummitates. The tops of the knobbed mountaine Valerian.

4. Saltunca Neaphlitána. Italian Sprknard.

6.Nardio montana tuberofa primum ger Knobbed mountaine Valerian, the first leaves.

TRIBE. 1.

7. Nardus Montana longiori radice.
Long Tuberous Mountaine Spiknard.

about it, with some fibres shooting from them, whereby it is encreased, and smelleth very like the roote of the garden Valerian; or Setwall, or not altogether so strong, being greene, as when it is dry.

gether to strong, being greene, as when it is dry.

7. Nardus Montana longiori radice. Long tuberous Mosmaine Spiknard.

This other Mountaine Spiknard or Valerian is very like the last, but hath a longer round white roote, shooting forth many long knobs, and small shores underneath, which may be separated, and grow for increase: it hath many small long and somewhat darke greene leaves like it, but smaller: the stalkes are not above halfe a yard high, in any that I have observed, bearing some siner cut and divided leaves thereon than any below, two alwayes standing together at a joynt; at the toppes stand reddish slowers, thicke thrust together in an umbell like the other, which passing away, leave small seed behind them naked upon the stalkes: the whole plant is of a faint weake scent, but the roote is much stronger, and much more when it is dry, than when it is sfresh and greene.

The Place.

The true Nardau is said by Garciau to grow onely in India, whatsoever others have said thereof. The first here was sound upon that pleasant high hill in Narbyne, called of the French, L'hort de Dieu, and Dei Paradises, both for the pleasantnesse of it, and for the excellent hearbes that grow thereon, as Pena saith, in the mostly most places thereof, facing the South and Mediterranean Sea, which is not farre from a small village called Gango. The second is sound upon the Alpes in Germany in divers places, as also of Lieuwis in great plenty, and sundry other places. The third is sound on the same hills, and on others also. The fourth was sound upon the Hills in Applia, which are in the Kingdome of Naples. The fift was seene as is aforesiad dry, but never seene growing greene: but that we may well conjecture, that it grew where

the French Spiknard was gathered, as Disferrides also and Fliny imagined. The fixth was found by Pena as he faith, on the hills neare Afindamm, and on the hills of Veganium: (Jufius faith her had it from Ferrances Imperatus of Naples, and gathered from the hill Virgined. The last is likely, being a kindle of the other to bee found in the same places with the other.

The Time

They all flower and florish in the Summer moneths of Iune, Iuly, and August, some carlier or later than others.

The Names.

Nardus is called in Greeke Náth a Naardo urbe Cyriaca forte saith Lobel, Emphrati contermina ch raphisaxus quasi Nardus spica, and so the Indian kinde is generally called Spica Nardi, and of some Nardus Indica, for a distinction betweene it and Celtica: The first of these Pena calleth Nardus Gangitis spuria Narboa, both for the like-nesse thereof unto the true Nardus Gangitis of Dioscorides; and that the next Towne of any note unto that Hill whereon ingroweth, being about seven miles of, is called Gange; and by that name of Nardus Narbononiss, and Nardus sparia Narbononiss, it is called by all other Writers. The second is called Nardus Celtica of Dioscorides, and of all other Writers lince, and Cesalpinus sollowing Pliny Nardum Gallicum. It is in shops called Spica Celtica, and by this most and best, is judged to be the Saliunca that Virgit in his Bucolicks maketh mention of in these Verses,

Puniceis humitis quantum Saliunca Rosetis, Judicio nostro, tentum tibi cedit Amyntus; in English thus: As the Mountaine Spiknard unto the purple Rose tree, So (if I judge) Amyntus yeelds to thee.

And is thought by them also, that the name integral is corruptly put for oursing in Dioscorides: for the: Valesians call is in their tongue to this day Selliga, as savoring of Saliunca, as Pena saith also: yet Matthiolus sinderth sailt with Fachsus and Remissions for taking them to be both one; and the Germanes also, who were reckened a part of the Celtes, call it Syldimics; some would have it called Nardus lights, because it groweth so pleneissibly on the Alpes of Lights, and yet Matthiolus saith, that the Physitians of Genus which is a City in Lights, did not know it before his time, and that he had published his Commentaries upon Dioscorides in the Italian tongue, which caused many both Physitians and Apothecaries, to be more inquisitive into the knowledge of hearties, than they were before. Some also following the Arabians doctrine and words call it Agrams, or Spica Romans, because they will in their tongue Cambail Banimis. The third is called by Gamerarius in his Epitome upon Masthiolus Ignes Teltica fulficiants for some also following the Arabians doctrine and words call it Ryrdus, or Spica Romans, because they sail in their tongue Cambail Banimis. The third is called by Gamerarius in his Epitome upon Masthiolus Ignes Teltica fulficiants for some also fulficiants of the sail of Clustus to be the former, when as Cameranim sail in the former, when as Cameranim sail in the former, when as Cameranim sail in the former, and sail in the former, and Pinan, and called by lim Nardus Alpina sin his Prodomus and Pinan, and called by him Nardus Celtica similis inodora. The fourth is called by Lugdunensis Saliunca Neaplitana, by Takennessaurus Phisminus Apulumand by Bauhinus Nardus ex Apulia. The lith as is before said, was thoughe by Chasses of the Hirculus of Dioscorides, although it sine not strong as he saith his doth: Anguillara taketh it to be the Nardus of Dioscorides, although the first is generally called Nardus montana, and also though by all Writers, to be Dioscorides his Nardus montana, notwithstanding bee

tion he faith, it hath the stalke and lease of Eryngium, and therefore could not be so forgetfull, as within two or three lines to contrary his owne Writing) in laying the errour in the writers of his copy, in the same manner as he set downe in Distammus, and is declared in the Chapter thereof going before: that is, of the source, profert for confert, it beareth not, for it prosident not, the roote onely and no part else being to be used: as also that the leaves hereof doe not agree with the leaves of Eryngium, wherein it is most likely an errour is committed also, in missuring and missaking one word for another, for all other things agree sufficiently thereunto. Dioscorides and Galens also it was called Thylacius, because it was brought out of Cilicais in leatherne bagges, which were called booking and Niris, as it is in Dioscorides copy, but called Pyritis, as it is in Galen, because it was used as a persume in their sacrifices. Baubinus, Camerarius, and others make two sorts thereof, one that hath but one two or three round small rootes like unto Olives, which thereupon he calleth Nardus montana radice obsorgs, and the other hee calleth Nardus montana radice obsorgs, and the other hee calleth Nardus montana radice obsorgs, and the other hee calleth Nardus montana radice obsorgs, and the other hee calleth nardus montana radice obsorgs, and camerarius Nardus montana longius radicales, when as it may be the place onely, where they naturally grow, that causeth the difference of forme in the rootes, as it hapneth in Anthora, Napellus, and many other things, too long here to recite: for being transplanted and manured, they grow much greater, and somewhat alter that forme it formerly held in the naturall places, yet I have given you the figures of both to see the difference.

The Vertues.

Dioscorides faith that the true Indian Spiknard is of an heating and drying faculty, and that it provoketh urine? It is profitable to ftay the loofenesse of the belly, and all fluxes both of men and women, and thin warry humours, being taken in drinke or applyed to the places affected: being drunke with cold water, it is profitable to those that have a loathing of their meate, or having swellings or gnawings at their stomacks, as also for them that are livergrowne, that have the yellow jaundife, or the stone in the reines or kidneys. The decoction used as a bath for women to fit in, or over it, taketh away the inflammations of the mother : It helpeth watering eyes by repreffing and flaying the humour, and thickning it also. Galen faith the same things and addeth withall, that it dryeth up the fluxe of humours, both in the head and breaft. It is an especiall ingredient into Antidotes, against poison and venome, as Mithridatum, &c. There had need be caution taken in the uling of it, for it often provoketh vomitings, being either put with Rubarbe, as sometimes it is appointed, or in other cordiall medicines: and therefore our London Physicians in their Pharmacopes, have appointed it to bee left out of many cordiall medicines. It is also with great caution to be forbidden to women with child, because it procureth them much disquiet, and may force their courses beyond either their time or conveniency. The oyle made thereof according to art, doth both warme those places that are cold, maketh the humours more subtill that were thicke or congealed before, digesteth those that are crude and raw, and also moderately dryeth and bindeth those that were too loose or sluxible: and hereby worketh powerfully in all the cold grieses and windinesse of the head and braine, lost the stomacke, liver, spleene, reynes and bladder, and of the mother; being findfed up into the nostrils, it purgeth the braines of much rheume gathered therein, and causeth botha good colour and a good savour to the whole body; Being steeped in wine for certaine dayes, and after diffilled in Balneo calido; the water hereof is of singular effect, for all cold indispositions of the members, used either inwardly or outwardly: for it comfortes the braine, helpeth to flay thin diffillations, and the cold paines of the head, as also all shaking and paralitick griefes: it helpeth also in all studden passions of the hear, as faintings, and swounings; and for the collicke, two or three spoonefuls thereof taken upon the occasion: The first of these which is the baltard kinde, being almost without finell or taste, doth declare it to bee of small vertue and officacy: but the mountaine French Spiknard, is reckoned to be effectuall, for all the purposes that the true Spiknard serveth for, but is weaker in operation; and moreover by reason it is somewhat more heating and lesse drying than it; it is more pleasing to the stomacke, and provoketh urine more effectually: the decoction thereof with Wormewood being drunke, helpeth those that are troubled with the swellings and windinesse of the stomacke, and being taken in wine is good for them, that are stung or bitten by any venemous creature. It helpeth also to dissolve all nodes and hard swellings, and is profitable for the spleene, reines, and bladder. It is also an ingredient of no small effect in Muhridatum, and others; and is used outwardly in oyles and oyntments, to warme and comfort cold grieses where soever they be. The Mountaine Spiknard is weaker than the Celticke or French Spiknard, by the judgement of Diescorides, Galen, and others.

CHAP. XLIII.

Hêre are many forts of Valerians to be remembred in this Chapter, some naturall, others strangers to our Country; and yet have beene free denizons in our gardens along time, others but of late.

1. Phu majus sive Valeriana major. The great Valerian.

The great Valerian hath a thicke short grayish roote, lying for the most part above ground, shooting forth on all sides other such like small peeces or rootes; which have all of them many long and great strings or sibres under them, in the ground, whereby it draweth nourishment: from the heads of these rootes spring up many greene leaves, which at the first are somewhat broad and long, without any division at all in them, or denting on the edges but those that rise up after, are more and more divided on each side, some to the middle ribbe, being winged, as made of many leaves together on a stalke, and those upon the stalke in like manner, are more divided, but smaller soward the toppe than below: the stalke riseth to be a yard high; or more, sometimes branched at the toppe, with many small whitish slowers, sometimes dasht over at the edges with a pale purplish colour; of a small scent which palling away, there followers small brownish white seed, that is easily carried away with the winde: the roote smelleth more strong than either lease or slower, and is likewise of more use in medicine.

There is a Mountaine kinde hereof, as Concretible faith, found in Savey, which is more fweete than this, even Atters of the finell of a Pomecition, but it is more fost of sentle than it.

d. Valerian

120

A. Paleriano Alpina minur.

Small wild Valerian of the Alpes

1. Phu majus frue Valeriana major. Thegreat Valerian.

2. Valeriana Cretica tuberofa. Knobbed Valerian of Candy.

2. Valeriana Cretica tuberosa. Knobbed Valerian of Candy.

This Valerian of Candy hath his first leaves, that spring up and lie upon the ground round about the roote greene, thick, and round, like unto the leaves of Afarabacca, and iometimes greater; the next that come after them are fomewhat longer, and fomewhat divided or cut in on the edges, and those that follow more and more divided, so that those that grow upon the stalke, are very like unto the divided leaves of the former Valerian: the stalke is hollow, and rifeth to be two foote high at the least, having here and there two smaller leaves set at a joynt: at the toppe whereof, which is divided into some smaller branches, stand many white slowers in an umbell, thick thrust, somewhat larger than those of the former, which turne afterwards into small and flat seed with a little downe at the head of them, like thereunto also: the uppermost roote from whence the leaves and stalke doe spring, is small round short and tuberous, from whence shoot forth round about it, divers other smaller rootes, fastned thereunto by long strings, like as the rootes of Filipendula are, the scent whereof is very like unto the former great Valerian.

3. Valeriana Alpina major sive latifolia. Broad leafed wild Valerian of the Alpes. This wild Valerian hath many large and somewhat round pale greene leaves, and in some they will be yellowish, rifing from the roote, lying upon the ground round about; every one having a long foote-stalke thereunto, some

whereof are very like unto Ivie leaves, but leffer and gentler, and others longer like unto the leaves of Canterbury Bells, but lesser also, and not so hard; in some a little dented, in others more dented about the edges, but not divided at all: the stalke is round, and about a foote and a halfe high, in some greene, in others somewhat reddish, having few leaves thereon, which are finaller, longer, and deeper cut in on the edges, than any below, and at the toppe is branched, whereon stand divers small purplish flowers, like unto the other Valerians: after which come small feed like unto the rest: the roote is large, round, and whitish, set with divers knots or joynts, and long fibres

under them, of a reasonable good smell, like unto wild Valerians, and of a bitterish binding raste.

4. Valeriana Alpina minor.

Small wild Valerian of the Alpes.

This small Valerian hath source or five small long, and somewhat narrow leaves, with one or two dents onely at the edges, lying on the ground next the roote, and are somewhat like unto the leaves of the great wild white Days of the control of the state of the great wild white Days of the great will will be determined to the great will be great will be determined to the great will be great will be determined to the great will be fie, especially those that grow highest, and are the smallest, but with sewer dents or notches about the edges : the stalkeriseth not up above a soote high, having very sew leaves thereon, which are smaller, longer, and narrower than those below, with as few dents or norches on the sides as the other: the toppe of the stalke is divided into few fmall branches, on every of which grow a few white flowers, like unto the Valerians, but smaller: the roote is small, and creepeth a little under ground, fending forth fibres, but no lesse sweet than the former.

5. Valeriana annua five Aftiva Clusy. Summer Valerian.
This annual! Valerian, hath divers long leaves lying on the ground, all of them deepely cut in or gashed on the edges, somewhat like the leaves of the Starre Thistle, among which rife up round hollow stalkes, two or three

3. Valeriana Alpina major five latifolia. Broad leafed wild Valerian of the Alpes.

TRIBELL.

5. Valeriana annua five Æftiva Clusij.

foote high, with some leaves growing thereon, two alwayes fet together at a joynt, as in the other Valerians, but smaller and more divided than the lower; branching forth towards the top, on the which stand many flowers fet together in tufts, being fmall and long, divided at the brimmes into five parts, making a ffisw of flowers, confifting of five leaves a piece, fontewhat like unto the flowers of the Indian Valerian next following, and are of a pale red or flesh colour, which afterwards bring small feed, like unto the red Valerian of Dodoness; the root is small, white, and wooddy, but perisheth every yeare; this hath a small weake Scent of Valerian.

6. Valeriana Indica five Mexicana. Indian Valerian.

The Indian Valerian growerh quickly into a stalke, from the first leaves that spring up, which are but few next the ground, fomewhat long and broad, somewhat like unto the first leaves of the Mountaine Spiknard, of a pale greene colour; the stalke is weake and hollow, not franding upright, but leaning or bending downewards, fer with joynts, at the which frand two long leaves, like unto those below, but a little more cut in or divided atthe edges, and at the joynts likewife fhoot forth two branches, fometimes on each fide one, and fornetimes but one branch on the one fide, which are divided, and at the toppes of them doe beare many flowers. (et thicke cogether in an umbell of tuft, each whereof is somewhat long, and endeth in five divisions; two of the uppermole whereof are broader and shorter than the rest, of ther two hangdowne as labels or lips, and the fift is the greatest standing in the middle, in some plants of a deepe red, of purple bemg in bud, and of a pale purple dolour being open, and in others milke white; each of these standeth in a small greene huske, wherein after the flower is fallen, the feed groweth, which haske openeth is selfe, and sheddeth the seed on the ground, when it is through ripe, if it be not carefully tended and gathered, which is

spongy,

122

THEE BELL

6. Muleriana andina fine Mexicana. Indian Valtrian.

Niteriana Africa rajor free later spongy, rounder, bigger, and blacker than any of the former

fongy, rounder, bigger, and blacker than any of the former Valerians, without any downe at the end of them: the room is small and stringy, perishing every them wighther first frosts the whole plant is utterly without tast from the winder any small in all that I have seen, and almost without taste from the small that I have seen, and almost without taste from least of the small red Valerian.

This small red Valerian is very the tunes the react red Valerian set forth in this & my former book, but the strength of the same long, and very narrow, very like unto the leave of Like or Flaxe, but not so long, harder or rougher in harding than they, and ending in a point: the flowers are of a labe red, like unto them for forme, being long, but smaller that they, and having as like seen to commend them. tle scent to commend them.

the scent to commend them.

8. Valeriana Petras. Rocky Valerian.

This simil Valerian hath divers sheaves lying upon the ground, some of them little or nothing divided, others as mud cut in, and gashed on the edges, as my of the other Valerian, but they are nothing so great; the stake is branched at the toppe, carrying turts of purplish lowers, but similer: the seed that followeth is smaller, whour any downe at the head, but in stead thereof it hath little skins, so it were at the ends, divided in five parts, and get them seems the a Starre, much like unto the toppes of the state of Valerian, as the leaves and flowers have the same of Valerian, as the leaves and flowers have the same of Valerian aminor annua. Small Valerian of a years.

9. Valeriana minor annua. Small Valerian of a yeare.
This small Valerian hath the first and lower leaves some This small Valerian hath the first and tower leaves somewhat round and dented, but the other that follow, and grow upon the stalke, are divided like unto the Valerians, the flowers are small and purplish, which followed by small seed that is blowne away with the winner, the rooten small and threaddy, perishing every year.

10. Valeriana minima. Small Valerian.

This little Valerian is very like unto the small wilde Valeddike the suppose has stalked for his

rian, but much smaller, having the leaves much divided like thereunto: the stalkes are not above halfe a foot high, bearing tufts of fmall purplish flowers : the rootes are long and small, with fmall white threads or fibres, fmelling like unto the small wild Valerian.

There are some other heartes set for the probes and others for Valerians, which in my judgement have so little one is called Physicians. Months some is called of most. Lattice against lather the minimum alternative which Dadmanic calletts against lather lettice, or Corne Sallet; which I have mentioned among the latitudes of Lettice in this and my other Books.

It. Valorians rubra Dodonai. Red Valorians.

This Valorians rubra Dodonai. Red Valorians.

This Valorians hath divers harts, but brittle whittin greene stalkes rising from the roote, full of taberous or swelling joynes, whereat stand two seaves on each side means and most and standone small leaves from betweene them, which are somewhat long and narrow, broaded in the middle, and small at both ends, without either division of dent on the edges, of a pale greene colour; the stalkes are three or source some head, without either division of ends whereof stand range sources, of a sine red colour, but without any scena of valorian a little to ordinary Valorian, but with longer neckes, of a sine red colour, but without any scena of valorian a little roote is great stood blowne a good while, they suddenly sall away, and the seed which is small and naked, with a little root of downs, at the toppe thereof, whereby it is easily castied away with the wind, ripeneth quickly after a the roote is great, thicke, and white, continuing long, and shooting out new branches every veare. white, continuing long, and mooting out new branches every yeare.

12, Valeriana Gracu. Grecke Valerian. The Greeke Valerian hath many winged leaves lying on the ground, form what like unso the wilde Valerian that groweth by the dirch fides, but more tender and small among which rile two or three round hollow brustle stakes two or three foots high, whereon are fet at the joynts such like leaves at grow below, but smaller, the soppes of the stakes are divided into many small branches full of flowers, each consisting of five small round pointed leaves, the sound like the state of the st of a faire bleake blue colour in force plants, and in others white, with some white shreads tips with yellow perdents in the middle: after the flowers are past, there come up in their plants small hand heads, containing small blackish seed: the roote is composed of a number of small long blackish threads, without any seems of a Vale-

This wild Valerian hath fundry winged leaves in ringing from the roote, whereafthe and leafe like largest, of a fad greene colour, without say dents on the edges, the stalke hath two fach like leaves and i joynt as grow below, but smaller, and at the toppe branched, with sundry small whitish purple flowers, but deeper than the Garden Valerian, the roote is a bush of blackish threads and strings, which send forth strings of extending besides that the lower branches doe shoot forth shrees so. Major, er branches doe shoot forth fibres also. Of this kinde there is accounted a greater unit a defendance of the

TRIBE. 1.

The Place.

The first is said by Diosecrides to grow in Pontus, it is found in the wet grounds of Mountaines, and in other moist places, it is generally kept in our gardens. The second grew in Candy, and was sent by Honorius Bellus from thence unto Clusius. The third groweth on the Mountaines of Austria and Styria; and so doch the fourth also, as Chifine faith he had from Places, but recordeth not from whence he had it. The fixth faid to come from Mexico a Province in the West-Indies, it came into these parts first from Italy, and as Bankinia faith, that which beared purple flowers, groweth (as he was given to understand) in the Country of Latines; or of the Latines in a place there called Siculus, and from thence was called of some Valeriana Sicula, and that with the white flower in the Country of the Sabines. The feventh was gathered on Mons Baldus. The cighth Fabine Columns found on the Mountaines in the Kingdome of Naples. The ninth growth in garden onely with those that are currious, the name rall place being not knowne. The tenth Lobel faith groweth about Mompelier in Franch. The eleventh and twelfth in our gardens chiefly, for we know not the naturall places of them. The last two forts grow in many Marshes and wet Medowes by Rivers and water sides in our owne Country.

They doe all flower in the Summer moneths of June and July, & the Indian kinds if they be fet early, will flower betimes, and continue flowring untill the frosts pull it downe, and so doth the Summer or annuall kind also. The Names.

It is called in Greeke of Phu, and vdo de dyfia, Nardus agreffis, or fplueffris, became it is in finell and faculty like unto Nardus, in Latine Valeriana, a multis quibus valet facultatibus. Some also callit Tigricoria, because itu an especiall ingredient into Treakle, and herba Beneditta, of Paracelsus it is called Tordina. The first is generally ealled, both in shops and of all other, Pha majus, and Valeriana major horteins: in English the great garden Valeria an, and of some Capons tayle, and Setwall: but Setwall properly is Zedourie, an Out-landish roote in the Apothecaries shops, which never was knowne to grow in any of these Christian Countries, The stoom is called by Bella, Nardus (retica, because the rootes have the smell of Nardus, (but the whole face of the bearie, as hee faith him. felfe, is most properly like a Valerian) as all the sweet Valerians are more or less; The chird is called by Clusius Vatelie, is most property like a Valeriant) as all the invect Valerians are more or lette. In crurcia cancarby Cinpus Valerians filterinis Alpina prima latifolia, and is the Valerians Alpina prima, and also the Valeriants Alpina Scrophularia folio of Bandiniu, described in his Prodomus; both which as hee himselfe saits, are comprehended under this of Cinfus: and is also the same that Pilleterius sent from Alompelier, unto Lobel in his life; time, under the name of Valeriana montana, which I doe here publish, and it is probable to be the Valeriana minimus of Lagdanish, although Banhinus seement to make it another peculiar sort. The fourth is called by Cinfus, Valeriana spicesfiris Alpina secunda saxatis, which Ranhinus calleth Valeriana Alpina Norde Celica simils. The fifth is called by Clusius Valeriana annua swe Affire, and Bashiniu calleth it Valeriana folis Calcierana. The fixth is generally now called Valeriana Mexicana and Indica: notwithstanding as is before said, they have beene both found growing naturally in Italy; and as Banbinus faith Faschalis Gallus fent him that with the white flower, from Paston many yeares agoe, under the name of Valeriana Indica Imperati; and againe from Cafabon under the name of Nordon Cretica: Corne. Jus did judge it to be Tripolium of Dioscorides, and was chiefly led thereunto, by the figure of Tripolium, which he faw in a Manuscript of Dioscorides, which Pinellus kept in his Library. The seventh Baubinus onely hath set forth the description thereof, under the same name is expressed in the title. The eighth Fabius Columna, calleth Valeriantila the description thereof under the same name is expressed in the title. The eighth Fabius Columna, calleth Valerians alter a tensifolia semine seabios selection. Tabermonianus calleth it Phu minus perraum, and Baubinus Valerianella semine selection to ninth hath no other than is set downe in the title. The tenth Kansh calleth Phu minimum, and Baubinus Valerianas structures of the seminers of the second series of the seminers of Speercrudt, and we in English as is before said.

The Vertues. Dioscorides saith that the garden Valerian hath a warming faculty, and that being dryed and given to drinke, it provoketh urine, and helpeth the drangury, and the decoction thereof taken doth the like also, and doth take away paines of the fixes, procureth womens courses, and is used in Antidotes. Gales faith that the reotes of Phu or Valerian are sweet, and like unto Nardas in quality, but much weaker to all purposes almost, yet it provoketh arine more plentifully, this either the sudian or Syrian Nardas, and is like unto Celtick Nardas therein. They saith that the powder of the foote given in deinke, or the decoction thereof taken, doth helpe all thranglings or choakings in any part, whether they be because of paines in the chest, or sides, and the past a way. The roote of Valerian boyled with Liquotice, Raisins, and Amiteed, is singular good for those that are finent away. The roote of Valerian boyled with the cough, and helpeth to open the passage, and to expectations the sides of the sides of the passage, the decoction thereof drunke, and the roote being taken in wints a side of expectative and provided with the plague, the decoction thereof drunke, and the roote being used to implicate a the passage of the side of the sides with a side of the sides of the side of the side of the sides of the sides, and or the purposed to the sides with the roote taken fresh, being broaded in applyed to the sides with the roote taken fresh, being broaded in applyed to the sides with the roote taken fresh, being broaded in applyed to the sides with the roote taken fresh, being broaded in applyed to the sides with the roote taken fresh, being broaded in applyed to the sides with the roote taken fresh, being broaded in applyed to the sides with the sides of the sight, or any pinne, have, or worlds therein. It is of excellent property to heale any inward fores or wounds, as also for outward hurts or wounds, and draweth any splinter or thorne out of the sides. The decoction of the roote of the sides Valerian, is stronger worlds draweth any splinter or thorne out of the side of the side of the side of the side of the sides paines of the fides, procureth womens courses, and is used in Antidotes. Gales faith that the reotes of Phu or Vaproperty to heale any inward fores or wounds, as also for outward hurts or wounds, and draweth any iplinter or thorne out of the fielh. The decoction of the roote of the lesser Valerian, is stronger to pass of the code, and insections than the greater, as Matthioluss said. It is very profitably applyed to assume that the stronger to pass of the code, caused of cold or of winds, if the sumes or vapours of the decoction thereof, made in the water distilled from the greater Valerian both hearbe and roote, in the support of the sum as singular good to be taken fasting for all the purposes aforefaid, and is a good and safe medicine in the property of the sum of the wormes in the belly, and is singular good to wash either greene wounds, or old where. It is generally called in the Countries of this Land, the poore mans remedy, to take the decoction of this root and drinke it, when by taking cold

rold after (weating, or over-heating their bodies, they be troubled with the cholicke or winde, or are otherwaies diffempered; or to use the greene hearbe bruised and laid to any cut or wound, of to draw out any thorne or fplinper, and heale it after.

> CHAP, XLIIII. Conyza. Fleabane.

tweene both. The providers and Pliny that followeth him, make but two forts; a male and a female, a country in forms and a female, a greater and a leffer, and a third which is betweene both. The providers and Pliny that followeth him, make but two forts; a male and a female, others have added a female, the least of all: but there are divers other hearbes referred unto them by Clusius and office, as they have found them in their travels: some of these forts are found wild in our Country in some places, but because they are not very frequent to meet with, I thinke it not amisse to ranke them with the rest of their Tribe in this place.

This great control of the rides. The truest great Fleabane. This great control of the rides accounted the truest and nearly unto change Discounted high divers hard rough, or hairy and woodly laskes, two or three stoote high; whereon are placed without discounted him of the edges, very clamping as the fallests also, surmitted more in the hotter Countries, than health, and are homewhat like mino the cleaves of the fallests also, surmitted more pointed at the ending of the properties of the fallest come forthat every joynt with the cleaves avellow flowers somewhat large, like into the first of Flaws were do Groundfell; which when it is full ripe, inverted into downer, and fivest gway with the feed: the small heach is somewhat strong, but somewhat sweet withall, and has satisfiance: and is so glutinous and clammy, that whe small proposed to the strong of the str

This kinde of Conyza hath divers round greene stalkes, about two foothigh, nothing to elaminy as the former, having many long political leaves flet thereon without order, of a fad or darke greene colour, each whereof is foure or five inches long, and an inch and a halfe broad: the flowers are yellow. forthewhat larger than the other, every one manding at the toppes of the branches upon a long stalke, in the same manner that the former doe, that is with a pale or border of leaves, and many finall, thrums in the middle, paffing into downe; and is carryed, sway with the winde, even as they doe. There At another of this fort with longer leaves, and leffer flowers. 3. Conjug Helenitis mellita incana. Hoary iweet Fleabane

The last P. annelfins referreth to the Company miner of Dioscorides, which Clusius rather thinketh is a species of his greater kinde, yet Banhinus calleth it Congrammion altera, and quoteth both Raumolfius and Clusius to call it Congrammior Dioscoridis. The Italians call it Congrammion it the Spaniards Attadequa : the French Conyza : the Germanes Hundfang and Durwartz : the Dutch Donderwortel

The Vertues.

The leaves of Fleabane as Diosecrides faith, are fitly applyed to the bytings or hurss of all venemous creatures, as also for pushes and small swellings, and for wounds: the leaves and slowers boyled in wine and drunke, is good to bring downe womens courses, and to helpe to expell the dead child: taken also in the same manner, it is good m procure urine, or when one maketh it by drops : it helpeth also those that have the yellow jaundise, and the griping paines of the belly: it is also good for the falling sicknesse, taken in vineger: the decoction is good to helpe ping paines of the belly: it is also good for the falling sicknesse, taken in vineger: the decoction is good to help many griefes of the mother, if women be bathed therewith, or fit therein: if the juyce beeput into the Matrix it causeth aborcement, that is to be delivered before the time: the oyle made of the hearthe, and annoysted, is very effectuall to take away all shaking fits of agues, and those tremblings that come of cold. The shall kinde helped the paines in the head. Galen saith that both the greater and the lesser are hot and dry in the third degree, and therefore powerfully warmeth any place whereunto they are applyed, whether used of themselves, or boyled in oyle, and anoyned; the leaves bruised and bound to any greene wound or cut, being first well washed or cleansed, healeth in a short space: applyed also to the soles of the feete, it stayeth any laske or sluce, and bound to the forehead is a great helpe to cure one of the frense: it openeth the obstructions of the liver, if the decoction thereof made in wine be drunked of either Goats or Sheepe eate hereof it will kill them by any extremity of thirth. The lesser is effectuall to all the ourposes aforesaid, but is more nowerfull to helpe any sluxe, or the bloody sluve. The sixth is effectuall to all the purposes aforesaid, but is more powerfull to helpe any fluxe, or the bloody fluxe. The fixth as is faid before, helpeth the toothach.

> CHAP. XLV. After. Starrewort.

1963 Helikenesse in many things that the Starreworts have with the Fleabanes, enforceth me to place them next thereasto, whereof we have such a number, as well of those that were formerly knowne to manext the results, whereor we have such a number, as went of those that were to interest and accurate my, as those which our later times have made knowne to us, and from Virginia, New-England, Sec. have come not the least store unto us. And although Dieferrides hath fet forth but one kind, which he calleth After Atticus of the place no doubt, where it grew most plentifully, or was of greater force, which -was the Country of Athens, yet later. Writers having found out divers other hearbes. Somewhat like unto it, have referred them thereunto; all which I meane in this Chapter to declare unto you.

1. After Atticus luteus verus. The true After Attick, or yellow Starwort.

1. After Asticus luteus verus. The true After Attick. or yellow Starrewort.

This Starrewort rifeth up with two or three nough hairy stalkes, a spote and a halfe high, with long rough or hairy brownish darke greene leaves on them, divided into two or three branches: at the top of every one where of standeth a flat scaly head, compassed underneath with five or five long because five or fixe long browne rough greene leaves, flanding like a Starre, the flower it felle, flanding in the middle thereof, is made as a border of narrow long pale, yellow leaves, fet with brownifh yellow thrums, the root dyen every yeare after feed time.

2. After cernuus Columna. The fost Starrewort of Naples.

The foft Starrewort is very like unto the former yellow Starwort, but that the leaves hereof are somewhat broader, larger, and not fo rough or hairy, the stalke is in like manner branched toward the toppe, which is not flenderer there than below, but groweth thicker when the flower flandeth, and bendeth downeward; on the toppe of every branch flandeth one flower, formewher toppe of every branch standeth one slower, somewhat like the other, consisting of many yellow leaves, with brownish threads or thrums in the middle, and compassed about with many more greene leaves, which are lost and gentle in handling, and not prickly or rough as the other; she feed is hitter in taste, long and notrow, somewhat star withall, yellowish, clammy, crested, and sweet in single is the root is composed of diversinge, yellowish starworks. Low creeping Starwork.

This low Starwork riterings with many stender, weaks crested, and somewhat harry stalkes, leaning downeyards, and not standing upright, whereon are see many long

long and narrow leaves, a little round at the toppe, very like unto long and narrow leaves, a little round at the toppe, very like unto the former, but finaller and greener up to the toppe; every fialke beareth opened overs which has yellow and large, like unto the flower of a come Manipold, so stained in a very hard huske, made of finall greene leaves, which she the flower is palt, becommeth fo hard and wooddy that one safe feare, open or breake it, to take out the feed which lyeth slope fitching therein a the roote is long and flender, having a few filters for the entire intro of Winder.

4. After latens major the fractor. Great yellow Starrewort of Matria.

Austria.

This Stat wort hath many long and narrow leaves, of a pale greene colour at the ground, formewhat like unto the leaves of that kind of Sostians, that is called Divide bit, whose leaves are not jaged at all, but are fornetimes covered with a little downe, the stalke is about two foote high, brownish and round, whereon are fet sparfedly long narrow pointed leaves, a little dented about the edges, at the toppe whereof it is divided into a few small and short branches, every one bearing a large vellow flavier, compofor the many small flowers, compared about with many long, for together in around head, compassed about with many long, somewhat broad and flar leaves, of a most excellent yellow colour, of a weake scent or none at all rafter the flower is pall, the seed is contained in the heads, cornered as if it were three ionare, lying dispersed in a downy substance : the roote is somewhat thicke and blackish, growing allope in the ground, fending forth many strings, & shooting forth many heads, wherby it may be encreased.

5. After montanns foly: Salicis. Starwort with Willow leaves. This Starwort from a long creeping roote, wonderfully sprea-I me starwort from a long creeping roots, wonderfully ipreading under ground, and encreasing: shootest up divers cretted strong greene stalkes, two foot high, plentifully stored with leaves thereon, being longer, harder, and greener than the last, without any downe or woollinesse on them, and a little dented about the

any downe or woollings on them, and a little dented about the edges, somewhat sharpe and hot in taste: the toppes of the stalkes are divided into two or three small branches, each sustaining divers small greene heads, composed of many small leaves set together, one about another, which in time open themselves into showers, of as large a size as the last, but with a smaller thrum in the middle, and narrower leaves compassing them, parted or divided at the end.

6. After latent languages starwort with woolly seaves.

This woolly starwort hath divers small and strong greene or browne stalkes, somewhat woolly, rising from the roote (which is spead under ground, and fastned with many long and strong shres, shooting yearely new sprouts bowing to the ground, and covered over with a soft woolly downe, compassing the stalkes at the bottome of them; of a sharpe hot taste, and somewhat bitters at the toppe of the stalke standers a large head, made as it were of many sealy leaves, which sustainesh a large round flower confisting of many long narrow and pale yellow leaves. of many fealy leaves, which sustaineth a large round flower confishing of many long, narrow, and pale yellow leaves, as a border to the middle, which are a number of small mostly flowers set together, of a deeper yellow than the border; the whole flower doth resemble that of Elecampane, and without any scent to commend it: the stalke brantheir from the joynts below, into three or four branches, rifing higher than the middlemost, every of them bearing such a slower: which when they are past, the seed contained in those heads, with the woolly or downy substance therein, is carryed away with the Winter.

7. After Intern angustifolins. Narrow leafed Starwort. This narrow leafed Starwort hath as great a creeping running roote as the fourth, and giveth as plentifull encrease, from whence spring up many small hard greene stalkes, not much above a foote high, whereon grow many long and narrow leaves, without any order one above another, not dented at all about the edges, but elfevery like unto the leaves of the wild Pellitory or Ptarmica, up toward the toppes, where they are divided fometimes into two or three finall branches, every one bearing a greene fealy head, and out thereof a yellow fearrelike flower, as the others have, but leffer than any of the former; these branches doe seldome over-toppe their middle or master branch, as the last recired doth; the seed that followeth is very like unto the other: and carried away with the

Pena and Lobel in their Adversaria have set forth two forts of After, which they call After went ann, and hirfuthe : Bankshus makerly them both of the number of his yellow Afters, but because that, as Clusius feemeth to fay they are comprehended under the others here fer downe, I make no further mention of them.

This Starwort rifeth up with a firong round falke, two or three foote high, bearing at the joynts two faire broad at the toppe of the fifth edwire brancheth) funded to make in the toppe of a finall Flos Solis, but more pointed at the ends, and being harder in feeling, full of voines: made of nine or ten greene leaves) tomposed of many long and narrow yellow leaves, with a brownish chrimme feed: the roote is fring past, there follower feed like unto a small Flos folis as it is said, for I never faw it beare feed: the roote is string various under ground, and spreading market: it losest both shalles and lease every yeare, feed: the roote is firingy, creeping under ground, and spreading maid: it loseth both falks and leafe every years,

Low creeping Starrewort, 3. After faptusus.

6. After luteus angustifolius. Narrow leafed yellow Starwort. 5. After luteus lanaginefus. Starwort with woolly leaves. 8. After Virgineus latifolius tuteus repent. Yellow creeping Starwort of Virginia.

9. After Virgineus lateus membranaceo caule. Yellow Starwort of Virginia with a filmy stalke. This yellow Starwort groweth to be 6.0r 7. soot high, with many stalkes, whose lower part thereof, almost to the halfe, is round, hard, and strong, the other part upward having a small stime of skin on soure sides thereof (as is no be seene in many other plants) up to the toppe which brancheth not, but beareth sundry small showers, as it they were tufts at the first, but being blowne open, each is a yellow starte composed of five or fixe small and long yellow leaves with small thicke yellow pointels in the middle, each having a blackish tippe or point resembling slowers, and afterwards turne to be star seed, broad at the head, which are so separately set together, that they resemble the stead of seed of a Rannensum, but greater: the leaves stand singly on each side of the stalke, being very like unto the former, of a dead or sullen greene colour, but not alsogether so large and broad, a little longer pointed also, and more rough in handling, with a small soot-stalke under each: the roote is knobbed and wooddy, with sundry long strings saltned unto them, and encreases the much at the sides, but creepeth not, holding strongly in the ground; this slowers that with us, and that not but in a warme yeare, whereby we seldome observe the seed: divers doe takeths to be the Wisanek, or Wosecan of the Virginians, but if Gerards information be right, as it is most probable, that which he calleth Wisanek, beareth crooked pods, and such dort the Peripleca of Virginia, as I sint well observed in Malter Francquevilles garden, whose rooked pods, and such dort the Peripleca of Virginia, as I sint well observed in Malter Francquevilles garden, whose rooked pods, and such dort the Peripleca of Virginia, as I sint well observed in the tender wisanek; this also lose the states as the former, and springeth fresh every yeare.

The other yellow Starwort of Virginia, groweth up but with one upright small round stiffe stalke, source or size footchigh, bearing two faire greene long shining leaves at every joynt, dented about the edges, but smaller than the former, standing on small footc-stalkes, and somewhat hard in seeling: at every joynt with the leaves on both sides, from the very bottome come forth branches, halfe a yard long at the least, with the like leaves on them: at the toppe of each stalke and branch standeth one flower, whole greene small round button under it, hath diver small greene leaves on the head thereof, out of which breaketh the flower, consisting of a dozen yellow small long leaves, compassing a middle deepe yellow thrum: this although I and some others have had it growing with us, yet slowed and seeded with none but Master Tradescant at South Lambeth. The seed by reason it slowers have have not yet well observed: the root is composed of sundry white and long hardish strings, with small sibrest them, and abideth divers yeares, encreasing by the sides, but perisheth to the ground, shooting new heads every yeare.

This kind of Starwort hath long and narrow leaves growing on the branched stalkes, which are a foote high, in singly thereon without order: the slowers grow singly at the toppe of every stalke and branch, composed of many duskie yellow leaves, with a browner thrum in the middle turning into downe, which with the sinall seed is carried away with the wind: the roote is threadly.

Wee have had from Virginia another fort of this kind, very like unto it, but with smaller flowers.

Fleabant like Starreworts

TRIBE ...

12. After fuptume Compenides Africania. Fleabano-like Searwort of Ravion.

This hath fundry weake branches rising from a stender long white roote, with divers small and long heavy serves middle, which after it is ripe turneth-into downe, which with the small seed enclosed together, siyeth away.

The Italian Starwort hath many wooddy round and brittle Italian Starwort, or the purple Margold.

The Italian Starwort hath many wooddy round and brittle Italian Starwort, or the purple Margold.

Whereon are fet without order to the toppes many somewhat hard and rough long leavest ound pointed, and is divided into sundry branches, bearing, single flowers like Marigold, the outer border of leaves Bering of a bhild, purple colour, and the middle thrum of a brownish pellow, breaking, out of a greene Italy head, like unto those or wherein lie small blacke and started long in their beauty, and in the end wither and string into a soft downe, with the wind; the roote is composed of sundry white strings which perish not but downe is tarried away leaves on their heads, and spring afresh every years:

wherein he is all blacke and that regulations what have unto Lattice seed, which with the downe is tarried away with the wind; the roote is composed of fundry white strings which perish not, but abide many yeares with greene leaves on their heads, and spring afresh every years.

14. After Anicus considered. Another blue Starwort, or another purple Marigold.

This other purple Marigold or blue Starwort, is a species or differing fort of the other Asistas Talorum force purples, but considered in stalke, leafe and shower, that one would thinke there were no difference, and indeed at the ends: the stalke riseth not up so high, showreth somewhat earlier before the other, and is of a paler purple oblight and colour, and sometime sound white also.

colour, and fometime found white also.

Of this Narrow-leafed kinde there is one also which groweth lower clear this, and in their fore called a dwarfe Alter kinde.

From among a number of small long and narrow leaves, houry as well on the under at application, of the forme of garden patic leaves, being as well on the under at application, of the forme of garden patic leaves, being and marrow at the bottome, and growing broader to the and which is sained pointed lying about the soone of this Mountaine Starwore, upon the growing broader to the find which is sained pointed lying about the soone of this Mountaine Starwore, upon the growing, rifert up a stalke it will a foote high, before with the like leaves grow below, but smaller up to the coppe, where there standed in which is a dominated of many long narrow leaves, of a purplish to the side of the standard of the standard long, and the saint small white saint a middle yellow through the roote is somewhat long, growing allope in the ground, which many small white sibres annexed thereunce, and encreasing by the sides as the rootes of Dassier doe.

17. After minor angustifolius.

The French purple Starrewort.

13. After Attions Italorum flore purperes.
Purple Italian Statrewort, or the purple Marigold.

122 CHAP. 456

15. After Alpinus carnice magne flore. The great blue Mountaine Statteviore.

16. Aster hirsutus Austriacus caruleus magno flare. Great blue Starwort of Austria. This Starwort likewife hath many leaves lying upon the ground, about the toppe of the roote, but they are thicker, broader, rougher, yet, with a foft hairineffer formewhat tharpe about the edges, and ending in a more rigid or flarpe point: with fush like leaves is the round stalke also beset up to the toppe, where it is divided sometimes into one or two branches, each sustaining as large a flower as the last, but the middle thrum is of a paler yellow colour, and compassed about with a number of small long leaves, of a pale blue colour, which passeth into downe, like unto the other s. This although it be somewhat like the last, yet is not the same, but a manifest differing kinde

This purple Starwort rifeth up with many flender, but straight tupright stalkes, of a foote and a halfe high, set with many seawes up to the coppe, longer and narrower than any of these blue or purple Starworts last recited, fomewhat like unto the leaves of Linerie or Tode flaxe : at the toppe of each italke fland three or foure flower imaller than the two last Starworts, and fomewhat leffer than the first of these blue kindes; confishing of many finall feaves standing as a starre, of a very pale bluish purple colour, and the middle thrim yellow, which passed into downe, and carryed away with the wind as the others doe. I should adjoyne unto these the Tripolisms, both for the likenesse of the slowers, and the English name of Sea Starwort; and although it be a sweet hearbe, yet because it is a plant that delighteth better to grow in watery places, I will referre it to bee spoken of among the Paludofa or wateru hearbes.

18. After Virgineus latifolius pracecior purpurante flore parve. The earlier and broad leafed purplish Starwort of Virginia.

The leaves of this Starwort which fland fingly on the fundry hard stiffe brownish greene stalke, of a yard high with short foot-stalkes under them; are broad and round at the bottome, growing narrower to the point, and small dented about the edges, of a fresh greene colour on the upper side, and somewhat yellowish underneath: each great stalke towards the toppe branchesh forth into slowers, which stand in a unit or spike, with divers small greene leaves below them on the stalke, and the slowers being many set on several small branches, have a small greenish fealy huske, and a small pale purplish flower comming out of it, confilting of fundry small leaves laid open like s statre, with divers pale yellow threads rifing up like a thrum, which turne into a downe with finall feed therein the toote is living, holding greene leaves all the Winter when the Italkes are withered and dead, but hard and twooddy at the head, fending forth long whitift strings: this flowreth a moneth or two before the next, that is bout the end of August, of later if the yeare provenor warme.

19. After Virginian angustifalian fermions payor absence flore. The narrow leafed and later flowred

Starwort of Virginia,

The many stalkes of this Starwort grow higher than of the other, bearing single leaves at every joynt, being long and narrow, without any dent at the edges, and without any foot-stalke at the bettome : at every joynt from about

the middle upwards it shooteth very long branches, and they oftentimes branched againe, at each joynt whereof stand single leaves, but much smaller and thicker set than below, the flowers stand fingly also at the joynts and toppes of every stalke and branch, which are small and Starre fashion, of a pale white colour, with a fingle purple thrum in the middle, rifing out of a fmall greene huske which turne into downe like the former : the roote is composed of fundry long white strings, which live long, and encreafeth much, losing all the stalkes in the Winter, and holdings aust of greene leaves, until it shoot new stalkes the next yeare; this flowreth much later than the other, sometimes not untill the end of October, or beginning of November, yet a moneth fooner in a warme yeare.

The Place. The first kind of Starwort groweth in Province and Narbone in France, in Lombardy also. The second on the Mountaines in the Kingdome of Naples. The third in New Castile in Spaine. The fourth at the foote of the Alpes of Austria and Stiria, and on Leytenberg, and other hills neare Vienna. The fifth in Mo-

Viensa, at the foote of divershills, and on the woods that were felled there. The feventh likewise in the fields neare Vienna, and in a small Wood neare the River Donaw or Danubins. The eight hath beene many yeares growing in England, fince it was first brought out of Virginia, and so hath the ninth also, but the tenth we have had scarle time enough to observe it thorowly since we got it from Virginia, by the meanes of Master George Gibbes Chirurgion of Bashe, who brought in his returns from thence, a number of seeds and plants hee gathered there himselfe, and flowred fully only with M. Tradescant. The eleventh groweth in many places of our owne land, in most or shadowy places. The twelfth Guillame Boel many yeares agoe brought out of Barbary with him. The thirteenth in many medowes both in Italy and France. The fourteenth in many places of Hungaria, Austria, and Moravia. The fifteenth in the graffy fields on the Alpes of Austria. The fixteenth groweth about Crenifum in Austria, and other parts of the Alpes there, as also on the Mountaine Iura in Switzerland neare Geneva. The seventeenth on the dry Rocky hills and Olive yards about Mompelier and Callrum novum. The eighteenth and last were sent us from France growing first in Canada. Some of them are hardly nourished up in gardens, especially the eighth and ninth, which are unwilling to change their naturall habitation.

The Time.

They doe all flower in the Summer moneths of June and July, some earlier or later than others. The Names

It is called in Greeke A'sap arfino & Subanior: in Latine After Attions; Bubonium & Inquinalia, both for that the flower is like a Starte, and that as it is likely, it grew plentifully about Athens, and of the effect to cure the fores that hapned in Ingwine, the groupe, Herba Stellaria also of fome. The first is called by all After Atticus legitimus, but Banbinus to diltinguish it, added foliolis ad flore in rigidis. The 2. is called by Fabius Columna After Cernus, be-cause the flowers bend downe their heads, and by Banbinus After Atricus folis circa florem mollibus. The third is called by Cynfus After secundus supinus, and so doe Dodonaus, Lobel, and Lugdunensis, and Camerarius, After Atticase repeas. The fourth is called by Clusius After terisus; Austriacus primus, or After Amonicus tertius, Ot Baubinus.
After luteus major felig Succifa. The fifth is Clusius his After Austriacus secundus; of Tabermontanus, Bubonium luteum: of Gerard After Italorum but fallely, of Lugdunensis Bellie lutea: of Baubinus After montanus luteus Salicis glabrofolio. The fixe is Clufun his After lanusinoso folio sevo quintus: of Tabarmontains After lute store: of Gerard After hirsuns: of Banhimus After lutens hinsurus Salicie folio. The seventh is Clussus his Anstriacus quartus: of Bauhiuns After Inicus linaria, rigido glabro folio. The eighth came fuff to us by the Virginian name Aquafcomenfe; somethinke that the Virginian name of the ninth is Wifanck, but fallely: but the tenth and eleventh without names, and therefore we have given them fuch names as feemed to us most convenient, and as are in their titles, untill fome fitter may be given by other. The eleventh Lobel in his observations calleth offer Conyzoides, as I and all others doe, but the twelfth was fo entimied by Boolins, as it is here fet downe. The thirteenth is called generally After Actions Italorum purpuses or carules flore. The fourteenth is a species of the last Actions Italorum flore purpuzee, whereof both Clufius and Camerarius make mention. The fifteenth is Clufius his After Auftriacus quinius, which he faith may be called Amelias Alpinus, in that it dothretemble the Amelias of Virgil. Lugdanensis calleth it After purpareus montanus. Bauhimus After montanus caruleus magno flore folis oblongis. The fixteenth Bauhimus onely remembreth by the name of After his/usus Austriacus caruleus magno flore. The seventeenth Lobel calleth After minor Narbonensium Tripoly store idinaria folio medio purpureus. The two last have their names given by us, as we dinke sittes for them. There hat beene formerly some controverse among Writers, what plant should bee After Attiens of Dissocrables, divers allowing of that After Attiens for lives, which is fet forth in this & my former Booke, whereof the 2, here fet forth; is I faid, is a kind nearest thereunto, others refusing it unterly, because it hath no purple colour in the flower, which that of Dissocrables hath; both in the description thereof by him, (as many described are that part in the description of the flower, to be propressed by living whitereas the new Editions have Purparenm luceumve) and in the vertues, where he faith that divers fay, that the purple of the flower, or in the flower, is good to heale the force of the groine; and rather allowing of the 13, kinde here fet forth, as likewife in my other Booke (whereof those with purple flowers here described are species) to be both the true After Atticus of Discouries, and the true Amelius of Virgil, which he describeth in the fourth Booke of his Georgicke, and that most plainely in these Verses.

1. Ruta heriensis major. The greater ordinary garden Rue of Hearbe or Grace.

TRIBE I.

3. Ruta Sylvestris major. The greater wilde Rue.

foure square heads (and sometimes in three square heads) like the other. This is of a more strong and virulent scent and talte than the garden kind.

4. Ruta sylvestria minor. Small wild Rue.

This small Rue, is also like unto the former, but that the leaves hereof are much more finely cut than it, both shorter and smaller, but as strong, or rather more than the other, both in scent, talle, and quality : the stake hereof rifeth not so high as the other, but brancheth at the toppe, bearing yellowish small flowers, and small feed in foure-foure heads, like thereunto: the roote is long and wooddy.

5. Rusa montaina. Mountaine Rue.

This Rue is the smallest of all the rest, whose leaves are the finest cut, and divided of them also, so that it hath fearfe the face or forme of any leafe of Rue; they are also much whiter in colour than any of them, and the most virulent and pernicious of all the reft, both in scent and taste : the flowers and feed are like unto the other forts, but the finallest of them.

6. Ruta sylvestris Syriaca sive Harmala. Wild Affirian Rue.

The Affirian wild Rue rifeth up with many darke round greene stalkes, about a foore high or more, whereon are fet diverslong leaves, divided into many parts, each whereof is longer, thicker, and greener, than the small wilde Rue, but not of fo strong or virulent a favour as it, yet somewhat strong, and a little sharpe and bitter : at the tops of the stand many flowers, consisting of five white leaves, larger than in any of the other forts of Rue: in the middle whereof rifeth up a greene three fourte head compassed about with many yellow threads: in which three fquare head when it is ripe, is contained small prownish cornered seed: the roote is thicke, and somewhat yellowith, with divers small fibres annexed to it. The Place.

The two forts of Garden Rue are onely nursed up in gardens in all places, yet the second is not so common as the first, but onely kept by a few. The other two wild forts grow upon the Mountaines in Spaine and Italy, and about Mompelior in France: but how we should believe Gerard, who saith some of them grow on the hills in Lancaspire and Torkesbire, you may easily gesse by their abiding our Winters, in gardens, for being of so hot and burning qualities, and growing in hot Countries, not enduring any cold; how should they be naturall to our climate, especially the more Northerly parts : the fifth in Spaine also, France, and other hot Countries. The last groweth in Syria, from whence it was fent into these Countries: as also in the fields, and about the hedges neare unto Constantinople, as Bellonius faith, in the fifth Chapter of his third Booke of observations.

The Time. The garden kindes especially the lesser, doth seldome flower in our land, and therefore scarse ever beare good feed. And the wild or Mountaines kindes doe the like.

The Names. It is called in Greeke nityarer, Pegenum quia caliditate semen genitale coagmentat, the roote of the fifth kinde, as

Est etiam flos in pratis, cui nomen Amello Fecere agricola, facilis quarentibus berba t Namque uno ingentem tollit de cestite sulvam. Aureus ipse, sed in folys, que plurima circum Fundantur, viola sublucet purpura nigra. Sapè deum nexis ornata torquibus ara. Afper in ore sapor : tonfis in vallibus illum Pafeores, & curva legunt prope flumina Melle,

Yet Guilandinus milliketh hereof, and although he allow of it, to be After Atticus, yet not to be Amelias, whom a I take it. Matthiolus doth convince : he nameth no man, but faith, that fome would make that hearbe, which be the judgement of all men, is Chelidonium minus, to be the Amelius of Virgil; which neither the flower, being if yellow, though standing like a Starre, not having any purple colour therein, which Virgil saith Amelias hath; for his words Aureus ipse, which is the flower, hath in foliys qua plurima circumfunduntur, the purple colour of the vis let, but not so faire, and cannot be referred to the leaves of that plant : neither the stature or forme of Chalidonian let, but not so faire, and cannot be reterred to the leaves of that plant: neither the stature or forme of Chelidonium, which is low lying upon the ground, and Amellus rising high, and bearing a bush of flowers at the toppe of his stake, as Virgil saith, uno imperment to this deceptive sylvame; neither the time of the flowring, for Chelidonium flow, reth in the Spring, and Amellus in the end of Summer, when the fields are mowed, as he saith, Tonsis in validous illustrations are legant prope summing Melle. Pena and Lobel in their Adversaria also, would make Tripolium to be the never the unto Amellus of Virgil, because the flower is purple, starre sufficient and yellow in the middle, and that it usually groweth in mostly places, neare unto Rivers, as Virgil saith of his; which in the greatest probability next unto this content is the property of the property of the state of the probability next unto this content is the property of the probability next unto this content is the property of the probability next unto the property of the probability next unto this content is the property of the probability next unto the property of the probability next unto this content is the property of the probability next unto this content is the property of the probability next unto the property of the property of the probability next unto the property of the probability next unto the property of the p of any other hearbe, but Virgil his words, after in ore fapor, which is harth or binding, agreeth not unto Tripolism and because I find no other Author agreeing thereunto, and that this is most commonly received of all, I dare not for sake so great reasons, and so many judgements, and adhere to this one of Pena and Lobel. The Vertues.

Dioscorides saith, that the purple leaves of the flowers boyled in water, was held to bee good for the paines and fore in the groine, as also the use of the fresh hearbe in oyle to anount the place, and likewise the dryed flowers, m tore in the grome, as also the use of the frein nearce in oyle to anoynt the place, and likewise the dryed nowers, use taken into the right hand of the patient, bound to the place that is grieved, it taketh away inflammations in those places, it helpeth children also that have the falling sicknesse: and those that are troubled with the Quinsse. It helpeth an hot stomacke, the inflammations of the eyes, and the fundament when it is fallen downe, if an oyntment the made of the greene hearbe, and old Hogs grease; it helpeth them that are bitten by a mad Dogge, as Cratevas saith it consument the swellings of the throat, and driveth away Serpens if it be burned. Gaten saith it is called Bubminm, not onely because, that being anonted, but also that being hung or tyed to the places, it bealeth the forein the groine: for it hath not onely a digesting, but also no small cooling quality, and repressing, being of a mixt property like the Rose. Pliny addeth that being bound to the place, it is profitable for the paine in the hippers.

CHAP. XLVI. Ruta. Rue, or Hearbe grace.

Here are foure or five speciall forts of hearbes called by the name of Rue, having little likenesse thereus to, but onely some shew in the leaves, which are these. First Russ Canina, whereas I means to speak among the Scrophularias. The second is Russ praterist, called also Thaliltrams, which you shall find in the next Classis. The third is Russ Mararias, which shall bee spoken of among other Capillar hearbes, and the fourth is Russ Capraria sive Galega, which shall be declared among the Abrighterium Counterpositions. Divers other hearbes have been entituded Russ, by singular Authors, as you shall since among the state of them, whereof to make mention here were needlesse; I rather referre you to the places specified. But

of our ordinary or garden Rue, common enough through all this Realme, there are some other form thereof which are here to be remembred with them, although not usually bred, or to be easily kept in the gardense

I. Ruta hortenfis major. The greater ordinary garden Rue or Hearbe of Grace.

This ordinary garden Rue groweth up with hard whitish wooddy stalkes branching forth on all sides, and buring thereon fundry long leaves divided into many small ones, being somewhat thick and round pointed, and of ring thereon fundry iong leaves divided into many imail ones, theing iongewise truck and round pointed, and or darke bluifn greene colour: the flowers that fland at the toppes conflit of foure small yellow leaves, with a green button in the midth, compassed about with sundry small yellow threads, which growing ripe, containeth within small blacke feed a the roote is white and wooddy, spreading farre in the ground, and shiding many yeares.

2. Ruta Hortensis miner. The lesser garden Rue.

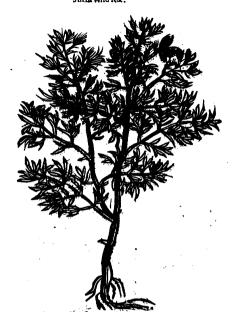

This Rue is so like the ordinary garden kind, that it will deceive many that doe not heedfully regard it, and Iss selfe am halfe perswaded that it is the pext fort of Rue, which is the greater fort of wild Rue, transplanted and many discounts and the person of the

nured in gardens. It rifeth not up fo high, neither beareth for great stalkes; the leaves are very like the common garden kind, but that they are smaller, and of a blacker or darker greene, colour: it dock more seldence give my flower with us, and the smaller, and of some form, nor the taste altogether so bitter as the other; and bereincom fisteth the difference betweene them.

This wild Rue, is in all things like unjoithe garden Rue, but that the leaves are fomewhat longer and therrows, and the colour of them are darker, more tending to greene: the falke in ftrong and welldry, in the natural place, which more than in the facility of the state of the falke in ftrong and welldry, in the natural place, much more than in these colder climates, but rifeth not fully so high as our garden kinde, where it fearly attained to any wooddinesse: the flowers also are yellow, composed of source yellow leaves like unto it; and small seed in

4. Ruta fylueftris minor.

s. Ruta Montana. Mountaine Rue.

Dioscorides saith, was called in his time, Moly montanum; and the roote of the Assirian wild kinde, was also as hee saith, called Moly, for the likenesse thereunto, being blacke with out, and white within : and Rus in Latine, of Rug, for the out, and write when a and were in Laure, or and, for the violent fierce vapours it fendeth forth, caufing itching blifters,&c. in English Rue, and Hearbe Grace, for the many good properties whereupto it ferryth, for without doubt it is a most wholesome hearbe, although bitter and firong, and could our dainty ftomacke brooke the use thereof, it would worke singular effects, being skilfully and carefully applyed. The first is called Rais Saiva, or 4, mestica, hortensis, or latifolia & major by all Authors, The fecond is called by Trague Ruta bertensis minor, and by Cordan Ruta sativa minor tenuifolia, Dodonam calleth it grave shau. The third is called Ruta sivestria of Matthiolus, Lobel, Lagdunensis, and others, and is the first of the wilde kinder with Dodonam and others, as the fourth is the fecond wilde with him. The fifth is the smallest wilde Rue , called of Line Rutula and Peganum Narbonensium : of Dodonans Rutass veftris minima: of Clufius Rusa montana legitima: of Campa rius, and others Rusa filveftris tennifolia. The last is called Harmala even in Dioscorides his time, as he faith, and Raf-fan of others, and so it is called still with most Wriggs, at Harmel, yet some Rata sylvestrie, and Syriaca. The Arabim call it Sadel : the Italians Rutta : the Spaniards Arrada ; the French Rue : the Germanes Ranten: the Durch Raytee: 188 we in English Rue, or Hearbe Grace.

The Vertues. Both forts of Rue (that is) the garden and the wilde, Dioscorides saith, doe heate, burne, and exulcerate the skin-It provoketh urine and womens courses, being taken in meat or drinke. The feed thereof taken in wine is an Ansidore of Counterpoison against all dangerous medicines, or deadly poisons: the leaves hereof taken either by themselves, or

with Figges and Walnuts, is called Mithridates his counterpoifon, or Mithridate against the plague, caufeth all venemous things, as well as of Serpents, to become harmelesse; being often taken either in meate or drinke, it abateth venery, and destroyeth the ability of getting children: a decoction made thereof with some dryed Dill leaves and flowers, ealeth all paines and torments, inwardly to be drunke, and outwardly to bee applied warme to the place affected. The same being drunke, helpeth the paines both of the chest and sides, as also coughes, hardnesse, or place affected. The same being drunke, helpeth the paines both of the cheit and sides, as also coughes, hardnesse, or difficulty of breathing, the inflammation of the lungs, and the vexing or tormenting paines of the Sciatica, and of the joynts being anounted, or laid to the places, as also the shaking of agues, to take a draught before the sit come; being boyled by inflused in oyle, iris good to helpe the wind collick, or the swelling hardnesse or windinesse of the mother, and steeth women from the strangling and suffocation of the mother, if the share and the parts there-about bee anoyited therewith; it killeth and driveth forth the wormes of the belly, if it bee drunke after it is boyled in wine to the halfe, with a little honey; it helpeth the gowt, or paines in the joynts of hands, seete, or knees, applyed thereunto; and the same with Figges helpeth the dropsie, which is a running of sharpe water, betweenethe sless and the skin, being bathed therewith; being bruised and put into the nostrils, it stayeth the bleeding thereof. It helpeth the swellings of the cods, if it be boyled with Bay leaves, and they bathed therewith. It taketh away wheales and pimples, if being bruised with a few Mirtle leaves, it be made up with waxe, and applyed thereon. It cureth the Morbhew, and taketh away all forts of warrs, on the hands, face, nose, or any other parts, if thereon. It cureth the Morphew, and taketh away all forts of warts, on the hands, face, nofe, or any other parts, if thereon. It cureth the Morphew, and taketh away all lors of warts, on the nands, race, noie, or any other parts, it it be boyled in wine, with some Pepper and Niter, and the places rubbed therewith: and with Allome and Hony, helpeth the dry stable or any tetter or ring worme: the juyce thereof warmed in a Pomgranar shell or rinde, & dropped into the tares that sie full of paine, helpeth them the juyce of it and senuel, with a little honey, and the gall of a Cocke put thereunto, fielpeth the dimpesse of the eye-sight: an oyntment made of the juyce thereof, with oyle of Roses, Ceruste, and a little vinegar, and an oyntment same of the juyce thereof, with oyle of Roses, Ceruste, and a little vinegar, and an oyntment same of the juyce thereof in the head, And those flinking alocts of the noise and other parts. The earing of the leaves of Rue taketh away the smell both of Garlike and Leekes. The Antidote that Muthidates the King of Pontus aled to take every morning falting, of Garikk and Leckes. The Antidote that Communates the King of Fourth used to take every morning fatting, thereby to fecure himselfs from any poylon or infection, was this. Take twenty leaves of Rue, a little salt, a couple of Walnuts, and a couple of Figges, bearen together into a Masse, which is the quantity appointed for every day. Another Electuary is to be made in this manner. Take of Niter, Pepper, and Cominseed, of each equall parts, of the leaves of Rue cleane picked, as much in weight as all the other three weighed, beare them well together as is sitting, and put thereto as much honey as will well make it up into an Electuary, (but you must first prepare your forms of the leaves of the salt will be a cleaned by the salt will be a complete to the salt of the salt will be a complete to the salt of the sa Committed, laying it to freepd in vinegar, for 24, houres, and then dry it, or rather tofte it in an hot fire shovell, or as others would have it in an Oven) is a remedy for the paines and griefes of the cheft or stomacke, of the spleene, belly, and sides, by winde or stitches, of the liver by obstructions, hindering digestion of the meate, of the reines beny, and nuce; by wings or intenes, or the nver by contractions; hundering digention or the meate, or the reines and bladder, by the stopping of the urine, and helpethals to extenuate fat or corpulent bodies. The leaves of Rue first boyled, and then laid in pickle, are kept by many to eate, as fawce to meate, like as Sampire is, for the dimnesse of sight, and to warme a cold stomacke. The distilled water thereof, is effectual for many purposes aforestial. Our garden kindes worke all these effects, but the wild kindes are not used so often with us, not onely because we have garden kindes worke all these effects, but the wild kindes are not used to often with us, not onely because we have them not usually, and that they will not abide our cold Country, but their fiercenesse is scarce tolerable, except for outward griefes and applications, for the falling sicknesse, palsies, gowts, joynt aches, and the like, wherein they worke more forceably than the garden kindes, for taken inwardly by women with child, it destroyeth the birth, and mightily expelleth the after-birth. Antigons, in his Rhapsody or huddle of memorable things, relateth a long of the control o of a Wesfell, that being to fight with a cruell Serpent; eateth Rue, and rubbeth her felfe therewith; before hand, to be the better defended from the poilon; whereby it was found to be powerfull against the sting or byting of venemous creatures. The small Mountaine kind is so violent, that it may soone kill one, if it be not carefully looked untoo, or to great a quantity given at a time.

CHAP. XLVII. Caryophyllata. Avens.

Here are divers forts of Avens more than formerly hath beene knowne, to bee fet forth together in this Chapter.

1. Caryophyllata vulgaris. Ordinary Avens.

Our ordinary Avens hath many long rough darke greene winged leaves, rifing from the roote, every one made of many leaves, fet on each fide of the middle ribbe, the largest three whereof grow at the ends, and snipt or dented many reaves, tet on each mee or the many reaves, from times two, and fometimes foure, standing on cented round about the edges; the other being small pieces, sometimes two, and sometimes foure, standing on each side of the middle ribbe underneath them: from among which rise up divers rough or hairy stalkes, about two foote high, branching forth diverily with leaves at every joynt, not fo long as those below, but almost as much cur in on the edges, some of them into three parts, and some of them into more: on the roppes of the branches stand small paleyellow slowers, confliting of five leaves, every like unto the flowers of Cinque-foile, but larger: in the middle whereof standeth a small greene head, which when the flower is fallen, groweth to be rough and round, being made of many long greenish purple seeds, like graynes; which will sticke to any bodies cloaths: the roote is made of many brownish strings or silves, which smell somewhat like unto Cloves, in many places, especially in the higher botter, and developed and seed seeds a large street but nothing so much or not as all in many cores places. higher, botter, and dryer grounds, and freer cleare ayre; but nothing so much, or not at all in many other places, especially if they be most, and are of an harsh or drying taste.

Of this kind Camer arms faith there is another found in Mountaines, that is larger than it, not much differing else in any thing.

2. Carjophyllata montana; Mountaine Avens. The Mountaine Avens from a long brownish round roote, of the bignesse of ones singer, creeping under the upper crust of the earth, (and not altogether to stringy as the former) with some small sibres shooting downewards in several strings. verall places, and finelling and rafting like the other, sendeth forth divers winged leaves, made of many small feaves towards the bottome, standing on both sides of the ribbe, the end leaves being largest and whole, not divided the

TRIBE I.

1. Caryophyllata vulgaris. Ordinary Avens.

2. Carvonbullata montara.

Mountaine Avens.

but somewhat deepely cut in on the edges, of a fresher greene colour likewise, softer also and gentler in handling: from among which rife slender stalkes, seldome branched, having very few leaves thereon, at the toppes whereof stand usually one flower apeece, yet sometimes more, made for the most pare like the former, consisting of five at fixe leaves, much larger than they, and of a deeper yellow colour, and sometimes with a white flower, as Camera. nixe leaves, much larger than they and or accept years worked, and to the middle, compassing a green head, which when the flower is past, increasent to be a round head, befet with flat feeds, not for rough, or ready to sieke so one garments, but every one of them having a long featherlike haire or thread at the end: the whole plant as well leaves as flowers, and feed, are covered with a small fost hairy downe, which is not much or easily differned unleffe one heed it very well.

3. Caryophyllata Alpina minor. Small Mountaine Avens.
There is a smaller kinde hereof found on Mont Baldus, little differing from the former, but in the smalnesse thereof, being covered with a foft downe, and of a darker greene colour, the flowers being large for the smalnesse of the plant, and confifting of fixe leaves for the most part.

of the plant, and confifting of fixe leaves for the most part.

4. Caryophyllata Alpina minor altera. The other small Mountaine Avens.

This small Mountaine Avens hath much longer leaves than the last, lying upon the ground round about; and small more divided, or cut into divers parts; making each part of the leafeto resemble that of Smalladge, being a blief in length, from among which rise up two or three weake trayling stalkes; with source leaves that of singly cut in, on the toppe whereof standerhone large slower, conflicing of size, and sometime of eight leaves, standing in a greene huske, whice ends reached the height of the flower; which is of a space yellow colour than the former, and attrictions such like heads, of long hairy seeds with some results somewhat long and standard with divers fibres at them.

5. "Carpophyllara munican five publifirs purposes. Purple Mountaine or marth Avens.
This Marth Avens hath leaves formewhat like the fecond fort out with longer fooce-stalkes, and formerolat help, the stalkes rise as high as the first many times, with fewer leaves for here and there on the main more divided yards. topes fland two or three small flowers apeece, hanging downe their heads; of a purplift yellow colour, surcespecting above the huskes that contains them: after which come such heads, but more lost and downers the them.

creepeth in the ground; and finelleth much leffe than the former, and some little or nothing.

Wee have had from New-England another of this kind, brought by John Newson a Chirurgion of Control is taller and greater than this, differing little in any thing elfe, giving flat thin blackish feed in huskes.

6. Caryophyllata aquatica altera. Another Marsh Avens. This other is like unto the fift, but hath the huske that containeth the flower, fpreading beyond the brims thereof, which is in some more reddish, and in some more double than in others," noe differing in any other nomble thing.

7. Caryophyllata Pentaphiles,

P. Composition Peninspollar. Cinque-foile Avons.
The Cinque-foile Rivons bath the leaves thereof divided into five parts; like unroa Cinque foile leafe; dented about the edges, the falkes are about a foote high; having some fuch like leaves thereon, at the source where it brancheth forth; at the toppes whereof hand pale yellow flowers, like the first fort, but imalier, with many vellower threads, somewhat downy in the middle: the roote is composed of many brownish thrings, findling forme-what like moothe former kindles.

The Place. The first as I faid before, is found wilde in many places of this Realme, under hedge sides, and by the pathes in many fields, and delighteth rather to grow in shadowy than Sunny places, yet is usually brought into gardenate the atherologic beautiful popular of a formula by the Springs of the River Abia, as Containing and Corona saint upon Mons Baldus, as Pens saith, and in some other places. The third and fourth upon Mount Baldus, as Pons relateth, both in his Latineand Italian delicipitions richeroff. The fifth and flixth grow by water fides, and in anoill and wet, or markin grounds, on the Mountaines. The last was found by Pans hard by Clatens on the Rhatin Alpes in Switzerland, whereas he faith, here mooks it for a kinds of Cinque itolic or To mentill at the first, in all by the funding with the first of the first, on all by the for a kinds of Avens.

These does now in the moneths of May, and June for the most part, and their seed is rine in Idly at the farthest.

by Names It is generally, called in Tarine now adays Carpophyllata and Garpahyllata, (for it is not found to be knowne to any of the ancient Greeke or Tarine Writers, except the General of Play, as most of the lare Writers doe considerity, and nor without good reason supposed from the General or without good reason suppose) from the scent of the roore, so neare resembling

Cloves,

Cloves, which are called Caryophylli, yet some have called it Herba Beneditta, of the excellent or ble fied qualities thereof, and others Sana-munda, for the like effects. Trages would have it called his Nardus agress us not onely for the sweet scent of the rootes, but for the cordiall properties it hath. The first is as I said, called of the most of the later Writers Caryophyllata & vulgaru & hortensis. Brunfelsius as I thinke first, and after him Gesner, Tragu, and Tabermontanus call it herba Beneditta, and Beneditta. Camerarius saith the French call it Sana-munda, and Tuner as I thinke, or Gefner first, and after them Lobel, call it Genne Pling. The fecond iscalled of Marchiolus (who mer as teninke, or Gefore Intt, and arteet them Loves, can it geome ring. The technicist and considered who first let it forth) Carpophyllate moment, and so doe Dodoneus, Lugduneushi, Anguillara, Tabermonomia; and Germa; Camerarius calleth it Carpophyllate Alpina, Tragus Benedicta sylvestrie: Label Carpophyllate and or minima alpina departum, in his bortis Germania; Baubinus calleth in Carpophyllate Alpina bina; The third and source be letter forts of this kind, were found by Pona on Mount Baldus, and alled by his Europhyllate Alpina omnium minima, and minima altera: The fifth is called by Lobel Carpophyllate Septembria data containing the con Alpina ommium minima, and minima altera: The fifth is called by Lobel. Carpophyllata September and the instantifolic pappole flore: by Clusius Carpophyllata montana prima: by Gesser in horis, Genm revalle: by Committee in horse, Carpophyllata palus frie, and in his Epitome upon Carpophyllata carpophyllata aguatica: it is in the september of the properties of the former, and aguatica in the first his mentioned by Bauhimus in his Matthiolus under the title of the former, and calleth it his Pinax, Carpophyllata aguatica altera, the slowers whereof are expressed by Clusius under the manerof carpophyllata montana sertia. The last is called by Pena and Lobel in their Advertaria, Carpophyllata Alpina Pentaphylla, Castor Durantes giveth the same figure, with the name and description of Matthioly's his Carpophyllata montant Tabermontanus calleth it Carpophyllata Alpina quinque felia, and so doth Bauhimus in his Pinax, who also settle downess if it were the Polympias I still is a language of the control of the source of the polympia to the source of the carpophyllata stilling in Language is which there is the source of the polympia to the source of the polympia to the polympia to the polympia to the polympia to the source of the polympia to the polympi downe as if it were the Polyrrhizos latifolia in Lugdunensis, which there is let forth, to have a white flower, growing on some hills in Savoy, but Gerard in translating Dodonans his supposition; that the Caryophyllata monta should be the Baccharis of Disservices, excepting the colour of the flowers, and the likell of the rootes, which yet he endeavoureth somewhat to reconcile, sheweth onely Dodoneus his misse; and not fully his owne, unlesse you will beleene that, all that he translateth out of Dodoneus, was first his owne opinions. The Vertues.

Being accounted by the latelt best Writers (as I faid before) to be the Genm of Plant, it is as hee faith, not onely good for the difeafes of the cheft or breft, but good also for flitches or paines of the fides, and to expell crude or raw found by all to be effectuall. It also dissolve the inward congealed or clotted blood, happening by falls or bruiss. or the spitting of blood, the rootes especially either greene or dryed, being boyled in wine and dranke; as also a manner of inward wounds, or outward if they be washed, and bathed therewith, or if they be fiftulous to bee inje cted. The same decoction also drunke, comforteth the heart, and strengthneth the stomacke, and a cold braine, and therefore is good in the Spring time to open the obliructions of the liver, helpeth the winde collicke by diffolying the wind, and flitches and paines in the fides, and being of a binding quality, helpeth also those that have fluxes, of are bursten, or have a rupture. If foule spots or markes in the face, or other parts of the body be washed therewis it taketh them away, and leaveth the skin well coloured. The powder of the dryed rootes, or the juyce of them when they are fresh, worketh the same effects that the decoction doth : and in callous ulcers, with the juyce of the rootes, if a little vardigreafe be added, it worketh a fingular good effect. Some use in the Spring time to put the toote to steepe for a time in wine, which giveth unto it a delicate savour and raste, which they drinke fasting every morning, to comfort the heart, and to preserve it from noysome and infectious vapours of the plague, or any pofor that may annoy it; as also to helpe digestion, and to warme a cold stomacke, troubled with grosse or some bumours, and to open the obstruction of the liver and sphere. Some docute to lay the mores dryed among gaments, to perfume them with the finell thereof, and to keepe away Mothes, &c. from them. The Cinque-folk.

Avens, because it participateth with the other, both in finell and talte, although weaker, cannot but likewise pe take with them in the qualities aforefaid, yet not so effectuall, although I know not any Author bath made mention of any experimentall effect thereof. The Mountaine Avens, as Matthialus faith, is found to be as good as the ord mary, for all the diseases whereunto it is applyed, and worketh more forceably and speedily in them all.

CHAP. XLYIII.

Calamus Aromaticus. The Atomaticall Reed ; and Acorus legitimus Diefertidis, five falfo Calamus edepatus efficial rum. The true Acorus of Dioferrides, or fweet finelling Flagge, universely called Calamus in the Apothecus thoppes.

Have joyned both these plants in one Chapter, for the transposition of the names, and the stweet ma-ling properties the one doth enjoy, although fallly appropriated to the other, as much differing both in se and manner of growing.

and manner of growing.

1. Calamus Aromaticus Mathieli. Calamus Atomatical Reed.

This Aromatical Reed groweth with an upright call fishing, fet full of joynin, at certaine spaces up to the topp, (not hollow as divers other Canes and Reeds are, but stuffed full of a white spongious pith, which is of a guant taste, somewhat bitter, and of the bignesses of a mans singer) and at every one of them, a long narrow state, of darke browne greene colour, smelling very sweet, differing therein from all other kindes of Reeds: on the toppe whereof groweth a bushy or Featherslike panicle, like tunto those of the common Reed: the roote is kinobby, wind divers heads thereat, whereby it encreases hand hooceth forth new heads of leaves, smelling allo very sweet, his ving a little binding raste; and sharpe withall. This is the description thereof exists in sundry Authora since Mathielus, although all others follow him therein, therefore I give you not their signre; but the signre of the offendales that Camerarius and Clussus set forth, that all may see what manner of thing that Calamus is, and the whole sigure of the plant, as Alpinus setteth it forth, in lib de stantic existics. whole figure of the plant, as Alpinus setteth it forth, in lib de plantis exosicis.

2. Colomi Aromatici Syriaci ut fertur veri flipites ficce.
The dry fialkes of the true Aromaticall Reed as it is supposed.

TRIBE. 1.

2. Calamus Aromaticus Syriacus vel Arabicus suppositirius. The supposed true Syrian, or Arabian Aromaticall Reed.

This plant which is supposed by many to be the true Indian Galamus aromaticus, (but much suspected by others I flicth up from a thicke unprofitable roote, three or 4. inches long, bigge at the head, and small at the bottome, with one, and sometimes more stalkes, two cubits high (saith Banbinne, who describesh it from the sight of the plant he received from Doctor. Doldines: but halfe a cubite high, or somewhat more, saith Alpinns lib. de plants exerticis) being straight, round, smooth, and easie to breake into splinters, full of joynts, and about a fingers thicknesse, holbeing unager, round, mooth, and calle to plant a market parties, and popular, and account a magnet unicanene, notion and foongy within, of a whitifit yellow colour (like the pith of an elder, faith Alpimur, or like other Receds, as Mashing, faith) the stalke is divided into other branches, and they againe into other smaller ones, two usually set together are joynt, with two leaves under them likewise, very like unto the leaves of Lymnachia, the Willow bearbe, or Loofe-strife, but lesser, being an inch broad, and an inch and a halfe long, compassing the stalke at the bottome, with sundry veines running all the length of them: from the joynts rife long stalkes, bearing sundry small yellow flowers made of leaves, like also unto Lysimachia, with a small pointell in the middle, after which follow small blackish long heads, or seed vessels, pointed at the end, containing within them small blackish seed : the Galles hath little or no form, yet not unpleasant faith Alpinus, being bitter, with a little actimony therein; but Baudinus saits, it is of an aromaticall taste, and very bitter. This (saith Alpinus) the Arabians and Egyptans doe use and call it Cassant are in Cassant Aromaticus, & from them all other Christian nations have to accepted it: but how improbable let any others judge that will believe. Theophrafius, Diofcorider, Gulen, Pliny, and others who doe all call it a Reed, when as this you fee is none, and as Theophrafius & Pliny fay different not in forme from other Reeds: for Pliny reckoneth up: 29 forts of Reeds, whereof this is one in their times, and for the investment the characteristic forms. thereof; onely used in sweet ownements : for the taste also ; Diescortdes saith it bath some astringency, and a little acrimony therein, but mentioneth no bitternesse, when as this bath more bitternesse in it than any other talks, which could not be forgotten by Diescaride if his had any in it. This plant growerh both in fundry moilt places in Egypt, as also by the lake Gemeafareth in Indea, and in divers places also of Syria and Arabia: and for ought that wee can perceive, is rather a kinde of yellow Lyamachia than any other plane.

This sweet finelling Flagge hath many flaggy long and narrow fresh greene leaves, two foore long specie, or more, yet structures somewhat brownish arthe bottome, the one rising or growing out of the side of the other, in the same minute that other Flagges of Flower-deluces grow, which are thin on both sides and tidged or thicke in the middest, the longest for the most part standing in the midst, and some of them as it were curled or plained to-wards the ends or the most part standing in the midst, and some of them as it were curled or plained towards the ends or toppes of them; finelling very (week, as well when they are greene and fresh; as when they are dryed, and so kept a long time; which doe so abide in a garden along time, as though it never did, or never would beare flower: the leaves every years dying downe to the ground, and should fine the every Spring, but after two, three or form the end of the did thought from the army faller. two, three, or foure yeare abiding in a place without removing, befides the leaves it shootests forth (not any stalke)

TRIBE,

CHAP. 48.

3. Acorus verus five Calamus officinarum. The fweet fmelling Flagge.

CHAP. 48.

as other Flower-deluces doe) a narrow long leafe by it felfe, flat like unto the other leaves, especially from the middle thereof upwards; but from the bottome to the middle it is thicker, narrower, or tounder, where it beginneth to grow flat, at which place comment forth one long tound head, very feldome two, in forthese bignes like unto the Catkin or Aglet of the Haffelnut tree, growing upright, and of the length that knesse of ones singer, or rather bigger; set with severall similar lines and divisions, like unto a greene Pine apple, of a purplish greene colour for the most part, out of which bunches, shoote forth small pale which flowers, consisting of four small leaves affecte, without any so good stent as the leaves, falling quickly away; and not giving any feed that ever I could observe or understand: the roote is thicker. that ever I could observe or understand : the roote is thicke and long, lying under the upper face of the ground, flipoting forward, and with small rootes as suckers on all sides like unto the garden Valerian, whitish on the outside, or greenish if it lye above the ground; and more pale or whitish on the infide, with many joyner thereabouts, and whereat, it hath or the doth shoote forth, long ducke sibres underneath, whereby it taketh strong hold in the ground, of a sirme or fast slibstance, yet not hard or wooddy, but easie to be cut, of a sweet scent, and somewhat bitterstate.

The first is thought by Matthiater and others, to grow in India, Syria, & India, The dry stalken of the same said to grow at the foot of Mount Libanus in Syra, not farfrom Tripoli, in the wet grounds there: the other as Maid before. The other Calams of the shops, or true Acors groweth in many places of Turky, (in moift grounds, for so with us it joyeth and sourisheth better than in dry) from whence the largest roots, the firmelt, whitelt, & sweetest are brought unto us: but it groweth also in Russia, and those other places thereabouts, in very great plenty; but the rootes being dryed, are more lanke or imall, not fo firme or white, nor of fo fingular a good fcent. The Time

These Reeds are strangers not growing with us, we having no further knowledge of them: the sweet smelling Flagge beareth his catkin in the beginning or middle of July and August. The Names

The first and second have their names in their titles, as their Authors have called them, but whether either of them be the true Calamus Aromaticus of Dioscorides, Galen, and others, it were worthy the knowledge; for although it be commonly to taken to be, yet Chafins in part improving it, and I shewing more doubts, doe make it the more improbable; and it is very certaine, that we have no true Calamus. Aromaticus brought unto us in these dayes, for even thorow all Turkie, with both Physicians and Druggists, or Merchants, (for they have no Apothecaries find as are in Christendome) it is not seene or knowne, for the Arabian word of Cassaberbia, which is Calama Aromaticus, they understand not what it is, and being demanded for it by that name, (although the Arabian tonget be very frequent among them) they fill will give contrary things for it, as Marthiolus in his Epiftles, and Bellonis in his observations doe declare. Now whether it should be called Calamus Aromaticus, or odoratus, it is worth the scanning also, because very many doe thinke the word aroma, from whence commeth Aromaticus, is the fame with odor and odoratus; but I finde Garcias a very learned Writer, and others also to contrary that opinion; saying the the Arabian words, derire or therira, fignifying aroma, (as Caffab doth Arumo or Calamus) is properly a drogut or drugge, whether they be spices that smell sweet, or any other thing used in medicine; that hath either a strong or no finell, for fo the Hebrew word deror fignifyeth alfo, as Mor deror, Myrrha aroma, or aromatizant, the bet Myrrhe, in the Scripture Exed, the 30, chapter, and 23, verse, was appointed among other spices to make the holy anounting oyle, and in the 34. verse of the same Chapter, with Gallanum which hath no sweet scent, as I thinks every one knoweth, and other gums to make perfume to burne : and Myrthe although it be reckoned with Ale and Caffia, as a tweet thing, in many places of the Scripture, yet it is not fweet to us, as wee account fweet thing in these dayes, and Myrrhe and Aloes are called Aromata, in the 19. chapter of Saint Johns Gospell. Garcias fall Calamus aromaticus he knew well, and was of much use in India, both with himselfe, and other Physicians. as all with many persons of high and low degree, but any to be odorans sweet, he knew not, but onely Innent odorain, and I thinke Pliny first broached that errour in numbring up his sorts of Reeds, calleth one odorarm, and therefore judged to be this, and therefore Hippocrates calleth it Myrepsicm, that is unquentarism or unquentic persons. And again. whether that roote that is generally called, Galamus odoratus and Aromaticus of the Apothecaries and others now adayes, be the true Calamus Aromaticus of the ancient Writers. Braffavolus Ferrarienfis, and Fuchfiur in their Writings, doe hold that opinion, that the Calamus ederarus of the shope, which is a root and not a Reed, or a stalk of a Reed, is the true Calamus aromaticus of the Ancients: which, that it cannot bee so, let us first scan the name, which is Calamus, or Arundo a Reed, which the Ancients alwayes speake of, and name no roote thereof tobe used, but the stalke or reed it selfe, and which Theophrastus and Pliny say, differeth not, but is like unto other sont of Reeds; although it groweth in Arabia and Syria, as well as in India, and all men plainely fee, that this rooteof

Calamies to called in thops, is neither a reed, nor the root of a reed, for being feene growing greene, as it is now adayes in many places, and as it is described before, there is no correspondency of it with a reed, (and crutely to see the face of things growing, hath brought many things to knowledge, which else would have lien in perpetuall ignorance and darknesse: how much therefore the world is indebted to those that are diligent searchers out of the genuine plants of the Antients, both by their face or forme, and by their properties and vertues, let the good and bonest acknowledge, let the vile or base neglect or contemme.) Secondly, the Ancients declaring the other notes, whereby it may be knowne say in this maner; that which is the yellower and fuller of Joynts is the best, (the thicker and shorter faith Phay, somewhat pliant) breaking into long shivers, (not brittle or breaking short) the fishila care and inoter takin runs, to the planty of earing and tong invers, (not brittle of of earing inort) the initial came or pipe being plant araneorum, or as Pliny faith; inell fiful araneom or araneos qued florem vocant or affentior eff cam numerofor or numerofus, which can be no otherwise interpreted, then that the pith in the middle of the cane or pipe, which they call the flower, the more the better, is like unto a Spiders coweb, (that is full of threads) and pipe, which they can the hower, he more that better, and bitting upon the tongue: now although some of the lenotes or markes may be found in that ballard Calamas of the shops; yet that is not enough, (for that hath deceived most men, to judge a thing to be right, because of one or two notes agreeing, the rest being not answerable,) but all the notes mult agree, for the falle Calamns breaketh short and not into shivers; it is not clammy in chewing, nor hath it any fiftula or pipe full of that cobweb like pith: by which comparison all men may plainely fee, that our Colamus is not that of the Ancients, and that we are utterly destitute of the true Calamus aromaticus of Dioscorides, and the rest of the ancient Writers: and yet so perverse are many in these dayes, that they will ftill perfift in their old errours, because they were bred in them, and will know no other, although they bee told them : but what may be the best substitute thereof in medicines, many have thought diversly. In that booke of subfitutes that is fallly attributed to Galen, Sphagnum: that is Museus arboreus, the most that groweth upon trees) is appointed, which divers have accepted, and Matthiolus among the rest, but as he saith examining, and considering the matter more seriously; he is not ashamed to retract that opinion, and condemne it quite, as erronious, judgeing no correspondence, but rather a meere contrariety, to be betweene Galamus Aromaticus, a simple of that worth, rarity, and quality, and the mosse of trees, which although it be a little sweet in smell, yet of no other quality equal thereunto. Some therefore appoint the feed of Nigella Romana, both for the feent and tharpe quicke talte, and othereanne, some incident thereunto. Others would have the Galanga major to be the substitute, for the hearing and opening qualities, they thinke it hath; but both the one and the other are hotter in their degrees by much, than the Calams, of the Ancients is: Matthiolas judgeth they shall not doe mitch amisse, that take the rootes of Angelica in. the stead thereof, because it expelleth both urine and womens courses, and besides the many other good properties the treat increor, became it expendent out it allowed to expell any point of venemous creatures, or other-therein, it is found by manifest proofes to be singular good to expell any poison of venemous creatures, or other-waies, and a soveraigne remedy against the plague, and pestilentiall ayres. But the most and best doe agree, that the Squisant or Iuneus odoratus commeth nearest both in degrees and qualities unto it. or elfe that falle Calamus of the shops, is the next best and nearest substitute thereunto, although it doe exceede it in heate, the lesse being to be taken, agreeing in many qualities therewith, and may also safely be used, untill the true Calamus bee better knowne, and brought in use. Acress is called in Greeke ange to drops, because rule chair, id est, pupillis sive acies oculorum salignoss medasus, it helpeth to cleare a dimme eyesight. Monardus, Tragus, Matthiolus, Cirdus, Gester, Camerais, Lugdusussis, Lobel, and Cinsus, doe all call it Acress of Acress of Acress of man perperime Calamine Arymeticus officina. Annual sullara calleth it Culumus moses tridis species. Amunus, Casalogus, Brasiness and Pachsine Culumus aromaticus condes. There hath beene formerly great ignorance of the true. Annual of Discovides, so in that it was generally taken and used for Calamas, it did amuse them the more, not imagining it to be devras, until some more innerally taken and used for Chiamas, at the amone them the more, not imagining it to be Acres, until some more in-dustrious and diligent, finding it growing in Turkie, and comparing it with that they had read thereof, pet (waded themselves certainely to be the true and right Acress; and Mattholns, first after them that so bound it; as I thinke published it to the world, and Lobel and Clusius after him, have now so well persuaded most manuacture or only the photimen new the work, and assessment and have now to wen periwacen more menexcept onerly the most unlearned, or the most wilfull, that few make any doubt of feruple the most of the fill would make the Galanga major to be the true Acorus, but it is knowne tertainely, that the Galanga major growth in trial and hath neither leaves or rootes like unto a Flower-delnie, as Dissertibles describes his aforms to thire, burnating hath leaves like unto Reeds, nor doe the rest of the faculties of Galanga answer these of Acorus.

The Vertues

If this Culamore aromaticus be the righe Culumns of Dioftorides, then he faith it hath thefe familiaes. It provoketh trine, and boyled with graffe rootes and invallage feed of helpeth those that have the tropfie. It hapeth the defects urine, and boyled with graffe rootes and similage seed, it helpeth those that have the stropse. It himseth the defects of the rebus; is profitable against the Strangury, or making water by drops; as also for those that are bursten the defects it provoketh womens termies or courses, estire during the applyed to the place; the strings thereof take the town a strong the provoketh womens termies or courses, estire during the applyed to the place; the strings the three the strings that the strings the strings that it is not allowed to the place; the strings that the strings in the strings that the strings in the Juyce dropped into the eyes, dryeth rheumes therein and elegreth the fight, taking away, all filmes or fuch like that may allow the eyes, dryeth rheumes therein and elegreth the fight, taking away, all filmes or fuch like that may allow them. The poster is of match them and does against all venome of postor, or instead of a had further than the control of the cont Disforder: furthermore, it is a speciall remedy to helpe a stinking breath, if the roote be taken faiting every more ning for some time together. The hot sumes of the deception made in water, and taken in at the month thorow a summer. funnell, the excellent good to helpe them that are troubled with the cobin it a didn't brite powder of the rootes of

TR 18 E. 1.

Снар. 49.

Acorm, with as much Cinamon, taken in a draught of Wormewood wine, is fingular good to comfort and strengthen a cold weake stomacke. The decoction thereof drunke is good against convulsions or crampes, and for falls or inward bruifes. An oxymell or Syrupe made of Acors in this manner, is wonderfull effectuall for all cold fpleenes. and cold livers. Take of the fresh rootes of Acorss one pound, bruise them after they are cleane washed and pickt, fleepe them for three dayes in vinegar, after which time let them be boyled together, to the confumption of the one halfe of the vinegar, which being strained forth set to the fire againe, putting thereinto as much honey as is draught of the decoction of the same rootes, is sufficient for every dose. The whole rootes preserved either in Surange taken in the morning with a small draught of the decoction of the same rootes, is sufficient for every dose. The whole rootes preserved either in Surange taken in the morning with a small draught of the decoction of the same rootes, is sufficient for every dose. The whole rootes preserved either in Surange taken in the morning with a small draught of the decoction of the same rootes, is sufficient for every dose. draight of the decorrion of the latter tooles, is indicated to every ones. The stones preserved are more desired than the dryed rootes that are steeped, and afterwards preserved. The rootes brusted and boyled in wine, and applyed warme to the testicles that are swollen, dissolven the tumour, and easeth the paines; it likewise mollisheth hard tumours in any other parts of the body. It is verily believed of many, that the leaves or rootes of Acorns tyed to a hive of Bees, flayeth them from wandring or flying away, and draweth a greater refort of others thereunto. Ith also affirmed, that none shall be troubled with any fluxe of blood, or paines of the crampe, that weareth the hearbe and roote about them. The rootes of Acorm or Calamus, as it is usually called, are used among other things to make fweet powders, to lay among linnen and garments, and to make fweet waters to wash hand, gloves, or other things to perfume them.

CHAP. XLIX.

Juncus odoratus sive Schananthos. The sweet Rush or Camels Hav.

Ecause through all the sorts of Grasses and Rushes, I finde none sweet, fit for this Classes, but this which I bring here to your consideration, let me, following the like method of Dioscorides, insert this Rush. and the other that shall follow in the next Chapter, in the end of this part of sweet hearbes, as a complement to the fame. Of this fort of fweet Rush, I finde two forts, a finer and a courser, or the true and a bastard kinde, although the ancient Writers have made mention but of one fort, which is the finest and truest.

> Iuncus edoraius tenuis The finer freet (melling Ruft).

groffer than those that grow within, which are a foote long and better, small, round and stiffe, or hard, and much smaller from a little above the bottome of them, than any Rush with us) of a quicke and spicy taste, somewhat pleasant, and of a fine sweet gentle or foir fcent : thus it hath growne with us, but bore neither flower, nor shewed any appearance of stalke, by reason the Win-ter deawes perished it quickly but in the natural places it beareth divers strong, round, hard joynted stalkes, having divers short brownish or purplish huskes on the toppes, containing within them mossie whitish short threads or haires, wherein lyeth s chaffie feed : the roote is stringy or full of long fibres, which are very hard as they are brought to us, from their naturall habitations, which have the smallest scent or taste, of any other part

1. Juneau odoratus tenuior. The finer fweet imelling Rush. This finer Rush hath many tuffs of heads of long rushe-life leaves, thick fer together, one compassing another at the bottome, and shooting forth upwards, the outermost whereof are bigger or

thereof, for so much as ever I could observe, either by the greene or dryed leaves that have beene brought unto us: yet Mathialm faith, he had some plants, that role with him of seed, whole rootes were fweet, fome lofing their frent; but the leaves and rushes of his were bigger than ours here described; having ashe faith leaves like Sedge, which is Carex or Sparganium, or like Zu, which is a large, or great kinde of wheat; whereby I guesse itwe of the greater or groffer kinde next hereunto following.

2. Innew ofer at realist. The grofter tweet finelling Ruft.
This greater or groffer Ruft, groweth in the fame, manner, that
the former doth, but is greater in every part thereof, and left
fweet alfo, as well as lefte fharpe and hot in talte; whereby it the meth to be a kinde of it felfe, that groweth fo great in the namial, as well as forraigne parts; or that it being the fame kinde; by growing in moifter places, acquireth thereby the larger hab-

They grow naturally in Arabia, Syria, Melopetamia, and all that Tract of the Easterne Countries, as also in force places of Africa.

As I declared in the description it commeth not to flowring in these colder Countries, and therefore Clusim and

others have thought it to be an annual plant: but assuredly it dyeth not every yeare in those hotter parts, and slowers in those time. The Time.

The Vertuer.

Dissorter faith it provides a firm and womens courses, discussed all swellings and wind, but troubleth the head a listed it remains cuttes of breaketh humburs, and digesteth them, and loosneth the breaking places of the values; the decochion of like flowers (faith he) if unke, stayeth the spirting of blood, and is condicible to the griefes and discassed for the kinner. I make the provides and discassed from the like of an astringent property, and therefore is more effectuall for those that have a longing in their dispasses to their meate, a dram thereof taken with the like quantity of pepper every morning faling for certaine dayes together, is a very good remedy for those that have the dropse, and for convulsions or examples: the decochion thereof is profitable for women to fit therein, the are troubled with the mother, for as Galeriath in open at holy on the configuration, digested to rundities, expelleth corrupt humours, cutteth tough flegme, and consumeth congrained marries in the dody, and this cfore it is of excellent good use, for the stopping of urine or womens courses taken estimated that the body, and this cfore it is of excellent good use, for the stopping of urine or womens courses taken estimated to by sometimation, it allayeth the inflammations of the liver stomacke, and body: the rootes doe binde more, and the flowers are more hor, but in all the parts thereof there is astriction, in some more, in others lefte, and therefore it is very profitably mixed with those medicines that serve to stay bleeding, it is used to be boyled in the broth of a chickin (I meane the whole plant) as very helpfull to ease the paines of the wombe, that women feele after their childing, the powder thereof is singular good for the sores of the mouth, and for all creeping ulcers; and taken with wine and vinegar, it is effectuall for those that have an ulcer in mouth, and for all creeping ulcers; and taken with wine and vinegar, it is effectuall for those that have an ulcer in their stomacke, if the stomacke or belly be somented with the decoction thereof, it taketh away all inflammations therein, and easeth the paines,

CHAP, L. Cyperus. Sweet Cyperus, or English Galinga.

Ofinish this first part of sweet hearbes, I have some forts of sweet Cyperus to describe unto you, others which are not sweet, I shall speake of in their proper place: yet unto these I thinke good to adjoyne the Trass dules for the proper place: the Traf dulce, for the prese refemblance in face and forme unto the others, and for the pleasantnesse in tafte, though not in smell.

This round rooted fweet Cyperus adaptation. The more common round rooted fweet Cyperus.

This round rooted fweet Cyperus shooteth forth many heads of long and marrow leaves, somewhat ridged in the middle, every leave, feeming thereby to be three square, and somewhat hard and rough in handling, and sweet in the middle, every leave the ming thereby to be three square, and somewhat hard and rough in handling, and sweet same the middle, every leave the ming thereby to be three squares. in feen; among these leaves rise many smooth square stalkes, about three foote high, stuffed with a white pith, and In icent: among their leaves rite many imooth iquare traixes, about three footening, tunted with a winter pitin, and not hollow, a wintoget any knot of joyar therein, unto the toppes, where there fland a few fhort leaves, and many final pariets, or thathe greene follows or eares of small pariets, or thathe greene follows or eares of small leaves above them, which after contains within them the feed the room paice of many long and round blackish browns fmall rootes; fallned together by long strings, of the bigness of small Olives, or the greater Filipendula rootes: of a sweet scan while they are greene, but more when they are dry, and of a bitter tafte, fomewhat like unto Galanga.

We have had a smaller fort hereof brought us from Spaine by Boelius, not differing from this, but if the lownesse Alter Ha

of the little an autorious nereot prought us from opene by opene, including troubles, but the foote high and in being smaller also in leafe and roote.

Of this little and took high and system Syriacus major. The greater Assiriar sweet Cyperus.

Of this little and took has beene one brought out of Syria and Eyps. Whose rootes and leaves were somewhat larger than the footened by the control of t Virtual Ande at the teleph beene one brought out of Agricand Beyer, whose rootes and seaves were somewhat larger him the former, the former him the former, the falke being formewhat shorter, the form of the rootes formewhat stronger and gricker, and of a province colour, on the quitted sife not differing in any thing.

In the first sample advanted Gricker winer. The lesser Affirian round rooted sweet Cyperus.

The first sallo another lesser four brought both from Syria and Condy, being more rough, whose rootes and seaves are clearly the halfe than the salls the stalkes also shorter than the small Spanish; but not differing in any other thing.

things with the state of the st

1. Cyperm retundan oderatus valgation: The care common round rooted (weet Cyperus. 2. Cyperm rotundus ederatus Syrlacys miner. The leffer Affirian round rooted (vecet Cypena)

4. Cyperus longus odoratus. The ordinary sweet Cyperus, or English Galinga.

This ordinary sweet Cyperus hath his leaves long, and as it were three square like the former, and as roughe hard in handling also: the stalkes are smooth, stuffed with a white matter, like as the others are, and three-square like the other, rising somewhat higher, and having some short narrow leaves at the toppes of them, and small low panicles like unto the other in all things, so that they are hardly discerned assunder above ground; the onely discrence consisting in the roote, which in this is long and round, of a blackish browne colour on the out-side, and whith within, full and sirme, creeping under the superficies of the earth round about, whereby it is quickly increased and hath also a very good sweet scent, as well greene as dry, yet more being dry than when it is greene as fresh.

5. Cyperus dulcis rotundus esculentus, Trafi dulce vocatus. The most delicate sweet Gyperus, or Rush Nut.

The leaves hereof are long and narrow like the other, with a thicke ridge in the middle, and sharpe pointed, if oote and a halfe in length; among which rise up the stalkes, smooth, without joynts, three-square, and a calle high, or more; at the toppes whereof stand five or size short narrow leaves, compassing the stalke, and standing like a starre, from among which come forth pale yellowish spiked eares, which are the slowers, wherein lyesher seed, when their colour is thorowly wasted and decayed: the rootes are small, long and round, and many often smaller at the one end, than at the other, hanging or growing at the ends of long strings, somewhat like unto the manner of growing of the Virginia Potatoes, of a pale reddish colour on the outside, and white and simile withis, of the bignesse of beanes; of no sweet scent, nor bitter or aromaticall taste like the other, but pleasant to the rate, eating like Chesnuts, or rather more delicate.

The Place.

The first is found in moist and moorish grounds, both on Mountaines, and at the socre of them, in stinday that in Italy and Spaine, as also by Nilns, and other places in Egypt, as a Alphaus saith, but is not to bee seems that are dens of the curious, either in France, Germany, the Low constriet, or England, where they hardly endure the ters, without great care. The second growth in Syria and Egypt. The third in Syria and Candy. The fourist growth in many Countries, and as well in Spaine and other hot Countries, where the rootes are sweeter, atthirding similar, as in these colder Northerne parts on this side the Alpes: it groweth well in our gardens, especially if they be somewhat moilt and not too dry. The last is reported by many Writers to be found naturally growing no what, but neare unto Verona in Italy, but Amatus Lustiannus saith, they are brought outor Ethiopia and S. Thomas lind. And it is probable by Drepannus in Sicilia, for Espissa Corresponding in its Misselian Medicinalia meaneth this, it take it is but are planted in Spaine and other hot Countries for their delight and use. It hardly groweth with meaning the safe it: but are planted in Spaine and other hot Countries for their delight and use. It hardly groweth with meaning the safe it:

5. Cyperus dulcis rotundus e sculentus Trafi dutce vocatus.
The most delicate sweet Cyperus, or Rusi: Nur.

TRIBE. 1.

5. Cyperus esculentus sive Trafi cute flores.
The Rush Nur flowring.

to any perfection, neither will it abide the extremities of our Winters; for as Camerarius faith it will rot, if it bee not taken up before Winter; and new fer agains in the Spring, after it hath beene well freeped in water.

The Time.

All these round rooted Ciperi doe flower or carry their bashy toppes in August with us, but the ordinary long rooted kinde, giveth his tusted head in the end of July for the most part.

The Number,

The Greeke words mirried Cypirus, whome Cyperus, and winner Cyperus, are taken by divers good Authors, to be one and the fame plant; others to be different, especially Cypirus from Cyperus, because that Pluy lib. 21.cap. 18. maketh Cyperus to be Gladiolus, whome Gaza in his translation of Theophrassis doth in all places follow, and Pluy in another place calleth the long rooted sweet kind Cyperus is the fing the word rooted kinde, then which no other was knowne to Dioscorides, and that Cyprus is the long sweet kind as Pluy doth take it: and that Cypirus is the water or marsh Cyperus, my opinion herein being construed by Aristophanes in Dialogo de canis, where he maketh the quire of company to say Saltaviums per Cypirus of Phlemus gandentes cantibus: to that hereby Cypirus must of necessity be here understood to bee a water or marsh hearte, as Phlemus gandentes cantibus: to that hereby Cypirus must of necessity be here understood to bee a water or marsh hearte, as Phlemus gandentes cantibus: to that hereby Cypirus must of necessity be here understood to bee a water or marsh hearte, as Phlemus gandentes cantibus: to that hereby Cypirus must of necessity be here understood to bee a water or marsh hearte, as Phlemus gandentes cantibus: to the rooma forme of the roote which is like a sthall boxe or vessell, in Latine also Cyperus and Inneus triangularis of angusos, to distinguish betweene it and the Inneus lavius or vulgaris, ordinary Rushes, yet Cornelius Cellus calleth it Inneus gandents; because at it is likely in those places where he observed it, it did peradventure beare foure-square stalkes, but it is not so in many other places: in English many doe call it Gallinga or Gallingale after the name the Dutch give it, because the round rootes are somewhat like unto the rootes of the small Gallinga, and yet that kinde with round tootes, is not so frequent in our land as the other with long rootes, so be so called for the likenesse thereof between them, I thinke the name is transposed from the one to the other. It is

C HAP. 50.

TRIBE 2.

montanus Cyperus duleis; and so it is probable Theophrassus doth in his 6. booke de causis plantarum, 16:28 17. chap reckoning Cyperus, (which Gaza translateth Gladiosus in all places following Pliny herein; as is above said) among other sweet rootes to be eaten. Dalechampius upon Pliny, Casalpinus; Cussus; and Fabius Columnae, take it to be Malianballa of Theophrassus, and Abaliam of Pliny. The Italians generally call in Trass. and Trass doce, Dolect. Inii, and Doleguine as Clusius saith, from Bellonius lib. 2. cap. 25. and thereafter divers Writers doe call it so, and Dulcichinum, as Mastussus. Gelmer, Dedamas, and others; it may styly bee called Russ. these, from the Spaniss Inncia accultantas, of the sormeo Staves and topics. Baptista Cortessus sight to this bee his) is called Furgism and Azulunum, and by the Sicilians Cassandi, because the rootes taste like Chesnus. Ponts in the description of Mount Baldus sight considently, that he hath soundit by experience in suffering the rootes to grow unremoved for three or source yeares, that it beareth neither Balke, nor slower, nor seed. But Mastussus, signimus, Lasse, Dode. new, and Columna, doe all say, that it bath both stakes, slowers, and seed, and so doe give the figure thereof in all their Workes: and Cluss in his annotation upon Bellonius, lib. 2. cap. 45. giveth a signing without spowers, as sin bore none: but assured both he (if he thought so) and Pona might be as smith deceived herein, as they that wrote the Colocasia never bore flower, which Columna disproveth. There remained none thing more to be spoken of, and that is, that many of our Apothecaries, are not onely so ignorant, that they doe not know, that onely the round sweet Cyperus, is that Cyperus and no other, which all the ancient Authors have appointed to be put into the medicines that they appoint; but are without care also, or desire to be furnished with those things, that are the genuine drogues of the Ancients; because the salie is better cheape, and easier to be had, and pat into their cho

It is of a warming quality faith Dioscorides, and giveth breathing to the veines: It provoketh urine, and helpen to breake the flone in the bladder, and to confiume the water in the dropfie, if the decoction thereof be drunke: and is a remedy againft the fiting of the Scorpion: it provoketh womens courses, and is good for the fretting paines and flranglings of the mother, if the parts be bathed with the decoction thereof, or they into over the summer thereof, or is the decoction. The powder thereof is a most especial remedy for all foule fores and ulcers of the mouth, although they be spreading and devouring cankers. It is also used in sweet continuous and always that are warming and conforting. Gales saith the rootes of Cyperus are of greates such experience, and such the summing and conforting. Gales saith the rootes of Cyperus are of greates such as the summing and womens courses. The roote of Cyperus and Bayberries, of each a like quantity beaten to powder, and made up with the urine of a Boy under yeares, and laid upon the belly of those that have a dropse, doth helpe them very much: and both of them boyled in wine, and drunke often while the other is used outwardly, doth worke effectually. Alpissus saith the Egyptian doe much use both the powder of the rootes, and the afters of them when they are burnt, to cure the ulcers both of the mouth, and score parts, and the decoction of them to be drunke, to comfort and warme the stomacke, brains, lungs, sineways, arteries, and the wombe; and it is be taken for some together, it warmeth and strengthesis and windinesses of the spinning and comforting the braines and the sense is consduceth helpe to the crudities, humaldisian the naturall vigour of the spirits, it is also an especiall remedy for cold and moil braines, and the distillations thereof, by warming and comforting the braines and the sense is consduceth helpe to the crudities, humaldisian and windinesses of the spirits of the spirits, it is also an especiall remedy for cold and moil braines, and the distil

Having thus showed you the chiefest of these sweet hearbes and plants that grow with m, it is time to commont my the to another forme, that you may therein heare what will be intreated of ...

PLANTE CATHARTICE SIVE PVRGANTES PVRGING PLANTS. CLASSIS SECVIDA.

The Second Tribe.

CHAP. I.

Eling to shew you here the chiefest forts of purging plants that may grow within; I must as well speake of them that worke upwards, as downewards, as also of these that are conducing or helping thereinto, although they be not so forcible in working as the others. I say the chiefest or most, because, that as in the former Classis some are origined that are differedly related of in other places of this Worke, so likewise it will fall out in this and some of the other following Classis, and begin with the hearbe Aloes, whose bitter juyce is for frequent in the every where knowne by the name of Aloes and Aloes Succotrina.

1. Aloe vulgaris Herbe Alees, five Sempervious marians.
Sea Housecke.

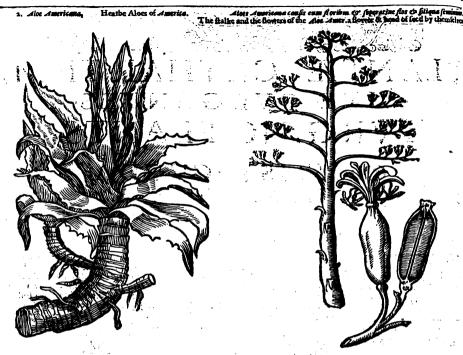

1. Alos vulgaris Herbe Aloes, sive Sempervivum marinum. Sea Housleeke.

This hearbe hath divers long fleshy pale greene leaves, of the thicknesse of ones singer, with divers hard dents or points on both sides of their, and pointed at the end likewise, the one enclosing the other at the bottome, and standing round, the outward-most binding. For the most part backwards, especially in those were search outling for the most part backwards, especially in those were search outling in the maturall places standing all of them outling and stiffe, or rather bowing inward than backward, whose servenger so thing bitter in taste in the places either natural or planted, but rather cold; in the middle of these leaves rifeth up a short thick stalks, branching forth into 2 or 3. parts; little more than a foot & a halle, or 2 show his hoearing many small bottle-like flowers, of a whitish colour with us, & so Diesconder faith also, but in the house Committee yellowish, as we are certainely informed, divided at the rinds, into five or sixe parts, every one hanging downer round about the stalkes, if from the middle thereof up to the top; it bearest fixed in buskes like unto an Alphedill, after the slowers are past; the roce is thick, and about a some long or less within the ground, thooring out some thicke, fibres at the end, and some small ones round about the sides, especially in the naturall places, but may better be discerned, if any of them be put into the ground in the Summer time: the stalkes next to the roce will have the markes of the withered leaves when they are past and fallen away, as may plainely bee discerned in many of shose that are brought from Spaine hither; and show for it a number of heads round about the withered leaves when they are past and fallen away, as may plainely bee discerned in many, of shose that are brought from Spaine hither; and show for it a number of heads round about the withered leaves when they are past and fallen away, as may plainely be discerned in many, of shose that are brought from Spaine hither; and show for the summer and some and some the second that th

The nearetemblance of the leaves hereof ainto the formet hath canfed it to be thus entituled, for it beareth very large long leaves, of a pale green colour, whereon is to bee feen an eye, of blue or afth colour, being of the length of a man, and of two of three fingers thicknesse in the natural places, denred about the edges where they are thingels, with hard sharpe treth like the other, and ending in a hard found bigge blackish thorse of prick, as bigge as a Fault-

TRIBE. 2.

constalent, which leaves are round on the under-fide, and channelled or made hollow like a gurter on the tipes fide, and at the bottome-encompasse one another, but growing flat when they are elder after a stores length, and the end i the innermost still obiding channelled and hollow; these leaves are full of juyce and full of threads running thorow them, but are no more bitter than the other; in the middle of these leaves after a long times abiding, rism a strong great spangs, stake, of the bignesse of a mans arme, with a few small dry and brownsh leaves, sparsed fet these on, and of the length of a Herselmans stake in some places, but rising higher than two speares length in these of 22. hands breadsh is hat is, about hine or ten soot: and about twelve cubits length, in the Duke of Florence his garden, and fiftenesse exhibits at Rome, branched almost from the middle thereofus to the toppe, into diverse branches, and each of them against into others, the great branch standing out for a good space, and then turning upwards; or each whereofara set waimber of sowers, even two or three hundred, being no other then long and large great shrees (quare hard limits; stringling out size great yellow hard and crooked threads, into a the toppes with yellow perioding); and in the middle amongst them another yellow round headed pointell, Lobel saith, of a purplish bit colours, which is not true, for they are of a whitch or yellowish greene colour, and of a sweet scene: these hades that bears the slowers, abore they are dry become the feed wellels, which being ripe, are divided into three parts of cells, each containing abundance of white halfe round light biparted seed, closely compact together: the rootes very great, comparable to the rest of the plant, two or three cubits long, harder than the former, giving a number of young sprouts yearely, which being separated and planted, will quickly take roote in the ground, and grow up; but mat be kept from cold in the Winter, and will not define to be much watered.

The Place.

The first groweth in Arabia Asia, Syria, and all the East Countries, and in India, as well a great way within the land, as neare the Sea side, and in the Hands there, as in Society as Garcias saith, where the best is made, as also in many places of Italy, and in Spains about Andalousia neare the Sea shore in such plenty, that divers shought to have made good store of alloca there, but after triall was made, it was not found any way so effectuall as the Indian sat. The other fort grew first in America, (which being brought into Spains, was from thence, spread into all quarters) and in that abundance about Mexico, as Vines doe in Spains, which they there use to plant, to serve them in seaso of hedges, as well to separate as to defend the limits of their grounds.

They flower in the hoster Countries, in the first Summer Moneths, but never in these colder, for they are preserved with great care from the frosts in Winter, which will cause them quickly to rotte, if they seele never so lie almost.

The first is the A'Am of Dioscorides, and all others both ancient and moderne Writers, and as Pone faith, became

it most commonly groweth neate the Sea, many doe suppose it tooke the name either from an also, that is, a falc falt, or from the a Salo, the Sea it selfet with whose breath it is much delighted. The hiardned sayes thereof is also usually called alloe, and became the best and purelt is made, as Garcias faith, in the Hand Sectorya; it is called Aloe Sectorya, and correspond to the Apotheceties shops Aloes Sacrorius, or Succe cirrias. It is also called, Aloes hepicases, became the best is trowned and red like a liver. It is called also apostors became in the ground, but will live also out of the ground. Some of the moderne Herbatists doe call it Semperorum marinum, from the histories of the traves and like helle and Salom, called Semperorum. Columella in his verses by naming Salomanning the bitter juyeds, is thought to meane this, and called it Salom amarinum, for there is no Sedam that bather juye but this onely. Another fort of Aloe was solved as formerly wont to be brought, (before wee became industrious), socials of only this belt for our ties) which was called a Caballium; either became they gave it horses, being the coursely orgotten and neglected. It is called in English heate Aloes after the Greeke, and sea Housteeke after the Latine mains, and Asygreeney that is Evergreene. Plany and others have written of an Aloe metallica, or fossillia in Indeed and other places, but it is found by divers Writers to be an errour in them, and no sinch thing to be found. The second as Gamara in the end of his Mexican Hiltory saith, is called of fome of the Indians Meller and of others Fit y Aguilla, that is so say, thread and needle, because it supplies both their use; the sharpe and thorness serving as an alle or needle, and the threads running within the leaves being spunne, serving as thread. Clusius called it Aloes on the pricke solved as the pricke and of the leaves, and of others Fit y Aguilla, that is so say, thread and needle, because it supplies the both their use; the sharpe and of other Futurous as an alle or

The Vertues. The first hearbe Aloe is usually hung up in houses to bee ready at hand upon all occasions, to apply a little of the juyce of a leafe presently cut of, or the peece of a leafe it selfe, upon any cut or fresh wound, which is found to bee just or a rear pretently cut of or in poece of a rear in case, upon any cut of them would, which is round to bee fingular good to foder and heale them i oven as Diofeorides faith, that that fort which grew in Afia, Arabia, e.e. is of more use to glue or soder wounds, than that which comment out of India: the leaves also are found to be exceeding cold in the hot Countres, and of very great use and effects for all manner of scalding with water, or burceeding cold in the hot Countres, and of very great use and effects for all manner of scalding with water, or burning with size, gun-powder, or the like, healing them quickly; the nature of the juyce, or Aloes it selfe, is sit to thicken, to dry, to procure sleepe, and moderately to heate; it openeth the belly, purgeth the stomacke, and the yellow jaundise, and stayeth the spiriting of womiting of blood, if a dramme thereof be taken in faire water: it is not onely a good purger of it selfe, but is added also with other purgers to cause the selfe trouble in the stomack a it healeth greene wounds, and bringeth old sores to cicatizing, as also those of the genitors, it healeth the chappes of the fundament, the piles and breaking forth of blood from them, being used outwardly; but assured it healeth the chappes of the fundament, the piles and breaking forth of blood from them, being used outwardly, because it healeth, and maketh the blood of them to be the more sharpe and freeting. It is also found to be more sharpe and freeting. It is also found to be more sharpe and freeting. It is also found to be more sharpe and sharpe and freeting. It is also found to be more sharpe and sissioned to anount the forehead and temples: dissolved in wine and boney, it helpe the forenesses of the reynes and gums, and all ulcers in the mouth: being torrised in a cleane earther veitell, it is in especially good medicine to be used with others for the eyes. Gales showeth that it is hot in the first degree compleat, or second inchoate, and dry in the all unters in the mouth: being torrined in a cleane carrieri veneri, it is an expectant good incollent to be used with others for the eyes. Gales showeth that it is not in the first degree compleat, or second inchoate, and dry in the third, and hatha little altringent faculty therein also, but extending butter; it opened the belly and purgerh moderately the stomacke chiefly swhereunce it is not friendly and conformable above all other medicines, (for where-sail other purgers doe trouble and weaken the stomacke, this onely is found to comfort and strengthen it:) and those humans that are in the lower parts hext unto the passage, for it is no strong or generall purger of the whole budy, to expell grosse humans, but those onely that be in and about the belly. And for this purpose the Aloes simply it felfe, is fitteft to be used, for if it be washed, it loseth the most part of the purging quality, and hath onely a comforting and strengthening property lest. And therefore if Aloes that is washt be given to those that are feverish. howfoever it may doe small farme to some, yet it is sound to doe much to others. Malticke or Cinamon are accounted, the best correctors or helpers to be mixt therewith when it is given: It healest also those ulcers that are hardly cured, and especially those in the fundament and secret parts. Messes saith it cleanseth the head and stomacke, and easieth those paines are incident unto them: and that the continuall use thereof preserveth any from dangerous and deadly diseases, and with Mirthe preserveth the bodies, not onely of the living but of the dead, from all pune faction and corruption : which offects long before his time were well knowne to the world, for the manner of embalming the bodies of the dead, with Aloes and Myrrhe, which was used among the Iewes, as appeareth in their 9. Chapter of Saint Iohns Gospell, the 39. verse, where it is faid that Nicodemus brought about 100. pound weight of Mirrhs and Aloes mixed together which was laid with the body of our Saviour Iohn in the Sepulchre: But the Aloes that is mentioned in all other places of the Scriptures, is understood to bee the Lignam aloes, which the Apointeuries use in their shops, in many medicines, appointed both by Greeke and Arabian Authors, as well inward as outward, for sweet oyntments, perfumes, and other compositions : and the Aloe tree is onely once or twice named, as in the 24. of Numb, and the 6. verse. The parable of Balaam concerning the beauty of Iacob, or the children of Ifreel, in the faire spreading of their habitations, to be like valleies stretched forth, like gardens by the River fishe, like the Aloe trees, (which Saint Perome translateth Tabernacles) that God planted, as the Cedars befide the waters. And in the 45. Plalme where Saint Peromes translation hath Myrrha Gueta & Cafia, it should be Offire Ales & Calia, for the Hebrew word Ahalod, which the most judicious doe translate Acadochum into Greeke, and Lignum aloes into Latine. It is often given to children for the wormes, either of it felfe, or in a few Ratios of the Sunne opened, and the stones taken forth and some pix therein, or ourwardly applyed to the belly, tinder the navill, made into a plaifter with a little oyle of Wormewood, or fome other fuch thing. Aloes also is often used inneadicines for the eyes, with a little honey to allay the fieate in them, to cleante the inward roughnesses of the eye-lide, and cleare the dimnesse of the fight, that commeth by most humour's distilling into them, by drying it up without that pnesse or offence; it healeth also the stching in the corners of them. Being mixed with a little vinegar and oyle of Roses, and the temples and forehead anounted therewish, about the time of tell, doth much fielpe the headach; and is a meanesto procure fleepe to those that want riffit be diffolved in white, and the head washed therewish, is flayeth the falling of or thedding of the haire ; used with honey and wine, is cleanfethall fonle neers.

that happen in the mouth or throat, as also filmlars, that happen in the yard of a manner in the fundaments and all terwards ingendenth field therein, to fill up the cavity: Hastly: Alone and so much use in the Apertreants shows or hould be, if our delicacy and nicenells did not hinder as, as either bloney or Sugare, but the blindwidth of the one, is so unpleadant and unwelcome to this delicate age, and the such as the action to common the blanking and acceptable thereto, that the rotting and corrupting (weengelp of it hash premount and one growth the abeliance bitternesse, that preserve home corruption of the other system of which premounts and one growth the action are the famous they fine. merly have beene, and so are used a being state or fours times washed with the departed types for from infusion of Damaske Roses, and dryed up againe, it is then called Alor Roses, Rosed Alors, which is a fate and gentle mil. dicine for render bodies, familiar and comfortable to the flounacke, helping more to furnishen dechan other Afon and purgeth also lesse than it, yet somewhat openeth the belly, and is good against surfers. The Aloen (that it is fay, the dryed juyce taken from the hearbe) that is used in all these Christian Countries yearments from the Past. Tadies unto us, where it is made, a yet Fabigu Columna faith, the made as good A loes in Ridges, from the leaves the grow there, as any that ever came out of the Ludies, which thing how he brought soppife; word I thinke worth to be knowne, and might be beneficiall to this Realme in time to come; it in any of our remote plantations (as the Summer-Handstor other fuch like hot Countries) the hearbe were planted in that sherry, that thereof for quantity of the dryed juyce might bee brought to us, both to require their travell, and to fave formuch paines the coft, to bring it from the East-Indies. The manner whereof as he relateth it is thus a steamt into his minde to make fome Aloes, out of the leaves that grew with them in inflicient plency at Naples; and finding that the juyce of the leaves, bruifed according to the usuall manner of all other hearbes, was unprofitable and uniavoryalfo, or that the fearifying of the roote, did not yeeld any juyce bitter like Aloes, or of any worth, her tryed that way, to take the iuvce out of the leaves of Aloes, which he had formerly tryed and found effectuall, to have the red or bloody juyce, out of the leaves of Aloes, which he had offiners, appear an infinite energial of his free feet of bloody juyce, out of the hearbe or this leaves, that the juyce was to be drawne or taken, not out of the hearbe of the deares, but out of the veines, that the juyce was to be drawne or taken, not out of the hearbe of the deares, but out of the veines, that runne thorow them: he therefore pulling divers leaves from the resets, while they were fresh, he laid their ends downewards, round about the brims of a broad from pan, that was glafed or leaded, (fuch asou ne lad their ends downewards, round about an ends of whole veines, dropped fores a yellow liquor by drops, which gaths ring together into one, when they had dropped well of themselves, besistroaked a little harder with his hand, mo draw forth what might be had from them, and tooke that also that grew, thicke from the ends of the leaves, and this he hid in the open and hot Sunne: having thus taken a reasonable quantity of this yellow juyce, he let it fland in the hot Sunne, for three or foure dayes, but fer it alide; and covered it in the night time, and as the juyce dryed on the fides of the pan, he often every day, for aped it downs into the moilt, until it became thorow dry and hard, and as easie to be dissolved as any : which from being yellow as the first, became more reddish in the drying, and lastly, blacke almost like dryed blood, yet cleare or thorow shining, light in feeling and not heavie, of a sweet and are maticall favour, but to extreme bitter, that evaluately a time was infected the rewith, and became for bitter, while it was that it was fearle to be evaluated by percipe into the mouth and throat. And thus as he faith no without much delight and content to have been found out the way, not known to any before thouse make pure without much delight and content to him. Et he found out the way, not knowne to any before; how to make pure, fincere, translucene, brittle and hard Aloes, of the colour of a liver; and was content to abide the trouble and paine, thus to impart it to others, that they also might take the pleasure; and profit thereof, to know and doe it if they will; but having given directions to some that failed in not soing right, they have left it of, as not to the done. The Aloes of America is faid to be bitter and shape in the lot Countries, where it growerh: but hath no bitterness the European parts of the world, where it is nursed up of divers. The juyce of the young leaves, and of the root mixed with the juyce of the Wormewood, that groweth in the same Country, is very profitably put into the wounds of those have beene bitten by vipers; the juyce of this leave boyled a little, on the fire, is a sure remedy quickly to heale both greene wounds and old foressof the youngest and tender leaves they used likewise to make conferve; and use it for the purposes aforesaid; Some also say, it seases the reach disease, to be taken in this meaner, Take a good peece of the roote hereof cut simall, and boyle it in a large stone pot, with a good quantity of faire we ter. For three houres space at the least, stopping the pot wery close with clay, or some other such altere was tree. rate a good peece of the roots instantiant and system in a large total post, with a good quantity of tank we ter, for three hourse space at the least, to popular the pot very close with clay, or some other such like matter, the no sumes breake forth, which pot after it hath opene so long in boyling, being placed nightimes the size Patient, to as they may receive the hot sumes thereof, when it is opened, will cause or procure them to sweat abundantly: O elfe if a leafe hereof be roafted under hot embers or coales, and the hot fumes thereof taken, will provoke fweeth extremely, that it is able almost to overcome the spirits, not to be endured, although this remedy boo infed but for three dayes onely together. They of Mexico, and other parts of America, where it groweth naturally, have as great use of this plant, and serveth them to as many purposes, as the Cocar Nut-tree doth so them of the Ball-Indies, or nie of this plant, and iervern them to as many purposes, as the country of the plant, and iervern them any other plant or tree, growing upon the Earth. For first the mighty tall and strong stalkes thereof, after it hath given his slower and seed, and becommeth dry, as also the leaves after they have beene dryed, are gathered and laid up to seven them instead of wood to burne: the hollow or charmethed level serve them in stead of tyles to cover their houses, to defend them from raine, which they can so apply dispose, that no other thing with them there can better performe that office. They net to cut it downe before it grow great, we cause the roote to grow into the greater sublance, from whence, a hole being made therein, they gather a certain liquor, which will quickly grow into the forme of a Syrupe, and being boyled a little on the fire, will be aschicked. Honcy, a little cleared and settled will become as Sugar; dissolved with water it will serve as vinegar; and will be made into wine, if Costal' (sublish in exercise). made into wine; if Ocpatis (which is a roote they use to call the medicine of wine) become unto it : which were they much use, but nothing wholesome; for it soone intoxicateth the braine, and causeth drunkennesse: but moreover cauteth to foule and flinking a breath to them that ufe it, that no carrion carkeife, or flinking finke do fmell fo loathformely. The Priests and Painters of those Countries, doe use the leaves, both in stead of Paper to write upon, and to draw any figure thereon: the Priests also use to pricke and wound themselves with the start ends thereof, which are to there and frong; that although they can caufe them to pierce how farre they pleafe jet will they not breake in the fleth, no not in other harder substances, for those prickes serve them in stead of an awii to make any hole, and the long threads in the leaves, ferve an flead of thread, to flow or tye any thing they weath therewith, yea it hath beene found to 60 good and throng thread as any home can make, and cloth bath beene we

ven thereof and made into thurs, &cc. (as Clufin reportes the Daughter of his Houltat Civell in Spaine did put

forme and flew to him, while he was refident there,) and often brought into the markets to bee fold: and being made into a course thread, serveth as cords or ropes in Ships, or other such like, purposes, and wish it also they safe being planted together, to worke into Sandals (a kinde of shoots in much use with the Spanjanda, as well as the Inbeing plantation of the ground to goe upon or to lay anything thereon to day; and intelligent floor courie gar-ments, such as Shepheards and Shipmen me, to be thereby defended from heat and raine.

Incca five Yucca India putata. The hipposed Indian Edeca.

No these kindes of Aloes may most fifty in my judgement bee referred, that plant which is usually in these parts called Inche or Tucca, for three plant that I know can it better bee adjoyred, the forme of the leaves especially being so like, and although the slowers be differing as may be perceived by the figure and description, yet that letteth not, for so also are the slowers of that of Americal much differing from those of the true Aloes, whose description is on this wife.

Iucca five Tucca India putata. The supposed Indian Intea.

This rate Indian plant hath a given further purises. The supported Indian plant.

This rate Indian plant hath a given stricke uniforcity rooses threathers in thate have mainly subdivide heads from whencestades forth mainly loop haird sind marrow intimed on indiance waves, very destine positional compassing one as the bottoms; of a grayifit greener colons indiang constitutify, we self-done failing waves, with facility hard dreads running in them; and being withered, become plant without to bind things a from the middle whereof

TRIBE 2.

(fome yeares for it doth not every yeare with us) firingeth forth a firing round stalke, divided into standard ches, whereon stand divers somewhat large white stowers hanging downewards, confissing of sixe leaves with divers veines, of a weake reddish or blush colour spread on the backe of the three outer leaves, from the middle to the bottome, not reaching to the edge of any lease, which abide norlong, but quickly fall away without bearing my feed in our Country, as farre as could be observed by any hath growne in this land, or in France, or e. The Place and Time.

This groweth in divers places of the West-Indies, and in our English plantations also, of Virginia, & New-England as it hath beene confidently affirmed to me. It flowfeth not untill the middle or latter end of July, the flowers fall ling away within a while after they have beene blowne open-

That it cannot be the true Tucca of Oviedus, Theyer and others, whereof the bread called Cafavi is made, both they and Monardes they plainely for the true Tacca beareth leaves divided into feven or nine parts, standing on long foot-stalkes. The not knowing what other or first name may be given it, let it hold still that name of Inca or Tucca, or Hyjucca if you will, until a fitter may be knowne. Baubinus calleth it Incca foigs, alloes. The Vertues.

There hath not beene knowne any property conducible to any difease as yet found out, or related of it. Some Merchants Factors have affirmed, but how probable I know not, that it groweth in some parts of Turkie naturally, and that they make a kinde of course cloth from the threads in the leaves, which are strong and hard: but the Relationship is the strong and that they make a kinde of course cloth from the threads in the leaves, which are strong and hard: but the Relationship is the strong and hard: tors were furely deceived herein, for it it doe grow there, it hath beene onely brought to them, as unto us and plators were turely acceived nerein, for it it doe grow there, it han beene onely prought to them, as tinto us and plated: the natives formerly in Virginia, as I heare, did and doe make bread of the rootes hereof, as they of Hispanial doe of the true Iucca, and much after the same manner, and it is said likewise, that the raw juyce is dangerous, if not deadly: Aldinus relapsth that the wound made by the tharpe point end, of one of these leaves in his owne had wrought such intolerable paines, that he was almost beside himselfe, untill by applying some of his owne Ballamas thereto, it miraculously eased him of the anguish, and all other trouble thereof.

CHAP. HIL.

Lapathum fativum & Rha. Garden Dock and Rubathe

Ecause both the true and the bastard Rhs or Ruharbe are sorts of Duckers, as shall be showed; I have therefore placed them together with the Patience or garden Docke, in one Chapter, and unto the for the names sake, rather than for any knowne properties correspondent. I have adjoyned two ther plants called also Rhs; although they have no resemblance unto the Dockes, as the other sorts of

1. Laparium fai ivum five Pariential, Garden Patience or Monkes Rubarbe. Garden Patience is a Docke bearing the name of Rubarbe, for some simall purging quality therein; and growed up with large tall stalkes fet with somewhat broad and long stire greene leaves, not dented at all; the toppes of stalkes being divided into small branches, beare reddish or purplish flowers, and three-square seed like unto our Dockes: the roote is long, great and yellow, like unto the wild Dockes, but a little redder; and if it be a little are ed, sheweth lesse store of discoloured veines then the first doth when it is dry.

2. Hippolapathum resundifolium unigare. Common Great round leasted Docke, or bastard Rubarbe.

This Bastard Rubarbe hath divers large round thinne yellowish greene leaves, rising from the roote, a little way about the edges, every one standing on a reasonable thicke and long brownish soote-stalke, from among which

rifeth up a pretty bigge stalke, about two sootehigh, with some such access thereon as grow below, but smaller, at the toppe whereof stand in a long spike many small brownish slowers, which turne into hard theee-square so ning browne seed, like unto the garden Docke or Patience: the soote groweth greater than that of Patience, will many branches or great sibres thereat, yellow on the out-side, and somewhat pale yellow within, with some discontinuous states and the states of coloured veines therein, like to the Rubarbe next to be described, but much lesse than it, especially when it is dry which then hath quite lost that fresh colour, which the other Rubarbe holdeth perspicuously.

3. Hippolapathum maximum rotundifolium exoticum, five Rhaponticum Thracium fed verius Rubarbarana verum.

True Rubarbe, or Rubarbe of Roman; or English Rubarbe.

True Rubarbe, or Rubarbe of Resease or English Rubarbe.

Because in my former Booke, I made onely a short relation of this Rubarbe, and the effects thereof; I think good here to give you a more ample declaration thereof; for it deserves to be worthily accounted of. At the side appearing thereof out of the ground, when the Winter is salt, it shath a great found brownish head, rising from the middle or sides of the roote, which openeth it selle into standy leaves, one after another, very much sumpled or solded together at the first, and brownish, but afterward fireageth it selfe, and becommeth smooth; we large, and almost round, every one standing on a brownish stalk, of the thicknesse of any mans thumbe, when he are growne to their sulnesse, and most of them two foot and more in length especially in any moist or good ground and the stalke of the lease also from the bottome thereof, next timo the foote, into the lease it selfe; being as long that is to say, two foote more, the breadth thereof also in the breadth place, from edge to edge being equall, or much, of a sad or darke greene colour, and this stands substance than the garden or Wood Sorrell: from among these riless in form, but not every yeare, a strong ship stalke, not growing so high as the Patience or garden Docke, with such round leaves as grow below, but smalls at every joynt up to the toppe, and among the flowers, which are white, contrary to the last recited Bastard Rubarb, or any other of the Dockes, spreading forth into many branches, and consisting of five or sixe small white leaves. or any other of the Dockes, foreading forth into many branches, and confifting of five or five finall white learning to be all threads: after the middle, and feeming to be all threads: after white come browniffs three famals feed, like mito other Dockes, but larger, whether, in may bee plainely known to be, all other to be the mito other by great, which due is and dundry great in preading branches must be of adarke brownish or reddiff, colour on the outside, and with a pale yellow than skin nudder it, which covered the unserfubliance or roote; which sinde and skin being pared away, the roote appeareth of to fresh and lively

3.2. Lapathum für Palientia & folium Hippolapatum / 3. Hippolapathum maximum five Rusponticum Tindeium vel Rubarbarum verum rotundifolige enigeris. Patience, or Monkes Rubarbe; True Rubarbe, or Rhaponticke. and a leafe of the Baftard Rubarbe.

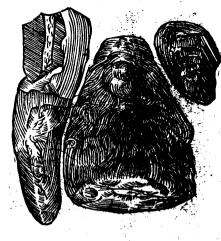

colour, with fleth coloured veines running thorow it, that the choilest of that Rubarbe, that comment to us, from the Indies and China, cannot excell it is which rooses, if it be dryed carefully, and as it ought (which must be in our Country by the gentile heate of a fire, in that we want the heate of the Sunne to dry it, as is used in the naturall places, and every peece kept from touching one another, (which thing may be observed, is also done by the Indians, in the dryed tooses that come to us, who put them upon strings to dry them apart:) will hold his colour almost as well as when it is fresh, and give a yellow tincture to the spittle when it is chewed, but not so much, nor hath that bitternes and altriction therein that the Indian root hath, as I have faid before, I have divers yeares taken up of these rootes, and dyed them carefully as I have (hewed you, and they have beene friewed to the best and most skilfull, who have approved of them, and divers of our Physicians save often times used them, and very many others to good

4. Rhabarbarum of Ponticum genuinum officinarum. The true Rubarbe and Rhapanticke of China, and the

Matthiolie hath given us a figure of Rubarbe, which he setteth forth for the true, but from whom or whence he had it, he declareth not, and it might be a figure not of his owne braine, as fome others of his are a although hee feemeth to fay that he learned from Persian Merchants, that it did grow in the Country of Success, which is subject to the Great Cham of Cathay, in the Mountaines, right the chiefe City thereof, called also Success, whose figure and description divers other Authors have followed. Trincavell in his sirst Booke and 12. Chapter, of the composition of Medicines, relateth also, that a Merchant who had formerly beene an Apothecarie, and resident in Person and Apothecaries, and the success are also as a few parts and a production of Medicines, relateth also, that a Merchant who had formerly beene an Apothecarie, and resident in Person are also as a production of Medicines, relateth also, that a few parts are a production of Medicines, relateth also, that a few parts are a production of Medicines, relateth also, that a few parts are a production of Medicines, relateth also, that a few parts are a production of Medicines, relateth also, that a few parts are a production of Medicines, relateth also, that a few parts are a production of Medicines, relateth also, that a few parts are a production of Medicines, relateth also, that a few parts are a production of Medicines, relateth also, that a few parts are a parts and the parts are a parts are a parts and the parts are a parts are a parts and the parts are a parts and the parts are a parts are a parts and the parts are a parts are a parts and the parts are a parts and the parts are a parts and the parts are a parts are a parts and the parts are a parts and the parts are a parts are a parts and the parts are a parts are a parts are a parts and the parts are a composition of Medicines, relateth alto, that a merchant who had formerly because an appropriate and redden in Brista a long time, did report unto him, that there grew true Rubarte in great abundance, upon the hilly places in Perisa, and that it was carried from thence into Spris and Egyps, and from thence into diversorber Countries of the world, but a fluredly that Rubart, which is used now adayes in all the world, I am fure in all the Chiffithan Countries of this part of the world, comment chiefly from the Country of Chims in the East-Indianand blash hand the countries of the world. Tradewood chief the Manufacture in friends there from the second flush when the countries from the second flush when the countries of the world, comments the first three from the second flush when the countries of the world. Indies, and hath beene brought by Arabian, Turky, and other Merchants, in former times from thence over land by Caravans : (as they call them , that is a number of Merchants and others , having Camels laden with it

. Rhabarbarum & Ponticum geruinum officinarum The true Rubarbe and Rhapantick of China, and the fhore

and all other manner of drugges and spices there to be had, wherewith they served all this other part of the world) unto Cairo and Alexandria in Egypt, Damafeo, and Tripoli in Syria, and from thence (as from the Store-houses) in to other Countries: but now fince the passage into the East-Indies by Sea hath beene knowne, and that it had beene brought unto us that way, there hatflittle or none beene brought by the Caravans over land, as in the former times. The forme of the roote, as all know that have seene and observed it, is somewhat great, round, and long withall for the most part, yet there are smaller and shorter peeces, as well as the greater that come together: whose colour on the outside is not all alike, no more than the substance within, for still some is better coloured and founder than other: the best is firme and somewhat heavy, not spungy and light, somewhat browne, but fresh at the outside, without many blackish (which are suspicious places, where oftentimes being broken it is rotten, corupted and naught, I say many, for the best preces have sometimes some) spots, which doe not runne farre inward, and if they doe yet not withstanding, the rest is excellent good, and not to be refused for allittle bad, which must be cut away as not fit, or at least not so fit to be used as the better, which is very much discoloured with fight-coloured veines running thorow it, bitter in take, and somewhat aromaticall in smell, especially if it bee fresh, and caning the firstle to be yellow, being a little chewed in the mouth. These properties belonging to the true Rubarbe, being to manifestly to be seen and discerned in the rootes of the former kinde, (excepting onely, those things which the nature of the Climate produceth) may so reasonably persuade any of reasonable ingentity, that the former is the same true Rubarbe with this, and a very Dock proper to the Country of Chima, and preasurements to some characteristic states that the same true Rubarbe with this, and a very Dock proper to the Country of Chima, and preasurements to some other Countries besides also. And if tryall were made thereof in some botter and dryer Countries, of our forraine Plantations abroad (as I have of late to divers of them put it in practife) I verily believe, it would come much nearer to the other qualities of the true China Rubarbe than it doth, and is wanting in ours, according to the heate and dimate thereof, wherein it is planted. This I thought good to intimate here, both to shew the correspondence of this Rubarbe of our English groweth, with that of the Indies, which is more probable to be a Docke of that County, than any fuch plant as Maribiolus ferteth it out for both by figure and descriptions and besides further to excite some of our Nation, if there be any ingenuity in them, to make the tryall by planting it in fundry other the bottom Countries, what effects it will procure, and how much it will better our English breeding: The true Rhaponticke which hath formerly come to us with Rubarbe (and not that faile kind of the great Centory rootes) is onely the lester and longer peeces of the rootes of the true Rubarbe, whose figure is set forth with the other, 5. Rhapbonicum Englis falio Latiore. The broader Elecampane leasted Rubarb.

I have adjoyed this and the next plant, for the names lake onely (as I faid before) because Loberhath to name and referred them: but to another place they might be more truely referred in my judgement, and that is unto the laceus Knapweeds, or Consummajus great Centory, both for the like nelle of flower and lette, although the scales of the head be different; yet at this time take the description of them in this place. It hath diverse leaves the fing from the roote, somewhat large and long, yet nothing so large as the leaves of Elecampane, greenish on the

upperfide, and grayith or white and woolly underneath, like therein unto the leaves of Elecampane, every one flanding on his owne stalke, broadest at the bottome, and pointed at the end, and dented about the edges from among which rifeth up, a reasonable bigge round stalke, about halfe a yard or 2 soote high, bearing at the from among when the transfer on the first state of representing a small Artichoke head, but that the scales doe not stand close together, but are much more open and loofe, especially after the flower is past; which standeth in the middle, composed of many blewish red or

6. Rhaporticum angusti solium. The natrove Elecampane leated Rubarbe.

TRIBE.2.

purple threades or thrumes, very delicate to behold: after which come blackish round and long stede, very like unto the seede of a Jacea or great Centorie, but a little longer and not altogether fo thicke: the root is somewhat long and thicke, blackish on the outside, and of a deadish colour on the infide, more loofe and spongye than either any Docke or great Centory, which hath in former times beene used among the Apothecaries for Rha Ponticum,

6. Rha Ponticum alterum angustifolium. The narrower Elecampane leafed Rubarbe.

There is small difference betweene this and the last described, but onely in the leaves, which are alittle narrower and longer then it, being as hoary white underneth and greene above as the other; and a little unevenly waved on the edges: the head and flowers are a like but a little larger, and so is the roote, fo that it is very likely, the naturall place of their growings, causeth the chiefest difference betweene them.

The Place. The first groweth about Laufanna in Savoy as Tragus faith, but only in gardens with us: the second naturally upon the hils not far from Caria in Germany, as also nere Friburg in Switferland, and on the mountaines in Austria. The third as it is reported grew in Thracia, and from thence brought to Trosper Alpinus, at Padoa, from whence some Apothecaryes in Venice had it : and Mafter Doctor Matthew Lifter, one of the Kings Physitions being in Venice, obtained 3 or 4 feedes, which he fent me with fome other feedes that he procured; and with me (as I thinke the first in this Land) they sprung up grew and seeded within two or three yeares, and from them, both I, and many other my friends, as well in England as beyond Sea have bin furnished, The fourth groweth chiefely as I fayd in China, or Cataya (for they are held to be but one Countery) as Matthielm his Perfian Merchant faith, and in the Mountaines of Persia, if ye will beleeve Trincavel his Apothecary, turned merchant, as is before declared: Thefift groweth both on Mount Baldus, as I am enformed, neere Verona in Italy, and also upon the hils in Smitferland, and in some craggie places in Savoy; though Lobel saith the last was brought out of Turkie, and that the last was brought out of Italy.

All these forts of Rubarbe doe grow with us in our gardens and doe flower, about the beginning or middle of The Time. line, and the feede is ripe in Iuly. The rootes that are to be dryed and kept all the yeare following, are not to be taken up, before the stake and leaves be quite withered or gone, and that is not untill about the middle or end of October; for if they be taken either alittle before the leaves doe fpring, or when they are fpring up, the rootes will not have halfe so good a colour in them.

The Names. The Greekes doe call the Dockes Namuson Lapathum, from Namuson, or Namileu, exinanire, quod foliorum decellum alvum emolliat, lenit & exinaniat, in Latine Rumex, which is rather attributed to those Dockes are sowen, than to those are wilde, and chiefely unto Sorrell, because the leaves are used to be eaten or sucked, to coole the heate and quench the thirst, even as children doe sucke a teate, which was called among the old Romans Rumem. Galen in 2 Alimentor, faith Lapathum might be called a wilde Beete, it is fo like unto the garden kinde, but because the Beete is more pleasant than the Docke, no man but will more willingly eate the Beete. The first here, is called of most men Lapathum satioum, Patientia & Rhabarbarum Monachorum, meaning those that commented upon Messus: The second Hippolapathum rounds folium, to put a difference betweene it, and the former garden Docke, which is also called Hippolapathum, it is also called of Lobel and others Pseudo Rha recentforum, of Clusius and Camerarius, Lapathum rotundifolium, and of Cordus in histor. Plantar, lib. 4, fol. 201. Rhabarbaricum, in Paris, and Camerarius, Lapathum rotundifolium, and of Cordus in histor. Plantar, lib. 4, fol. 201. Rhabarbaricum, in English great round leafed Dock, or bastard Rubarb. The third Alpinus calleth Rhaponticum Thracicum, because as isaforefaid, it was brought him out of that Country of Thracia, and in his tractate thereupon he will by no meanes bee perswaded that it is true Rubarbe, but so entituleth it, and the rather because be onely saw the rootes while they were young as his figure sheweth, but not so great as the true Rubarbe, such as I have expressed: neither do I think he pared away the outer barke or skin of the rootes to make the infide appeare the fairer but as agreat many with us also have done, dryed the roots as they tooke them out of the ground, and then they shewed both blacke and imall. Mafter Doctor Lyfter also sent it me by the name of Rhaponicum verum, but because the roote is so like both in colour, forme, and quality unto the true Rubarb, and the small long roots unto the Rha Pontienm or Rubarbe of Pontus, I account it true Rubarbe and Anguilara faith they are both one, the difference confiking chiefely in the greater or leffer long peeces, and to the climate, which giveth the true Rubarbe, or Rubarbe

TRIBE 2.

CHAP. 2.

CHAP. 5.

of Pontes, a more folid and firme substance, a more bitter taste and aromaticall finell, and an astringent or corroborating quality after the purging, all which are the effects from the climate, as being hotter and dryer, and therefore giving unto the rootes firmenesse bitternesse and astriction, which are all wanting in some fort in the rootes of this Rubarbe growing with us: yet it hath the purging quality, onely in a double proportion and the forme and colour to like the true as may be, which causeth it to be had in respect and good use, besides the beauty of the plant it selse, and may well be called English Rubarbe, to distinguish it from that which cometh from China, The fourth is thought by the most and best writers to be the Rha or Rheum of Dioscerides, Galen and the other ancient writers, which was diverfly named in our former times, as Rha Barbarum, Rha Turcienm, Rha Posticum, and Rha Scenicum or Sceniticum many thinking them to be severall things, because of the names impofed, as comming from feverall places, when as the goodnesse or badnesse, newnesse or oldnesse of the roots might cause this variation. For the Arabians did call it Raved or Raiwand Sceni, or Seni as some write, but I finde it should be rather Cini, which corruptly the Portugalls, first pronounced Chini, according to their Language, and from them all our parts of the world, doe call that Country China, which was formerly called Singram regio: Much controversie there is among writers, concerning the name Rhabarbarum or Barbaricum: Fish for the name Rha barbarum the Rha of Barbaria, what this name of Barbaria should fignifie, some thinking it to be that part of Africa, where old Carthage Rood, as Fuschim who faith lib. 1. de compositione medicamentorum, the the fouldiers that went with the Emperour Charles to Tunis, brought true Rubarbe of that Country home with them: others thinke that it was brought from Barbaruma City in India, above the River Indus, and that River. Indicum and Barbaricum were all one: and others thought that it came from an Island in the red Sea called Barbaria, whereunto shippes for Merchandise doe much resort : but Matthiolas refusing all these opinions would faine induce his owne, that Barbaria being often mentioned in Galen as lib. 4.c. 6. de wenda (anique that Ginger was brought out of Barbaria, which Dioscorides and Plinye say groweth among the Troglodises, and from them brought to us: and againe he faith that Glans Vnquentaria or Nux Ben, is brought out of the Country of Barbaria, which Diofeorides faith groweth in Athiopia, in which Country the Troglodites doe inhabite. and Plinye lib. 12. c, 21. faith it groweth with the Troglodites. Plinye also in the same booke and 19 chapter Thewing the canfes of the fearfity of Cmamon in his dayes, faith it was because the Barbarians in their furie burn the woods where it grew: whereby as Matthiolus faith, it may plainely appeare, that the name Barbaria, can fignifie no other Country than the Trogladites of Ethiopia: which as Strabe in his fifteenth booke of Geography faith, is as plentifull in fpices as the South parts of India: but by the trafficke of our Merchants in these times there is no Rubarbe growing in those parts that they can heare of; and if I might ghesse as formerly others have done, I would say that the name Barbarum was joyned with Rha, in that both Gracians and Romanes accounted all remote nations from them to be Barbarians. Now for the names, Scenicum and Sceniticum; Messes faith it is all one with Indicum, whose faying Matthielus contradicteth, saying it should be rather Sinicum which is a Country of India, for the Scenita be a people of the defart of Arabia, and are utterly destitute of all man ner of Spice and drugges of worth. The name of Rha Turcicum and Ponticum, is thought also to be all one, because fome Turkish Merchants brought it from Pontuse and for the word Rha, it tooke the name as some suppose from the River Rha, now fayd to be called Volga in Pontus, where those rootes did grow : but I rather think it came from the Arabians Reiwand or Raiwand: whether the Rha Barbarum and Rha Fonticum, be one thing or diverse, is next to be spoken of : Matthiolus contendeth against Ruellius and others, with many words and reasons to proove them differing : First that Rha Fonticum as Dioscorides and Galen describe them, are without fent; then that Rubarbe hath in it a purging quality by nature, which Rha Ponticum hath not, being fayd by Die scorides and Galen to have rather an astringent quality therein : and that it is not bitter as Rubarbe, but rather somewhat sharpe & quicke; it is not solide and heavie but spongie and light; it is not drye but tough or pliang it is not yellow as Rubarbe, but blacke: by which reasons he is perswaded that they differ, and that Ruellar was in a greaterror to fay, that they differed onely in the fent, which hapned by the coldnesse of the Country, where Rha Posticum grew: Matthiolus also saith that Manardus Ferrariensis, having beene formerly of that opinion, was afterward otherwise persuaded, upon sight of the true Rha Posticum, that was brought out of Mula via, agreeing in all things with that of Dioscorides, as the sayd Manardus relateth, in the last Epistle of the full booke written to Leonicenus; Surely this we may well fay, that Dioscorides and Galen never faw or knew fich Rubarbe, as we have brought us now a dayes, and I am halfe in doubt that wee in these times cannot welltel what fort of Rha Phonicum that was of Dioscorides and Galen; for if we scanne the text of Dioscorides a little, we shall finde him to say, that the Rha or Reum called by the name Rha Ponticum, is a roote like unto the roote of the great Centory, (and if it be but like, it cannot be the same) but smaller, on the outside of a blackish red colou spongie, light and without sent, and that it grew in the Countries beyond the Bosphorus: the best as hee saithin that which is found, without rottennesse or worme holes, and doth sticke in the mouth with a little astriction in the tashing, and giveth a yellow colour in the chewing, tending to a Saffron colour: this comparison of the roote to be blacke like the roote of great Centorie, but lesse, and of a redder colour, spongie and without sent, cannot agree with any of the qualities of that Raphonticum, we have formerly seene brought unto us, much lesse unto the Rubarbe that wee have now, and for the rootes of the great Centory, they are very long and great, almost like unto a great Parsneppe roote, but blacke on the outside and very rugged; which made those in ancient times, and unto our dayes still obstinately to take the very rootes of great Century, and use them as if they had beene true Rha Ponticum: So that to affoyle this doubt wee may well fay that it is probable, that those rootes which were usually brought in those times, when Dioscorids and Galen lived, were the small rootes, or the long branches of the greater rootes of Rubarbe, and not dressed or pared, that is the outer skinnes taken away, which are blackish being dryed, and not such great thicks rootes as we have now a dayes, and that they were adulterate, as Galen mentioneth some were in his time, that is, that the rootes were boyled or steeped in water for some time, to take out the strongest juyce, and the roote dryed up againe, which then it is probable, might be of a blackish red colour and spongie, light, and without fent, not having any purging quality, but onely an aftringent left in them : for I doe verily thinke that Rha Partienm (such as I have seene, hath beene brought over to us, being in colour taste and qualitie, the same with Ru barbe, but in smaller and longer peoces) is either but a small kinde of Rubarte, growing not bigger in those

places, from whence it is brought, or that it is but the bigger branches of the great rootes of Rubarbe, the colour and properties as I fayd being so like. The fift and last, Lobel and Pena have onely set forth, under the titles before expressed, whom all other writers that have mentioned them have followed: and it is probable that the Turkes, with whom as it should seeme it is called Rhaponticum, used it in steede of the true Rhaponticum of Dioscarides, and to note the difference betweene them, Lobel addeth Helenii folis. But some of latter times have called it Centaurium belenii folio, for by that name, I received the seedes thereof from beyond Sea: but that quality yellow, in the true Rhaponticum of Dioscarides, and not to be found, either in this or the great Centory, doth easily convince their obstinacy, that will still persist in an opinion so contrary to truth.

The Vertues.

The leaves of these kindes of Dockes, boyled in broth, doe a little (fome more, fome lesse) mollifie or boolen the belly; but the rootes have a more opening or purging quality in them, and fome more or leffe also according to their quality. The first round leafed one, somewhat more than the garden Patience or Monkes Rubarbe. although weaker than the next thereunto by much: The Baltard Rubarbe hath almost worne out the use of the Patience or Monks Rubarbe, it is grown to common & plentiful; to that unfelle fome that are wilful & will not use it. hat Patience, or that are too gripple, not to be at any coft to have the best, or have little care what they use, but take what commeth next to hand, there is (or should be) none, but will use it in their diet Beere, or Ale, or in decoctions to purge the Liver, and clense the blood, before the other; yet that I may relate the properties that are found therein (that thereby you may be affured this Bastard Rubarbe, will doe the same more effectually) are thefe. Trages faith, a dramme of the dryed rootes of the first fort called of some Monkes Rubarbe, with a scruple of Ginger, made into pouder, and taken fasting, in a draught or messe of warme broth, purgeth choler and fregme downeward very gently, and fafely without danger; the feede thereof contrarity doth binde the belly, and thereby helpeth to flay any fort of laske, or bloody flixes the distilled water thereof; is very p ofitably used to heale fcabbes, as also foule ulcerous fores, and to allay the inflammations of them. The juyce of the leaves or rootes or the decoction of them in Vinegar, is of very many used as a most effectuall remedie to heale all scabbes and running fores. The round leafed Docke or Bastard Rubarbe, hath as I sayd all the properties of Monkes Rubarbe, but more effectuall, both for inward and outward difeases, and moreover healeth the sting of Scorpions; and as Dissembles faith, he that shall take the roote thereof. shall feele no paine after the stinging a the decocition thereof with Vinegar, stilled or dropped into the eares taketh away the paines, gargled in the mouth, taketh a-way tooth ach, and being drunke healeth the Jaundise: the seed thereof taken, easeth the grawing and griping paines of the stomacke, and taketh away the loathing thereof unto meate, which commeth by vitious sharpe humore gathered to the mouth of the stomacke: the roote thereof, helpeth the ruggednesse of the nayles, and being boyled in wine, it helpeth the swellings of the throate, called the Kings Evill, as also when the kernells of the eares be swolne: and helpeth them that are troubled with the stone; provoketh Vrine, and helpeth the dimnesse of the fight. The rootes of this Bastard Rubarbe, is used in opening and purging Diet drinkes, or in Diet Beere or Ale, with other things, to open the Liver, and clenfe the blood, and to allay the heate thereof. The properties of the other round leafed Docke, which we have entituled English Rubarbe, are the same with the former, but much more effectuall, and hathall the properties of the true Indian Rubarbe, excepting the force in purging, which is but of halfe the strength thereof, and therefore needeth, as I fayd, to be taken in double quantitie, and likewise hath not that bitternesse or astriction, in other things it worketh almost in an equality; The true Indian Rubarbe is an excellent and fafe medecine, to purge the body of choler and flegme, being either taken of it felfe, made into powder, and drunke in a draught of white wine, or fleeped therein all night, and taken faflug, or put among other purgers as shall be thought convenient, clenting the stomacke and Liver, and thereby the blood, opening obstructions, and helping those griefes that come thereof, as the laundice, the Dropsie, the swelling of the spleene, tertian and day agues, and the pricking paine of the sides, as also stayeth the spirtting of blood, comming as well from the Lunges, as any other part: the powder taken with Cassa discoved, and a little washe Venice Turpentine, clenseth the Reines, and helpeth to strengthen them after waste, and is very effectuall to flay the Gonorrhan or running of the reines; It is also given for the paines and swellings in the head. for those that are troubled with melancholy, and helpeth the Sciatica and Goure, and the paines of the Crampe: for which purpose one dramme or two, of the extract thereof, made in this manner, and given in broth doth work effectually. Let a fufficient quantitie of Rubarbe be steeped in Cinamon water, which being strongly pressed forth, let it be thilled in a glasse Limbeck in balues, until the water be drawne forth, and the substance remaining, be of the thicknesse of honey, which keepe in a close covered pot or glasse, for the use aforesaid. The powder of Rubarbe, taken with a little Mumia and Madder motes, in fome red wine, diffolyeth congealed or clotted blood in the body, happening by any fall, or bruife, and healeth burtings, and broken parts, as well inward as outward, the cyle likewife wherein it hath beene boyled, being anointed worken the fame effect: It helpeth the yexing, or hickocker and all fluxes of the belly, if it be toaked or dryed a little by the fire, but much more if it be more roulted to be halfe burnt, and taken in wine after this manner: Take againt of good Clarec wine, and burne it with fome Sugar, and a toppe or two of Rolemary, into which put a dramme and a halfe of Rubarbe torrified, or roafted by the fire as is aforefaid, and one dramme of (bebul Myrobalanes, alittle broken or bmiled, letthele frand in the burnt wine all night by the fire, and fireing it forth in the morning, giving this at two times fulfing, which will in three or fours dayes tray any fcouring or last, frengthning the stomack and inward parts after y ands. It is used to beale those Vices sharhappen in the syst, and systids, being steeped and strayned, as also to all wage the tumors and allay the inflammations, and applyed with honey or cute, that is to fay boyled wine, it taketh away all blacke and blew sports, or markes that happen therein. This Rubarbe is so gentle a melicine, that it may be given to all lorged gentle conflictations, (but, in robultions or firong bodies it purged little or nothing) whether they be children, or women, much childre, and that fairly at all kines of the years: the whey of milke, but effectally of Goatta milke, is the best and most accommodate liquor, wherein it is year the wary of milke, but especially of Coates milke, at the period to the more afternoon and in puriod to the first which and in puriod the first product and in puriod the first product and in puriod the first product and first product product and first product product and first product pro

TRIBE 2.

CHAP. 4.

CHAP. III,

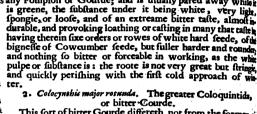

1. Colocynthis Vulgaris. Coloquintida or the bitter Goarde.

His bitter Gourd runneth with his branches upon the ground, as a Gourd or Cowcumber doth, his ving diverse rough hairy leaves thereon, every one by it selfe, which are lesses, most usually into five a ger, than those of the Cowcumber, and more divided or cut in at the edges, most usually into five a seaven parts, each partition also dented in, or notched round about, the leaves of the forme doe we may not resemble those of the Circuil Cowcumber; at the joynts with the leaves come forth the leaves which are yellow, of the same fashion with them, but somewhat smaller, and also small tendrels.

flowers which are yellow, of the same fashion with them, but somewhat smaller, and also small tendrells or twining stalkes as the Vine hath, wherewith it windeth about any plants, or other things that sland next unit, thereby strangling or killing them: the fruite that followeth is small and round as a ball, many of them new much bigger than a great Crabbe or Peare-maine, greene at the first on the outside, and afterwards growings be of a browney ellow, which shell is as hard as any Pompion or Goarde; and is usually pared away whilest

Celocynthis Pomiformis & Pyriformis.

The round and Peare fashioned bitter Gourde.

This fort of bitter Gourde differeth not from the former, of ther in leafe or flower of manner of growing, but onely interfruite, which groweth to be twice as big as the former, and a round; greene at the first, but of a pale yellow when it is rick, whose pulpe or inner substance is also white and spongie, and in a manner as bitter, with such like seedes as are in the former, and disposed for the most part into eight rowes, or partitions the roote perisheth as the former.

3. Colorynthic oblongs. The long bitter Gourde.
This kind of Colloquintida differeth not from the last gree fort, for either manner of growing, forme of the leaves a flowers, but onely in the fruit, which is as great almost as the last, but is not so sphericall or round like a ball, but somether long with the roundnesse, and being a little flat at the head; the shell or outer rinde thereof, is greene at the first, and after wards groweth to be whitish, with many spots thereon: the is also bitter but not so extreme as the first.

4. Colocynthis pyriformis. Peare-falhioned Coloquintida or bitter Gourd.

This Peare-fashioned kinde, hath many trayling rough branches like the first, and such like long and round points leaves, cut in also on the edges but not so deepely, neither so large or great, and of a darker greene colour; at the joynts with the leaves, come forth the slowers, being yellow, but small than the first, and likewise small twining classers as the other, which taketh hold on every thing, that it may comprehend the

fruite is small, not bigger than a large Catherine Peare, and many smaller, yet all sashioned like a Peare, it head whereof is somewhat rounder than a Peare; the shell or outward rinde whereof is greene, but white what it is ripe with many long lines or strakes thereon; the inner pulpe or substance, being almost as white, light, and spongie but lesse bitter than any of the rest, at the least in those have growne in my garden, having but some rowes or rankes of white seede like the rest.

The first commeth as a Merchandise to us from Arabia, Egypt, and Syria, yet is nourished up in the gardes of those that are curious. The other forts some have beene found in Spaine and Italy, but we sow their seekery years in our gardens, if wee be desirous to see them, for they never come up of their ownesses, ing.

They flower late, and so doe they ripen with their fruit, which unless the yeare proove kindly, hardly come to perfection, untill stepe very late; but the first worst of all.

The Names

The first as that which onely was knowen, or at least additioned by the minimum writers, is called a Greeke wavestone Colorynthis, and of some own a many Siens photo gives Consider the billione Cowning the billione of delivery of the Latine's Considerable with the straight of the strai

have their names in their titles, as most writers do cal them, that mention them, and as much as can be said of them, onely Trague calleth the Pyriformis, Colorynthis Germanica, because it is lesse dangerous, and more easie to grow in these colder Countries. Bestern that set out the Bishop of Eystor in Germany his garden, calleth both the Pearse stationed Colloquimitids, and the greater that beareth round fruite like an Apple Pseudo cosey publides. It is the same that in the Scripture in the 2 of Kings and the 4. chapter, is called a wild Vine, whereof one gathered wilde Gourds: the Arabians call it Chendell and Handal, and thereof Trochisci Albandal quasi ex Colorynthide came.

The inner white fost spongie substance, under the outer shell or rinde, is that onely without any seede. which is used; and being extreame bitter purgeth violently, even to excoriation and blood oftentimes, especially in tender bodies! but the dofe or quantity which was given by the ancients, and is yet continued in the hotter climates of Europe, (their dry constitutions better enduring it) doth farre exceede the proportion, that our moiclimates of the properties, are possible able to endute without manifest danger, unlesse it bein those that are robustious, and nied to continual strong labour: for Dioscorides appointed 4. oboli, that is 2 scruples or 40 graines, of the inner substance to be made with honey, Myrrhe and water into pills, when our Physitians, dare scarle give one objective. Im. that is 10 graines or halfe a scruple; yea they thinke halfe this quantity, mixed among other purgers, is a Interior of grants of the purgers, is a firing purgers, and it is fo found by dayly experience, and therefore to avoyd the danger that often happeneth, being a great enemy to the stomacke and bowels, although Pliny saith the contrary, it is best to correct the violence thereof with oyle of Roses, Gum Tragacantha and Bacllium, as it is appointed in the Trochifei Albandall, which lenifieth the sharpenesse thereof by the gummes, and causeth it by the lubricity of the oyle, to passe the sooner away: This is the safest way to take it inwardly at the mouth, the substance of the seede in powder, the looner away to take it inwardly at the industrial antifice of the feeds of the decoction, is not of halfe that force, as the pulpe it felfe, fo found by Lobels experience, and others, if the feedes be taken forthout of an apple, and it overcrusted with loame or clay, and some Vinegar and Niter put to be heated therein, the liquor doth ease the paines of the tooth-ach, and fastneth loose teeth, if they bee washed be heared therein the adjust a detreate the paints of the tooth-acts an latitude tools even, it they be walned therewith: and if in an Apple fo ordered; some old fweete wine, or new boyled wine, be put to steepe for a day and a night (which some have fallely interpreted that the Apple, should be steeped in the wine) and the wine strayned forth to be brunke warme, purgeth the body more gently. Dioscorides order was to boyle the wine or honied water, in the Apple, and let it stand open all night to coole in the ayre. It purgeth strongly steeme and choler, and other tough or clammie grosse humors, from the further or more remote parts, as the braines, sinewes, muscles and joynts, as also from the lunges and breast, and from the veynes also; and is therefore very helpefull (if it bewisely applyed) to all the diseases that happen to those parts, as all old paines in the head, the meagrime that is inverate; the falling ficknes, the apoplexie, the turning or fwimming diffines in the head, the watring of the eves, the could Gout, the Sciatica or hipgoute, and other paines of the joyntes and fine wes: it is helpfull also for the laundile, and for putride or rotten fevers, for an old cough, the straightnesse of the chest, shortnesse of the breath, and above all these, it helpeth the cholicke, whether it proceede from slegme or from winde, as also the dropsie, being taken either in glisters, or suppositories: it is not good to be given to the aged or weake, but to the strong, young, and lusty bodies; neither to women with childe, for if it bee applyed to the wombe it deftroyeth the childe. Being steeped in vinegar, it taketh away all discolourings of the skinne, as morphew, and leprye, dry sturfe and scabbes, if the places affected, be often rubbed therewith. Pure oyle being put into an hollowed or clenfed apple of Coloquintida, and fet upon warme afthes or embers, to be throughly heated, both maketh the haire blacke, that was not so afore, stayeth it from falling that is disposed thereunto, and keepeth it long from growing gray: the same oyle dropped into the cares, taketh away the paine, and singing noy se of them: and mixed with a little Oxegall and anointed, on the belly warme, killeth the wormes and cause them to avoyde, and oftentimes purgeth the belly, being onely so applyed: Galon saith, that the bitternesse thereof, which might be availeable for many griefes, suffereth it not to exercise them, but is overcome by the webement purging quality it hath: If when it is taken it flould worke overmuch, and bring forth excoriations and blood, to the danger of the patient, a decoction of Raylins of the Sunne, given with Oyle of fweete Almonds, or the Oyle of Walnuts, mittigateth the violence thereof, Rats and mice doe much delight to eate feedes. and the feede hereof also: if therefore they be fet, or layd, in diverse corners of the house, troubled with them. it will kill and destroy them all: The decoction of them also sprinkled in Chambers is sayd to kill fleates: The other forts of Coloquintida are seldome or never used with us, yet Tragus commendeth the use of Colocynthic Pyriformis, as being leffe bitter and violent in purging, and therefore safer to bee taken inwardly.

CHAP. IIII.

Cucumis agrestis sive Asininus. The wilde or spirting Cowcumber.

His wilde Cowcumber (as well as the former wilde or bitter Gourde, differing from all the reft of their families) is fit to be entreated of apart by it selfe, as also to be next remembred, being as violent in all the qualities thereof, as the former, or rather more: It creepeth on the ground like unto the former, with many rough trailing branches, whereon are set very rugged and rough ill coloured greene leaves; somewhat whitish underneath; little or nothing

divided or parted at the edges; at the joynts betweene the branches and the leaves, come forth fmall pale yellow flowers, opening into five leaves, at the end of fmall greene heads for the most part, as all other forts of Gourds, Cowcumbers, &c. doe: but those that have flowers onely without such heads, fall away quickly without finite; for that greene head, as in all others, groweth to be the fruite, which is small, rough, round and long, and somewhat of a grayish greene, when they are ripe; the short rough soote stalkes, being crooked, and bending the fruite downewards, which with a little touch, when they are throughly ripe, will quickely open at the end next the stalke, and sprirt out the juyce, and some seede, into their faces or hands, or other places against

Cucamis Sylvestris.
The Wilde Cowcumber. ter as is all the rest of the plant. The Place. Land, where it is used. The Time. sufually ripe in August. The Names.

it that rouched it : the feede being ripe, is blackift, and fone, what rugged, but otherwise white, lying in a greene most fubstance, very bitter and loathsome to taste: the roote is white, and firme, thicker, and shorter, than in any other for of Gourde or Cowcumber, with some fibres therear, very bit-

It groweth naturally wilde in Italy, as Matthiolus faith, in many places by the way fides; and in untilled and moorish places, we onely preserve it in gardens, throughout the whole

The roote hereof doth often abide in the ground, all the wind ter long, if it ftand reasonably defended, or the ground berich with foyling, shooting then forth leaves betimes: in other col der grounds not defended, they perish every yeare: the fruite

It is called in Greeke sing ayer, in Latine Cucumer & Cucumis agrestis, or assimum, as many writers doe, or anguinus, a Turner and Cordus, but not properly: Mathiolus, Tragus, Dodonaus, and some others, call it Cucumis sylvestris. The dryed or hardned juyce of the fruit, is called, Elaterium, Gazatranslating Theophrassus calleth it Agitatorium. The Vertues.

The rootes hereof and the dryed juyce of the fruite, artificially and not rudely prepared, which is called Elaterium, archiefely used in medicines and scarse any other part: Concerning Elactium, there is difference betweene Theophrassus, and Disserties, of the age, and durability, and in extinguishing or encreasing the slame of a lampe or candle. Theophrassus in the minth booke and foureteenth chapter of his hittory of Plans, faith Elaterium is the most durable medicine of all others, and

that the best, is the eldest; for as he saith, a Physicion of sufficient credit, kept by him some Elaterium, that we 200 yeares old, which he received of one as a gift; which not with standing the age, was of wonderfull verue, and until it was 50 yeares old, it was fo aboundant in humidity, that put to the flame of a lampe or candle, it would put it out. And Disserted state that Elaterium, is fit to be used as a purging medicine, from two years old, until it be tenne, and that is the best, which being put to the flame of a lampe or candle, will make burne the more bright. Vnto Theophrassus, Pliny subscribeth the same thing, and saith that it is sound true we have a subscribed the same things, and saith that it is found true we have a subscribed the same things. experience, that untill it be 50 yeares old, it will cause a lampe or candle, to spertle hither and thicher, before put it out; whereupon Mathiolus giving credit to the testimonies of Theophrastus and Pliny, is persuade that the text of Dioscorides is corrupted, but I verily believe they both say true, the reconciliation of their pugnancy, being onely in the manner of making of Elaterium. Theophrastus his Elaterium being greene, al suppose, and made of the substance of the inner pulpe of the fruite; yet in the tenth chapter of his fourth book, he faith it is made of the feede, which I never faw, or heard of any to be fo made with us; and that of Diofeoriks being white, (which as he faith himself is the best, and condemning the greene,) made onely of the more thing watery, and wheyish part: Mesues also saith that the best is white: my selfe having made of both forts cante ftifie, that Elaterium, made of the substance of the fruite; although very gently presed through a fine sive, willbe greene, and continue moylt many yeares, after it is evaporated and dryed up hard, relenting with the ayre, and will require many yeares to confume the humidity therein, when as the other fort, made of the whitish, wheyis liquour, that droppeth through the five of it owne accord, in the cutting of the fruite, without any touch of pressing, will be white when it is dryed, and so remaine white, hard and drye, for many yeares, unlesse it belsfi open to the moyst ayre, or stand in a moyst place to cause it to relent: the greene fort likewise is not of halfs, that force or violence, to purge either upward or downeward, as the white Elaterium; whereof one graine weight dissolved in liquor, worketh forceably in any tender body; yea I have oftentimes seene, that halfes graine weight put into a purging medicine, to quicken the weakenesse thereof, hath troubled the stomackevery much by castings, and much disquiet, and working also downeward with more violence, then it could be thought the whole graine given of it selfe could doe. This narration although somewhat tedious, I was the more willing to declare, because I thinke none hath shewed it before, and my little experience may set anedge unto others, to polish that which I have here shewed you, but rough hewen. The dose or quantitie thereofteken at a time, Dioscorides faith is a whole obolus, and the least quantitie halfe an obolus, (fome take the obolum weigh 12 graines, but the most usuall is but 10 graines,) which sheweth as I sayd before, the great doses, which the ancients were wont to give of purgers in their medicines, which we dare not follow: It purgeth cholerand flegme from all parts of the body, and as he faith, is the best medicine to purge those that are pursic and short winded: to procure a vomit, he adviseth to dissolve it in water, and with a fether dipped therein, to touch the lower part of the tongue, as low as you can; but milke or rather creame which is more unctuous, is firrer togist it in, for it will not fuffer it to flicke to the tunicles of the stomacke, but will cause it slippe away the more for dily: it helpeth also the falling sicknesse, being put into the nostrels with milke, and mixed with honey and old oyle, it cureth the Kings evill, being annointed therewith: It bringeth downe womens couries that are flayed,

and killeth the birth if it be applyed to the secret parts: It purgeth clammie and watery humors from the joynts, and that flrongly: the juyce of the roote doth the fame likewife, and therefore used in glisters, or layd as a plaiand that thought the place payned with the Sciatica, eafeth the paines thereof, the fame juyce of the roote, boyled with wormewood in water and oyle, cureth an inveterate megrime, if the temples be often bathed therewith, and some of the leaves and rootes, be beaten together, and layd as a pultis thereunto afterwards; the juyce of the roote with a little milke, cast up into the nostrels doth the same : for it wonderfully purgeth the braine of the roote with a rich and healeth the evill favour of the notirills caused thereby: It cureth also the old paines of the head and the Epilepsie: and being mixed with Goates dung, and layde as a plaister upon any great or hard swellings, or kernells, it resolves them: The juice of the roote, as well as of the fruite (and so doth the decotion of them also, faith Mesues) being drunke doth helpe the dropsie, for they mightily draw forth watery humors, and the yellow I aundise, and all obstructions both of the liver & spleene; Dioscorides also sheweth this medecine to cure the dropsie. Take saith he halfe a pound of the rootes hereof, and being bruised, let it be put into three quarters of a pint of strong wine, giving thereof three ounces, for 3 or 4 dayes together, untill the tumour be discerned, to be aboundantly wasted and fallen; which thing it worketh faith he, without any troubling of the ftomacke! A few graines of Elaterium mixed with conserve of Roses, and some thereof taken will doe the like, and herewith Caster Durantes faith he cured many: The powder of the roote mixed with honey, and layd upon any fowle scarre in the skinne, doth attenuate it, and taketh away the markes or blew spots, that come upon on any fowle traffe in the satisfies don't accommode a said target in way the markes or one upons, that confidence bruiling or blowes: the roote boyled or layde to fleepe in ftrong Vinegar, cureth the morphew and clenfeth the skinne of all foule spots, freekles, and other discolorings thereof; and the powder of the dryed roote faith Dioscorides, clenfeth the face and skinne from all scurfe, and taketh away the blacke or ill colour from any fearre: the juyce of the leaves dropped into the eares, easeth them of the paines and noyse therein, and helpeth the deafenesse: the decoction of the roote gargled in the mouth, taketh away the paines of the teeth; the powder of the roote mixed with honey, and put into old fores and ulcers, clenfeth them throughly, and thereby furthereth their healing wonderfully: Our Apothecaries doe most usually take the roote of this wilde Cowcumber as a subflitute for the roote of Coloquintida or the bitter Gourd, that not being so frequent or easie to be had as this.

CHAP. V.

Scammonia. Scamonye.

Aving shewed you in the two last Chapters, some purging plants that runne, or spread upon the ground, or clime up by those things that are set by them: let me conjoyne some other the like, part growing naturally in our owne, and part in other Countries, and first of Scanonye, which is properly a Convoluntus or winding Bell flower, which we call Bindeweede: I will comprehend in this Chapter also, those onely that in forme and force in working, come necrest unto the true: the rest that differ shall follow.

1. Scammonia Syriata legitima. The true Scammonie.

3. Convolvulus major albus. The great white Binde weed.

Chap. 5.

CHAP. 5.

I. Scammonia Syriaca legitima. The true Scammonye.

The true Scammony hath a long roote, of a darke ash-colour on the outside, and white within, and of the big. nesse of an arme. (for such hath beene brought us from Tripoli) with a pith in the middle thereof, and many fibres thereat, (which being dryed as Marthiolus faith, the pith taken out, seemed so like unto the rootes of Tur bith, which are brought us, from the farre remote Easterne parts, none knowing what plant it is, nor whereunt it is like, some thinking it to be the roote of Tripolium or Sea-Starre-worte, which Matthiolus confuteth; o. thers a kind of Ferula or Ferulaceous plant, altogether improbable, but that they are not fo tough, but more brit. tle, that otherwise it might be thought, to be the right Turbith of the Apothecaryes shoppes) from whence are many long, round, greene, branches, winding themselves like a Bindeweede about stakes or trees, or any other herbes or things that stand next unto it, unto a good height without any clasping tendrells, like the true or wild Vine: from the joynts of the branches, come forth the leaves, every one by it selfe, (yet I have seene dryed plant that have had two leaves one against another,)upon short foote stalkes, somewhat broad at the bottome, with two corners next thereunto, and some also round that I have seene, and then growing long and narrow to the end; being smooth, and of a faire greene colour, somewhat shining : towards the tops of the branches atthe joynts with the leaves, come forth large whitish Bell flowers; with wide open brimes and narrow bottomes; after which come round heads, wherein are contained 3 or 4 cornered blacke feede; for fuch I have had given me, from whence hath sprung plants, which perished quickely, not abiding a winter with me: if any part of the plant be broken, it yeeldeth forth a milke, not hot or burning, nor bitter, yet somewhat unpleasant, provoking loathing, and almost calting.

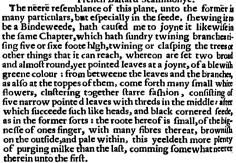

2. Scammonia Macrorhyza Cretica. Long rooted Scammonye of Candye.

Prosper Alpinus, in lib. de exoticis, faith, that he in his former times received from Candie, another for of Scammonye, differing nothing from the true Scammonye here before described, but in the fashion of the room which is long and flender, of about a fingers thickneffe, but purging as strongly as that of Spria, and this in my judgement doth very neere resemble, our common white greater Bindeweede, that shall follow next the Countrey making the difference onely as I thinke.

3. Convolvalus major albus. The great white Bindeweede.
Our great Bindeweede commeth as I think so neere unto the former Scammonye, that excepting the largenese of the rootes, and the greater force in purging, which may both proceede from the climate; you would fay this were altera eadem, whole many flender winding stalkes, runne up and winde themselves upon hedges, or whatfoever flandeth neere unto it, having diverse large leaves growing severally thereon, somewhat long, and pointed at the further end, and parted into two points at the broad part, next to the stalke, making it seems almost three fquare, being smooth and of a pale greene colour, yeelding a milke being broken, but not so plentifully as the Scamonye: at the joynts with the leaves towards the toppes of the branches, come forth large white Bell flowers, without any division in them, after which rise round skinnie huskes, or heads, conteining within themdiverse blackish, three cornered seede, like the former, but lesser; the roote is whitish, and small, of the bignesse of Couchgraffe, or somewhat greater, running much under ground, and shooting forth in sundry places: both stalkes and leaves perish every yeare, the roote living in the ground, and shooting a fresh every spring, which veeldeth milke, being broken.

> 4. Scammonia Monspeliaca dicla. French Baftard Scammonye.

4. Scammonia Monspeliaca dieta. French Bastard Scammonye.

5. Scammonia rotundifolia Virginiana. We have had a kind of Volubilis from Virginia, ver neerely refembling this kinde of French Scammonye, both in growing and forme of leaves (as you may perceive by one let by the plant) but the flowers being small and white doe open like a Bindeweede, and not like a starte,

into five leaves, like unto t'e last, the seede groweth not in pods, but in small heads, being small and blackish like other Bindeweeds, and therefore if not to the family of Bindeweeds, I know no better place than to insert it here. And peradventure this may be the Indians Hololuichi, that Aldinus mentioneth in his Farnessan gue den to be fo dangerous.

The first groweth in Syria, and the farther Easterne parts, where no frosts are felt in the winter, for it

quickly perish with the first approach thereof, and therefore to be kept safe in these cold climates, it requireth ome vault, or flove, or other fuch convenient place. The second growent in Candy as Alpinm faith. The third is frequent in sundry places of the Land, growing by the hedges sides and running thereon. The fourth groweth neere the Sea side, as well by Mompetier, as the kingdome of Valentia in Spaine, where Clusius saith he found it: and the last in Virginia.

The Time.

They flourish in these Countries in Iune, Iuly, and August, but the first, and two last, doe seldome perfect any feede with us. The Names.

The first, is called in Greeke Esquaria, and in Latine also Scammonia: the dryed juyce which is most in use, is called Engineerier Scansmonium, both in the Druggists, and Apothecaries shoppes, as also with most writers, vet fome call the plant fo too : the same being prepared, that is, baked in a quince, under the embers, or in an Ovenor any other way, is called of the ancient writers Diagridium, which should onely be used in medicines, according to the appointment of all Physicians, who are led by the tradition of their elders: but all Apothecaries in generall, doe use the Scammonye it selfe, as it commeth, without any other preparation, so as it be of the pu-In general, doe are the statistically a territory of the control of the properties o diffolved, wherein it is appointed to be put: the dayly experience of Apothecaries, who are chiefe mafters in their professions, or should be, if they be worthy of their name, doth teltifie there against, finding that if Scammonie come to never fo little heate almost in the mixing thereof, it will curdle together and lye in knots in the modicine, beate yee it almost never so long after it is mixed; and therefore they alwayes in their Scamoniate medicines, rubbe it finely into powder of it selfe, without other preparation, and so put it last of all other things into any medicine, that hath beene boyled or heated, and that when it is almost cold, for feare of curdling or gathering together in knots, as I fayd before; and being thus mixed, the medicine shall worke more safely without perturbations of the stomacke, &c. and more surely without tediousnesse or procrastination, than if Diagridium, were put into it : let not this be imputed as an errour in our profession, or a setled wilfulnesse to contrary so great and ancient authority, for we know that true experience hath mastered reason and antiquitie, and we alfo know, that the experience and diligence of our times, hath in many more things, not onely taught us to vary from the Methode and order, appointed by the ancient writers of Physicke and hearbes; but to contrary them also, when we have found either by reason or experience, that there is cause so to doe, as in the dose of this Scame monie is plaintly to be observed. For Dioscorides appointeth a dramme to be given at once, when no Physitian with us, dare fearle give halfe a feruple, of not above. The fecond Alpinus so calleth, as is in the title, and that is as much as can be sayd of it: the third is called Volubilis major & Convolvulus major, by diverse, as also Smilas levis major by others, Helxine Cissampelos by Cordiu on Dioscorides, and Malacocissus Damocratic by Anguila-ra: the fourth Gesner in horis calleth Scammonia Monspel, and Lobel Scammonium Monspeliens, but Clusus who in his Spanish observations, first calleth it Scammonea Valentinas doth in his history entitle it, Apocynum 4. latifolium, yet referreth it to that of Mompelier as both one : Camerarius and Lugdunensis doe call it Scammonia maritima Monsfeliaca as the learned of Mompelier doe, and use it accordingly: the last is remembred onely by my selfe, who suppose it by being like in forme to the last, to be neere also in quality thereunto. The Vertues.

Scammonye being the basis as I may so call it, of those medecines wherein it is put, there had neede of especialleare to be taken in the choife thereof, that onely that which is fincere and pure, without droffe or adulteration on be used in Physicke; which may be knowne if it be not heavie, or close compact together, but that it be moderately light, with some small holes or hollownesse heere and there therein; and that it be smooth and plaine in the breaking, and not in grumes or knots, or having fmall stickes or stones in it; somewhat cleare and blackish alfo, but not of a deadish darke or evill favored colour, and that will be made quickely into a very fine and white powder: this I mention comparatively, for it will be a very hard matter, for any to know the best by relation, but by inspection; and chiefely by comparison of the good and bad together, that so you may learne to know eighter of them at the first sight. The doss hereof as it is appointed by Diescorides and others, doth to sarre exceede the proportion of our moderne Phylitians, that it hath made Pena to doubt, that the Scammonye in Diofeorides time, was more corrupt, and encreased with other things than ours is, because he gave so much, and we doe give folittle; and Matthieles on the otherfide to doubt, whether wee have any fincere Scammonye brought unto us at all, or else that the text of Dioscorides is corrupt, wherehe appointeth a dramme or foure obolos, that is, two fcruples to be taken at a time; and he fetteth downe also, that if a purging medicine be required to be effectuall; you should take 3 aboli, that is halfe a dram, of Scammonye, 2 oboli; that is one feruple of blacke Helleber, and one dram of Alors, all thefe to be taken together at one time: but the greatest doss now adayes exceedeth not halfe an obelses to altrong body, and leffe to the weaker, or more tender. Pena in his diligent observations, and declara-tions hereof set downe in his Adversaria, hath caused all whom it may concerne, both to understand the shoyle of this Scammonye, as also thereby to bethinke them of the sincerity of other drugges; and that as he guesseth the quantity of Scammonye is fogreat, that is spent in all countries, which is made onely in one, that unless the quantity were sugmented by mixture, there could not be fufficient fineers and pure juyce, to ferve them by much; and although in former ages, and even in our former times, there hat beene much faile and corrupt Drugges, because it is not expected by the state of th and although in former ages, and even in our former times, there hath beene much falle and corrupt. Lyngges, brought into Europe, and all the countries thereof farre and neere: yet the skill and curiofitie of these times is such, that our Merchants taking onely the best for us of all forts, and refusing the course, that I thinke lessessed, if not worne out, that sophisticating art in the matters thereof, when they see that none but true and sincere is affected and bought; the worst to lye on their hands untill it grow better: It purgeth both slegare, yellow choice; and watery history world world but still been indiscretely or catelestely given without the respect, it will not onely trouble the stomacke more than any other medecine, but will also scower, free and rate the gutts in Working too for readily, often into blood, and often times causing faintings and swort large. Our Physitiah therefore doe following twe, to any render and gentle body any Scammoniate Electuary.

1. Scammonea Monfpoliaca offinis, & 1. Seeamone Agyptiaca.

Baftard Scammonye of Spaine and Agypt.

These doe purge a little, but to little purpele, none of them comming any thing neere the vertue or force of the true Scammonye; yet they of Egypt doe fometimes use the juyce of their owne kinde, in the flead of the true Scammonye, and to that purpose doe gather and harden the juvce thereof, and keepe it to use when they want better, allowing double quantity for a

and but in pills feldome any at all, so avoyd the dangerous symptomes that often happen thereupon; for Plays, Paulus Eginata, and others show the dangers thereof, and Mesus also declareth three severall hunts or harmes that come to the body thereby, and the remedies of them, which is not from the purpose to bee here set downe. The first is faith he, that it engendreth certaine gnawing windes in the stomacke, so much offending it that it one cureth a disposition to vomite. To be baked therefore in a quince, and some parslye, fennell, or wilde carrot seed or Galanga mixed with it, is the remedy hereof: The next is that it enflameth the spirits, by the overmuch fharp. nesse or siercenesse therein, whereby it readily induceth feavers, especially in those that are subject to obstructions ons, that doe coole and quench the heate thereof, and such are the muccilage of the seedes of Pfillium, or Flea. wort, Prunes boyled or rather the pulpe of them, the juyce, or the Iulep, or the water of Roses or Violen. wort, Primes boyled or father the plane of the prime of the boyling thereof, (that is the Scammonye) you freepe it in the oyle of Rofes or Violets, or in the juyce of a fowre sweet equince, and mingle with it a little Summed or Spedium. A third is that having a strong opening and drawing faculty, it canfeth immoderate fluxes of the belly, by opening the mouth of the veine more than is fit. This harme also is taken away, by mixing aftringent and restraining things with it, such a more than is fit. This nature also is caken away, by infanting artingers and rectaining things with it, fisch a Massicke is, and especially yellow Myrobolanes and quinces, or the juyce of them. Againe, it raseth or shaves the intrales and guttes, by reason of that sharpe juyce wherewith it doth abound, and by which it procure the ments and paines therein, the disease called Dysenteria which were call the bloody slike, and Tenesian, which is a difease, when one defireth to goe often to the stoole, and can doe nothing; but this danger is remedy ed. if movil. fat and llippery medecines be used, as gum Tragacantha, bdellium, and oyle of Almonds and Rose as also the pulpe of prunes, made up with Sugar, the muccillage of Psylinm or Fleaworte seedes, Malticke and quinces taken afterwards, and warme water last of all; all which cause it to passe the quicklier from the slomacke and bowels, and thereby stay it from doing harme; whereby those that are wise, are taught to give the broth of barly, sweetned with Sugar, to drinke to those that have taken thereof: This fault also is helped, if cold medicines as well as hot, being mixed together be given, thereby to yeeld helpe to the heart, liver, and to-macke: thus farre Melues. The juyce faith Dioscorides applyed to the wombe, destroyeth the birth; being mixed with honey and Oxe gall, and rubbed on wheales pimples and pushes taketh them all away: and boyled in Vinegar and annointed, taketh away the Lepry or outward markes in the skinne : being diffolved in Rosewater and vinegar, and the head moyfined therewith, eafeth the continuall paines therein. A dramme or two of the rootes of Scammonye purge in the fame manner that the juyce doth, if some of the things appointed therewish be given with it? the rootes boyled in water, and made into a pultis, with barly meale, easeth the Sciatica, being layd thereon: it taketh away fourfes and scabbes, if they be washed with the Vinegar, wherein the rooter have beene boyled, and also healeth apostumes. Our English Bindweede hath beene experienced to be purging, the rootes especially being boyled, and the decoction thereof taken in a reasonable proportion. That of Candy is mentioned in the description. They of Mompelier have often used the dryed juyce of the fourth, in stead of the true Scammonye when it was wanting, but in a double quantity, which yet did not worke to effe-Ctually.

CHÁP. VI.

Scammonia supposititia. Supposed or Bastard Scammonyes.

iere be fome other plants to be joyned next unto the true. Scannesge for the firong purging quality in them, but not either deadly or dangerous, as the Apernam is, which elfe for the outward like nesse might be referred unto them.

T. Scammonia Monspeliasa affinis. Spanish Bastard Scammonye.
This Spanish kinde of Climer is very like unto the great Bindeweede, in the branches, leaves, and rootes, but the leaves being somewhat longer, are of a grayish greene colour, giving milke more abundantly that any, and the rootes being small white and brittell, more aboundantly creepe under ground, and quickely over fpread any place where it groweth, alittle peece being left in the ground, will fpring up quickely into a plan ready to clime; so that many being weary thereof, doe arive rather to destroy it quite out of their gardens than keepe it any longer: the flowers are white and starre fashioned, but there come long poddes after them, like unto Periploca or Asclepius, this looseth both leaves and branches, and springeth a new every

2, Secamene Agyptiacum. Bastard Scammonve of Egypt.

This likewife feemeth to be of the same kindred with the former, as by Alpinas his relation may be gather red; for as he faith, the Egyptians with whom he faw it, reckoned it a kind of Scammonye, yet made nogreat use in Physicke thereof. It climeth he saith with many winding branches, having long and hard greene leaves on them, greater than the leaves of Sofeli Ethiopicomo france: the flowers are white but larger than the for mer fort, and bring hard crooked coddes afterwards, two alwayes growing together, like unto the coddes of the Oleander or Rose Bay tree: from the leaves or branches of this plant, sloweth a pale yellowish milker juyce, no lesse hearing and burning the throate than a spurge, this booseth his leaves, but not his brancher ever yeare, fresh springing a new in the spring. The Place

The first, grew about Pincia in Spaine as Cluffins faith. The other in excepts.

They doe both flower in the latter end of Spinimer, and bring ripe fruite in the end of September.

CHAP. VII.

Soldanella sive Volubilis marina. Soldanella or Sea Bindweede.

Lthough this plant groweth by the sea side, and plentifully enough on our owne coasts, in many places, and might there fore be remembred among other Sea plants, when we come to them, yet because it hath a strong purging quality therein, I thinke it not unsit to joyne it unto the other of his nature: I will also adjoyne hereunto that kind that groweth upon hills, called Soldanella Alpina or Montana, because the leaves are round, somewhat like unto these.

This Sea Bindeweede hath many weake, flender brownish greene branches, trayling or lying upon the ground. rather than raifing it felfe up, or climing upon other things, whereon are fet divers leaves, not alwayes two together at a joynt, nor yet alwayes single, one at a joynt, which are almost round like unto the leaves of Asabaca, but a littleunevenly dented about the edges, and thicker, every on standing on a long foote stalke, and of a grayish greene colour; among which come forth the flowers towards the ends, every one by it felfe, comming forth at the joynts, in fashion like unto the imall low common Bindeweede, that groweth upon the ground by the way fides, every where almost, but a little larger and of a reddish purple colour: after which come round heads, wherein is enclosed two or three round blacke seedes, the roote is small and long, fpreading a little in the ground, and shooting up diverse heads in severall places: if any part thereof be broken, there issues he whitish water, which as well as the leaves are bitter, salt and unpleasant.

2. Soldanella maritima major. The greater Sea Bindweede.

This other kinde hath likewise divers long slender branches: whereon are set larger leaves, many of them having a division, on both sides the leafe, next the bottome, and many of them but on one side, and many also that are smaller having none at all; yet all of them for the most part a little sinuated on the edges, toward the ends, which are round or with a dent in the middle, making the point feeme double forked, with many veines running therein; the flowers are of a reddish purple colour, and are not bell or cup fathion, like the former, but consist of five somewhat large and long leaves: the heades and seedes are like the other, and the roote creeping a little in the ground.

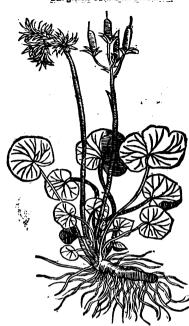

3. Soldanella Alpina major. The greater Mountaine Soldanella. From the likenesse of the leaves, this Mountaine Soldanella tooke the name, which hath many hard round leaves, fet upon long foote stalkes, a little unevenly cut about the edges, greene on the upper side, and of a grayish greene underneath, and somewhat reddish like the leaves of Sowbread, resembling the Sea Soldanella: the stalkes are stender, small, round, and reddish, about a spanne high, bearing source or five slowers are the coppes, every one hanging downe their heads, like unto a bell flower; confifting but of one lease plained into five folds

TRIBE. 2.

2. Soldenella unig. & major maritime.
The greater Sea Bindweede.

3. Soldanella Alpina major. The greater Mountaine Soldanella;

Each of them ending in a long point, which maketh the flower feeme to have five leaves, having a round greek head in the middle, with a pricke or point at the end thereof: the flower is of a faire blew colour, in fome deper or paler, or white as nature lifteth, without any finell at all: the middle head after the flower is fallen night to be a long round pod, bearing that pointell it had at the end thereof, wherein is contained finall greenish feeth the roote hath many fibres, shooting from a long round head or roote. There is a lefter fort hereof as Cluju faith, little differing in funder one from the other, but in the greatnesse or smallnesse.

The Place:

The first groweth on our owne Sea coasts, in many places plentifully, as well as in other Countryes. The other groweth as well wilde in desert places, as in gardens in Syria, as Ranwolfius saith, as also on the coasts of the king dome of Naples, as Imperatus saith: the last groweth on the snowye hills in Hungary as Clusius saith.

The two former flower toward the end of Summer, and their feede is ripe in Angust: the last in the seturall places flowreth not until Inly or Angust, as the snow melteth sooner or later, but in Aprill in Garden.

The Names,

The first is taken of all writers for the most part, to be the $k_{O}^{i}\mu c^{i}$ $\theta_{2}\lambda a_{O}^{i}a$ Brassica marina of Dioscridi, all the markes and notes thereof agreeing with this: yet it hath no resemblance unto any kinde of Colewott as the name should import, yet many authors doe call it Brassica marina, as Matthiolus, Cordus, Gesur, Camira, Dodonaus, and others, and some of them also call it Soldana and Soldanella, as well as Lobel, Casalpani, Tabermontanus, and others. Baubinus calleth it, Soldanella maritina minor: we in English doe call it by divert sames, as some call it Sea cole, according to the Latine name, others more properly in my judgement Convolve sumarinus, Sea Withvinia, or Sea Bindweede, because the branches winde themselves, and the slowers, are like the small kinde of Bindweede, and that it groweth naturally neere the Sea coasts, as also Sea Bells for the like nesses of the sumarinus, and some also call it Tussilago marina, Sea Fole-soote, for the resemblance of the leave. The other Raswolsus calleth Brassica marina genus, as it is extant in the Appendix of the great Herball of Luganels; and Imperatus calleth it, Convolvulus marinus noster; Baubinus calleth it, Soldanella vel Brassica marinus major, and hath set forth the figure thereof in his Matthiolus: the last is called by most, Soldanella Alpina, and some Lunaria minor carulea, in English Mountaine Soldanella, (but not Mountaine Bindeweede, as Gerard doth, because it is no Bindeweede) or clie Blev Lunary or Moone wort.

The herbe and every part thereof as Diofcorides faith, is an enemy to the stomacke, being sharpe in talte, and openeth the belly very powerfully, and violently, and therefore not fit to be given, but unto strong and robustome bodies, and that boyled also in the broth of fat meate, to hinder the violence of its working: the decoding thereof with some Rubarbe, is commended by some to helpe the Dropsie and Timpanie, and the powder of the leaves with Rubarbe, and a few Cubebes drunke in wine, is of the like operation: the juyce also not present

but issuing forth of it owne accord when it is broken, gathered, and dryed, and afterwards relented, and layde as a plaister to the bottome of the belly, worketh upon that disease (the Dropsie I meane) mightily, drawing forth those watery humors: diverse also doe use to eate the greene herbe fasting, to purge them, even as others doe Scurviegrasse: the powder of the dryed hearbe is of very good use, to bring or raise up fielh in deepe and hollow Vicers, helping also to heale them. The Mountaine Soldanella, is of a drying or binding property, good to consolidate wounds and helpe the Sciatica and Goute.

CHAP. IX.

Convolvuli sive Volubiles majores. The great Bindeweedes or Bellflowers.

Here are diverse sorts of Bindeweedes or Bellslowers, some greater, others lesser, of the greater in this Chapter, whereof some of them have beene made mention by former authors, but others not spoken of by any before.

fooken of by any before.

1. Convolvatas Azureus sivecaruleus major. The greater blew Bindeweede or Bell flower.

This greater Bindeweede riseth up with many winding branches, climing and spreading on whatfoever it cantake hold on, that standeth neere it, winding it selfe alwayes contrary to the course of the Sunne, on
these branches grow many faire, great, round leaves, pointed at the end; of a sad greene colour, at each joynt,
where the leaves are set come forth flowers on pretty long foote stalkes, two or three set together, which at the
first are long and pointed, almost like a singer, but being blowen open are like great bells with broad open
mouthes or brimmes, made of one whole lease, ending in sive corners and soulded or plaited so also, and small at
the bottome, standing in small greene huskes: these slowers are of a pale blue colour being in budde: but being open are of a verydeepe azure colour, or blue, tending to a purple, the soulds or plaites being deeper or redder,
which open for the most part in the evening, abiding so all night and the next morning, untill the Sunnes heate
closeth them, never opening againe: after these slowers are past, the stalkes of them bend downewards, and beare
within the huske three or source blacke seedes: the rootes are stringy, and perish every yeare.

2. Convolvulu major purpureus five trifolius. The greater purple Bell flower with cornered leaves.

The growing of this Bellflower is all one with the former, the chiefest difference consisting in the leafe which is three cornered, and in the flower which is deeper, tending to a deepe purple violet colour, and more reddish in the plaites and bottome.

3. Convolvulus trifolius Virginem. Blew Bell flower of Virginia.

This Bell flower or Bindeweede climeth and spreadeth on pales, &c. like unto the former, having leaves very

5 Convolvulus pennatus Americanus. The red Bell flower of America.

O,

TRIBE.2.

like anto the last, but smaller, and cut rounder in the division of the lease on each side, and one side also a little longer, bending downewards: the flowers also are much smaller, of a watchet or pale blew colour, changing mon the fading thereof to be of a reddish purple: the seede is like the former but smaller, and the roote periods theth like the reft.

4. Convolvulus Arabicus sive Agyptius. The Arabian or Egyptian Bindeweede.

CHAP. 10.

170

The Arabian or Agyptian likewise climeth and spreadeth like the other, with a lease at every joynt standing on a long foote stalke, parted sometimes into five small long leaves, sometimes into more, each one ending in mall pricke, and the one or the other lower peece of the leafe, divided into two parts; at the joynts with the leaves, come forth such like Bellflowers, as are in the former, of a purplish blew colour.

5. Convolvulus tennifolius sive pennatus Americanus. The red Bell flower of America. This Indian kinderifeth up at the first with two double forked leaves, abiding a long time without fading, be tweene which springeth up a stalke, three soute high in some places, branching forth diverse wayes, being of a brownish colour, and spreading it seife as the others doe: the leaves that are set at each joynt, are winged; that is, fundry small, narrow, and long, darke greene leaves, but fresher being young, set on both sides of the middle ribbe, and one at the end, from the joynts likewife rife long stalkes, with two or three or more small long hollow flowers at the end, from the joynts like white rule long italies, with two of three or inore imail long hollow flowers at the ends of them, of the fashion of Tobacco, or the white Iasmin flowers with five points, and not for much layd open as the other Rell flowers, being of a bright red colour, and plained like the Bell flowers, with five chives or threads in the middle, tipe with so many pendents which turne into long pointed pods, continuing long and blacke seede, tasting hot like Pepper, the roote is small and stringic perishing every yeare: the leaves talte a little (weete and nitrous, and yeeldeth a thinne pale milke, when it is broken.

The Place and Time.

All these are strangers, the two first are thought to come out of the East Indies or the East Countrey towards it, the reft are specified in their titles from whence they came: They all flower late, and therefore we can yet feldome get ripe feede from any of them.

The Names. The first is taken by most, to be the Nil of Avicen and Serapio, which they call granum Wil, and Habal Nil. for there is another Nil or rather Nir, because of the blue colour, which is the Anill or Indico of Dioscorides and our times, which shall be spoken of in his place, it is called by some Flos Nottis, because his chiefest beauty is in the evening, night, and morning; others call it Convoluntus Azureus ep carnleus, as they call the second refolim & pupurocaruleus: the third and fourth have their names in their titles, as much as can be fayd of them: the last is called Quamochlie by the Indians, and lasminum folio Millefolii by Casalpinus, who was the first as I take it that wrote of it, Camerarius next unto him in Horso Medica faith, it may not unfitly be called Convolvulus to nuifolius: and Fabius Columna faith, it cannot be more fitly referred to any tribe, or family of plants, than unto the Convolvuli, and therefore calleth it himselfe Convolvulus pennatus exoticus rarior; he that set forth Clasius his Curas Posteriores, referreth it to the Iasmines, calleth it Iasminum Americanum, and so doth Banhinus also: but in the flowers onely is the likenesse of the Islamine, and in no other part of the plant, or manner of growing, all the Is mines being wooddy and perennes plante, and this as the other Convolvali herbaccous & annual; some have no ken it to be the Ligustrum nigrum, that Columella speaketh of, but with little judgement in mine opinion: the Inlians call the first and second, Campana Lazura, that is, Campana carulea, the Arabians in Syria and Egypt Hasmila. The Vertues.

The feede of the first and the fecond also (for they are congeneres) doe purge very strongly, but slowly and oftentimes with great trouble to the stomacke, causing vomitings, yet it avoydeth raw indigested slegme, and melancholy humors, from those that can endure it, and killeth the long flat wormes of the belly.

CHAP. X.

Convolvuli five Volubiles minores. The smaller Bindweedes.

Te lesser sorts of Bindeweedes remaine to be intreated of in this Chapter, whereof there are many and fundry varieties, all of them having a purging quality, more or leffe, as you shall presently hear in this Chapter.

1. Convolvulus Althee foliss: Mallow leafed Bindeweede. This small Bindeweede groweth not high, nor climeth much upon any thing, but for the most part, lyeth with his small slender havrie branches upon the ground, having diverse leaves very thinnely or sparfedly set on them; somewhat broade and long, like unto the leaves of Marsh Mallowes, but smaller, crumpled and cut in on both fides at the lower ends, dented about the edges, and of an hoarie or dufty grayish greene colour, clammye or sticking like gumme to the teeth, sharpe and somewhat bitter in taste, when they are chewed in the mouth the flowers come forth one by one, at the joynts with the leaves, all along the stalke up to the top, every one upon a long stalk, which are very like the small wild Bindweede, that groweth upon the ground:confifting of one whole leafe yet plaited, as it were before the opening into five plaites, and being open have five or ners, as if it had five leaves, broad like a cup or Bell at the brims, and fmall at the bottome, of a fine delayed purple colour sometimes, and sometimes deeper: the roote is small and brownish, creeping under ground, and shooting up heads in other places.

2. Convolvulus minor albus Vulgaris. The common small Bindweede. The common smal Bindweed that groweth every where in fields, by the wayes and hedg sides, formetimes rises up and windeth it selfe, but usually spreadeth on the ground, with long trailing and winding branches, one within another, and leaves fer thereon formewhat like unto the greater white Bindeweede, but much leffer, the flower is for forme like the other white Bell flower either wholly white or the plaites purplish but lesse, made of ore leafe plaited as it were into five fouldes, and opening wide at the brims, after which come small blackish seeds, in small long and round heades: the roote is small and slender, running both very deepe downe into the ground,

and spreading farre abroad likewise, especially if it get into garden mellow grounds.

3. Convolvalus spice folius. Lavender leased Bindeweede.

This small bindeweede is as great a plague to the fields, where it naturally groweth as the last: the leaves are long and narrow, refembling Lavender, and the flowers of a deepe purple colour, wherein it different from others, for elfe it is like the laft.

1. Convolvuls Althen folds. Mallow leafed Bindweede.

2. Cenvolvulus minor albus vulgaris. Common fmall Bindweede

This Bindweede is in all things like the fecond, faving that the flowers are either of a pale purplish, or bluish colour, the foulds being white or of a deeper purple, without and white within, and the bottome fo likewife, which is of much beauty.

5. Convolvulus minor Africanus. The small African Bindeweede.

There is small difference in this from the former for the manner of growing, the leaves onely make the variety, which are not divided at the bottome, but whole, and the flowers purple, but bell fashion like the rest.

6. Convolvulus Africanus minimus. The least

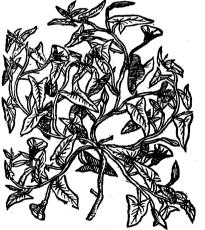

African Bindeweede. This fort creepeth not as the former, but standeth a little upright, or leaneth fornewhat downe upon the ground, like the next Spanish kinde, the smalnesse both of leaves and flowers from the last maketh it noted to bee a severall fpecies.

7. Convolvulus minor Hispanicus caruleus. The blue Spanish Bindeweede.

This Spanish kinde shooteth forth sundry small branches three footelong or more, from the small threddie roote which dyeth every yeare, having fundry leaves fet fingly thereon, fmall and long at the bottome, and broader, and almost round at the end, somewhat hayrie as it were all over: at every leafe for the most part, from the middle of the stalkes upwards, commeth forth a flower like unto the common fort, folded into five plaites, which open into so many corners, of a most excellent faire skie coloured blue (so pleasant to behold, that it amazeth the spectators) with white bottomes pointed upwards and yellow in the middle, which turne into fmall round white heads, con-

teining within them finall blackish cornered seede to be new sowen every yeare. 8. Convolvulus minor Atriplicis folio. Blacke Bindeweede.

If this small Bindeweede meeteth not with hearbes or other things whereon to clime, it riseth up but a little, and leaneth downe againe unto the ground, otherwise meeting with fit things, it will winde with his long stender reddish threddie branches about them, to the height of three or foure foote or more, bearing his leaves singly at the joynts, as the others doe, either formewhat like unto the leafe of an Arvache, or round like unto the wilde blackBrionye, for of both forts there are, but much finallers the flowers are very small and many flanding together along a small long state, that commeth from the joynts, where the leafe standeth, and are of a reddish greene colour, but so small that they are oftentimes not headed, and so quickely faded that they are scarce, regarded: after which come finall blackiffs three cornered feeder, the roote is small and donder, periffring every yeare, and

TRIBE.2.

CHAP. II.

3. Convotunius spice folius. Lavender leafed Bindweede.

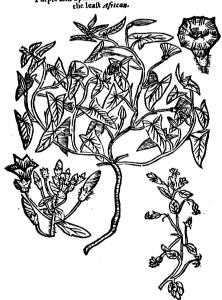

rifing of the fallen feede every fpring, unlesse it be continually weeded out of the garden.

The stalke hereof is much branched, and the branches also much divided, having two small leaves at every joya hoarie, and hairy very like unto Mouseare, the upper leaves being smaller, and the flowers large, of a pale blis colour, spread open like the small Bindeweede: the seede that followeth is blackish browne, one in a small eround head, the roote is very threddie and bushing, yet perisheth yearely.

4. 6. 7. Convolvulue minor purpureus. Caralcus Hispanicus & Africanus minimus.

Purple and Spanish blew Bindweede and

10. Cissampelos altera Anglica minima. Small blacke Bindeweede. This onely in the smallnesse, rising not above a hand breadth high, differeth from the common blacke Bind

The fuft Clufium faith he found in many places of Spaine: the fecond, third, and fourth, grow in fundry Commit

of this Land: the fift and fixt were found by Doctor Boelius, (often remembred both in my former and this or the works in Barbary and brought tous: the feventh was also found by him in Spaine and Portugall: the eight in many Countries of this Land, both in fields and else where, and will bee also found as a weede in gardens to be pulled out: the ninth in Candy, and the last groweth about Drayton neere Port (mouth. The Time.

They flower in Summer, yet some later than others of their kinde. The Names.

They are called Convolvuli & Volubiles, quia crebra revolutione vicinos frutices & berbas implices. Ciufius calleth the first Convious at Ather folio, not knowing to what plant of the ancient is might be referred, unless it might be referred, unless it might be the last one of Plinge, whereof he maketh mention in the 22. chap. of his 22. booke. Gerard much mistooke this plane, calling it Papavor corniculatum minus, but his correcter hath or his 22 chapt or his 22 chapt or the fecond is called Convolvalus & Valabilu minus by most writers, yet some Smilax lavis minus as Dodonaus; and Helsine Cisampelos as
Matthiolus & some others, and taken to be the Scammonea senuis of Plinysthe third is thought by Caffor Durantes to be Camabrica Plinti, and Clusius faith the same likewise: of Corrusus called Scammonea Patavina, of Guilandinut Helxime fans, of Tabermontanus Scammonium minus, and of Lobel as it is in the title e the fourth, fift, fixt. and feaventh, have their titles in their foreheades, as much as is necessary to be fayd of them; the eight is thought and feaventh, neverther the sin their foreneades, as much as is necessary to be sayd of them: the eight is thought of many to be the Helxine of Dissocration, which was called also Cisson in Greeke helium are summed, which was called she to differ from Parientia, called Helxine also, this most commonly growing in Vineyards, creeping up upon the Vines, with a leafe like Ivice Democration in Geoponicia calleth it Malacoting, quasi multis bedera: Lobel calleth it Cisson like Vines are pigies. Dodowan calleth it Helxine Cisson of Convolvulus inger: Tragus taketh it to be Orobanche of Theoporaline, which Gaza translatith Ervangia; of Thalins in Harryna filva, Volubilis media five nigra, Cordus on Diofeorides taketh it to be Elatine, Angullara to bee Centunculus Plinii, and Fabius Calumna calleth is Polygonum Haderacoum: the ninth is so called by Pona in his Italian Baldne, as it is in the title: the last is not spoken of by any before.

The Vertues. They are all of the mature of the other small Bindeweedes no doubt, which is to move the belly : yet Clufius faith the first is used in Portugall, as an hearbe of singular effect to heale all fores or wounds; Ciffampelos, is faid likewife to purge the body strongly, if either the juyce, or the leaves and herbe in powder, be drunke in wine or other drinke. The leaves being braifed and layd on hard tumors or knots in the fieth, distolveth and confumeth them.

CHAP. XI.

Smilax aspera. Pricklye Bindweede.

Here are two forts of this Bindweede, differing very notably both in leafe and fruite, as you shall heare by and by: but there is another plant referred unto them, which is the Sarfaparilla, that is brought from the Well Indies, which I must adjoyne, and speake of it also here:

t. Smiles upper a fruit urabro. Prickly Bindweede with red berries.
This Bindweede groweth up with many branches, where with it windeth about trees, and other things, fet with many crooked practices or thornes like a bramble, all the whole length, bending this way and that, in a securely proportion, for at every joynt it bendeth or boweth it selfe, first one way and then another, having fomewhat a broad and long leafe thereat, standing upon a long foore stalke, and is broad at the bottome, with two forked round ends, and then groweth narrower unto the point: the middle ribbe on the backefide of most of them, having many finall thornes or prickes, and also about the edges; the lowest being the largest and growing smaller up to the coppe, smooth and of a faire greene colour, and sometime spotted with white spots; at the joynts with the leaves also, come forth clasping tendrels, like as the Vine hath, whereby it windes it selfe; the flowers fland at the coppes of the branches, at three or foure joynts, many breaking forth together in a cluftre, which are white, composed of fixe leaves a peece, starre fashion and sweete in sent, after which come the fruits, which are red berryes when they are ripe, of the bignesse of Aparagus berryes or small Grapes, and in fome leffer; wherein are conteined fometime two or three hard blacke ftones, like also unto those of Asparagus; the roote is slender white and long, in hard dry grounds, not spreading farre, but in the looser and moyster places, running downe into the ground a pretty way, with diverfe knots and joynts thereat, and fundry long rootes running from thence.

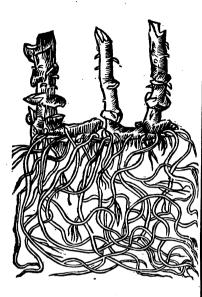

2. Smilan aftera frulla nigro. Prickly Bindweede with blacke berryes. This other prickly Bindeweede, is like the former for the manner of growing in all points, his branches being joynted in like manner, with thornes on them, but nothing to many, climing as the former: the leaves are somewhat like it, but not having those forked ends at the bortome of every leafe like it, but almost wholly round and broad at the bottome, of a darker greene colour alfo, and without any or very, feldome with any thornes or prickes, either on the backe or edges of the leaves, with tendrells like a Vine alfo; the flowers come forth in the fame manner and are flarre fashion, comfilling of fixe leaves a peece like the other, but they are not white as they are, but of an incarnate or bluth colour, with a round red umbone in the middle of every one, which is the beginning of the berry, that when it is ripe, will be blacke and not red, being more lappie or fleshie than the other, with stones or kernells within them like unto it : the rootes hereof are bigger and fuller than the former for the most part, and spreading further under the ground.

The Sarfaparilla that cometh from America into Spaine, and from thence into other Countries, hath beene feene fresh, even the whole plant as it hath beene brought from Spaine to the Duke of Florence, Lucas Chinus his Physician, being by at a witnesse, that in all things it did refemble the prickely Bindweede, and differed in

1. 2. Smilax aftera frince & ness frince follo. Prickely Bindweede, with red and with blacke berries!

3. Smilan afpera Peruana five Sarsaparilla. West India Sarsaparilla.

Buenas noches Hilfanu. The heades with feels of the true Sarfaparilla as it is supposed.

nothing from it. Matthiolus setteth downe this relation in his Commentaries, in the 1 11. chapter of his sift booke of Dioferia, des, speaking of Sassaparilla, what plant it should be, and agreeth with Ghinus, that the Smilax aspera (with red berries, for in not speaking of the other he declareth that he knew it not) was the true Sassa, which both Ghinus and others likewise had proved by many trialls, to be as effectuall to cure the French disease, as the Sassa of the Indies. Prosper Alpinus likewise in his booke of Egyptian plants, declareth that he found in the Island Zacynthus, the rootes of Smilax aspera, whose leaves he setteth forth to bee without prickles, growing by a running river side, to be greater larger and fuller of substance, than ever he had seene them, in any other place in Italy before; and being so like the true Sarsa of the Indies, that he was fully perswaded the Sassaparilla that commeth from Peru, was the bootes of Smilax asspera; the difference betweenethem, in greatness or goodnesse, if any be, to be onely in the climate and soyle; and saith that an Apothecary in that Isle,

had gotten much money thereby, both by his owne practife, and the fale of them to others for Sarsa: and sith moreover that he saw himselfe, in some bundles of the Indian Sarsa, some of the rootes, that had the knoss at hem, as the Smilax aftern hath, and some leaves therein also like it, which my selfe have sometimes seeme in them likewise. Gabriel Fallopius likewise in the booke that he wrote of the cure of the French disease, in the chapter of Sarsaparilla faith thus; I was perswaded saith he, and stood in that opinion along time, that the Sarsaparilla, was the roote of Ebulius or Wall worte, luntilla Spaniard that brought the whole plant unto the Dult of Florence, made my errour knowne unto my selfe, for I saw it to be the roote of that Smilax aftern, that Dissorties and other the ancients make mention of in their writings; and was better confirmed in my opinion, by the experience I had thereof, in curing diverse about Pisa as persective of the French disease, by the rootes of this Smilax as person, which I caused to bee digged up for my use, growing on the hill of S. Insian, as with the rootes of Sarsaparillas for two yeares while I sayed there to practice Physicke; which opinion also Amatus Instanting and Physitian of good note, although a lew, construct in the fift booke of his Centuries. Alpinus also sheweth another note of difference, in the rootes of Smilax aspers, whereat many in his time stumbled; for they saw the rootes of the other to be long and smooth without any knots: to enforme you therefore throughly herein, and take away this doubt: he sheweth that the suffice of Smilax aspers, are downe right, short, and sail and take away this doubt: he sheweth that the suffice occasion of Smilax aspers, are downe right, short, and sail

joynts or knots, from which joynts or knots, shoote other rootes or strings, which in dry grounds, are but small joynts of Knos, and in the more moyft and mellow, are greater and longer, without any joynt at all in them, (as is to be seen in the rootes of many other plants, whole rootes have many strings) and that these rootes are las is to be which are like the Sarfaparilla, and not the first, which are short and full of joynes: and that the smalnesse of the rootes of Smilax aftera, growing in Italy, or other dryer Countries, must be rather imputed to the climate or the roote of the chimate and foyle, rather than any thing else: by this narration you may perceive the judgement of the elder times, and likewise their practise to use Smilax aspera instead of Sarsaparilla, for the diseases whereunto Sarsaparilla is incomer but I verily believe that the plant of Sarfaparilla, that groweth in Pern, and the Well Indies, is a Decuproperties that the same of the smiles after a so notably as the Mechacan from our Brionye and may very well be that plant that Simon de Towar, chiefe Phylitian of Sevill in Spaine, fowed the feedes of, and had it growing with him: and of the fee d that he fent to Claffus under the name of Convolvulus percerinus, did one plant likewife foring for a yeare with Honestus Lopes, in the low Countries, to whom Clustus had imparted some of Tovers feede, but perished at the first approach of winter: the descriptions of both Tover and Clusius, in their manner of growing, are fet forth by Cinfus, in the fecond booke and 18 chapter of his Exotickes or strang things, which I thinke not amisse here to relate unto you, yet contracted into one, least it should bee too tedious to see them downe both particularly : Having put the feede into the ground, the first two leaves that sprung (fay Tover and (lufius) were very like the first two leaves of Campanula Indies, the blue Bindweede (and such likewise doth the feeds of Mechoacan yeeld, at the first springing saith Tovar) the roote afterward saith Tovar sent forth many branches, which woond themselves, very much about the poales that were set for them to clime on, like unto Smilax aftera, having fuch like leaves alfo, but greater and fofter; the branches had crooked thornes or prickes, growing on them likewife as the Smilax after a hath, but fewer and nothing fo sharpe: that of Honestus Lopet faith Cistins, forang up with many branches, winding it felfe also about the poales, that were stucke into the ground by them; having fome tender prickes like thornes growing on them, effecially at the joynts, which were (faith he) nothing but the first sprouting of rootes, which no doubt would have taken hold of the ground, if earth had beene put unto them; it had very greene leaves faith Clufius, like unto Bindweede, but longer, and cornered like wie leaves, ending in a long point, like to the leaves of Smilax aftera; the flowers faith Towar were great and white, every one as bigge as a middle fifed dish, which opening in the morning did fade at night; from whence the Spaniards called the plant Buenas noches, that is, good night: the plant of Honestus Lopez laith Clusius, brought forth buddes for flowers, but could not bring them to perfection, the earely trolts destroying the whole plant: Clofins faith that he had a small branch with three heades of feed thereon, (whose figure I heregive you) the larges that ever he saw in that kinde, for it had five leaves a peece, every one almost an inch broad and long, which feemed to be the cup of the flower and fruite, every head which was three square and skinnie, had within it three round feede, as big as great peafe, of a smoakie or brownish colour. The report of Master White a Painter, upto Master Gerrard, as he setteth it downe in the chapter of Sarsaparilla, is somewhat to this purpose; that it is the roote of a shrube or hedge tree, like unto Hawthorne trees with leaves like Ivye, the comparison unto Hawthorne is rude, according to his skill, but it seemeth the branches abide and perish not, there fpreading very much: the leaves are better refembled: but flowers or fruite he remembred not. These descriptions doe feeme unto me, (although no mention of roote be expressed in the relation) very probably to set tions do the net of the continuous no mention or roote be expended in the relation) very probably to let forth the growing of Sarsaparilla, whereof no doubt Simon de Tovar, if he had lived longer, had given Clussus better information: Baubinus in his Pinax, maketh it a third species of Smilax asspera; calling it tertia Smilax asspera lodge to the continuous time no doubt will declare the truth hereof more plainely, yet it might be hastened, if there were in any eminent person, any such ingenuity of spirit, as to cause such things, that are rare to be sought out, and brought home (and many such there are in Italy, as at Florence, Rome, Venice, Padon, and many other places, that have their gardens stored with all the rarest plants they can heare of, and brought thither) and then frare, diligence and experience had the ordering of them, after they were brought, they might make them famous that procured them, and be the meanes of a great deale of knowledge to others, for the true declaration of fuch things, as are either doubtfull or hidden in the course of Physicke.

The Place.

The two first grow in Italy, Spaine, and other the warmer Countries, whether the continent or Isles, throughout Europe and Asia: but the third is found onely in the West Indies; the best commeth (as it is sayd) from the Honduras, others not so good from other places there, as the fertility or the barrennesse of the ground, and the temperature of the climate, afforder in meanes thereof.

The Time.

In the hotter Countries these flower, and bring forth their berries timely enough in the yeare, but in these colder Countries, without conveniencie to keepe them in the winter, the frosts will soone consume them,

The Names.

The word Smilax is diversly taken and with diverse significations among writers; it is taken for two forts of trees, it is likewise taken for three sorts of herbes. Theophrassus maketh mention of one of the trees, in the 3 cooke and 16 chapter of his history, calling it Smilax Arcadum a soft Oake, which is like unto an Ilex or Holly Oake. The other which the Grecians call Smilax simply, is called in Latine Taxus, the Yew tree: the herbes, are first, this here expressed, as well as the other more gentle sort, which is the common Bindeweede, this the Grecians call outhat regysia Smilax aspera, as they call the other outhat have Smilax lavis sine lenis, and the other the Grecians call outhat smilax smilax borensis, which is Dolirbus or Phaseolus, the French or Kidney Beane, as shall be shewed in their severall places. This Smilax aspera is called also of Galen in his seventh booke of simples Milax aspera. Theodorus Gaza the translater of Theophrassus, interpretent it Hedera Cilicia, following Pluse, who saith in lib. 26.c. 35. that the herbe called Smilax which is like unto tvye, and came first out of Cilicia, but is more frequent in Greece, bath thornie branches, &cc. Plinye also calleth it Nicophoros lib. 24. thinke first of all distinguished it by the berries, calling the one rustile fruits, and the other migro, when as they might as well be distinguished by their leaves, the red berryed as I take it having thornie leaves, and the other

fmooth and without thornes or prickles, yet. Gerards' figures' have both of them prickles on the leaves, calling the one Luftanica and the other Germanica, whereas it is that one and the fame plant; growing in deverall Computers: Trapus feemeth to bee doubtfull of Diofeoride this Smiller after a thinking Lopalite the Toppe to be it. Hobe's calleth that with blacke berryes Smillar after a floid Smillar after a feet or genera. And trie very likely to be that kinde that Alpinus faith, he found with to large and great rootes, as is before expredied; and others to much commend to be used inflead of Sarfaparilla. The Sarfaparilla or Sarfaparilla is folly. It a Spanish word which the Spaniards imposed upon this, when they fift faw it in the West Indies, because they judged thems which the Spaniards imposed upon this who there there there were the safe when the safe and t be both one thing, that is Smiler affers : for so they call it in their language Zarsi or so some write it sors, signifying Rubus a Bramble, and Parilla viticula, the diminister of Vent; a Vine, soif one should an admall Vine. like Bramble; and yet Garcias Lopes Luftianus faith, the name the Indians call it by, doth fignificas much. Some call its Salfaparilla; and fome Smilas Peruana. Mattholus giveth us a figure of Sarfaparilla, noither branches nor leave, having any frew of thorne or prickles at all upon them, which as he faith he received from Gyprus; and hathout having any frew of thorne or prickles at all upon them, which as he faith he received from Gyprus; and hathout hat he faith he received from Gyprus; and hathout hat he faith he received from Gyprus; and hathout hat he faith he received from Gyprus; and hathout hat he faith he received from Gyprus; and hathout he faith he received from Gyprus; and he faith he received from Gyprus from G naving any inter or thorne of precises at all upon them, which as is in the true Sarjapardag, which as I fand knot or head, from whence the long imooth roots fhould figring; fach as is in the true Sarjapardag, which as I fand before I have often feene my felfe in diverse bundles thereof: but affordly there are diverse forts of Sarjaparda, the best being very large & full with a white pith in the middle, which will rend or slive in the middle which and this most commonly is brought without head or knot, but with a number of fibres on all sides thereof, which must be taken away before it can be used, another fort is not so full and great, yet rendeth or cleaveth reasonably well, and is the most spent, because the most store thereof is brought : the third is a hungry fort; and is of least respect and use, this being asually brought with the heads or knots, to be seene from whence the rootes sprung I fay usually, for sometimes you may finde a head or two among the middle sorts

The Vertues: This prickly Bindweede faith Galin if the leaves be talted they have fome sharpenesse in them; and being used any way they heate. Diosecrites faith that both leaves and berryes being drunke, before or after any deadly posson is taken, are a remedy there against, serving to expell it. It is fayd also saith he; that if to a new borne childe some of the juyce of the berryes hereof be given, it shall not be hurt by poyson ever after: It is given as an Am redote against all forts of poysonous or venemous things. If a dozen or fixteene of the berryes being beaten a powder, bee given in wine, it procureth Vrine when it is stopped. The distilled water of the flowers being drunke, worketh the same effect, and clenieth the raines, and alwageth inward inflammations. If the eyest washed there with, it taketh away all heate and rednesse in them, and if the fores of the legges be washed there with, it healeth them throughly. The rootes as you have heard before, are used by diverse learned and judicion men in flead of Sarfaparilla with as good successe, as if they had used the true; for Sarfaparilla doth not purge its body of humours manifestly as other purgers doe, being generally held not to heate, but rather to dry the humor, yet it is wel perceived that it spendeth the humors, by a secret and hidden property therein, whether by purging a walting & confuming them much wherof is performed by fweating which it provoketh notably if it much tied now adays in many kinds of difeafes, namely in all cold fluxes from the head & braine, rhumes and catarrhes, and fo all cold griefs of the (tomack, and expelleth winde very plentifully both from the (tomacke and mother: It le-peth not onely the french difease, but all manner of aches in the finewes and joynts, all tunning fores in the legs, all flegmaticke fwellings, tetters, or ringwormes, and all manner of fpots and foulenesse of the skin: it is not conven ent to be given to those whose livers are over hot, nor to such as have agues. The manner of using itis diver sexcording to mens feverall opinions, for in former times it was used beatento powder and fo drunker others again boyled it fo long untill it became tender, which being beaten or broken, was afterward firayned into the decodi-on, making a kind of thicke drinke like a creame. Some agains and that most usually boyled it in water, to the halfe, or to the confumption of the third part, as they would have itstronger or weaker; and that either by felfe, or with other things meete for the difeafe attempted and others also put it among other things into drink. either beere or ale new tunned up, to drinke after it hath flood three or foure dayes for Physicke drinke, forth remedy of those griefes, it is conducible as aforesayd.

CHAP. XII

Lupulus five Lupus Salistarius. Hoppes..

He Hoppe is found to be of two forts, one manured for the use and profit of the toppe heads, the other wilde growing in hedges, and other fuch like places of it owne accord; and was no doubt by ordering and manuring brought to be larger in every respect; and more fruitfull for use, such the manured is: I thinke it not amisse to speake of them both in this place, being so neere in some and quality the one unto the other, and not separate them, or trouble two places with them.

1. Lupulus sativus. The manured Hoppe.

The manured Hoppe rifeth up ar the first, with diverse great browne heades, like unto Afparagies but large, which afterwards spreading into rough branches, clime upon great high poles, that are set for them to numero, having many hard and rough darke greene leaves on them, cut into three or five divisions, somewhat like unto Bramble leaves, and dented also about the edges : at the toppes of the branches, which hang downe agains; for the most part come forth many feely heads; being as it were a number of small yellowish greene leaves, growing thicke regetter; from among which come forth the flowers; of a whitish yellow colour, which being past, and the heads changing their colour, to be fornew har whitish yellow, they are fit then to be gathered to keepe: and therethere is a small round seede found therein a therobre is great at the liead, shooting forth many blacking ftrings, taking fall hold of the ground!

2. Lupidari fylve first. The wilde Hoppe.

The wilde Hoppe growerling in the fainte manner, rathping upon crees or ledges, as fluided next unto the with cough branches and leaves like the former: this givet both fluid friendes, and in faire lefte plenty, the the manured doth, yea many times, there is fearfe a held origin felsion a yeare upon diverte; and hereinon filteth the chiefe difference.

The Place,

These plants are more frequent in these colder, than in the hotter countries, which sheweth the goodnesse of God unto us, to provide for every Country, fuch things as are fit for the instentiation of life; for where Vines grow not, and the water too cold and raw, to drinke simply of it selfe, there are these Hoppes chiefely bred to make drinke to ferve instead of wine or water: They delight chiefly, or rather onely to grow well, in low moilt grounds, where they may have moysture enough, and ver not too much; for therefore where they are planted on hillockes, as it were, there are trenches made to receive any great quantity of water, and bee conveyed away, that the plants stand not drowned therein.

The Time

These spring not up untill Aprill, and flower not untill the latter end of lune, the heads are not gathered, untill the middle or end of September.

The Names.

It is observed and much marveiled at, by our ordinary writers, that this plant should not be remembred by Dioscorides, Galen, or any other of the ancient Greeke or Latine writers except Pliny, who doth but onely name it and, number it among those herbes that grow of themselves, and that are used for meate with diverse nations, calling it Lupulus salsetarius. The Arabians have not onely remembred it, but commended the use of it highly for many diseases, as you shall heare by and by.

Mesus maketh it his third kind of Volubilis with rough leaves, among his purging plants: the Greekes at this day call it ξεψων & βρυωγία, Bryon and Bryonia it is likely for the forme of the leaves and running of the branches. It is called Lupulus & Lupus salictarius, & reptitius (quia salit & reptat per arbores, vel quia scandit salices) of all our moderne writers, onely Lobel calleth it Vitis septentrionalium, the Vine of the Northerne regions, and Tragus as I sayd before thinking it to be Smilax aspe-ra: the Italians call it Lupolo; the Spaniards Hombrazillos, the French Honblon, the Germaines Hopssen, the

Dutch Hoppe, and we in English Hoppes.

to be eaten, after the fame manner that the buds of Asparagus are, and with as great delight for the taste, yet they have little nourishment in them: their Physicall operation therefore is to open, the obstructions of the Liver and spleene, to clense the blood, to loosen the belly, and to clense the Raines from gravell, and to cause them to make water in whom it is stayed: the decoction of the toppes of the Hoppes, of the tame as well as of the wilde, and so also the rootes doe worke the same effects, but that they are somewhat hotter than the young buds, which have more moy flure in them : in clenting the blood, they helpe to cure the French difease, and all manner of scabbes, irch, and other breakings out in the body, as also all tetters, ringwormes and spreading fores, the morphew likewife and all discolourings of the skin, and are used in Agues; the decoction of the flowers and tops, are used to be drunk, to helpe and expell poyson that any one hath drunk: half a dram of the seede in powder taken in drink, killeth the worms in the body, it likewife bringeth down womens courses, & expelleth Vrine. The flowers and heads, being put into bathes for women to fit, in, take away the; iwellings and hardnesse of the Mother, and is good for the strangurie, or those that very hardly make their water; the juyce of the leaves dropped into the eares, clenfeth the corrupt fores, and stench arising from the corruption in them; Mesus saith they purge choler, but worke more effectually, being steeped in whey of goates milke: A Syrupe made of the juyce and sugar, cureth those that have the yellow jaundise, easeth the headach that cometh of heate, and tempereth the heate both of the liver and stomack, and is very profitably given in long & hot agues, that rise of choler and blood. Those bakers that will use the decoction of Hoppes, to mould up their bread, shall make thereby their bread to rise better, and be baked the sooner: Clusius reciteth the manner of a medecine used in Spaine, by women leeches, to cure the falling of the haire, caused by the french disease, in this fort. A pound of the roots of Hopps, wel washed & boyled in 8 pints of faire water, to the confumption of the third part, or a halfe if they fee cause, whereof they give half a pint to drink in a morning, causing them to sweate well after into the decoction they put sometimes, two or three roots of parily, and as many of couch graffe, with a few R aylins of the funne. The Ale which our forefathers, were accultomed onely to drinke, being a kinde of thicker drinke than beere (caused a stranger to say of it, Nil spissius dum bibitur, nil clarius dum mingitur, unde constat multas faces in ventre relinquit, that is, there is no drinke thicker that is drunke, there is no Vrine cleerer that is made from it, it must needes be therefore that it leaveth much behinde it in the belly) is now almost quite left off to be made, the use of Hoppes to be put therein, altering the quality thereof, to be much more healthfull, or rather physicall, to preserve the body from the repletion of grosse humors, which the Ale engendred. The Wilde Hoppes are generally used Physically more than the manured, either because the Wilde is thought to be the more opening, and effectuall, or more easily to come by, or that the

owners of the manured, will not spare, or lose so much profit, as that which would be taken away might yeeld;

yet affuredly they are both of one property, take which you will, or can get.

The Vertues.

The first buds of the Hoppes, being layd a while in fand, maketh them the tenderer, and being boyled are used

CHAP.

TRIBE 2.

GHAP, XIII.

Bryonia sive Vitis Sylvestris, Bryonie or Wilde Vine.

1548 Nder this title of Bryonye I must comprehend diverse and sundry plants, some whereof are of one Land, and found plentifully therein: others are strangers comming from other parts: Among which I must remember the Mechoacan of America, a plant neerest resembling the white Bryonic, as you hall heare when we come to it, and some others also that are strangers of those parts.

1. Bryonia vulgaris five Vitis alba. The common white Bryonie or wild Vine.

The white Bryonie or wild Vine that groweth commonly abroad, ramping up on the hedges, fendeth form many long rough, very tender branches at the beginning, growing with many very rough broad leaves thereon, cut into five partitions for the most part, in forme very like a Vine lease, but smaller, rougher, and of a whinth or hoarie greene colour, spreading very faire upon trees or bushes, or whatsoever standeth next it, and twining with his small claspers, that come forth at the joynts with the leaves: at the severall joynts also with the leaves and claspers come forth, (especially towards the toppes of the branches) a long stalke, bearing thereon many whitish flowers, together in a long tufte, consisting of five small leaves apecce, layd open like a starte. after which come the berries, standing more seperate one from another then a cluster of grapes, greene at the fit and very red when they are through ripe, of the bignesse of Nightshade berries, of no good sent, but of a most loathsome taste, provoking vomit: the roote groweth to be exceeding greate, with many long twines or branches growing from it, of a pale whitish colour on the outside, and more white within, and of a sharpe bine loathsome talte.

2. Bryonia alba vulgaris fructu nigro. Common white Bryonie with blacke berries.

This Bryonie differeth from the former white kinde, neither in the running rough branches or in the leave, or in any other thing from it, but in these two particulars : the berries hereof are blacke and not red, when the are through ripe, and the roote is of a pale yellow colour on the infide, and somewhat brownish on the out

3. Bryonia Cretica dicoccos. Candie white Bryonie with double berries.

The white Bryonie of Candy, shooteth forth many long rough trayling branches, in the same manner like the former in all respects, with classing tendrells winding it selfe upon any thing as the other doth; bearing broad leaves with such divisions therein, as it hath, but that they are somewhat smaller, greener, and striped with white lines thorough the middle, as likewise in the veynes that goe to the corners: the slowers likewise are somewhat greater than the former, of a pale whitish colour, standing every one, upon a little longer stote stalke, which, give berryes in their places, greene at the first, but red when they are ripe, and formed in a differing manner than the others. For standing sensitive that the state of the standard state is a sensitive as the best one as if it were but the state of the standard state of the standard state of the standard standa from the others; for standing femicircular upon the stalkes, they are joyned at the bottome, as if it werebut

1. Biyonia alba vulgaris : White Bryonie.

CH AP. 12.

6. Bryonia Sylveftrisnigra. Common blacke Bryonie.

one berrie, but are parted at the toppes into two parts, wherein are conteined two feedes, from wheree rofe the one one the roote is very long, but never growing to be bigger than a mans arme, of a browner colour on the outside, and not so white within as the common.

utifiet, and not write write and a Bryonia nigra Disfortidis. Blacke Bryonie with blacke fruite in clusters.

This blacke Bryonie sendeth forth many long greene branches, whereon are ser diverse broad leaves, some This parke beyond tendent want many long given containing, whereon are let diverte broad leaves, fomewhat long pointed and not divided on the edges at all, of a fad or darke greene colour, having at the joynts with the leaves calping tendrells, whereby it winders it felfe about what foever it meeters with, towards the toppes come forth likewise long bunches of whitish mossie flowers, which afterward turne into berryes, greene at the fift, and blacke when they be ripe; the roote is somewhat great and blackish on the outside, but of a yellowish colour on the infide, full of a clammic moyst humour or juyce, that will cleave to your fingers.

5. Bryonia nigra baccifera. Blacke Bryonie with fingle red berries.

This kinde of Bryonie hath many long and square branches, more hard or wooddy than the last, winding themselves about every thing that standeth next unto them, but hath no classers at all, the leaves are somememicives and the transfer of the finding colour, a little unevenly dented about the edges, and flanding upon long foote stalkes: towards the toppes of the stalkes, at the joynts with the leaves, come forth white flowers, every one flanding on a short stalke, which afterwards give single berries, greene at the first; and red when they are ripe, little lesse than Cherryes, wherein are contained source or five somewhat large round and blacke feede: the roote is great thicke and long, fomewhat like the laft, and having fuch like clammie juvee within it as it hath,

6. Bryonia nigra sylvestris, sive Sigillum Santta Maria. Common blacke Bryonie or our Ladies fignet, This kinde of Bryonie hath also long trayling branches, without any clasping tendrills, (in all places that I This kinds or bryonic hact also long traying branches, without any chaping tenurins, (in an place that have feene) whereby it might faften and winde it felfe, the leaves are fomewhat broade and like unto the leaves of the roughor prickely Bindeweede, ending in a fharpe point; the flowers come forth at the joynts upon long stalkes, many clustering together, in long thinne or sparfed clusters, every one consisting of five small white leaves, and after they are fallen, there come in their places, small berries, red when they are ripe for the most part. or changing somewhat blackish, in some places by standing long: the roote is brownish on the outside, and white within, somewhat great if it grow in moyst grounds, but much smaller or whiter, in hard drye or stonie places, as Dalechampius faith; of a little hot and sharpe raste.

7. Bryonia alba Peruana sive Mechoacan. The Mechoacan of Peru.

The Mechacan of Peru that hath growen in these parts, sendeth forth divers darke gravish long branches, winding themselves about Poales that are set for them, or any other things that are next unto them, whereon doe grow faire broad leaves, pointed at the ends, very like in forme, unto the leaves of the last recited Ladies seale, out of a darke greene colour, thinner and harder in handling, feeming fo dry as though they had no juyce in them?

the flowers are many, standing in long clusters, yet every one bigger than any of the former, (of a fullen yellow colour in the Indies as Monardus faith, and as large as an Orenge flower, with an umbone in the middle, which afterwards becommeth the fruite, and being ripe is as big as an hasell nut, divided by a thin kinne in the middle, in each side whereof lye two blacke seedes of the bignesse of pease) of a darke whitish colour in the warmer Countries of Europe, but not with us, yeelding berries and feedebut not so large: the roote growth to be as great as any Bryonie roote, being not bitter or loathsome to taste, as it is, but rather altogether without either taste or smell, having many circles in it, as may be difcerned in the dry rootes, that come

over tous, and may easily be brought into powder.

8. Mechacan/ylvefiris. Wild Mechacan.

This wild kind of Mechacan is altogether like the other.

Mechagani radin. The roote of Mechoacan,

7. Bryonia alba Peruana fine Mechoasan, The Mechacan of Peru.

TRIBE.2.

Снар. 12.

both in manner of growing, with branches, leaves, flowers and rootes, but leffer in every particular, and the roote (wherein is the chiefest difference) being sharpe and loathsome, procuring vomiting and troubling the stomatke when it is taken, as meh as any ordinary Bryonie can doe. 9. Mechoacan nigricans five Ialapium. Blacke Mechoacan or Ialap.

Although we have not feene this Ialap grow withus, or have heard it to grow in any these parts of Empy, neither are assured that the plant thereof is of this family, more than by conjecture, and fight of the dryed roots. (brought unto us as a Merchandise and a purging roote) being somewhat like in vertue and in forme unto the inaller peeces of the former Mechoacan: yet I thought good to make mention of it in this place, among the reft of this kinde, both to let it be knowne to the world, and to excite some one or other to get the seede, or the

greene roote, that by fight thereof growing fresh, we may know to what tribe or family it doth belong : It commeth to us in finall thinne pecces, fome greater fome smaller, yet nothing so large as the greater, but rather as the smaller peeces of Mechoacan, of a brownish blacke colour, somewhat more solid, hard, compact, and gumme withall for out of it will rife a black gum, being layd on a quick or burning coale, but not (flame in any that I have frene or tryed) and of no unpleasant taste; but sticking a little, in the teeth when it is chewed.

The Place.

The first groweth on bankes or under hedges, throughout this whole Kingdome. The second groweth in some Countries of Germany, Bohemia, &c. where the former white doth not. The third groweth plentifully Candy, from whence Honorius Bellus fent the feed thereof to Clufius and others. The fourth Gerard faith ground in bushes and hedges, almost every where, but herein I am fure he is much mistaken, thinking that our ordina blacke Bryonie is this of Diofeorides for I have neither found it my selfe in any place, nor understood of acre tainty from others, that they have found any with blacke berries and a blacke roote; and I finde fome good as thours doe doubt, whether the right be to be found or no. The fift Baubinus laith was found in the woodst Huningen a village in Germany. The fixt is found wild in many places of our owne Countrie as well as in Italy as Matthiolous faith, or in France and Germanie as Lobel faith. The feaventh as Monardus faith, groweth interprovince of Mechoacan 40 miles beyond Mexico, from whence it was first brought into Spaine: but afterward, both more plentifully, better conditioned and of more effect, was brought from the firme or maine land of Nice raqua and Quito. The eight Mon. rdus faith was brought from the promontory of S. Helen, which is on the fame continent with Nicaragua. The last is likewise brought from a place inthe Indies, called Chelapa or Calapa from whence also-it tooke the name.

They doe all flower in the monthes of Iuly and August, some earlyer or later than others, as their originally from colder or warmer countries, and their feede if they give any ripe with us, is perfect foone after. The Names.

It is called in Greeke durino reuni Vitis alba . Vitalba fic dieta non quod fit vitis fed quodei fimilis, as all Browia a Coin forte quod est pullulo, extollo, exalto, quod in vicinos frutices scandens se extollat atá, late pullulet : is likewise called Vinoter, psilotrum quod ex ejus acinis coria depilari ac confici possunt, in Latine of some Vitirel of others Rorastrum, of Apuleius Apiastellum & Vva Taminia, but of most Vitis alba, Bryonia, and Bryonia alk. The second is called Bryonia nigra, Vitis nigra, & Vitis albabaccis nigris, and onely distinguished from the sit. by the colour of the fruite and roote, for that it is but one kind, differing by the nature of the climate where groweth. The third is called Bryonia Dicoccos of Honorius Bellus, who as I fayd before, first fent it from Cont, Baubinus calleth it Bryonia Cretica maculata. The fourth is called in Greeke auning unadra, in Latine Vin nigra, (ita dicta ab acinis radiceque nigris, & quod vitis similitudinem habet) Bryonia nigra & Vitis Chironia, 🗯 true kinde of Dioscorides, whose branches having tendrels, whose leaves being Ivye like, the berries and rose blacke, is knowne to very few. The fift is called by Baubinus in his Prodromus Bryoma syl, baccifera, in his Pine, Bryonia lavis sive nigra baccifera. The sixt is taken of most writers to be Vitis nigra, or Bryonia nigra of Dioscoria, as Matthiolus, Anguillara, Lacuna, Gefnar, Castor Durantes, Lugdunensis, Tabermontanus, and Lobel. Dodona calleth it Tamus & Visis fylveftris, but faith it differeth from that Vitis fylveftris that is called Labrufca, which differeth little from the true manured Vine; but that it groweth wild and beareth few or no grapes : Some Dodonaus call it Vitis Taminia, and the berries Vva Taminia, yet some would appropriate that name to the Bryon alba: it is in most of the Apothecaries shoppes in Italy, France, and Germanye called Sigillum Santta Maine Beat & Maria: Some likewise would have it to be the Cyclaminus Cissanthemos of Dioscorides, which it cannot be, for he faith the roote is unprofitable, which this is not, and others to be Pliny his Salicastrum; both which at more truely referred to the Dulcamara or Solanum lignofum. Gerard is much deceived in thinking Cyclaminu altera Dioscoridis, to be a kinde of Cyclamen. The seaventh is called of most men Mechoacan, from the place what it grew, yet Monardus faith the Spaniards that used it, called it Rhabarbarum from the effects, and to distinguish it, called it Mechoacanum Indicum, & album Rhabarbarum, and Rhabarbarum Mechoacanum: Bauhinu: fait it doth neerest resemble the Bryonia sylvestris, and therefore calleth it Bryonia Mechoacana ditta, Dodoneus ratha taketh it to be a kinde of Scammonye calling it Scammonium Americanum but not rightly. The eight is called Ma choacana sylvestris, as a wild and worse kind of the former, and as Monardus saith, they that do once use it, will to ver use it againe, in regard of the violent paines and symptomes it doth procure, and therefore Monardus though it to be rather a Scammonye, and is called of Bauhinus Bryonia Mechoacana Slugstris. The last is called salapim, Ialap, and Gelapo, in different places. Bauhinus calleth it Bryonia Mechoacana nigricans. The Arabians callet white English Alfesera, the Italians Vite bianco & Zucca salvatica, the Spaniardes Nueza Blanca Bryonia nd Norca blanca, the French Coleurees and Fenardens, the Germanes Stick murta. Hunds raben & Tenfels Kirsche, the Dutch Witte Bryonie, and we in English Bryonie, White Bryonie, White wild Vine, and Tetter berries.

The Vertues. The roote of the white Bryonie purgeth the belly, with great violence, troubling the stomacke and hurting is liver, wherefore it is not rashly to be taken, but as Mesues adviseth, some spice is to bee added to it, or low Masticke, Quinces or other such like astringent and strengthening thing. The first and tender shootes, as Disfer rides and Galen fay, were used in their times to be eaten in the spring, both to purge the belly and to provide urine, and is faye to be also used in our times in other parts, but not in our countrie, who delight not in so bine,

but in more pleasant sallets: By the strong purging quality of the roote, it may bee profitable for the diseases of the head, as the falling sicknesse, the diffinesse and swimmings in the head and braine, by drawing away much fleeme and rheumatick humors, oppressing those parts, as also the joynts and sinews, and is therefore good for palnegure and transfers, and fritches in the fides: in purging the belly of waterish humors it is good also, as fame fay, against the dropsie, and in provoking Vrine: it also clenseth the raines and kidneyes from gravell and the Rone, by opening the obltructions of the spleene, and wasteth and consumeth the swellings & hardness thereof. It clenfeth the mother wonderfully, in helping those that are troubled, with the rising and suffocation thereof. by drinking once a weeke, of the wine wherein the roote was boyled, going to bed, and expelleth the dead childe. and afterbirth in those those that are delivered, but is not to be used by women with childe, for feare of abortionand another with downe also their courses when they are stopped, by taking a dram of the roote in powder in wine, or string in the decoction of the rootes; it clenseth the chest of rotten slegme mightily, and therefore an Electuary made of the rootes and honey, doth wonderfully helpe them that have an old and strong cough, or that are ready to be strangled with flegme oppressing them, and that are troubled with shortnesse of breath: the same also by the state of the state and ned juyce, is often used to be taken to the weight of two or three graines at the most, in wine or broth, to all the nurroles of purging aforelayd. For outward applications, Diofeorides faith, that the leaves, fruite, and roote, by the farpe quality that is in them, doe clense old and filthy fores, are good against all fretting and running cankers, gangranes and tetters, and therefore the berries usually called of the Country people, Tetter berries, are with good fuccesse, and often experience applyed to them: the roote also clenseth the skinne wonderfully, from all blacke and blew spots, freckles, morphew, leprie, foule scarres, or any other deformity of the skinne whatfoever, as also all running scabbes and manginesse, either the powder of the dryed roote, or the juyce thereof rudely taken, but especially the facula, or fine depurate and hardened white juyce, to be used at all times of the yeare. The distilled water of the rootes worketh the same effect, but more weakely; yet the water is often used to deere the skinne from spottes, &c. the roote being bruised and applyed of it selfe to any place, where the bones are broken, helpeth to draw them forth, as also splinters or thornes in the flesh: and being applyed with a little wine mixed therewith, it breaketh byles and helpeth whitlowes on the joynts: it is fayd that Angulfus Calar, was wont to weare it with bayes, made into a roule or garland, thereby to be secured from lightning. The rootes of the blacke Bryonie are of the same effect with the white, but much weaker in purging choler and flegme and other humors, and provoking Vrine, in helping the falling fickeneffe, the palfie, the paffions of the mother, and the other diseases before mentioned: it doth in some fort clense the skinne of spots and markes. but the white is both more used, and more effectuall; the juyce hereof or the roote it felfe, boyled with wine, and honey, and drunke, and the roote also bruised and applyed with honey, to the Kings Evill, is very effectuall to heale it, and all other kernels, knots, or hard fwellings, either in or about the necke and throate especially, or in other parts: being applyed also in the same manner, to any place out of joynt, is good both to ease the paines, and to confolidate and strengthen the sinewes, that they be not easily againe put out of their place: it is oftenuled also with good successe, being fresh, bruised and applyed to the shoulders or armes, that are full of paine and ach, as also to such hippes or hucklebones, as have the Sciatica, or paines therein the leaves bruised with wine and layde upon the fore neckes of Oxen, that are wrung with the yoake helpeth them. Matthiolus faithe it was reported unto him, that the roote of our fixt Bryonie (which I say is called beyond Sea, Sigillum Beata Maria, our Ladies seale or signet, and which he thinketh to be the blacke Bryonie of Dioscorides) being roasted nthe embers and eaten, is a powerfull medecine, to helpe forward the acts of Venerie, and addeth withall, that texcelleth all other medecines, taken for that purpose; which yet he saith he can hardly beleeve; yet Lobel doth perke him for that report. The Mechoacan is a familiar medecine used of many, especially when we first had it, sall new things are; but now is much neglected, although it be the same, and worketh the same effects: it is given to all ages young and old, and to young children, yea women with childe without any harme or danger. salfo at all times of the yeare, for being without any evill tafte or (mell it may be the better taken of the molt delicate, and tender ftomacke, that doth loath all other medecines: it is most usually being made into powder taken in wine, or if any refuse that manner, the roote may be boyled either in a little broth, (as it was to Queene Elizabeth in her last sickenesse, without her consent or sence in the taste) or wine, and so taken: the dose whereof in powder, is from halfe a dramme to a whole dramme, or a dramme and a halfe or two drammes, as there is cause, respect being had to the age and strength of the patient: It purgeth cholericke and slegmaticke, yea grosse viscous and putride humors, whatsoever in the body, as also the yellow waterish humors of the dropsie, with much ease and facility: it clenseth also the liver and spleene, and like the true Rubarbe strengtheneth the stomacke, corroborating the inward parts, after purging and opening the obstructions of them, it helpeth also all diseases that come from them, as the dropsie: the Jaundise, &c. for it rectifieth the evill constitution of the Liver, by opening and dissolving the hardnesse thereof, as also of the spleene and stomacke, dissolveth also the windinesse and expelleth it; it taketh away also all old, or inveterate paines of the head, by clensing the braine and the nerves, and purging those rheumaticke distillations, and humors that are in them; it helpeth also all paines whatfoever in the joynts, in particular or generall, as the joynt aches or gout, and those of the bladder and raines, in procuring one to make water, and the collicke also, by expelling the wind wonderfully; it helpeth the paines of the mother, by tempering the cold humour, and expelling the windinesse which are the causes thereof: it helpeth the shortnesse of breath, and the old cough: It is also availeable in the French disease, by taking it often as there is cause, and purging the old peccant humors, especially if the disease be not of any long continuance. It takethaway also the cause of old and long lingting agues, whether they be tertian or quotidian or other intermittive agues, caused by obstructions. The Islap is in working and purging somewhat like unto the Mechoacan, but exceedeth it, in working more strongly, and a little more churlishly upon both flegmaticke, and watery humors, yet (trengthening both the liver and ftomacke : the manner to take it is, being made into powder, to drinke it in white wine fasting, yet some take it in the distilled water of Cichorie or Borrage, or else in broth made with cold herbes.

CHAP. XIIII.

Ricinus five Palma Christi. Palma Christi, or great Spurge.

Ecause there be many forts of Spurges, and that this kinde of great Spurge doth much differ from all the other forts, hereafter set forth, I thinke it fittest to ranke it in a chapter by it selfe before the other, a captaine to all the rest; for although the properties be conformable to the Spurges, yet so are not either forme of leaves, flowers, or feede, of any of the foure or five forts, I shall here shew you : Tal. this therefore as the first kinde.

1. Ricinus sive Cataputia major vulgatior. The more ordinary Palma Christi, or great Spurge. This great Spurge, (which doth grow in the warme and hot countries, of Europe and Afia to be as great in the body as a man, and as tall as a reasonable great tree, and is used to be lopped every yeare, whose seed cannot be gathered without a ladder fet thereto, and whose lease falleth not away in the winter as Bellonins saith in the first booke of his observations, the 18 chapter) springeth up in our countrie, to be eight or neere sometime tenne foote high, whose stemme will be hollowed as bigge almost as our ordinary canes, of a brownish colon, with an eye of blew hoarinesse upon it: the leaves that stand both upon the stemme, and upon the brancher fendeth forth, every one feverally, on all fides upon long foote stalkes, are very broad, and divided into fire feaven or into more divisions (representing the hand of a man, with the fingers spread abroad) of a darken deepe greene colour on the upperfide, and whitish greene underneath; the flowers are many round buttons, shoo tingforth together, and frand all along upon a long falke, at the toppes of the frem and branches, confiling many pale yellow threads, which fall away without bearing any feede: but lower upon the fremme or many stalke: and sometimes also upon the branches, breake forth other heades, which are the seede upon long for which opening it felfe, or being opened, there lyeth within it the feede, whose outward huske is discoloured, a sit were spotted and shaped like unto a ticke, which conteineth within it, apretty large, shining round some what long and state feede, of a browne colour, having a white pulpe or kernell within it; of a fiery hot taste, be ning the mouth and throate, of whomfoever shall taste it, but very unctuous or oylie; whereof an oyle is presel which is onely used for outward remedies, for as Dioscorides faith it is cibis fadum; but serveth to burne in lampa in those hot countries, where it is naturall and plentifull, the roote confifteth of many long and great strings, and small fibres, which perisheth with us quickely, after it hath felt the first frosts, and must be new set every year by them will have it, but abideth in the warme countries, as I fayd in the beginning of the description may

1. Richus five Cataputia majos vulgatior. The more ordinary Palma Christi or great Spurge.

. Ricinus Americanus & follum novellus Palma Christi of America, and one of the first leaves.

TRIBE 2. 2. Ricinus major Africanus Syriacus vel Agyptius. Palma Christi of Syria,&c.

Camerarius in his hortus medicus, maketh mention of another fort whose seede was twice so bigge as the for-Camerarius in his hortus measurs; makern mention or another fort whole food a stria. This is very probale to be mer, the colour whereof was not so pale or spotted, and came as he saith out of Spria. This is very probale to be that hot violent fort, that Aldinus in his Farnessan garden remembreth, being brought from £gypt, the halfe part of whose seeds being taken by a strong

Fruelus Ricini Americani. Palma Christi of America feede.

young man of twenty yeares, mightily troubled with the headach, purged him very forcibly and cased his paines, but in that he chewed the seede in his mouth (and did not fwallow it whole without chewing as it should have beene) it inflamed his throate and mouth of his stomacke for violently, that after he had endured an ague, intolerable thirst, and fainting of the spirits, nine dayes after the taking thereof he dyed, not withstanding the care of three Physitions with all the remedies they could use. Of the seede being, fet sprung up a plant greater than the former, whose leaves were larger more crumpled and redder in other things little differing.

3. Minor.
There is another kinde also but lesser in every part thereof, although it grow in the fame ground, whose seede being ripe is evidently ob-

ferved to be much leffer: This is not remembred by any Authour that hath written thereof, before Clufius in the fecond booke of his Exotickes and 21 chapter, and Bestern that fet forth the Bishop of Eystot his garden, in a great large volume, whose seede that we first saw came from the Bermudas, where they made oyle thereof. and grew with us in that manner before expressed.

4. Ricinus Americanus, Palma Christi of America.

The Palma Christi of America differeth from the first, and second fort, not onely in the greatnesse, for as Alomardu & Aldinus fay it groweth to be a much greater tree; than any growing in Spaine, whose first leaves were almost round, & bigger than the first, but those that follow are broad and torne on the edges, into sundry corners, in the seede there is some difference also, which although they be three alwayes joyned together, yet the outer huske is not rough or prickely, but smooth and of an ashcolour, the innermost seede it selfe, being somewhat like the other, but more blacke and not spotted at al, and is as oyle as the first, for thereof as I here, there is made good store of oyle which serveth in the steede of oyle for any outward uses. Clusius remembreth a very small fort of this Indian kind, whose seede is the smallest of all other, even smaller than the former small kinde, which was brought from America.

The Place. The first groweth in Spaine as Clusius saith, to a great largenesse as is before sayd, and in [andy as Bellonius faith, the greater kind, whereof Camerarius maketh mention, groweth in Syria, & Africa, and as Aldinus faith in Agype. The first lesser fort in America, and Guinea as Clusius saith, in the place before remembred. The great kind of America, Monardus saith growth in Gelisco a province of new Spaine, from whence an oyle made of the seede thereof is brought, of muchuse as you shall heare by and by : and the last and least of all other, was brought

from Brafill as Clufius faith in the 25 chapter of his 2 booke of Exoticks the minth fruit.

The Time Those that grow with us flower not untill the beginning of August, and their seede doth seldome come to perfect ripenesse in this Country. The Names.

It is called by Dioscorides in Greeke nin i nejtav. Cici & Croton, a Crotonis sive ricini animalis similitudine. auod refert semen. Arias Montanus in his Commentaries upon Jonas, faith that the hebrew word Kikajon (which is necre the Greeke Kiki) doth fignifie this plant, although S. Ierome did translate the word to be Hedera, and our English bibles have it, a Gourd that was rayled up by God to shelter londs from the heate of the Sun. Jonah. 4. of some Pentadaliylus, by Mesues Granum Regium; Casalpinus from the Italian name Girasole tooke it to be Heliotropium Dioscoridis, but most commonly it is called Ricinus & Palma (bristi, and in the Apothecaries shops Cataputia major, the oyle whereof is known to the most of them, by the name of Oleum de Cherva, yet it is also called Oleum Cicinum, as well as that oyle made of the Indian feed, brought from thence: In Spaine they call the feede of the ordinary as well as the Indian fort, Figuo del inferno, and thereafter fome call it Ficus infernalis. The leffer kinde Clusius faith in the same place before mentioned is called Eraway by the Indians. The great Indian kinde, Clu-I'm faith is called Cureau in America, and we to diftinguish it from the former kind, do call it Ricinus Americus, or Americanus, Palma Christios America. The Arabians call it Cherva, the Italians Mirasole, Girasole, & Cataputia maggiore, the French Palma Christi, the Germanes Winderbaum, the Dutch Molenkruit and Wonderboome, and we in English Palma Christi, or great Spurge. The Vertues.

The feede of Palma Christi is almost wholly used, and the leaves but seldome, yet 30 feedes clensed from the huskes, being bruised, and taken in drinke saith Dioscorides (but Cost eus in his Commentaries upon Mesues judgeth this to be a fault in the writers of the coppy of Dioscorides, setting 30 for 3. and yet that is the utmost, according to the dose of those times as I have sayd diverse times before) doth purge choler and slegme, and draw water abundantly from the belly, provoking Vrine also; which manner of purgings as Dioscorides himselfe confesfeth, doth trouble the stomacke and overturne it mightily: yet with good advise it may be given to strong and able bodyes, with Aniseed or Fennellseede, who are troubled with the dropsie, joynt aches, the gour and science, because it draweth water and flegme very strongly, from the more remote parts. Durantes adviseth some of the

feede to be boyled in the broth of an old cocke, for the same purposes: the oyle he saith of the seede is profitably put into glisters, to open obstructions, to ease the paines of the collicke and windinesse of the mother; Clusius faith he knew diverse Emperickes give of the small seed, that came out of America in a small quantity as a purge indiverse diseases, because by purging the body well, they found good successes, because by purging the body well, they found good successes, because by purging the body well, they found good successes, held it as a secret of worth, which they kept to themselves. Monardus saith that the oyle of the Indian seede, (and other authors say the same, of the oyle of the former kinde) is found by dayly experience, to bee helpefull to many difeases, as well in the Indies as in Spaine; for as he saith it helpeth all diseases proceeding of cold causes, it dissolves tumours and swellings, disperseth winde especially of the collicke and mother, if the places grieved be anointed therewith. and some few drops thereof also taken in a little chicken broth that is fat: it wonderfully helpeth the crampe, and convultion of the fine wes, being gently rubbed on the places grieved, and thereby caufeth the fine wes to be thretched forth, that were fhrunke: by anointing the stomacke the belly or the left fide, where the spleene lyeth, it easeth them of the obstructions in them: it killeth the wormes in children, if either you give a droppe or two thereof, inwardly in milke, or fat broath, or anount the lower part of the belly therewith, it taketh away also the hardnesse of the belly in children, that are apt thereto, or have wormes: the oyle also helpeth all scabs, or running fores of the head : dropped into the eares, cureth the deafeneffe, and taketh away the paines and noyfe therein it mightily clenfeth the skinne from all manner of spots, markes or blemishes therein, as also the deformities of fearres and of the pox: the greene leaves bruifed and applyed of themselves, or else with barly meale, asswageth the inflammations as well as the swelling of the eyes, and the swellings also of womens brelts, after childing; being applyed likewise to womens brests, they doe helpe to encrease milke in them: It hath beene formerly se downe by good authors, that Palma Christi planted in a garden, was a sure remedy against moales, to keepe them from working in the ground but Cameraries disproveth that asseveration saying that they will work in the same manner, although they be planted therein, yea or although the branches be thrust into their surrowes or trenches.

CHAP. XV.

Tithymalus sive Lastaria. Spurge or Milkeworte.

Here are many other forts of Spurge, that are remembred by diverse authors, with whom there is much variation about the true names of diverse of them: some of them are of the Sea, as particularly to be found there abouts: others in the woods and mountaines properly belonging to them some againe onely growing in gardens in these parts, and for the anost part not well knowne essentially of the solo be found, others also of the fields: they have also obtained sundry names, according to their

formes or natures, yet all of them Spurges or Milkeworts: for some fort is particularly called Tithymalus, some of there Lathyris or Cataputia, others againe Esula or Pityusa, and others Peplus, Peplus and Chamassice: and because they are all

of them congeners, that is of one family or kindred, and of one quality or property, which is to purge, I thinke it fittest to remember them all together, yet in severall chapters.

I. Tithymalus Paralius five maritimus. Sea Spurge. The Sea Spurge rifeth up with diverfe reddift wooddy flake a foote or halfe a yard high, fet thicke with leaves, from the botome to the toppe, which are small long and narrow, yethrodest in the middle, somewhat like unto the leaves of Line a Flax, but thick and whitish, full of a white milke if any partit broken, which is so hot, that being tasted, it burneth the month and throate intollerably; at the toppes of the stalkes stand many pale yellowish flowers, with two leaves under them compaining the stalke, as it is usuall to all the other forts of Spurges, and containing them, after which come three square small heads, wherein is conteined round discoloured seede: the roote is long and wooddy, abiding long, and so doe the leaves on the braches not falling away in winter.

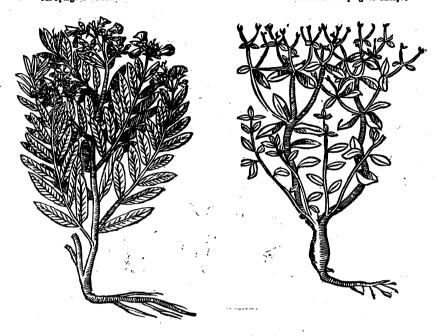

2. Tithymalus maritimus Venetus. Sea Spurge of Venice. This Sea Spurge hath longer or taller and thicker ftalkes, somewhat hollow and reddish, branching forth into diverse parts, befet with small long leaves, but somewhat larger, and more separate than the former, two alwayes standing together all along the branches like Licorice: the flowers are small, pendulous, and of a sad purplish coour, consisting of five small leaves a peec, like a small starre, without any round leaves under them as in the former, after which come such like heads and seed: the roote is great long and wooddy withall, sending forth new branches every yeare.

3. Tithymalus maritimus Creticus spinosus,
Thorny Sea Spurge of Candy.

The Thorny Sea Spurge of Candy, sendeth forth diverse brownish round stakes, whereon are set many which hoary leaves, being small thick and long, as plentifully yeelding a causticke or burning milke as any of the forms: upon the branches stand diverse thornes with the leaves, and likewise the ends of the stakes and branches of in sharpe thornes; under which come forth the slowers, in some whits sharp others purplish like unto the last Taly wall for the forme, and without any cups of leaves under them, which give small round seede like the former the roote is not wooddy as the some but very slessie, especially while it is young, and abiding many years.

2. Titiymalus maritimus Vanetut. Sta Spurge of Venice.

3. Thebyerales maritimus spine fus Cretique.
Thornie Sea Spurge of Candye.

4. Tithymalus linifolius Paralio congener. Bastard Sea Spurge.

This Spurge, rifeth up with brownish stalkes, having many narrow leaves growing thereon, like unto the first Sea Spurge, but somewhat larger and a little broader: the flowers seede and roote are not much differing from

The Place.

The first of these groweth by the sea side, as well in divers places of our owne Country, as beyond the Sea: The second groweth on the shores of the Adriatike sea in many places, and in the Island Lie that pertaineth to the Veneriains. The third in Candy as Honorius Bellus saith. The last in Franconia or Frankeland, neere unto the banks of the river of Mayne.

They flower in July for the most part, and their feede is ripe in August.

The Names.

Tiduard in Greeke is so called as it is thought from 1936 mamma & uard, existofa, quia lattem ab uberibus exisissum reddit, in Latine Tithymalus also and Lattaria or berba Lattaria of giving milke, which is common to all the rest of the Spurges. Some call it also Lattara marina & caprina, both for giving milke as Lettice doth, and that Goates delight much to eate it. They are all in general called Spurges in English, from the purging quality, and Milkewort likewise from the milke they yeeld, which as I sayd is common to all the forts of them. The said Milkewort likewise from the milke they yeeld, which as I sayd is common to all the forts of them. The said of the sayd was called in his time Tithymalus Paralius or maritimus, agreeing with that of Dioserides (which he sayd was called in his time Tithymalus and Mecona) in all points. The second Anguillara thinketh to be Alypum of Dioserides, and Pena and Lobel say, that at Venice it is used as a kinde of Pitypisa or Esula by the Physitions & Apothecaries there, whereupon they called it in their Adversaria, Esularara & Lio Venetorum insula. The third is remembred onely by Bellus in his third Epistle to Clusius, saying that in Candye, (because it is of the kindred of the Tithymals, giving aboundance of milke, they call it Galassivida, as differing from another of that name, which I have shewed you before, in the 22 chapter, of the former part, under the name of Blastaria Cresical spinosa, which Clusius called Lexicium spinosame Cresicum, and was judged of others to be a Verbascum simula simula in alled by Camerarius, Tithymalus simplications, and by Bankinus in his Pinax, Tithymalus simplias linaria folio; by Tabermontanus, Tithymalus anangdaloidet angustifolius.

The Vertues.

The first of these sea Spurges is not mentioned by any author either ancient or moderne to be used in Physicke; for the vehement and sharpe exulcerating quality thereof is such, and so great in purging exceeding other spurges, that it is not safe to use it inwardly, and outwardly applyed it doth burne the skinne, and therefore unlesse to take away fearres, scabbes, or warts, or the like it is not used at all onely Galen saith of it, that the milke thereof mixed with meale and cast into the water, astonisheth fish so much, that it maketh them to rise to the top

R₃

of

186

of the water. The second is as I sayd before used at Venice, by the Physitions and Apothecaries instead of Elale (I meane the rootes) in Benedicia Laxativa, purging pils and other medecines, because it purgeth forceably, and with great Violence, as Pena setteth it downe. The third is used in Candy, of the poorer fort as a strong purge, when they have occasion; but the last is not mentioned by those authors that have written of it, what foreign quality in purging it hath.

CHAP. XVI

Tishymalus Characias. Wood Spurge.

Fithis kind of Spurge there are diverse forts, which I entitle Wood Spurge as a difference to be knowne from others, although all of them doe not manually grow in woods. 1. Tithymalus Characias vulgarie. English wood Spurge.

The English wood Spurge, hath diverse tough woody brownish red branches, two foote high or more, bare or naked of leaves, for a space next to the roote, and afterwards let up to the toppe, with many narrow and long leaves, yet broader than those of the Sea Spurge, and nothing so large as the near somewhat smooth in handling, and without any dentes about the edges turning reddish in the spring, and more in the formmer time: a true toppes of some of the stalks, (for all of them doe seldome flower at one, and are very much branched) stand many yellow flowers, whose under cups, that is the two almost round leaves compassing the stalke, are yellow likewise; after which come small round heads, almost three square ftanding up a little higher in those cups, than the flowers did upon little stalkes, every one by it selfe, wherein are conteined small brownish round seede, the roote is long and somewhat woody, speading well under ground. but not creeping.

2. Tithymalus Characias Monspeliensium. Great French Wood Spurge. This kinde of Spurge is somewhat like unto the former, but groweth larger and bigger, having but one of two stalkes at one time standing upon the roote, which are reddish, bare of leaves at the bottomes of them,or the stalke that flowreth standeth harder and larger leaves than the former, which is divided at the toppes into fundry finall branches: whereon grow the flowers, standing in cuppes as the former doth, which are more yellow in some places, and more blackish in others, the seede and rootes are correspondent unto the other.

3. Tithymalus Characias folio lanuginoso. Hayric or downie white wood Spurge. This white wood Spurge, hath stalkes and leaves somewhat like unto the last, but that the stalkes doe never

z. 4. 5. Tithymatus Charachas. Serratus Monsp. Charachas angashijolius. Wood Spurge. Great French wood Spurge. Narrow leafed Wood Spurge.

8. Tithymalus Myrfinites incanus. Hoarie Myrtle Spurge.

rume red, but alwayes abide whitish, and are branched: the leaves also being almost as large, are whiter and forer in handling, with a kind of cotten or hairinesse on them, which maketh them to be the easilier knowne, by that difference : the flowers are of a paler yellow colour, not differing in feede or roote.

4. Tithymalus Characias forratus Monspeliensium. Dented Wood Spurge. This wood Spurge rifeth up with many greenish stalkes, 2 or 3 soote high, whereon are set small long thick far greene leaves, somewhat like unto the leaves of the largest Mirtle, but more pointed at the ends and a little dented about the edges, the stalks are branched very much at the tops, that beare yellow flowers like unto the other, but about the way long, nothing fo hard or wooddy as the former, but as Pens faith having a more fieshy pith in the middle, and a more fost substance without, whose barke doth to neere resemble the Twibish of Alexandria, as no roote can doe more.

5. Tithymalus Characias angustifolius. Narrow leafed Wood Spurge: This small Wood Spurge hath diverse weake branches, that stand not upright, but set thicke with leaves which are white long and narrow, much like unto the first wood Spurge, but nothing so great; the flowers seede and roote differ little from the other.

This wood Spurge rifeth up to no great height, with hayrie stalkes, bare at the bottome, thicke set about the middle, with somewhat hairie leaves smaller and softer than the last, of a blewish greene colour, and smaller upwards, the flowers stand in cuppes as the others doe, of a greenish yellow colour, consisting of foure leaves a pette, bowing outwards like unto an horné or halfe moone, joyning together at the backe of them, with yellow threads in the middle: the feede is like the other: the roote is very small in respect of the plant, and blacke on the outlide.

7. Tithymalus Myrsinites. Mirtle Spurge. This Spurge hath divers whitish branches, leaning downeward, not standing up right, whereon are somewhat thicke fet without order, many smooth and whitish greene leaves, small at the bottome, and larger in the middle, ending in a point somewhat small and sharpe; somewhat like for forme but not for hardnesse, unto the leaves of Knee holme, or Butchers Broome, the flowers are small and yellowish, not so many standing together as the other, else alike, as the scede and rootes are.

8. Tithymalus Myrsinites incanns, Hoary Mirtle Spurge. This white or hoary Spurge hath many upright reddish flalkes, about a foote or more high, whereon are set without order, such like leaves as the last recited Mirtle Spurge, but a little larger, and of an hoary white colour and hayric withall: the flowers are yellow flanding at the toppes of the stalkes like unto it, and the heads triangled bearing the like feede: the roote is small and differeth not much from the former.

9. Tithymalm verrucofus Dalechampii. Warelike Mirtle Spurge. This kinde of Spurge hath finall flender stalkes, halfe a yard high, divided into branches, whereon are let without order, small broade whirish greene leaves, like unto small Mirtle leaves: the flowers are small and yellowish, after which come round heads, standing like small warres, whereof it tooke the name, wherein are smaller feede, than any of the former; the roote is small and not long, with diverse sprayes running from

10. Tithymalus arboreus. Tree Spurge. The stemme of this tree spurge groweth up right, as biggeas a mans thumbe, from the bottome, and being there bare without leaves for almost halfe a foote, then shooteth forth diverse

7. Tithymalus Myrfinites. Myrtle Spurge.

io. Tithymalus arborens. Tree Spurge.

CHAP. 16.

branches, of a fingers thickenesse, whereon are set narrow long leaves, somewhat like unto the Sea Spurge, or rather the marsh Spurge, or great Estala, having larger yellow slowers and seedes, but like the other former form the rootes are not fo great and long as some of the former, yet sufficiently comprehending in the ground, to fa. staine the whole plant, which Lobel compareth to a Myrtle tree, for the bignesse and fashion of growing but no to the leaves.

11. Tithymalus latifolius Hifpanicus. Broad leafed Spanish Spurge. This broad leafed Spurge springeth up sometimes, but with one stalke, halfe a yard high or more, and no branched, and sometimes with more, and spreading forth many branches, from the bottome up to the toppe: the leaves that stand on them, are large and long, of a fresh greene colour round pointed, somewhat thicker fat in handling: and like to the younger leaves of Woade, the flowers are of a purplish yellow colour, like in forme unto the others of this kinde, and standing in cuppes after the same manner: the roote is great thicke and

12. Tithymalus palustrissive Esula major Germanica. Great Marsh Spurge. This great Spurge (which is usually called Efula major, to distinguish it from other Spurges) riseth up with many great round reddish stalkes, whereon are somewhat thicke set, many long and somewhat broad green leaves, neither so broad or long as those of wood Spurge, else somewhat a like t the tops of the stalkes are fur. nished, with fewer and smaller yellow flowers, than so great a plant, would beare shew to have : some flower breake forth alfo below the coppes, at the under joynts, standing upon their stalkes, three or foure together the most: afterwards come small round seede like unto the others, the roote is of a blackish colour on the onfide, and white within, great thicke and spreading diverse wayes, the barke whereof is thicker and more flefly than in any of the rest, and endureth the extremities of the winter, although the branches for the most part neith

every autumne, and rife a new every spring.

13. Tithymalus Helioscopius. Sunne turning Spurge of Wartwort. The Sunne Spurge or Sunne turning Spurge, hath for the most part but one reddish stalke, halfe a yard high, bare of leaves at the bottome almost half way upwards, and then spreading into two or three small branches, wherea grow sparsedly, diverse yellowish greene leaves, smaller at the bottome, and broader at the ends, somewhat like unto Pursane leaves: the flowers are yellow like unto the rest, standing in hollow cups of two leaves a peece, the stalke running through them, as is to be seene in most of the others; the whole toppe or head of flowers fayd to turne with the funne, whereof it tooke the name, the feede is small but round and like the relt: the root is small and threddy, perishing every yeere after seede time, and rising againe of it owne sowing.

This fweete Spurge rifeth up, but with one brownish stalke for the most part, not above a foote high, wherean grow not very many leaves, yet without order, which are somewhat long and narrow at the bottome, and broadeness. der to the middle, yet not sharpe but round pointed, and of a pale greene colour, giving milke when they are

11. Tithymalus latifolius Hiffanicus. Broad leafed Spanish Spurige.

broken, but not sharpe or hot, like all the rest: the toppe of the stalke is furnished with many flowers, fomewhat large, in fome places yellow, and in others reddish, which after give yellow feede, finaller than the last: the roote is greater than it, whose milke is sweete like the leave, and not hot or Charpe, and abideth not but persheth after seede time.

The Place: The first groweth most usually in woods, a

> 12. Efula major Germanica. Great Marth Spurge.

well in our Land as in Germany, Hungary and other places. The second at Mompelier and other places in France, as also in the Kingdome of Valentia in Spaine; as Clusius faith. The third groweth likewise in Spaine and France, as also in Germany and in Smitzerland. The fourth Lobel and Pena fay, groweth no where, but in the Country of Narbone or Languedocke, yet Clufius faith he found it in the kingdome of Valentia in Spaine. The fift is fayd by Lobel to grow in Narbone, and Provence, and not to be seene any where else but in gardens. The fixt Columna faith he found on the hils Apprenses in Naples. The seventh groweth as Camerarius faith, on certaine hils in Italy, but in these parts, chiefely in the gardens of the curious. The eighth was fent out of Italy. The ninth groweth in the dry fandy grounds, nigh unto Lyons by the river Rhodanus. The tenth is found onely in the hot Countries of Spaine, Italy, and Narbone in France, and is kept with great care and regard from the frosts of our cold winters. The eleventh was found by Clasius in Spaine. The twelfth groweth in many places of Germany, and as Lobel faith in his observations, in a wood belonging to Mr, John Coltes, nigh unto Bath very plentifully. The thirteenth groweth wilde with us in many and diverse places, as well as in other Countries. The last groweth as Tragus saith, in the moyst grounds upon some of the Alpes in Switzerland, and Pena and Lobel fay in the gardens of the Low Countries, with them that are lovers of plants.

The Time. All these flower in the Summer months of June and July. some earlyer or later than others, and their seede is ripe foone after the first Myrtle leafed Spurge is observed by Camerarius to abide the winter better, than some other, that come from hot Countries.

The Names. The first is called in Greeke nousand acognias & Tithy.

malus Characias also in Latine, that is to say Vallaris, because it usually groweth in the low moyst places of the woods, or in trenches that have been made to drayne the water, and is the first Tithymalus Characias of Dodonaus, and with Lobel Tithymalus Characias Amigdaloides we call it in English Wood Tithymall, or wood Spurge, because it is more usually found in woods, than any where elfc. The fecond is called by Lobel and Pena Tithymalus Characias Monft & Characias fimply by Matthi Lacuna; Louicerus, Lucdunensis, and Tabormontanus, by Clusius Tithymalus Characias legitimus, called also mas & yountus ab ampla & patula coma & Amygdaloides a foliorum forma, by Dodoneus Tsthymalus Characias alter. The third Clustus waketh to be another fort of this second kind, but differing in the smothnesse and woollinesse of the leaves. The fourth is called by Lobel Tiehymalus ferrains Monspeliens, which is the fift Characius by Dodonaus, and by Clusius called Tiehymalus Myrites Valentinus, for he faith the true Myrites of Dioscorides is neither knowne in

Spaine por in France. The fift Lobel in his observations calleth Myrsinites altera, yet saith it better agreeth with a Characias or Wood Spurge, then Mirtle Spurger it is the fourth Characias of Dodonaus, who faith they doe amise, that call it Myrsinies; Clusius calleth it Tishywalus Characiae tertius Austriacus; it is the third Myrsinies angustifolius of Tabermontanus, and by Baubinus Tishymalus Characiae angustifolius. The fixt Fabius Columna calleth Tithymalus lunato flore, from the likenesse of the flowers, and Baubinus thereupon calleth it, Tithymalus falvations lunate flore, taking it to be the Dendroides of Cordus upon Diescorides and the Platophyllos of Anguillara, but with no reason that I know, for it answereth unto neither as you may perceive by the description. The seventh is called famina by Dioscorides, and Myrsinises by Matthiolus, Oesner, Camerarius, Dodonaus, Lobel and others. The eighth Bankinus calleth Tithymalus incanus hir suns, and thinketh it may be the plant, that Camerarius calleth Pityusa Anglica, because Doctor Pennye sent it him; but because it hath leaves so like unto the former Spurge with Mirtles leaves, I have joyned it next thereunto. The ninth is called by Dalechampius Tithymalus verrucofus, and by Banhinus in his Pinax, Tithymalus Myrsinites fruttu verrucoso, and saith Guilaudinus was wont to call it . I ppium. The tenth is called Tithymalus Dendroides by Matthiolus, Gefner, Camerarius and others. Lobel calleth it in his Adversaria and Observations, Dendroides sive arboreus Myrtifolius, Myrthei speciei non a foliu fed a frusice, which as it feemeth made Dodoneus to account it a kind of Characias, and fet it for his third of that kinde. The Eleventh is called Platophyllos of Clufins, who judgeth it to be the right or true Platos phylles of Dioscorides, and so all others since him, because there is not any of these Spurges, found to have so great and large leaves as this hath; although Pena and Lobel tooke the Characias Monspeliensium, to be Platophyllos which afterwards changing their minds, they acknowledged this of Clasius to be the most probable. The twelft is called Esula major, and Esula major Germanica, by Tragus, Dodoneus, Lobel, and Lugdunensis, and by Baubinus in his Pinax Tithymalus palustris fruticosus. The thirteenth is generally by all writers, taken to be the true Helia-Scopius, that in Solffequus of Dioscorides, and by Brunfelfins and Tragus called Efula vulgaris. The last is called by Trages Efula dulcis for the reasons shewed in the description, whom diverse others since have followed: Trages himselfe faith that many would referre it to Miliaria of Plinie, but this may bee plainely seene to be a kinde of Tithymall. Camerarius in his horeus medicus, nameth a kinde Tithymalus arvensis annuus, which hee faith is like

100

2. Lathyris major vulgaris five Cataputjaminor.

Ordinary garden Spurge.

hereunto, but fuller of branches, and but an annuall or yearely plant, and that it is not without sharpeness. which Bankinus referreth to the Cyparissia with spotted leaves, as is hereafter shewed: in his Pinax he referred hereunto also, the Puyusa sive Esula minor floribus rubris of Lobel, and calleth it Tithymalus montanus non acres but I cannot so thinke, but take it to be a fort of the small Efula, as you shall finde it in the next chapter savene The rootes of diverse of the Spurges, and of some other plants also, are taken by diverse writers, to be the Tm. bith officinarum, and of the ancients, as the Myrsmites altera of Lobel, being the fift in this chapter, which he sim is taken of some to bee the true Turbith, that commeth from Alexandria into these Christian parts of the world : of the Characias Monspeliensium, Lobel saith in the same place againe, that the rootes be the most like up. to the true Turbith if any be like ir. The Esula rara Venetorum set forth in the last Chapter, is also called be some, Turbith nigrum of Actuarius: but all the best writers say, that the small common E/ula, is the true The petum nierum of Alluarius; whom Mesues, Rhasis and Avicen tollow, the roote of Alpum Narbonensium, a herba terribilis, is likewise called Turpetum album by the same Atharius, in diverse places of his booke, dem, thodo medendi. Mesues againe faith that Turbith is the roote of an herbe that giveth milke, whose leaves are like unto Thapfia or Ferula, Fennell giant, and there upon diverse have taken the rootes of Thapfia to be true Turbih Serapio taketh the roote of Tripolium or Sea Starwort, to be the true Turbith; and lastly the roote of Scammone is taken of some, to come neerest the true Turbith, as hath beene shewed in the chapter of Scammonye here before Matthiolus faith that all the forts of Tuhymall, were indifferently taken and used for E/ala by Physitions and A. pothecaries in his time : but assuredly the Turbith officinarum, which is most likely to be the same of the ang potheraries in his time: our antirectly the Involuno planaring, which is most here of the late of the another ents, is not the roote of any of the Tithymalls, or Spurges, because all of them are hot and sharpe, whiche fresh or dryed, and the true Turbith is almost inspid, and because they being dry break short, without any of those long threds that are in the true Turbith: neither can it be Alypum or Esna: for they are hot likewise: It cannot be the roote of Thapsia, which besides the heate and sharpenesse is too white also and the roote of the true Turbith. is somewhat blackish on the outside, and not so white within as Thapsia is. That Tripolium cannot be it, Liosunda and Galen declare sufficiently, who say it is sharpe in taste, and hot in the third degree, which qualities are no to be found in Turbith. Lastly, that Turbith should be the roote of Scammomye, I cannot thinke, because they do quickly grow greater than the rootes of Turbish, are ever seene to be. The Arabians call Tithymall Xanxer of E. thutia, Mesues Scebran & Alscebran, the Italians Titimalo & Tortumaglio, the Spaniards Lechenersna & Lech tregna, the French Herbe au laitt, the Germanes Wolffs milke, the Dutch Wolfs milck, and we in English Milkewor or Spurge in generall, and particularly Sea Spurge, Wood Spurge, &c. as is extant in the titles,

The Vertues. All these Spurges except the last, are heating and exulcerating the skinne, if they be outwardly applyed, and are vehement and excoriating purgers taken inwardly, without great care and caution : for as Melues faith inhi booke of purging Herbes, they are all offensive to the heart, liver, and stomacke, they breake the veines, share the guts, and heate the whole body so much that thereupon they raise fevers many times: the first ill qualities therefore he faith are taken away if those things be put thereto in the taking, that doe strengthen the heart; live, and stomacke. The second and third are taken away, by putting thereto such things as have a glutinous qualit, and fuch are gum Tragacant, Bdellium, and the muccilage or expression of the seedes of Fleaworte and Purslaine The fourth evill quality is taken away, by mixing cold and moyst things with it, and such are the juycend Sowthistle, Endive, Pursaine, Nightshade, or the seedes of Quinces well beaten with Vinegar. These Tiby. mals or Spurges doe purge with great violence, both upward by vomits, and downeward by the stoole, flegue. ticke humors, both from the stomacke, and from the joynts, as also blacke choller, melancholy, and the dropse, but they wast and macerate the body, and consume generation; 3 or 4 droppes of the milke taken fresh is often put into a dry figge, which is taken by strong Country people, to purge them; but it requireth some caution in gathering of the milke, that they stand with their backes, and not their faces to the winde, and especially the they touch not their face or eyes with their hands. The milkie juyce of them is the strongest worker; the steds and leaves are next in quality thereto, and the rootes of most are of the same operation, but not so strong; yet and teaves are next in quanty thereto, and the rootes or most are or the same operation, but not so strong; yet they being boyled in Vinegar helpe the toothach, especially if they be hollow, and the milke put into them, to as it touch not any of the other teeth or gummes, doth worke more effectually and speedily; the same milke lay also upon any hairy place, taketh away the haires; but it is necessary that it lye not long at a time, as that the place be anointed with oyle of rofes, and Nightshade quickly after; the same also taketh a way callous knots, and allother callous or hard kernels, or cornes of the feete, or other parts of the body, if they be first pared to the quick, and fome thereof dropped on or layde to: the same also boyled in some oyle of bitter Almonds, clenseth the skinne of the markes or scarres that come of fores, as also other deformities and discolouring of the skinne, and the scabba the markes of tearres that come or loves, as and other deformatics and disclosuring of the skinne, and the leaves and fourfes of the head: The Myrtle leafed Spurge is effectuall in all these diseases, excepting vomiting where in it is weaker. The rest are all of a like quality, but the Helioscopius is the weakest; yet the leaves of the grater forts in generall, although some attribute it to the broad leafed Spurge onely, cast into the water, caster the state of the water of the water of the water of the state of the water of the wat the fifth therein, to rife up to the toppe thereof, which lying thereon as halfe dead for a while, may be easely to ken with ones hand or otherwise. A lye made of the ashes of them, and the ashes themselves also, are answersble to the same effects before set downe in many things. The sweete Spurge as Tragus faith doth strongly provoke vomitings, if the roote thereof be taken inwardly. The outer barke of the roote, being steeped a day and night in Vinegar, and then taken forth dryed and powdered, halfe a dramme of that powder taken in wine or honyed water, doth purge all waterish humors downewards, as also choller, and is very profitably given to those that have the dropfie, the roote also wonderfully sodereth and healeth all manner of greene wounds. Traguralfo sheweth the manner of making certaine pills, that are very effectuall for the dropsie, and those that are shortwinded, which may be taken as he faith without either paine or danger. Take of the rootes of Efalls prepared a aforefayd halfe an ounce, of aloes one ounce, of Masticke one dramme, these being beaten into powder eachb! it selfe, are to be made up with Fennell water into great or small pills,

CHAP. XVII.

Latbyris five Cataputia minor. Garden Spurge.

Nto these greater Spurges I must adjoyne this other kinde of Spurge, which by all authors both before and fince Galens time, was accounted to be neerest unto them, and yet differing from them, and there is forefitted to be expressed in a Chapter by it selfe: yet hereof there are two or three sorts observed, one greater than another, as shall be presently shewed.

Tashweis major hortensis. The greater garden Spurge.

The greater of these garden Spurges rifeth up, but with one hollow straight whitish stalke, as big as a finger. maddowed as it were over with browne, on which grow up to the toppe, for the first yeare, many thicke fat long and somewhat narrow leaves, of a blewish greene colour on the upperfide, and more whitish underneath, fomewhat like unto Willow leaves for the forme, yeelding milke as plentifull as any of the

rest: the next yeare after, it divideth it selfe, into many small branches, with smaller leaves at every partition, every part thereof veelding milke, as the others doe: the flowers are of a pale yellow colour, and frand in cups like the former forts, but are smalher than many of them, yeelding fweete, and nothing fo hot and burning feede, in three fquare heads, fornewhat like unto those of Talma Christi, but round and bigger, than any of the former Tithymalls or Spurges, which in the hot Sunne will cracke and leape out of the huskes: the roote is long and wooddy, perithing as some as it hath given seede, and springeth againe of it owner feede, that is suffered to fall.

2. Lathyru minor. The leffer garden Spurge.
The leffer kinde of garden Spurge is to like unto the former, that I shall neede but onely to tell you, that it is the very same, bur lesser in every part thereof; for whosoever hath seene the greater fort, will presently say when they see this, it is the same, but a lesser kinde, and so much I hope will satisfie to declare and diffinguish these two forts.

2. Lathyris minima. The least garden Spurge This small garden Spurge hath many slender branches, lying upon the ground, fet full of small leaves, no bigger than those of Knotgraffe; among which rifeth up a stalke, about a foote high, with fuch like leaves on it as grew below: at the toppe whereof ftand many small yellow flowers, clustering thicke together on their small foote stalkes, but not spread abroad like unto the former forts: this yeeldeth milke as the others doe: the roote is small, spreading many small strings, with fibres at them.

The Place. They all grow in some places wilde, about the borders of fields, but most usually in gardens, where, when they are once planted they will hardly be rid out againe.

The Time. They flower in July, and the feede is ripe in August. The Names.

They are called in Greeke Advess Lathyris, quia congenerem Tithymalo quidem, sed efficaciorem & magis virosam signaret : in Latine Cataputia minor, for as is before layd, the Ricinus or Palma Christi seede, is called Cataputia major, and it is likly it was so called quia femen fert seu pilulas sive catapotia, & in English garden Spurge, that they may differ from all others. The first and second are generally by all writers called, either Lathyris or Cataputia winer. The last is called by Lugdunensis Lathyris minor Dalechampii, and Bauhinus thereupon Lathyris minor conglomerato store, and it is likely also to be the same that Casalpinus calleth Cataputia pusilla; The Arabians call it Mandana and Mahena dane, the Italians Catapuzza, Lathiri and Cataputia minore, the Spaniards Tartago; the French Espurge, the Germanes Springkraut, Springkorner and Treibkorner: the Dutch Sprinakcruids & Spurgie; and we in English, Spurge

and garden Spurge. The seede of this Spurge, is for the most part onely in use with us, whereof 5 or 7 or 9 or 10 graines, at the most are taken at a time, to purge both by stoole and vomit, tough slegme, choller, melancholy, and water, as Disserides faith: the usuall manner is to swallow the seedes whole, without breaking either buske or kernell and then they worke the more gently and weakely, but if the haskes be broken, and the kernels swallowed whole or chewed, or bruised and mixed with drinke or broth, they will then worke more violently; and therefore to be taken with the more caution: the milke is more violent, even as the former Tithymals or Spurges are to be taken inwardly, but outwardly applyed and carefully, it helpsth to take away haires on the eye-browes, forehead or temples, for it must not touch any other part of the face or skinne; the same also cautelously applyed, taketh away the proud and dead flesh in wounds, hard callous knobs, cornes or warts in the flesh, (if they bee first pared to the quicke and then applyed) running scabs and fores, and the blemishes scarres and spots of the skinne : it is put also into hollow teeth to take away the paine, but you must beware that it touch no other of the teeth or gummes, or other part of the mouth: the milke made up into Trochifces, or little balls, with the meale of beanes or peafe, and kept dry, doth serve all the yeare to use, as occasion is offered, for the purposes aforesayd, the diffilled water of the whole plant, is of especiall use, to clense the skinne from freckles, morphew, or any othen discolourings, either of it selfe, or mixed with the water of beane flowers, and bastard Distanie, and being gently bathed on the places troubled with the itch, taketh it away in a very short space: the same simple water also clenseth soule vicers and sores. The leaves being boyled in fat broath, worketh to some purposes more fale. ly, though more weakely. It is held by many good authors, to be effectuall for all the purposes, the greater Spurge or Palma Christi is applyed unto.

CHAP. XVIII.

Tithymali five Esula minores. The smaller Spurges.

A Aving shewed you all the forts of the greater Spurges, there remaine diverse other small kinds Which I will comprehend in this chapter, that so I may accomplish, and set forth the whole family of them together.

1. Pityufa, Tithymalus Pinea five Efula minor. Pine Spurge or small Esula. This small Spurge hath diverse weake and slender stalkes, halfe a yard long, whereon grow many small long and narrow pointed leaves, without order round about them, very like unto the leaves of Tode flaxe: at the roppes of the stalkes grow yellow flowers, sometimes dasht over with purple, like the former Spages but lester, and standing in the like cuppes, which falling away, the seede groweth in small three square huses, wherein is conteined small round seede: the roote is small and long, of the bignesse of ones singer, fomewhat blackish on the outside, but white within, and abiding many years, yet the extremities of the winter, do fometimes rot it and cause it to perish to both milke, roote and seede, are somewhat like in heate and sharpened. unto the garden Spurges, but not altogether so violent: the roote of this Efula is accounted of the most skill. full, to be the truest Efula minor; and the extract out of the roote hereof, rightly prepared and called Extraction Esula.

2. Pityusa sive Esula minor floribus rubris. Small Spurge with red flowers.

There is another of this kinde growing a foote high with fuch like leaves thereon, whose flowers are reddin standing in the like cuppes, that the other Spurges doe.

3. Tithymalus Cypariffus vulgaris. Common Cypresse Spurge or Welkome to our bouse.

The Cypresse Spurge is so like unto the first described, that it deceive the many, that doe not marke them precise. ly; for this hath also diverse slender brownish stalkes, whereon grow small narrow leaves, yet somewhat shows and thicker than the former, and thicker fet upon the stalkes also: the flowers and seede are like the other, and is the roote also, whereupon diverse have miltaken it, and take it for the true Esala minor, and so have used it in stead thereof.

1. Thimalus Pinea. Pine Spurge.

2. Efala minor altera pupureis floribus. mall Spurgewith red flowers

3. Tithymalus Cyperifiles unigerly.
Cyprefic Spurge or welcome to our house.

Tithymalus Cypariffias maculatis foliis. Cypreffe Sputge with spotted leaves.

Thisother Cypresse Spurge, distereth not much from the former having smooth round reddish stalkes, two foote high at the leaft, the tops whereof doe a little bend downewards; the leaves are fat and long like unto the former, but flanding more together at spaces, which are greene on the upperfide, and more yellowish underformer, but flanding more together at spaces, which are greene on the upperfide, and more yellowish undermath, thicke set with deepe yellow spots almost red, which are eminent at their first springing: the slowers likewise are of a little deeper colour, tending to a red or purple: the roote is smaller than those of the former, and more parted into sprayes or branches, with many fibres at them, of a brownish red colour on the outside, and Winor.

more parted into sprayes or branches, with many spres at them, or a brownith red colour on the outside, and pale within, not abiding as the other doth after feeding time.

There is another of this kinde lesser in all parts thereof, else not differing from it.

5. Tithymalus Leptophyllor. Small annuall Spurge.

This annuall spurge hath many slender weake stalkes, bushing forth into many branches, and spreading fare upon the ground, whereon grow very small long and narrow leaves, standing upright, the uppermost whereof are somewhat broade at the bottome, and compasse the slakes, ending in a long sharpe point or end; the standard where she chief and search stalkes, to me there square heads but very small.

the flowers are yellow, like unto the other and very small, after which come three square heads, but very small, wherein is conteined very small round grayish seede, not much bigger than poppy seede : the roote is small sone hard and woody, perishing every yeare as soone as it hath given seede.
6. Esuarorunda sive Peplus. Round headed Spurge, or Vineyard Spurge.

This Spurgeshooteth forth round about the roote many small weake reddish upright branches with small leaves fee by couples for the most part, somewhat like the leaves of Sun-turning Spurge, but rounder pointed and smaller, of a grayish greene colour on the upperside, and a little reddish or purplish underneath, oftentimes which will change to be wholly purple, in the Sommer time; the flowers are very small and yellow standing more round, or close together, as it were in an umbell, other wise like unto the rest: and so is the seede also very fmall, conteined in three (quare heads: the roote is fmall and long, with many fmall strings and fibres at it, perifhing also every yeare, and rising againe of it owne sowing.
7. Peplis. Small purple Sea Spurge.

This small purple Sea Spurge, spreadeth his small purplish branches upon the ground more plentifull than the other, and somewhat lesser; whereon doe grow many small leaves like the other, but not so round at the ends; and purplish likewise both underneath and above oftentimes, especially in the beginning of the heate of the yeare the flowers are small and yellow like the other, and so is the seede, but somewhat bigger and standing two together for the most part, not onely upon the toppes, but here and there upon the branches also: the roots is small and flender and of no use.

8. Chamafyce. Petty Spurge or time Spurge. The pettie Spurge is one of the smallest Spurges that is, having very small slender branches, lying upon the ground divided offerimes into other smaller, with smal pale green leaves set thereon, smaller than those of Tyme.

a Tubjer

194

6. Efula votunda frue Pepius. Round headed Spurge.

7. Peptis. Small purple Sea Spurge,

or as Pena compareth them unto Rupture wort: the flowers are the smallest and so is the seede of all the relifet in heads by couples like the last: the roote is small and long, consisting of nothing but threds, and is a no use.

9. Esula exigna folis obsusts. Petty Spurge with broad pointed leaves.

This Petty Spurge likewise groweth close upon the ground, the small round branches not exceeding an hard breadth in length, with small long and narrow leaves, broad at the points or ends, as if they had beene cut off, se without order on them, yeelding milke as the others doe: the flowers and seede is like the last, and so is the roote also.

This is the smallest Spurge of all the rest, the small branches not extending two or three inches in length, with agreeable to the plant, and the roote as small as threeds.

Tuberous or Knobbed Spurge, hath diverse small reddish branches, lying upon the ground, with many small leaves, somewhat like unto those of Saint solons wort set thereon without order, every one having the middle ribbe white therein: some of those beare a few small showers at the toppes of them like unto the other Spurges, and seed likewise in three square heads; the roote is tuberous in his naturall place, blackish without white within, and formed somewhat like a peare or sigge, from whence the name thereof rose: but a little differing in our climate, not keeping so proportionable a sigure as it hath come over to us, even as the blacke Raddish hat done likewise; and therefore we may thereby plainely perceive the nature of the soyle, doth alter much the forme of rootes, and leaves also in many things.

This other Tuberous Spurge, the figure whereof Cinsiu had sent him from Plateau, is so like the former, that I verily believe (as I sayd before of the sormer) the soyle and climate was the cause of the alteration therein, upon the ground, somewhat reddish towards the bottome of them, divided into other smaller branches: the stowers that are fet thereon by couples on both sides are small like the other, but a little rounder: the rugged or set with knobbes, wherein is conteined small round seede, like unto the other, the roote is long and round, having many other small and long thicke rootes, issuing from the lower end thereof, with many small sebres thereat, blackish on the outside and white within, like the former.

The knobbed spurge of Germany, different from the former two sorts of Apies, sirst in the rootes which confist of many reddish knobs, set together with diverse long sibres among them, like unto the rootes of Scrophuleria, or great Figgewort: the branches are small and tender, whereon grow the leaves which are small and sar-

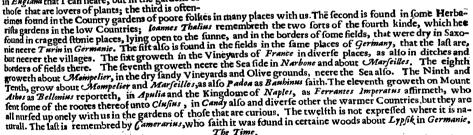

8. (banefice. Petry Spurge or Tyme Spurge.

TRIBE 2.

row, somewhat like unto the leaves of Meseron but smaller: the flowers are yellow, and the seede small and round, growing in three square heads, like unto the other forts of Spurges.

The Place,

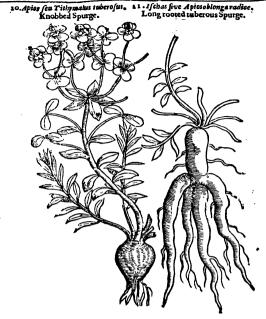

The first and third forts, grow in some places of Germanie and France, both by the Rivers side and borders of fields, but no where naturall in England that I can heare, but in the gardens of

They doe all flower in the Sommer Months of Iune, Iuly, and August, some earlyer and some later than others; but the third kinde is often found in flower in May.

Pilyusis called in Greeke II wasa, in Latine and in shoppes Esula, or Esula minor, because there is a greater as hath beene shewed before; it seemeth to have taken the name from Pityusa, being derived thereof, and made adiminitive, as if it were Pity usula, and short Vusula or Esula, as a small Pityusa or Pine Spurge. The first is taken to be the Pityusa of Dioscorides, and called Esula minor generally in most Countries, although the seede answere not to the description of Dioscorides; yet is often confounded with the third, which is called Cyparissian by moltanthors, and therefore Takermontanus maketh the first to be his second Tithymains Cupressinus: that the roote hereof is taken by Alluarius and others for Turbith, I have shewed before. Nicolaus Myrepsicus in some medecines and purging pils, doth appoint to be put thereinto Esula, by the name of Chamapitys: whereupon Fuchsus thinketh, that Nicolans his Chamapitys, is the ordinary ground Pine and not any kind of Tithymall, being deceived by the Etimologie and double fence of the word: for Chamapitys fignifieth a low Pine, which Pityusa doth also: but Chamapitys doth resemble a Pine, as wel in the resinous smel, as in the forme of the leaves, which Pityusa doth not, and also that Pityusa is a strong purger, fit for such medecines, and pills, as Nicolaus appointeth it an ingredient, and therefore by Chamapitys there he only meaneth that Efula with Pine tree leaves. The fecond is by Lobel in his observations set forth under the same title, is here expressed, and I have adjoyned unto the first as most likely to be a species the reof, rather than of the Efula dulcis Tragi, as I have shewed you in the next chapter save one before this, as Baubinus would make it. The fourth Baubinus referreth as I fayd before to Camerarius his Tithymalus arvenfis, and to that which Ioannes Thalius in his Harcynia Saxanothuring aca calleth GRathous . Bauhinus in his Pinax calleth it Tahymalus Cyparissia foliis punctis crocels notatis. The fifth is Matthiolus his Leptophyllos, whom Camerarius and Thalius doe follow. It is Trague his Efula exigua, and Peplis minor of Dalechampius. The fixt is

TRIBE.2 called mand ui ainn, Peplus & Syce, and winer aggad's Mecon aphrodes as Dioscorides saith, in Latine Efnla. tunda, from the forme as well of the branches, growing up round about the rootes, and the umbell of flower which are round, which names hold withall writers. The feventh is called manie & manie , Peplis & Peplis of the red colour of the leaves, and and count a few Andrachne agria, i. Postulaca I livestris, of the face and form of the whole plant : it hath no other Latine name than Peplis, yet Banhinus calleth it Peplis maritima folio obial. and Casalpinus Peplium, and is Dalechampius his Peplion. The eight is called Chamolyce, quasi humilis velion. and Cefalpinus Peptiums and is Datecompins in Feption. The eight is cancil Comment, and given the names firis ficus generally of all writers. The ninth and tenth Banbinus enely remembreth, and given the names they are in the titles. The eleventh is called Non Apios of Diofeorides, and Yours Ifthas of Theophrafius, from they are in the titles, The eleventh is called a so appear of Dispersion in the roles, by which names the forme of the roote, which is like unto a peare or figge; in Latine Tithymalus inberofus, by which names to ther the one or the other, all writers call them; but there is an errour in Fuchfiss and Tragus, in militaking a final wilde kind of Vetch, with small tuberous or clogge rootes, growing in woods and fields to be Apios, which Matthiolus thereupon calleth Pseudoapios, and is the plant that Gerard doth call in English Pease Earth Nut. Latine terra glandes, and of Tabermonianus and others Chamabalanus: Turner also is in another errour suppositi the Bulbocast anum or Nucula terrestrictobe Diescorides his Apies. The twetth Clusius faith he had the figur onely fent him from Platean, and thereupon calleth it Ischas altera. Banhinns translating the name to Tilbon lus oblongaradice, and I to Apios five Tithymaius tuberofus oblongaradice, but I verily thinke it to be, but alim rious kind of the former Apios. The last Camerarius onely hath made mention of in his Horrus Medicat, and calleth it Tithymalus tuberosus alter, and Baubinus Tithymalus tuberosus Germanicus, as it is in the

All these spurges are of the nature of the former, yet some more, some lesse violent in purging, and conductor better to some speciall diseases, as you shall heare in particular. The first Pityusa which is accounted the true Esulaminor, (although the Cyparissias be taken of many for the same, and so used but with lesse successe, pe ncereft thereunto) is accounted of force to heale the bitings or ftingings of venemous ferpents : it purgel strongly downewards both choller and slegme, and taketh away the hardnesse and paines of the belly, and twee lings of the breafts: the feede and roote prepared helpeth the dropfie, being carefully and with good advife taken the leaves (fleeped a while in vinegar, and afterwards dryed and made into powder, which is the preparation them) may be given to the weight of three drammes faith Dioscorides, (which I hold proportionable, to their of the great quantities of purgers, given by the ancients whereof I have spoken before, which is over large tob given to any in our time, or at least nation) the roote (prepared in the manner aforesaid) is given likewise to the weight of two drammes faith Dioscorides, in meade or honeyed water : but one dramme is fo strong, that it is not fit to be taken but with caution, and by a strong body) the feede faith Dioscorides may be taken to the weight of a dramme: but feeing 9 or 10 feedes, of the garden Spurge is a fufficient strong medicine, I thinke so many those seedes are too many by much: and of the juyce or milke a spoonefull Diescorides appointeth, being made into pills with flower, which is the strongest of them all: an extract made artificially out of the rootes is mud commended by many in the dropsie, and other diseases before named, but it had neede of an artist, as well in the preparing as giving. The Pills of Efula fet downe in the 16 chapter before, doe properly belong unto this place being to be made more properly, of this Esala than of that. The small annuall spurge is in purging like the other forts, but is not fo strong for the diseases aforesaid as the former are. The seede of Peplus or the round Esula, to ing beaten and drunke in hydromel or honyed water, purgeth flegme and choller. The leaves are used tobe pickled up, and kept to be used in meater, and the powder of them saith Diosecrides, strewed upon meater or bleth the belly: The small purple Sea Spurge hath the same properties, and is used to be pickled and earn, with the like effect that the former is. The Petty or Tyme Spurge, is used for paines of the mother, if the young branches and leaves be bruifed with a little wine, and put up as a peffary. The fame boyled and taken doe purg the belly even as the milke or juyce doth also, and is good against the stinging or biting of serpents, and taken away all manner of warts and excrescences of the like nature. It is very effectuall for the dimnesse or miltinesse of the eyes, to cleere the fight, and also for watering or running eyes, and to take away filmes or scarres that grow upon them, used with a little honey. The tuberous or knobbed Spurge faith Dioscarides, purgeth downs wards, if the lower parts be taken, and upwards if the upper parts be taken: but the juyce to the quantity of half a dramme, purgeth both wayes, and so doth the plant being taken wholly together. The manner of drawing on the juyce thereof (is somewhat rude in regard of the exquisite manner of preparing extracts chymically in our dayes) as Dioscorides setteth it downe is thus. Beate the rootes and put them into a vessell full of water, slime them well therein, and with a fether gather the upermost upon the water, which being dryed and kept, served for the uses aforesaid, and for those that have the dropsie. All these clense the skinne from discolouring, even as the former doe, and with as good successe. There is none of them but are strong and violent, and therefore great caution and advise is to be had, in taking of them inwardly, and therefore some appoint to put diverse add hearbes to them in the taking : but for outward applications there is the leffe feare of danger, because if the skinne be any thing exulcerated, and the parts inflamed, helpe may sooner be had and applyed thereto, than withCHAP. XIX.

Hippophaes, Hippophastum & Hippomanes. Thornie Milkewort or Fullers thorne?

Beause Dioscorides speaketh of Hippophaes and Hippophastum, making them both Thornie plants, yeels ding milke and purging, before Ricinus and the Tishymales, and Theophrasius in his ninthbooke, and sitteenth chap, saith that Hippomanes is made of Tishymalus, or latheria Milkewort, the best as hee faith, was knowne to be made in Teges and was held to be of great worth; yet my Theobrass in Latine, which is very ancient without name of the Printer or yeare of the Printing, hath in that place Hippophaes although I confesse I have seene Greeke copies which have had Hippomanes, but surely Hippomanes being declared by other authors, to bee a kinde of poyson made of the nature or thinne sperme of Mares, as you shall heare by and by, could not in my minde be so unknowne to Theophrastus, that he should say, it was made of the Tithymalls or Milkeworts, but rather that Hippophaes was a Milkewort, or made thereof; for in his 6. booke and 4. chapter, at the latter end he numbreth Hippophyon which Gaza translateth Lappago, among those plants that beare thornes at the leaves, and in the same booke and 5. chapter he nameth Hippopheos which Gaza translateth lappago likewise, to have gentle smooth leaves, not like unto the Capers, which have sharpe leaves as well as stalkes, and in his 9 booke and 15 chapter, maketh no mention either of forme.having declared it before, or of purging or poyfonfull quality therein; but numbreth it among other things, the best whereof grow in Arcadia, and nameth it next after the Elaterium, made of the Wilde Cowcumbers, so that it is probable his Hippophyon, Hippopheos, Hippophaes, or Hippomanes, whether you will, for diverse doe thinke diversly, was an herbe or roote, that bore thornes as is before declared, whose condensate milke or juyce, was of anuch worth being made in Teges: I thinke it not a miffe somewhat to declare both what I thinke Dissertion of the name: and what I thinke Dissertion of it his Hippophees and Hippophees and the derivation of the name: and what I make and others say of it also, that say they have found it, to incite some industrious to attaine it also, if that which I shall shew you in my opinion be not it, and likewife to shew what diverse authors doe report of Hippomanes, that thereby the diversity of things might cleere Theophrastus from imputation of want of knowledge, what Hippomanes was, or venity or things might elected to support against a limit the properties of the latest of the latest and that his Hippophaes and Diofeorides Hippophaes, was one and the same things. This therefore is the text of Diofeorides concerning Hippophaes. Hippophaes where with fullers doe refresh garments, growethin gravelly grounds and neere the fea. It is abushing plant thicke of leaves, or well spreade, having long leaves like unto the Olive tree, but smaller and longer, and betweene them many whitish hard thornes di-flant one from another. The flowers stand in clusters like unto those of Ivye, but smaller and more gentle, fomewhat reddiff or blush out of a white: the roote is thicke and tender full of juyce, like milke and bitter in tale, from whence as from Thapfia, a juyce is taken, which being dryed up either by it felfe fimply, or with the flower of Orobus (or the bitter vetch) is kept for their use that neede it: Hippophesium (saith Dioscorides) which fome call Hippophaes, groweth in the same places, and is a kinde of Fullers thorne also. It is a low herbe having thornie small leaves, without either stalke or flower, with empty heads, it hath thicke and tender rootes: a juyce is drawne out of the rootes, leaves, and heads, and dryed up to be used. Thus farre Dioscorides: In comparing therefore Dioscorides and Theophrasses, I doe not finde them to vary more than in a letter or two of the word. For as you heare Dioscorides faith Hippophaes hath many branches full of leaves, and some thornes also, and Theophrafus doth intimate the fame, saying that Hippophees hath smooth leaves, and some thornes also, and Theophrafus doth intimate the same, saying that Hippophees hath smooth leaves, and thornes by the leaves, or is a thornie plants of the saying that Hippophees hath some plants of the saying that the roote of Hippophees is thicke and full of a milkie juyce, and Theophrafus saith Hippophees (as I sayd my booke hath it, and Columna in his chapter of Hippophees hath so also, or as others have Hippomenes, which as I sayd before cannot be) is made of a Tishymell or Milkewort, the best being made in Teget, and is of great worth, Pliny maketh mention of Hippophaes in one place, and of Hippophaes in another, as of one and the same plant, as likewise of Hippophaesian in severall places, which as yet in one place he calleth Hippophaesian in the same plant, as likewise of Hippophaesian in severall places, which as yet in one place he calleth Hippophaesian in the same plant, but did deliver what he sayd onely upon the credit of the author, we shall not neede to insist more uponhim. The Greek name in modes commeth either of ion & o odes or ode which is interpreted equarum salus aut lux, aut ab equis genita, for so Plinye in his 22.book, and 12.chap. saith. Debent accommodate esse or equorum natue re,neg,ex alia cansa nomen accepisse and in ποιιανές ex in π & co μανία quia equorum maniam sive surorems anabat; but because Dioscovides saith it was called Spina fullonia, and that garments were clensed thereby, it seemeth the Etymon of the word was rather derived from in προλακεη pro advertion accrescentio, & sic pro valde or multum, & oduse pro lumine or nitore, of the clenfing quality: for so Plinge saith of Hippophassum in his 27 booke and 10 chapter Hippophassum in since a quibus sunt pila fullonia: for with the plants roote made into bals, those times of his used to scoure garments, like as if it were done with sope. Anguillar saith he found Hippophass in the Island Pelopone (us, in the sandy grounds by the seaside, which had a roote of the length of ones hand or better, yelding a thinne juyce, being either broken or wounded, like in colour to milke, of a very bitter taste (but saith the saw then neither flower nor fruste) and strong smell, which the inhabitants call Acantha Nacatharile, Spina Purgatrix, thepurging Thorne, which Baubinus setteth downe in his Pinax for a kinde of Rhamnus Catharteicus folio olea, and thinketh the Hippophastum quorundam of Lugdunensis to be the same; Fabius Columna refusing the opinion of others that tooke the Rhammus primus of Diescovides, as Lobel supposeth that purging thornie plant to be, growing by the sea sides of Italy, France, and Holland, supposeth that that kinde of Rhammus which groweth in Campania and Apulia, by the sea shores, called by the Italians in those places Spina santa, and which is the second fort of the first kinde of Rhamuus, set forth by Clusius, doth more neerely resemble the Hippophaes of Dioscorides: but in my minde neither of both these shrubbes, wanting milke at the roote can be the Hippophaes of Dioscorides called also Spina fullonia. Ruellius likewise saith that Hippophaestum, was brought from Narbone in France, which had finall whitish leaves among the thornes; by Lugannensis it is said that Hippophastum was sent to Daleshampius from Melita or Malta, and was a plant, spread full of thornie branches or rather the branches being wholly but thornes themselves, with small white slowers, standing close to-

CHAP.20.

CH A P. 20.

gether at the joynts and partitions of the branches; but whether it were purging was not fignified: this declaration, being onely taken from the dryed plant was fent: but if I may be bold to give my centure, what Hippopher is, and whether it be to be found or no, I would furely conjecture, that the plant called Galafivida Cretica, which I have fet forth in the 1 5 chapter of this part, under the title of Tithymalus maritimus Creticus spinosus, and as I far I have let forth in the 15 chapter of this parties of Tithymall, or Spurge having thornes, and giving milke, whose there, is fayd by Honorius Bellus to be a kinde of Tithymall, or Spurge having thornes, and giving milke, whose roote is thicke and fleshy, might as neere resemble Hippophaes, both for forme, for giving milke and purging que. lity, as any other plant what loever, and even the relation of the leaves and flowers fet downe in that place, is no greatly differing, let others judge hereof as they fee cause. Now concerning Hippomanes let me shew you all what diverse authors have written thereof. First it is imputed to Theophrastus to say, as some corrupt (a) thinke) greeke copies have it as I fayd before, and Camerarius as I thinke was the first that did so cause it to be read, that Hippomanes is made of Tithymall, but is miltaken for Hippophaes as I layd before. Theorisms faith read, that Thippopmanes is a plant whereby horses are made surious madde. Collumella saith the Hippopmanes is a poyson, which kindleth lust in horses like to that of men, but what it is, or whereof it is made or taken, he doth not expresse. Plinge also in his 28 booke and 11 chapter affirmeth, that Hippomanes was of 6 ftrong power or force in witchery or forcery, that being but layd to the brasen figure of the mare at Olympuni would drive the horses in extreame fury to cover it : Which Pausanias before Plinge his time, doth set downe more at large in his fift booke : but Aristotle in his 6 booke and 18 chap, of the nature of beasts, saith that the mares doe let passe from them a certaine thinne humour, like unto their sperme, when they are inflamed with lust to be covered, which is called Hippomanes by some, and in the 22. chap, of the same booke he saith, that there flicketh to the forehead of the foale, new fallen, a certaine round, and somewhat broad blacke peece of flesh skinne, of the bignesse of a small dryed Figge, which the mare licketh up with the secondine, as soone as the hath foaled, which if any shall take away before she hath devoured, and afterwards offer it her to smell there unto, she not knowing the tent thereof, will be stirred in to great fury or madnesse, but will not suffer her foalen sucke her that hath it taken therefrom; which thing Innius Solinus Polyhister confirmeth in the 48 chapter of his booke, onely he varyeth from Ariforle, in saying it is of a brownish yellow colour, which hee said was black.

And Plinje writeth also the same thing in his 8 booke and 42 chapter, although he said also, it was an other thing as you have heard before. Virgill in his third booke of Georgickes hath these verses, to shew what it is, and wherem used, taken as it should seeme from Aristotle,

Hinc demum Hippomanes, vero quod nomine dicunt
Pastores, lentum distillat ab inquine virus
Hippomanes, quod sepe male legere uvverca.
And Tibullus the Poet in his a. booke and 4. Elegie, hath the same also in effect in these verses
Et quod, ubi indomitis gregibus Venus afflat amores
Hippomanes, cupida sillat ab inguine equa.

Anguillara is of opinion that the Hippomanes of Theocritus is the lesser Stramonium, or thorne apple, and the Cratevas, whom Theocritus his interpreter doth cite saith, that it is a plant whose fruite is like the wilde Concumber fruits, but full of thornes: Now if the ancients have lest these doubts, whether Hippomanes be an how or made of an hearbe, and shew not certainely what the search is, or doe not all agree that it is the spermos mares, how shall we in these times compound the controversie.

Dioscorides saith that the pure juyce of Hippophaes is selfe being dryed, and the weight of halfe a scrupt thereof taken, or the weight of two scruples, if it be made up with the meale of the bitter Vetche, taken meade or honyed water, purgeth downewards slegme, choller, and water: the whole plant rootes and all being bruised and put into meade, and about a quarter of a pint thereof taken, worketh in the same manner: the juyce taken from both the plant and the roote, as it is used to be done with Thapsia, a dramme thereof taken at a time, is a purgation of itselfe for the same purposes. The juyce pressed out of the rootes, leaves, and heads, of Hippophassium, is to be dryed and halfe a dramme thereof given to whom you will, in meade or honyed water, draw-th forth slegme and water: principally and chiefely this purgation is sit or convenient, for those that are not bled with the falling sickenesse, shortnesse of breath, and aches in the joynts and sinewes.

CHAP. XX.

Alypum Monspel Sum sive Herba terribilis Narbonensium. Herbe Terrible.

Ecause this herbe is of a most violent purging quality, sharpe and exulcerating withall, very like unto the former *Tithymalls*. I thinke it fittest to joyne it next unto them and another within which by *Fena* his judgement is very like thereunto, both for face and quality.

This terrible herbe hath many wooddy stalks, rising two or three foote high, dividing it selfe into smaller branches, covered with a thinne barke, the elder branches being, of a darke purplish colour, and the younger more red, thicke set with small hard and dry leaves without order, from the bottomet of toppe, which are somewhat long and small at the setting on, broader in the middle, and sharpe pointed, somewhat like unto small Mirtle leaves, of a greenish colour on the upperside, and whitish underneath: at the conference of every branch standeth a round shower in a scaly head, consisting of many purplish thrummes or threds, pale in the middle than round about, somewhat like unto the head of a Scabions or rather Knapneede: the roote is a singers thicknesse, long, wooddy and of a brownish colour, somewhat salt, if it grow neere the sea shore, what it may drinke any of the Sea water, or else not salt; at all, but bitter if it grow further off: the leaves also rather after the same manner.

1. Alypum Monspeliensium sve Herba Terribille.

2. Tartonraire Massiliensium.

Hippogloffum Valentinam Glufie.

2. Tarton raire Massiliensium. Gutwort of Trouble belly.

The herbe Gutworte or Trouble belly, hath very many hoary, or filver white slender and very tough branches, two foote high, divided into many other smaller, whereon grow many small white hoary leaves round about them, smaller than those of Alpam; the flowers are white and small, serclose together, in a long tust, but so covered with the white woollinesse that they can scarse bee perceived: after which come small black seeds, bitter and unpleasant, and so siery hot; that if any shall either chew of them or the leaves, a little in their mouth, they will so heate the mouth, lippes, and jawes, that no washing will for a long time take it away: the roote is small long and wooddy, with many sibres at it, yellowish on the outside and white within, nothing so hot, bitter

or unpleasant as the leaves or seede, yet leaving a small hot taste at the end, without any sent, and not giving any milke: it is saith *Pena*, very like unto the *Turbith* of *Alexandria*, or of the shoppes, in the forme thereof.

2 'e Place.

The first groweth on the monntaine or hill, called Cestim or Cap de ceste, and in other rockes and stony places, hard by Marseilles in France, as also in diverse places in Spaine as Clusius saith. The second doth likewise grow neere Marseilles by the Seaside, on a small hill neere thereunto, called Mondrond, as Pena saith, and all a long the coast of Liguria, and the Isles of Corsica, and Sardinia, as Lugdunensis saith.

They flower not untill it be late with us; but Clusius found the first in flower, in the moneths of February, and March, as he faith in Spaine.

The Names?

Names in Greeke, quasi indolens inoffensumque remedium uss avriogegov, per contrarium enimse habet, quemadmodum in dius; Grace scilicet fella γλικου scive dusta o δοςση. Helostium tota ossenamenta sit tenera appellans: except it might rather be said to come from alter, idest, salfam vel maritimum, because it groweth neere the sea: in Latine its called also Alppum & berba terribisu, according as the common people of Provence doe call it, from the effects it worketh. It is called also Alppum, which purgeth blacke choller: but Paulus reconsileth this doubt in his seaventh booke; and fourth chapter; where hee saith, that the seede of Alppum, purgeth downewards blacke choller, taken with a little salt and Vinegar, in the same quantity that Epithymum doth: but if we credit Dioscorides, saith he, it doth lightly exulcerate the guts: but is the same in my judgement saith Paulus, which is now called Alppus: the roote hereof, as I sayd in the chapter of Tubymussis, is called by Almanius Tuppetum album, as that of Esula minor, Turpetum nigrum: There is some doubt with many, whether we have the true Alppum of Dioscorides or no, for that some copies differ from others in the description of the some of the plant, some having the word underges that is like fennesh, and importes somewhated say others.

TRIBE.2.

CHAP. 21.

whereupon Lobel and Pena are bold to affirme in their Adversaria, that our age knoweth no herb, that may so we or more truely, both in the forme and purging vertues, refemble Dioscorides his Alypum, (except the Fernila then this herbe here fet forth, altering that word onely, which as he faith may be a fault (fuch as is common in many other places of his worke) in the transcribers: and hereupon as it is probable Mesus grounded his onini on, that Turbith was the roote of a ferulous plant. Clusius faith that diverse professors in the Vniversitie at V. lentia. did call an herbe which he therefound Hippoglossum, supposing it to be the true Hippoglossum of Dioscorid. where it can as he faith be nothing like, the properties being so differing, except in a little appearance of like, nessent in the leaves: Clusius also doth not acknowledge it to be Alpum but missisch of their judgement, the doe referre it thereunto, because the leaves are so dry, that they seeme to be without any juyce in them; when upon the Spaniards call it fiempre enxuta, and from the round head of flowers, which is paler in the middle than round about, doe call it Coronilla de frayles, Coronula fratrum the Friers Crowne, and of some as he saith Segul hada, but others of good judgement doe hold them, to be both but one plant, the divertity, if any be, to confilt in made, but others or good langement does not be the climate. Talechampis as L_{ij} Lugdenents (ettech it forth, was of opinion, that it might be Emperon of D_{iij} (in the climate, which others as he faith called P hacoides, onely led thereunto, by the purging quality and growing near the Sea, as Emperon doth; and because that the Crithmum or Faniculum marinum, is disprooved by most not to be the sea as superior doth; and because that the control of the sea a Saxifrage, with the other which is a purger) because it hath no purging quality in it at all; but seeing we hold this Alpum, to be the right or neerest it of Dioscorides, I cannot see what reason can move any, to think it to be Empetrum also, seeing Dioscorides maketh them two distinct herbes in severall chapters, and placeding one the very next unto the other : fome also as Lugdunensis saith, take it for Ptarmica, or for the third forth Conyza. Baubinus in his Pinax, calleth it Thymelea foliis acutis, capitulo Succisa, sive Alypum Monspeliensim The other is called Tartour aire by Lugdunensis, and Lobel, and is so called as hee faith, in the Isles of (orsica) Sardinia, and all along the Sea coasts of Liguria and Marfeilles. Dalechampius saith that many doe referre the to the Sesamoides magnum of Dioscorides, which he hath mentioned in his fourth booke, and 147 chapter, with leaves of Groundfell or Rue : and therefore Dalechampius in the description hereof faith, the leaves are like Ru which in my judgement doth very hardly agree thereunto, but much leffe unto Groundfell, whereunto they an also compared. Furthermore he saith also, that peradventure this may be that Helleborns of Theophrasius, who feede is like Sefamum, and wherewith in Anticyra as he faith they used to make purgations: but the extreme purging quality herein, shewing it as Pena faith, to be a new plant of our ages finding, and not well knowned be mentioned by any of the ancient writers, Greekes, Arabians or Latines, hath caused diverse to referre it, a say, fome to Sefamoides, and others to Theophrastus his Helleborus, with the fruite of Sesamum, and ver whose ver will advisedly consider, the seede of all the sorts of Hellebores, both the white and the backe, shall not find them much unlike the seedes of Sesamum it selfe. Alphonsus Pentius of Ferrara tooke it to be Cneorum of The phrastus: the roote hereof as Pena saith, is like unto the Turbith of Alexandria, and hath not so much heates bitternesse therein, nor other evill taste as others have. Baubinus calleth it Thymalea foliis candicantibus sericis Star mollibus.

The Vertues.

The feede of Alypum (faith Dioscorides) or herbe terrible, purgeth downeward blacke choller or melanchs, if it be taken in the like quantity with Epithymum and a little falt and Vinegar put to it in the taking, but hefail it doth a little exulcerate the bowells: the common people in Narbone, but effectially the Quackfalvers and we men leeches, as Pena faith, notwithstanding they find the effect to purge with such violence, yet doe often give; making a decoction with the leaves flowers or feede, or otherwise make them into powder, and give it that with wine or broth; the smallest quantity thereof, to be taken in chicken broth, saith Plinye is two dramms a meane quantitie is foure drammes, and the greatest portion to be given at once is fixe drammes: (Inssis sait that the Landlopers in Spaine, doe usually give the decoction hereof unto those, that are troubled with the Fraid disease, and that with good successes it is reported: the other Gutworte or Trouble belly is as violent in working as the former, or rather much more, for the violence thereof is found institute, that it oftentimes causeth in moderate fluxes, even to blood and excoriations; especially if the dryed leaves be given unadvisedly in powde, and mixed with some porable liquor, and driveth forth choleriske, slegmatiske, and watery humors in about dance; the roote likewise worketh powerfully for the same diseases, which if it were Theophrass his Hellborn, or Dioscorides Sessamum, were unprofitable or of no use; the seede onely with them and not the roote, having the propertie and power of purging. Advice therefore before taken, and preparation both of the physickes body, the quantity also, the disease and strength of the patient considered, it may be admitted to be given when better and safer things cannot on the suddaine be had.

CHAP. XXI.

Thymelea. Spurge Olive.

Here remaine yet some other violent workers, which shall be declared in this and the next clapter ters following, and first of the Thymelaus, and then all the sorts of Chamelau and Sanamandad Clusius, because they are so like both in forme and nature: and let me also adjoyne the small soft moides of Dalechampius, for the necre affinitie with them.

This Spurge Olive hath diverse tough stakes, rising to the height of two or three soote, sometimes in the naturall places, and much lower in some other, of the thicknesse also of ones thumbe, covered with an associated when and spread into many branches; whereon grow many small clammic, stat, pointed leaves, somewhat like unto Mirtle leaves, or rather unto the narrow leaves of the Olive tree, for they are larger and broader the the leaves of Flaxe, whereunto many doe compare them, and doe continually abide on the branches without the leaves of Flaxe, whereunto many doe compare them, and doe continually abide on the branches without the leaves of the Olive tree.

falling off, as the Chamelea doth; at the toppes of the branches, grow many small starlike flowers, confishing of foure white leaves a peece; after which come small berries greene at the first, and of a very red colour, like unto Corall when they are ripe, being a little more long than round, of the bignesse of a Mirtle berrie, with a pulpe of substance like unto a Cherry, wherein is one kernell covered with a blacke fost and brittle shell: the roote is fost and tender while it is young; very like unto a Raddish roote as Clusius saith, but wooddy when it is growne elder, coverd with a rough thicke barke.

2. Thymelea minor five Cneorum Matthioli. Small Rocke Roses.

This plant hath diverse long weake and slender but tough branches lying upon the ground divided usually into other smaller ones whereon grow many small long and somewhat thicke leaves neere unto those of Meseren, set without order to the tops where is shooteth forth a tust of many flowers together, consisting of source leaves a peece, of a bright red or carnation colour, and in some plants white, very sweete, which turns into small round whitish berries, conteining small round seede, of a grayish colour: the roote is long and yellowish, spreading divers wayes under ground, and abideth many yeares shooting forth new branches.

3. Chamelea Germanica sive Mesereon vulgo. Dwarfe Bay or slowing Spurge.

There are two forts hereof, the one having a pale, and the other a deeper red coloured flower, they both rife up with a thicke wooddy stemme, five or fixe foote high or more, and of the thicknesse (if they be very old) of a mans wrest at the ground, spreading into many stexible long branches, covered with a rough grayish barke, beser with many small long leaves somewhat like unto Privet leaves but smaller and paler and in a manner round pointed, falling away every yearer the flowers are small consisting of source leaves, many growing sometimes together at a place, and usually before the leaves appeare, after which come small betries, greene at the first and very red stough branches covered with a yellow barke.

4. Chamalaa Alpina incana. Mountaine spurge Olive.

This mountaine Laurell hath a small wooddy stemme three or soure foote high or more, branching forth towards the upper parts, into many slender and tough branches, covered with a rough hoary greene barke, beset at the ends thereof with flatter fuller and smaller round pointed leaves than the former, of a grayish greene colour on the upperside and hoary underneath, which fall away before winter as the last doth: the flowers are many, set together at the ends of the branches, greater than the last, consisting likewise of soure leaves a peece of a light blush colour, standing in small grayish huskes, of as little sent as the other: the berries are small long graines of an excellent red colour, which afterwards turne blacke: the roote is long and spreadeth about under the upper part of the earth.

5. Chamelas tricoccos. Widdow waile.

This triple berryed Spurge Olive hath no great stemme at all, but spreadeth from the ground into many flexible tough greene branches, whereon are set diverse narrow, long, darke-greene leaves all along them, which

1. Thymelaa. Spurge Olive.

2. Thymelea minor five Cneurum Matthio'i. Small Rocke Rofes or Spurge Olive.

202

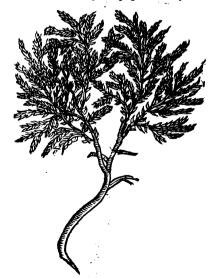

TRIBE 2.

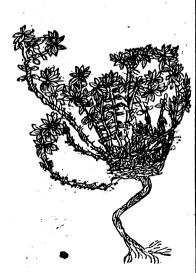

3. Chamelea Germanica, frue Mefereos. Dwarfe Bay.

4.Chemeles Alpina incana Mountaine Spurge Olive. 5. Chamelas tricoccos. Widow Waile.

Sanamunda tertia Clufti. Sparge Olive of Africa. The third Spanish Spurge Olive of Cinfort.

abide greene all the winter; the flowers are very finall, scarce to be seene, and come forth betweene the leaves and the stalke, of a pale yellow colour, confishing of three small leaves, after which come small blackish berries three usually set together: the roote spreadeth not much in the ground but is hard and wooddy, dying oftenrimes if it be not well defended in the extremitie of winter.

6. Sanamunda prima Clusis. The first Spanish Spurge Olive of Clusius.

This kind of Spurge Olive hath diverse flexible pliant branched stalkes, rising up to a soote and a halfe high, covered with a blackish barke, and under it with a gentle smooth one, which may be easily separated into long threads: having many small and somewhat long hairie leaves thicke set on them, smaller sharper and thicker than those of Chameles or Dwarfe Bay, and commeth somewhat neere in likenesse to the Sea Tithymall, or Sea Sourge, but somewhat hayrie, of a bitter sharpe and burning taste, somewhat clammie or gummie in chewing: theflowers grow with and among the leaves on the branches, confifting of foure small yellow leaves a peece after which come small blackish berries somewhat like unto the last: the roote is thicke long and wooddy. Clusius

white touch the state of with thorter leaves, and whiter or downie, and small yellow flowers in tusts.

7. Sanamunda 3 Clussi. The third Spanish Spurge Olive of Clussis.

The third Spanish kind of Spurge Olive, hath whiter and more pliant stalkes, covered with a thicker barke, very hard to breake, the smaller toppe branches being almost wholly white with doune, which bend againe towards the ground, whereon are thicke fet a number of whitish leaves, and thicke, covered as it were with cotten or doune, smaller than the last, and very like to those of Stonecroppe of a sharpe hot burning taste: the flowers are small and greenish or pale (saith Clusius like unto the others, the roote is thicke and wooddy like the

8. Sesamoides minus Dalechampii. A different Spanish Spurge Olive. There is another fort of this plant as I thinke, that Dalechampius as Lugdunensis saith, used to call Sesamoides mimus, that is in comparison of the greater kind, was set forth by him a little before, not understanding the minus of Dioscorides, which is a farre differing plant : but this Sesamoides minus Dalechampii, hath small pale greene leaves, set about the woolly stalkes: the flowers come forth at the joynts with the leaves, which are small and white, and not yellow, very sweete in sent, farre differing from all the rest in sweetenesse,

9. Sanamunda Monspeliaca glabra. Smooth French Spurge Olive.
This greene or smooth spurge Olive, hath a thicke white wooddy roote, covered with a pale coloured gentle pliant thicke barke, from whence shoote out many small slender branches, full of joynts, and of an hand breadth fomewhat like unto the leaves of *Polygala* Milkewort or Gangflower: the flowers are small and yellow stanling with the leaves and amongst them: the seede hath not beene observed.

10. Sanamunda Africana. Spurge Olive of Africa. This African plant hath diverse pliant stalks rising from the roote full of joynts, and two small and almost round leaves at them, which sometimes lye so close to the stalke, that they seeme to be onely thicker joynts than the others the flowers are yellowish growing at the toppes of the stalkes: the roote is long and tough, with a rugged

The first groweth in many places in Spaine, as also in Italy in Hetruria and about Trent as Matthiolus faith, and likewise in Narbone of France. The second in Germanie, Bohemia, and Austria: The third in many places of Germanie also: The fourth in the mountaines of Savoye: The fift in Provence and Spaine: the fixt in the Countries of Grando and Valentia in Spaine as Clusius saith. The seaventh both upon the hils, and neere the sea in some places of Spaine. The eight by the Sea side in the Island of Corsia, and is seldome seene, either in Spaine, Italy, or France. The ninth was found upon the hill neere Mompelier called Horeus Dei. The last by Boetius often remembred in this and my former worke in Barbery. All of them are very tender, loving onely the wormer Countries, and will not without extraordinary care be kept in ours.

The first flowreth not in Spaine untill July and August, but the rest some in January or February, and some in March and Aprill, in their naturall places, and many with us not untill June or July, if they be preserved in the

The Names. Opunana in Greeke is called Thymelea in Latine also with all writers, quast Tithymelea, ex Tithymalo & Olea dedutta. The Arabians call this Mesereon promiseuously with Chamalaa Germanica, and Tricoccos, the Greekes call the berries hereof, properly xorroe with Coccum Cnideum or guidium, as some have it, but as Dioscorides faith, are not those of Chamelaa, yet assuredly the properties are not so farre differing, but that the berries of Chamelen may very well be used in the want of the other: Dioscorides faith that the leaves were called Cneorum in his time, whereupon Guilandinus tooke this to be Cneorum migrum of Theophrastus, as he doth the Chamelea to be Cneorum album (which Gaza translateth Casia) for hereof they made two kinds, the one white the other black.

Cordus in his history of plants calleth the Cneorum Matthioli Thymelea minor whom Baubinus followeth (and so doe 1) calling it Thymelea affinis facie externa. But if I should in this place, upon this occasion, to save the often epetitions in other places, shew you all the opinions of other writers concerning Cneorum; whereunto they doe referrethem, and their contraries, I thinke I should not doe amisse: Anguillara maketh Lavendula to be Cneorum album, and Rofmarium to be nigrum, whom Matthiolus refuteth thus, that Theophraftus faith both forts of Greerum, fend downe long rootes into the ground, and the branches are pliant and gentle, fit to binde things withall, neither of which properties can be found in Lavander or Rosmary, Matthiolus in his last Latine edition, setteth forth a figures of Cneorum, the one in the chapter of Cinamon, which he saith hath the true notes of meorum album Theophrasti, and the other in the chapter of Thymelsa, which he thinkerh to be nigrum: and in his third booke of Epiffles, in that unto Ioames (rate, and in his fourth booke of Epiffles, in that to Bartholomens Maranta, as well as in his Commentaries upon Disscorides, in the Chapter of Cinamon he is perswaded that Theophrafius his white or sweete Cneorum is the Casa whereof Virgill in his Bucolicke and Georgickes maketh so then mention, and which Plinge also from the teltimonies of Higinus, calleth Cassia the sweete herbe and not

CHAP. XXII.

Laurella. Laurell or Spurge Laurell.

His Laurell or Spurge Laurell (that it may be knowne from the Bay tree, which is of divers, called the Laurell tree) rifeth up usually but with one stemme, yet sometimes with more, very tough and pliant, covered with a whitish thicke tough barke, branching forth into divers parts toward the copies, whereon are fer many long. Goods this section of the copies whereon are fer many long.

plant, covered which which there tough parks, oranging forth into divers parts toward the toppes, whereon are fet many long, fmooth, thicke, fomewhat broad and fining darke greene leaves, fomewhat like unto Bayleaves, but longer, fmoother, fofter, and not with hard veines therein as Bayleaves have; the flowers come forth towards the toppes of the stalkes and branches, and at the joynts with the leaves many fet together, which are somewhat long and hollow, ending or spreading into foure small leaves, of a whitish, yellow; greene colour; after which come small round, and somewhat long blacke berries when they are ripe, wherein lieth a white kernell; the roote groweth downe deepe into the ground, and spreadth likewife tough long white strings, somewhat woodie; both lease and flower, both barke and roote are very hot and sharpe in raste, hearing and burning the mouth and throate of any that shall raste them; it keepeth the green leaves all the Winter, and doth not shed them.

2. Chamsadaphnoides Five Laurella Cretica. Candie Laurell.

From a crooked small white roote, rise up three or source crooked and bending blackish stalkes, thicke set with leaves without order, covering them allmost wholly, which are long and small towards the bottomes, and grow broader to the ends, being thicke and hard, greene above, and grayish below, tasting very hot, and burning this Laurell for the forme and propertie, and groweth very low.

The first groweth wild in many places of this realme, as well as beyond the seas, and being brought into gardens will there abide; and flourish sufficiently well, the other was sent out of Candie to Prosper Alpinus, who that given this remembrance of it.

The Time;

The first flowreth very early in the yeare, even in I anuary or February, and sometimes before, if the Winter be milde, the berries are ripe about June; the other hath not floured, as is before said.

The Names.

It is called in Greeke Asprontic a Lauri foliorum similitudine, and the Latines accordingly, Laureola quasi pusila Laurus. Some doe appoint two kinds of Laureola, mas & famina, some accounting this to be mus, and Chamalea Germanica to be famina, others this to be famina and Chamalea to be mus; so variable are divers in their opinions: Matthiolus taketh this to be Chamalaphne of Dioscorides, and the Chamalea to be Daphnoides, but in both

1. Laureola Florens. Lawrell in flower.

2. Laureola cum baccis. Laurell with berries.

the Aromaticall tree, which is like to Cinamon : Lugdunenfis by correcting the greeke text of Theophrastum divers places where he thinketh it is faulty, sheweth the figure of a Plant, accounted of divers, as he faith, tole the Cheorum album of Theophrasius, which Baubinus judgeth to be the Dorychnium Imperati & Platean, mentioned in Clusius his History of Plants. But Baubinus, both in his annotations upon Matthiolus as he hath published them, and in his Pinax referreth both these Plants of his, the first unto Ocymoides repens Polygoni folio of Lobel, and the other unto the Ocymodes repens of Camerarius, Mysonus, as Lugdunenfir faith, referreth his Cneorum album, unto Aviceme his other Oleander, which he calleth wild Oleander, for as he faith it is like common Oleander, both in leafe, flower, and fent. The third is called Chamalan & Meserconusually now adayes, and so likewise by Trans. Dodonaus and Camerarius call it Chamalaa Germanica: by Fuehius and others, Daphnoides, Gefner in hors in Dakanoides no firm unique respective problems and contest of the c na by Lobell & Chamalaa altera by Clusiu, and Italica by many with us, because Clusius said it came to them only from Italy. The fifth is the true Chamelea & Mesereen of the Arabians, & generally called now adayes Chamelea tricoccos. The fixt is called Sanamunda, by the Spanish Mores in Granado, as Clusius saith, and of the professor Herbarisme, or Herbarists there also, though the countrie people call them, as he saith, Mierda cruz, of the properties of the strong purging. Banhinus calleth it Thymelas foliy: Chamelas minoribus subhirsuis, and is the Th. melea species Myconi of Lugdunensis, & the second Sanamunda of Clusius, which Baubinu calleth Thymelea solid Kali lanuginosis salfis. The seventh is the Erica Alexandrina of Lobell; and the 3. Sanamunda of Clusius. The eight is called Sefamoides minus Daleckampy by Lugdunensis, who in my mind much confoundeth both himself and his readers herein, for he referreth this both to Clusius his second Sanamunda, which he saith is hot, sharp, and somewhat salt, even as he saith his Sesamoides is : and also to the Cneorum nigrum Myconi, which he shew. eth after the description thereof, that the taste of the leaves is somewhat binding, with a clamminesse or gleuish neffe therein also, which is quite differing in propertie, and yet he maketh them to be all one Plant: and Renki mus following him herein, to fetteth it downe in his Pinax: but both this description, as I have before given you, differeth from Clussus his second Sanamunda, which as Clustus saith, hath his flowers in clusters at the 100, and from the other which hath them at the joynts, Clustus again giveth unto his yellowish flowers, like unto those of the Olive tree, and Dalechampius faith, it beareth small white flowers, very sweete : so that it may seeme m be a species thereof, and not the very same, but it cannot be also his Cneorum nigrum Myconi, if the taltesbe 6 different : let others judge hereof after they have considered them both well. The ninth Baubinus setteth down in his Pinax, with the title Thymelea folys polygale glabris, in his Prodromus with the title Sanamunda viridis, vil olibra, and referreth it to the Thymelaa Species Myconi of Lugdunensis, who saith it doth best agree with Cluster his fult Sanamunda. The last is not remembred by any before.

The Vertues. The first Spurge Olive worketh very churlishly with whomsoever, and in whatsoever manner you give it viz. the leaves prepared beaten to powder, and taken in wine or broth, or the berries swallowed whole or brit fed and taken by themselves; for as Dioscorides saith, if twenty source of the berries be taken in drinke (this proportion is answerable to the rest of the phisicke in those times as I have often said) or the inner pulpe of the onely, it purgeth downewards very strongly, both Choller, Flegme and water, but as he saith, they will burne the jawes and throate, and therefore they had neede be rowled, or otherwife given with flower or burne meale, or swallowed in meale, or in raisins, the stones taken out, or taken with purified honey, being beam with niter and vinegar, it is applied to them that are given to over much sweating. He that will give them. der of the leaves, had neede first to take away the strings that runne in the leaves; which may be done while is groffely beaten, before it be beaten finer, which prepared in this manner may be made into Trochifees or balk, to keepe all the yeare, the leaves being gathered in Autumne : It is a remedy also for them that have eaten and drunken Hemlocke, the poylonfull herbe. All the Sanamunda's likewise are violent purgers, for halfe a dramme of the juyce of the berries taken in wine, or in broth, which is the better, and the fafer way, purgeth water humours aboundantly; and therefore if it be taken with good advise warily, it may doe good in Dropsio, Gouts, Joynt-aches, the Sciatica, and the like: in Spaine they usually give a dramme in the decoction of me Cicers, which purgeth flegmaticke and melanchancholy humors wonderfully, and consequently is availeable to all such diseases, as rife from such humours, Lugdunensis recordeth a cure of one in the Hospitall at Lions, who was grievously tormented with the Crampe, performed by Dalechampius, by giving him a dramme of the leave of the fourth kinde here fet downe in pouder, in a little barley water, which wrought as forceably as if held taken Colocynthis, and thereby was restored to his health. The country people, as Matthielus sheweth, de often take of those berries to purge themselves, thinking to be their owne Physicions herein, and deceive themselves, their fee due for their counsell, but as he there saith, they often deceive themselves, by their unskilfull foolhardinesse, and make more worke for the Phistions to cure them of the paines and torments, and other dangerous diseases that follow the taking of these violent purgers, if they free them not of further trouble by the owne deaths: Pliny is justly to be taxed for writing in his 27. booke and 9. Chapter that the Coccognidate (which as I faid before, is called by the Grecians the fruite of Thymelea) doth stay or bind the belly (Sifti alva) is the word in the generall Copie, which yet fome would impute to be the errour of the Writer out thereof when it should be Citt alvum) when Galen and all other Authors acknowledge it to be a strong purger. Mel adviseth that Mesereon (which I said before the Arabians doe confound, and is to be understood this Thymlu, as well as that Chamalaa, &c.) is not to be given without the correctors appointed for it, and yet not, but unto strong able bodies: All these therefore are not safe to be given to weake bodies or stomackes, to women with child, or to children that are not strong, except they be strongly infected.

TRIBE,2

he is much mistaken : Lobel and Lugdunensis doe take this Laureola which he calleth Mas, to be Daphnoide, and the Chamalaa Germanica to be Chamadaphne or Laureola famina. Tragus also is much deceived in millakine this plant, for Dioscorides his Thymelaa. Most of other writers doe call it Daphnoides, or Laureola, Dodoneus I faid before, would make it to be Creorum nigram of Theophrasta, and the Chamelea his Cneorum album. In my former booke! was partly perswaded, that Chamelaphue of Dioscorides, was the Chamelea Germanica, or case fomewhat neere thereunto; but upon better thoughts, I thinke that Chambdaphne may be more truely referred to the Laurus Alexandrina of Matthiolus, whose leaves are small like unto Bay leaves, and the berries red who they be ripe, standing upon the leaves: and if you would aske me then, which is the Laurus Alexandrinad Dioscorides, I would answere you, that it is that Laurus Alexandrina legitime, that Lobel hath set forth in his Ap pendix, to his Adversiaria, whose branch I communicated to him, to set forth, as I had it from Pifa, whose learn come neerer unto Dioscorides his description, than either that of Matthiolus, or of any other as you shall be ther understand in his proper place; the other is called Chamadaphnoides, idest, Laureola Cretica by Prosper Al. pinus, lib, de plantis exoticis, The Vertues.

The leaves and berries hereof are as violent a purger, and do heate and inflame the throat, bringing the flomat, of whomfoever shall take thereof, and drive them into as many dangerous diseases, as any of the former, yeta ken advisedly it purgeth flegme from the somack and oftentimes by vomit also, it procureth womens courses, and being chewed in the mouth, it draweth down from the head and braine much corrupt matter that would offendi Many Emperickes do give theberries sometimes, but the leaves more often, to evacuate the watery humors inthe dropsie, and think they finde good successe thereupon, as also to ease the paines of the collick, doe give the power of the leaves in a little broth: the berries and leaves hereof when they are fresh boyled in oyle; and afterward strayned forth: this oyle being annointed on the belly loofeneth the belly, and helpeth the collicke, and being anos ted on the backe and raines provoketh urine and helpeth the piles.

CHAP. XXIII.

Laurus Tinus sive sqlvestris. The Wilde Bay tree.

Shall in this chapter shew you the wilde Bay trees, and joyne it next unto the Lanreola, both forth name and nature thereof.

1. Laurus Tinus Lusitanicus. The first wild Bave of Clusius or of Portingal !. The wilde Bay tree rifeth up to the height of an hedge buffi, or the Dog-berrie tree; having diver long square stalkes, full of branches, and faire large broad leaves, somewhat like unto Bay leaves, set inc.

1. Laurus Timus Lufitanica cerulea bacca. The first wilde Bay of Cinfins or of Portingall:

206 CHAP. 23.

2. Lawus Tinus alter vel 2. Chili. The fecond Wilde Bay of Clufus.

derthereupon, two alwayes let together at a joynt, one against another, but of a darke greene shining colour. of no fent at all in them, and of a bitter sharpe unpleasant taste, troubling the stomacke, causing loathing, and of no tent at all as the toppes of the branches and twigs, stand many small sweete smelling slowers in clusters. confifting of five white leaves a peece : after which succeede small berries, being somewhat long flat and corneconfilting of the winter leaves a peece, after winter increase infant perries, peing somewhat rong that and corne-red, of an excellent pale bright blew colour, inflaming and burning the mouth and throate, of whosoever shall taste it, that it is almost insupportable, and not but in a long time, and by drinking milke, and holding it in the mouth, to be taken away or eased; this abideth greene all the winter.

2. Laurus Tinus alter vel 2. Clusis. The second wilde Bay tree of Clusius. This other wilde Bay tree, rifeth to be a bush, much about the same bignesse with the former, having stronger flakes, and more plentifully branching forth, which are reddish being young, and more greene with the rednesse when they are older: whereon grow the leaves in the same order, but somewhat longer, narrower, and more full of veines than it: the flowers stand at the toppes of the twigs and branches, in the same manner that the other doe, but are more purple and lesse sweete than they; which afterwards give smaller, fuller, and blacker berries, than the former: this also holdeth his greene lease all the winter without shedding.

3. Laurus Tinus sylvestria alter sive terrius. The third wilde Bay tree.

This wilde Bay groweth feldome to be a tree of any height but abideth low shooting forth many slender branches, covered with a darke greene barke, with fad greene smooth leaves, set by couples thereon, somewhat resembling Bay leaves without any smell: the flowers grow in tustes or clusters at the ends of the branches, somewhat reddish while they are in bud, but whiter being open with reddish edges, consisting of five leaves a peece. finelling sweete: there seldome followeth any fruite but are blacke round berries when it beareth, yet not perfect to fpring againe in any that I have feene.

4. Laurus Tinus Cretica fruticosa. The shrubby wilde Bay of Candye. This Bay tree groweth low and shrubby, bearing many slender round short branches covered with a black bark with knotty joynts, wheron are fet s or 6 or more leaves like the former, but smaller upon short foot stalks which are wholly without fent, but heating the mouth and tongue with a little aftriction: the fruite or feede is as small as a pepper come, with a thin rind opening into three parts like a Spurge feed, containing within each part a small long whitish kernell like to a graine of wheate, smelling strong and tasting somewhat bitter and heating or bur-The Place.

The first groweth in Portugall and Spaine in diverse places, as Clusius faith, in Italy also on the hils of Florence and Komania; and in the wood Valena in Narbone, and among the dwarfe scarlet Oakes, in many places of Mount and noments; and in the Monester in France. The second as Clusius saith he found in the Monestery of Pera longa in Portugall, and neere the Seafide alfo, in other parts of Spaine: the third he faith he onely faw in Boylot his garden, rayled from Italian feede, which afterwards communicating the fuckers thereof, became familiar in many other Herbarists Gardens there, as it doth also with us in our Country; and the last in Candye,

The Time. The first flowred in July and August, and the fruite was ripe in October in some places of Portugall; when as in other places, Clusius faith he found it in flower in November, with the fruite on it then also: the second flowrethalfo and beareth ripe fruite much about the same time: the third flowreth with us onely in December and continueth flowring Ianuary and February, if the winter be not too early or too extreame.

It is called by Theophrastus in Greeke adem ayela Laurus sylvestrie, in his first booke and to chapter, among The Names. It is called by Theophraftus in Greeke Adorn dyela. Laurus sylvestrus, in his tirst booke and 15 chapter; among those trees that are ever greene, which Gaza translateth onely Laurus, not naming sylvestris at all, for it is not remembred by Dissorties or Gales, or other of the Greeke writers. Plinye maketh mention thereof, in his 15 booke and 30 chapter, and in other places, calling it Tinus, which some understand to be this Laurus sylvestris, wilde Bay. M. Cate also remembreth it in l. derenssica, by the name of Laurus sylvestris and no other ancient Latine writer besides: all the later writers doe call them Tinus, Laurus Tinus, and Laurus sylvestris as Clustus day. The Latine writer besides: doth. The Italians call it Lauro salvatico, and as Lobel saith Lauro regio if he be not mistaken; the Spaniards and Portingalls Vna de perro, Follado and Durillo; the French Laurier sauvage; the Germanes wilde Lorbeerbaum; the Dutch wild Laurn's Boom; and we in English, the Wilde Bay tree.

The Vertues. There is nothing recorded of them by any Author, to be used either inwardly or outwardly; but our late experience hath found the berries, as I fayd before, to inflame and burne the mouth and throate, in as violent manner, or rather worle than Laurell or Chamalaa, and worketh downewards likewise with trouble and perturba-

CHAP. XXIIII.

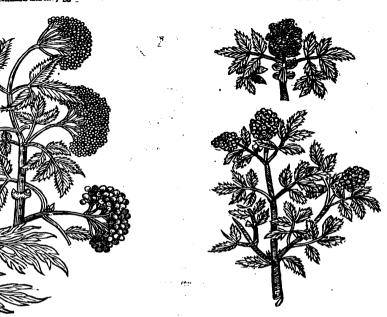

Sambucus. Elder.

Mong the number of these strong purgers, the Elders must not be omitted to be spoken of, whereof there are many kindes, and the Ebulus Wallwort or Danewort, is to be reckoned with them, for the likenesse both of forme and qualitie, as all Authors doe.

1. Sambuens vulgaris. Common Elder. The common Elder tree groweth up sometime, if it sand alone and in good ground, to a reasonable great height, otherwise standing thicke together, as for the most it is found to be, it is a shrubbe of meane height, spreading his branches farre and wide, covered with a grayish barke for the outside, but underneath it hath another that is greene, having a pith in the middle even of the Elder branches, but the young ones much more: at the joynts of the branches come forth on both fides winged leaves, confifting of 7 or 9 upon a stalke, a little nicked ordented adort the edges, of a faire fad greene colour, but smelling somewhat rancke and strong: the flowers stand at the toppes of the severall branches and twigs, many growing together in broad tusts or umbells, of a white colour, smelling more strong than the leaves, which being past, there rise up in their places

The common and the jagged Elder.

4. Sambuen racemofa rubra. Red Berried Elder.

fmall round berries greene at the first, and blackish when they are ripe, full of a purplish juyce within them, wherein lie some small flat seedes or graines: the roote is great and thicke spreading farre about. There is a kinde of Fungus or excrescence growing at the soote of the body, and on the branches of this tree, called Iewe eares, which I shall further declare among the other sorts of Mushroomes.

2. Sambucus frustualbo. White berried Elder.

This Elder is so like the former, both in growth, barke, pith, branches, sent leaves and flowers, that untillic come to beare fruit, it is very hard to be discerned from the other; the chiefest difference bereof, is that the brief are not blacke, but of a pale whitish yellow colour in most places, yet in some they abide greenish; and hereby onely it is distinguished from the former.

As the former Elders were distinguished onely by their berries, so the onely difference in this from the single the former of the leaves, which are so much jagged, and divided even to the middle ribbe, that unlesse the series as well flowers as fruite or berries, it different not from the common Elder: in all other part 4. Sambucus racemosa rubra. Red berried Elder.

4. Sambucus racemola rubra. Red berried Elder.

The Mountaine Elder also differeth little from the first fort, for but that it groweth seldome so great, and that the slowers being somewhat yellowish, grow not in large spread tustes, but in small long branched cluster, like unto Privet, and that the berries following them are of a scarletred colour, pleasant to be eaten and not of sensive to any: it is like it in the growing, rugged white barke in the body and Elder boughes, and somewhat reddish in the young leaves, as also in the rootes the wood being not so for nor so pithy:

5. Sambucus palustris sive Aquatica. Marsh Elder.

The Marsh or Water Elder, hath his body and branches covered with a whitish barke, but they are smaller and marsh british that any of the source who like the covered to the distance of the same any of the source who leaves a second with a whitish barke, but they are smaller and marsh british that any of the source who leaves a second with a whitish barke, but they are smaller and marsh british that any of the source who leaves a second with a whitish barke, but they are smaller and marsh british that any of the source who leaves a second with a whitish barke, but they are smaller and marsh elder.

The Marsh or Water Elder, hath his body and branches covered with a whitish barke, but they are smaller and more brittle than any of the former: the leaves also differ much from them, being broad and smooth divided at the edges, into three, or sometimes into sive divisions or incisures, and dented round about, being very it: the slowers stand in tustes or umbells like the first forts, but they are smaller and whitish, the outermost being ted, which compasse the middle flowers round about, but have no threds in the middle, of a reasonable sweeter, round point eafter which follow very red berries, somewhat slat and full of a red juyce, bitterish in taste, ready to provoke castling.

Of this kinde is this Elder or Gelder Rose, growing after the same manner with such like leaves, but the flower is composed as it were of many white, or pale blush flowers, set together in a round tuff or ball.

Wallwort is but an herbe every yeare dying downe with his stalkes to the ground, and rising againe a stell every spring, and is like unto the Elders both in forme and qualitie, that deservedly it hath the name of a dwarf Elder, which riseth up with a source square rough hairy stalke source foote high or more sometimes: the winged

o. Sambue :: Rufea. 5. Et Aquatica five pa'ufiris. The Gelder Role and the Marih Elder.

TRIBE 2.

7.8. Ebulus valgaris & lasin atis folis. Ordinary Walwort and with fine cut leaves.

leaves, are somewhat narrower than the Elder, but else so like that it might soone deceive one not very well exercised or cunning: the flowers are white with a dash of purple, standing in umbels very like those of the Elder, but more sweete in sent; after which come small blackish berries, full of juyce while they are fresh, wherein there lye small hard kernels or seede: the roote doth creepe under the upper crust of the ground, springing a fresh in diverse places, being of the bignesse of ones singer or thumbe sometimes.

8. Ebulus folis laciniatis. Iagged Wallwort.

This Wallwort is in all other things fave the leaves, so like unto the ordinary kinde, that there can be knowne no difference: but the forme of the leaves, doth so deforme the whole face of the plant, and bring it ont of knowledge, like the Iagged Elder, that none almost would thinke it should belong unto the former: the flowers and fruite and sent, onely leading us to judge of the species, and whereunto to be referred, for the leaves are almost as much jagged and divided as the lagged Elder, which is the onely difference in this from the former.

The Place.

The first or common Elder groweth not wilde but is planted in all places, to serve for hedges, and partitions of grounds, vineyards, &c. to hold up the bankes by ditches and water courses, and to bee planted in places where Conies breed for shadow: every sticke or branch being thrust into the ground, serving as a stocke which will easely take roote and grow. The second as it seemesh Tragm first found in the woods of Germany. The third is found wi'd on hills in watery woods. The fourth is not knowne certainely from whence his original came, but is found planted in the gardens of those that are curious, and lovers of rare plants. The fifth is sound by water sides and moorish grounds of Germany, France, England, Italy, and Premont in Savoye as Pena hath setti downe. The fixth is nursed up onely in gardens, but best delighteth in moist grounds: The seventh growin, that it will hardly be gotten forth. The last is a stranger in England as yet, and nursed onely in that curious garden of that Venetian Magnifice Signier Contarpin.

All or most of the Elders flower in June, the Wallwort somewhat late, as his fruite is likewise later ripe, even not untill September, when the others are ripe for the most part in August.

The Names.

In Latine generally Sambucus, of Sambin as it is thought the first finder thereof; but Quintus Serenus calleth it Sabucus in his veries, and thought to be derived from Sabucus or Sambucus as Hermolaus saith, which is an hollow instrument of Musicke, called also Pettis & Magadis: The excretence growing on the Elders is usually called Fangus Sambucius of Podonaus Gummi Sambuci, and of some Auricula Inda, in English Lewes cares. The first is called Sambucus urbana domestica, campetris, and vulgaris of all writers, and of Bankinus Sambucus fruttu in umbellanigro. Tragus calleth the second

CHAP. 25.

Sambuci aliud genus, Dodonaus Sambuci altera species. Lobel Sambucus fructin albo. Bauhinus Sambucus fructin in umbella viridi. The third is called Sambucus Montana of Matthiolus, Gesner, Castor Durantes, & Cameraring: of Tragus and Lonicerus Sambucus Sylvestris, and because he saith it hath beene certainely observed, that the Hindes and Does doe greately affect the leaves thereof, when they are great with young, Tabermontanus cal-Hindes and Does doe greately and Gerard after him Sambucus racemoja vel cervina; of Lobel Sambucus montanarace, moja, and Ioannes Thalius, in the description of Harcynia Saxono-thuringica, Sambucus montana, sen equileosus valo. Banjanus calleth it Sambucus racemofa rubra, putting a doubt whether it be Sambucus mont and of Plinye, which be faith groweth on Monntaines, and thinking it also to be myor of Theophrassus, whereof he maketh mention in his 3 booke and 4 chapter, among those trees that onely delight to grow on hills, and will not grow in the champions, and which Gaza in the Latine translation hath omitted and left out: but the Greeke Theophrassus. hath not my pygus as Bauhinus fetteth it downe, but onis, Phagus, as Gaza hath it in other places, he and Pline before him, being the cause of many mens errours, in missaking the Latine Fagus a Beech tree, for this single Phagus of Theophrastus, which is a kinde of Oake as you shall understand in his proper place, when I shall speake of all the forts of Oakes. The fourth Lobel in his Dutch herball, first made knowne to all, having found it plan ted in the gardens of the low countrie Apothecaries, and others that were lovers of rare and strange plants, and called it Sambuens laciniatis foliis, whom all others have followed. The fift is called Sambuens aquatica of Me. thiolus, Tragus, Lobel, Cafter Durantes, Lugdunensis and others. Sambuens palustris of Dodonans, Casalpinus and Camer, vius; Cordas in biforia calleth it Lycolia phylos famina, i, Vna Iupina, Ruellius tooke it to be Opulus but that is a kind or name of Maple, as Lugdunen lis hath it. Anguillara calleth is Plantanus aquatica: (and so do the Italian for the most part) which is the third kinde of Maple as he saith, Gefner calleth it Sambucus palustris vel aquatica file vestris, and saith some also called it Chamaplatanus: Lugdunensis first and Bankinus after him, doe take it to be Sejunal Thranpalus of Theophrasius in his third booke and seventh chap, and in his fourth booke and I chap Baubinus calleth it himselfe Sambneus aquaticas flore simplici, as hee calleth the Gelder Rose Sambneus aquatica flore globoso pleno. The Wallworte or Daneworte or dwarfe Elder, is called in Greeke 20 unickers, id est, humilis Sambucus, in Latine Ebulus, by which names all other Greeke and Latine writers have called it: and the last from the Noble Contarenus his garden, receiveth the name of Ebulus laciniatis foliis as it is in the ritle. It is finposed it tooke the name Danewort, from the strong purging quality it hath, many times bringing them that it unto a fluxe, which then we say they are troubled with the Danes. The Arabians call it Infacts, the Italian Sambuco, the Spaniards Sabuco, Sauco & Canivero, the French Susean Susier & Suin, the Germanes Holder & Hol. der, the Dutche Vlier, and we in English Elder.

Снар. 24.

2i0

The Vertues. Both Tioscorides and Galen doe attribute to the Wallworte, as well as to the common Elder, (for they account their properties both one) an heating and drying quality, purging watery humors aboundantly, but not without trouble to the Homacke: the first shootes of the common Elder boyled like unto Asparagus, and the young leave and stalkes boyled in fat broth, draweth forth mightily choller and tough flegme; the tender leaves also eaten with oyle and falt doe the same: the middle or inner barke boyled in water, and given to drinke, worken much more violently; and the berries also either greene or dry, expell the same humors, and is often given with good successe to helpe the dropsie, by evacuating great plenty of waterish humors: the barke of the roote all boyled in wine, or the juyce thereof drunke, worketh the same effects but more effectually, then either leave or fruite doe; the juyce of the roote taken provoketh vomit mightily, and purgeth the watery humors of the dropfie; the same decoction of the roote cureth the biting of the viper or adder, as also of a mad dogge, and mollifieth the hardnesse of the mother, if women sit therein, and openeth the veines and bringeth down their courses: the berries boyled in wine performe the same effects; the haire of the head or of other parts wethed therewith, is made blacke; the juyce of the greene leaves applyed to the hot inflammations of the eye, affwageth them: the leaves boyled until they be tender, then beaten and mixed with barly meale, and applyed hot inflammations affwageth them, and helpeth places that are burnt either by fire or water, cureth filtulous ulcers being layde thereupon, and eafeth the paines of the goute, being beaten and boyled with the tallow of a bull or goate, and layd warme thereon: the juyce of the leaves fnuffed up into the nostrills, purgeth the tunicles of the braine; the juyce of the berries boyled with a little honey, and dropped into the eares, ealeth the paint of them: the decoction of the berries in wine being drunke, provoketh urine: the powder of the feedes, felt prepared in vinegar, and then taken in wine, halfe a dramme at a time, for certaine dayes together, is a means to abate and confume the fat flesh of a corpulent body, and keepe it leane: the berries so prepared, and as much white tartar and a few anifeede put to them, a dramme of this powder given in wine, cureth the dropfie humour, by purging very gently : the dry flowers are often used in the decoctions of glisters to expell winde and easeth chollicke, for they lose their purging quality which they have being greene, and retaine an attenuating and digesting propertie being dryed: the distilled water of the flowers, is of much use to cleare the skinne from some burning, freckles, morphew, or the like : and as Matthiolus faith both the forepart and hinderpart of the head, being bathed therewith, it taketh away all manner of the headach that commeth of a cold cause. The Vinegu made of flowers of the Elder by maceration and infolation; is much moreuled in France, than any where else, and is grate full to the stomacke, and of great power and effect to quicken the appetite, and helpethto or groffe or tough flegme in the cheft. A Syrupus acetofus made hereof, would worke much better than the order nary, for these purposes. The leaves boyled and layd hot upon any hot and painefull apostumes, especially in the more remote and finewie parts, doth both coole the heate and inflammation of them, and ease the paines. The distilled water of the inner barke of the tree or of the roote, is very powerfull to purge the watery humors of the dropsie or timpanie, taking it fasting, and two houres before supper: Mathiolus giveth the receipt of a me decine to helpe any burning by fire or water, which is made in this manner; take, faith he, one pound of the ner barke of the Elder, bruise it or ent it small and put it into two pound of fine sallet oyle, or oyle Olive, the hath beene first washed often imes with the distilled water of Elder flowers, let them boyle gently a good while together, and afterwards straine forth the oyle, pressing it very hard; set this oyle on the fire againe, and pa thereto, foure ounces of the juyce of the young branches and leaves of the Elder tree, and as much new war it them boyle to the confumption of the juyce, after which being taken from the fire, put presently thereunto, two

ounces of liquid Vernish, (such as Ioyners use to vernish their bedsteeds, cupboords tables, &c.) and afterwards of Olibanum in fine powder foureounces, and the whites of two egges being first well beaten by themselves, all these being well stirred and mixed together, put it up into a cleane pot, and keepe it for to use when occasion serveth. The young buddes, and leaves of the Elder, and as much of the rootes of Plantaine beaten together, and boyled in old Hogs grease, this being laid warme upon the place, pained with the gout doth give present ease thereto. The leaves also burned and the pouder of them put up into the nostrills. gout dorn give present care training a faithful form of the fresh flowers of Elders into a bagge, traiteth the bleeding being once or twife used. If you shall put some of the fresh flowers of Elders into a bagge, letting it hang in a vessell of wine, when it is new made, and beginneth to boyle (I thinke the like may be tried with a veilell of ale or beere new tunned up, and fet to worke together) the bagge being a little preffed every evening, for a seaven night together, giveth to the wine a very good rellish, and a smell like Muscadine, (and will doe little lesse to ale or beere.) The leaves of Elders boyled tender and applied warme to the fundament, easeth the paines of the piles, if they be once or twice renued growing cold; The foule inflamed or old ulcers and foresof the legges, being often washed with the water, of the leaves or of the flowers distilled in the middle of the moneth of May, doth heale them in a short space. The distilled water of the slowers, taketh away the heate and inflammation of the eyes, and helpeth them when they are bloud shorten. The hands being washed morning and evening with the same water of the slowers, doth much helpe and ease them that have the Palsie in them, and cannot keepe them from shaking. The pith in the middle of the Elder stalkes, being dried and put into the cavernous holes of Fistulous ulcers, that are ready to close, openeth and dilateth the orifices, whereby injections may be used, and other remedies applied for the cure of them. It is said that if you gently strike a horse that cannot flale, with a flicke of this Elder, and binde fome of the leaves to his belly, it shall make him stale quickly. The Mashromes of the Elder called lewes eares, are of much tife being dried to be boyled with Ale or Milke with Columbine leaves for fore throates, and with a little Pepper and Pellicory of Spaine in powder, to put up the would or pallet of the month when it is fallen downe. Matthiolus faith that the dried lewes cares steeped in Rosewater, and applied to the temples and forehead, doe case the paines of the head or headach. The Mountaine or red berried Bider, hath the properties, that the common Elder hath, but weaker to all purposes: the berries hereof are taken to be cold, and to procure sleepe, but the frequent use of it is hurtfull: It is said that if a branch of this Elder be put into the trench that a moale hath made, it will either drive them forth, or kill them in their trench. The Marsh Elder is of the like purging qualitie with the common, especially the berries or the juyce of them. Mens and birds doe feede upon them willingly in the Winter. The Wallwort or Danewort, is more forceable or powerfull than the Elder, in all the diseases and for all the purposes whereunto it is applied, but more especially wherein the Elder is little or nothing prevalent; the Wallwort serveth to these uses. The young and tender branches and leaves thereof taken with wine, helpeth those that are troubled with the stone and gravell, and laid upon the testicles that are swollen and hard, helpeth them quickly: the juice of the roote of Wallwort applied to the throate; healeth the Quinsie or Kings evill: the fundament likewise is stayed from falling downe, if the juyce thereof be put therein: the fame also put up with a little wooll into the mother, bringeth downe womens courses; the same juyce of the roote is a mighty purger of watery humours, and held molteffectuall for the dropsie of all others herbs whatsoever: the dried berries or the seeds beaten to powder, and taken in wine fasting, worketh the like effect, the powder of the feeds taken in the decoction of Chamapitys the gout, joynt aches, and sciatica, as also for the French disease, for it easeth the paines by withdrawing the humors from the places affected, and by drawing forth those humors that are fluent, peccant and offensive: the pouder of the roote worketh in the like manner, and to the same effect. The roote hereof steeped in wine all night, and a draught thereof given before the accesse and comming of the fit of an Ague, prevaileth so effectually there against, that it will either put off the fit, or make it more easie, and at the second taking seldome faileth to ridit quite away. An ointment made of the greene leaves, and May butter made in the moneth of May, is accounted with many a foveraigne remedy, for all outward paines, aches and crampes in the jointes, nerves, or the all the outward parts ill affected: as also to mollifie the hardnesse, and to open the obstructions of the spleene, the grieved parts anointed therewith. The leaves laid to steepe in water, and sprinkled in any chamber of the house, as it is said, killeth Fleas, Waspes and Flies also, if you will credit the report. Tragus saith, that the tender branches boyled in wine, whereunto some honey is put, and drunke for some dayes together, is pro-fitable for a cold and drie cough, cureth the diseases of the breast, by cutting and digesting the grosse and tough flegme therein. Briefely what soever I have shewed you before in relating the properties of Elder, doth Wallwort more strongly effect in opening and purging choller, flegme and water, in helping the gout, the piles, and womens diseases, coloureth the haire blacke, helpeth the inflammations of the eyes and paines in the cares, the llinging and biting of Serpents or a mad Dogge, the burnings or scaldings by fire and water the wind collicke, the collicke and stone, the difficultie of urine, the cure of old fores and filtulous ulcers, and other the griefes before specified, which for brevitie I doe not set downe here, avoiding tautologie as much as I can-

The Theater of Plantes.

CHAP. XXV.

Helleborus niger. Blacke Hellebor or Bearefoote.

F the Hellebors there are two primary forts, white and blacke : Of the white fort we will speake in the next Chapter, and of the blacke in this whereof there are fundry forts as you shall heare.

The true blacke Hellebor (or Bearefoote as fome would call it, but that name doth more fitly agree unto the other two ballard kinds) hath fundry faire greene leaves rifing from the roote, each of them flanding on a thicke round stiffs greene stalke, about an handbreadth high from the ground, divided into seven, eight, or nine parts or leaves, and each of them nicked or dented from the middle of the leafe to the pointward on both

Blacke Hellebor or Christmas flower.

2, 3. Helleboraiter minor, & trejoissespinofus. Bastard blacke Hellebor or Beares soote, and with trefoile prickly leaves.

fides, abiding greene all the Winter, at which time the flowers rife on the like short stalkes, as the leaves grow on, without any leafe thereon for the most part, yet sometimes having a fmall short pale greene leafe, refembling rather a skin than a leafe a, little under the flower, and grow but little higher than the leaves: each stalke also beareth usually but one flower, yet sometimes two, confifting of five large round white leaves a peece like unto a greate fingle white Rose, changing sometimes to be cither dasht with a purple about the edges or to be wholly purple without any white in them, as the weather or time of continuance doth effect, with many pale yellow thrums in the middle, standing about a green head, which after groweth to be the seede vessell, divided into severall cells or podes like unto a Colombine head or Aconitum hyemale, but greater and thicker, wherein is contained somewhat long and round blackish seede, like the seedes of the bastard kindes: the rootes are a number of brownish blacke strings, which runne downe deepe into the ground, and are fastened to a thicke head, of the bignesse of ones singer. Of this kinde there is an other whose flower is red from the first opening, which Bel-Florerabio. lonius remembreth in his observations to have seene in the woods of Greece.

2. Helleboraster minor store viridante. Bastard blacke Hellebor or Bearesoote.

The smaller bastard Hellebor or Bearesoote is in most things like unto the former true blacke Hellebor, for it bearest halfo many leaves upon short stalkes divided into many parts, but each of them are longer and narrower, of a darker greene colour dented on both sides, and seele somewhat hard, perishing every yeare, but rise againe the next Spring: the slowers shereof stand on higher stalkes, with some leaves on them also, yet very sew, and are of a pale greene colour like the former, but smaller by the halfe at least, having likewise many greenish yellow threads or thrummes, in the middle, and such like heads, or seede vessells and blackish

3. He'lehorafter manimus five Confiligo.

The greatest bastand blacke Hellebor or Beares foote
colled Setterworte.

feede in them, the rootes are more stringie blacke and hard than the former.

3. Helleboraster alter trifolius spinosus. Trefoile Prickly leased Bearesoote.

This fort differeth little in the manner of growing, from the last described, having long stalkes with leaves thereon, and slowers at the toppes of the same sashion and so is the seede also that followeth, but the leaves are harder, and only divided into three parties, & the dentes about the edges are hard sharpe and prickly; the slowers being of a paler or whiter greene colour.

4. Helleborastermaximus stve Constitigo. The greatest bastard blacke Hellebor, or Bearesoote, called also Setterwort.

This great Bearefoote hath diverse sad greene leaves, rising from the rootes, each upon along stalke, which are divided into 7 or 9 divisions or leaves, each where-of is narrower than the lesser bastard blacke Hellebor or Bearefoote, nicked or dented about the edges, but not so deepely, and abiding above ground greene all the winter, whereas the other perisheth as I said every yeare, and riseth againe in the spring: this shooteth up a reasonable great and tall stalke, higher by the halfe than the other, with such like leaves thereon as grow below, smaller up to the toppe, where it spreadeth into divers branches, bearing many hollow cup-like flowers, divided at the brims into 5 parts, but doe seldome spread theseloves open, of a whitish yellow greene colour somewhat like the other bastard kind, & sometimes purplish about the brims or edges, with a greene head in the middle, & a sew white threads about it; (wherby it may seem likely to be that south kind of Veratrum nigrum of Clusius, which he calleth peregrinum, and saith is like unto the third of Dodonesse, whose figure as hee saith, he sheweth there, to be knowne which he mea-

6. Helleborns niger Sanicule foli o major.
The greater purging Sanicle like Hellebor.

5. Helleborus niger fernlageus. Fennell leafed bastard blacke Hellebor.

8. Epipatiis Matthioli. Matthiolas
his baftard blacke Hellebor.

CHAP. 25.

neth ; but it is not the third of Dodoneus ashe faith, but the fecond, and this that I here describe unto you, is Te donans his third Veratrum nigrum) which greene head growing to be the vessell, wherein the blacke seede is contained, shooteth forth into soure, five, or sixe hornes; fashioned like the other bastard kind, but smaller, as the feede is also for the most part, the roote is but single with nothing so many stringes growing with ir, and of times perisheth after it hath given seede, yet not alwayes, nor in all places: the whole plant, and every per thereof, is of a worse smell than the other: the roote of this with the lower part of the stalke next thereunto is that Setterwort, that the countrie people doe use to rowell their cattell withall. Of this kinde also Clusius ma keth mention of an other, differing onely in the darker greene colour of the leaves, and in the flower, that the edges of the three innermost are of a darke purple colour.

5. Helleborus niger ferulaceus. Fennell leafed bastard blacke Hellebor.

This kind of baltard Hellebor (hooteth forth many greene stalkes, fometimes lying or leaning to the ground or else standing somewhat upright, beset very thicke with small leaves, finer and shorter than fennell, some of them ending in a tuft of fuch like fine greene leaves, and some having at the toppes of them one large flower, peece, somewhat reddish or brownish on the outside, while they are in bud and a while after, which being open couldit of 12, or 14 long and narrow leaves, of a faire shining yellow colour, set in order round about a green head with vellow thrummes in the middle, laying themselves open in the Sunne or a faire day, but else no maining close: after the flower is past, the head growing greater sheweth it selfe compact of many round whi tish seede, very like unto the head of Adonis flower, but much greater: the rootes are many long and blacking ftrings fet together at the head, very like unto those of the lesser blacke Hellebor or Bearefoote, but harder sliftor more brittle, and seeming to be without any moisture in them, but abide and increase every yeare, although the stalkes with greene leaves doe utterly perish every yeare.
6. Helleborus niger Sanicula folio major. The greater purging Sanicle like Hellebor.

This Hellebor hath divers broad darke greene leaves, each of them standing upon a long footestalke, which cut in on the edges into five divisions for the most part, & dented about besides, somewhat resembling the leaves the common Sanicle, but more truely the leaves of the field Ranunculus or Crowfoote, or Geranium Batrachoide Crowfoot, Cranes bill: from among which rife up divers flender fmooth greene stalkes, having some leaves upon them, and at the rops of them, two or three or more flowers together, each of them confilling of many small bar whitiful leaves, as a pale or border, compassing many threads in the middle; which being fallen, there rife w many flat whitish and long feede, somewhat like unto seete Fennell sweede, but not altogether so bigge, not vellow ; Gerard following Dodoneus description, and not his owne knowledge; saith the seeds are like up Carthamus, and his Corrector mendeth not the fault: the rootes are small blacke stringes, shooting from a tope head, like unto the roote of the Bearefootes.

. Helleborus niger Sanicula folio minor. Small purging Sanicle like Hellebor.

This small Hellebor or Sanicle, (which you please to call it) hath divers small and somewhat round leaves ere rie one upon a long footestalke, being not much broader than the nayle of a mans thumbe, yet divided even h the middle ribbe into seven parts, every one of them being short, narrow, and dented about the edges: stalkes are many and small, not above an hand breadth high, with one or two leaves on them, more cut in a divided than the lower are; at the toppes of them stand divers small flowers very thicke, set together in tusting umbles, like unto the last, but smaller, after which come small flat seede, somewhat like the other, but lesseth much, as it is also in all the other parts thereof.

8. Epipastis Matthioli. Matthiolus his bastard blacke Hellebor.

This small herbe riseth up with fundry slender weake smooth stalkes, bearing each of them a broad gress leafe, divided for the most part into five divisions or parts, somewhat like those of the fixt, yet sometimes in into three, especially the first or lowermost, and dented also about the edges : the flowers grow from among the leaves upon the like flender stalkes, being starrelike, and composed of fixe pale coloured leaves, with many shot th eades in the middle; the roote is a tuft of blackish fibres like the former blacke Hellebors, issuing from thicke a head.

The Place.

The first groweth in Germany, France, and Italy, and Greece in fundry places : the second I have seene in some woods in Northamptonshire, and in other places of this Land; the third grewat Delft with Corvinus, and then at Rome, as Aldinus faith in his Farnesian garden : the fourth groweth, as Tragus faith in the borders of flor fields and grounds, and on rockie hills by the Mofella and the Rhine, as also in Harcynia Sylva; and as Fena faithing Aquitaine, as also by the river Lanus at Mompelier: the fifth groweth neere Vienna in Austria, and both the Ha garies as Clusus saith: the fixth groweth naturally on the hills of Germany, and other untilled and craggy place the seventh groweth on Mons fructus neare the Alpes, as also on the I granean hills : the last as Pena faithin the low grounds or valleyes of the forrest or wood of Esfens, not farre from Inpiters hill.

The first doth flower in December and Ianuary, if the weather be any thing temperate: the second, third, fourth in February or March, and their feede is ripe in May; the fifth in Aprill; the other in May and June. The Names

It is called in Greeke (1)460eos, and fometimes without the afperation 1 ALECGOS, fic dielum volunt quod cite corporis eripiat, in Latine also Elleborus & Elleborum, and also Helleborus, & Helleborum, & veratrum, quad me tem vertat: But there is much controversie and contrarietie, both in the ancient and moderne Writers concerning them : for the Helleborus of Theophrastus and Dioscorides doe much differ the one from the other, and divers d our moderne Writers, thinke that ours doe differ from them both. Some likewise appropriate one herbe, for another unto theirs as you shall presently heare. Theophrastus saith in the ninth Booke, and eleventh Chapter his History of Plants, that the rootes of the blacke and white Ellebor, are like the one unto the other, except colour, that is, the one blacke the other white (which may be reconciled if you will take it spoken onely of the Fibres, the one being blacke, the other white) but that the leafe of the blacke as he faith is like unto a Bay leak, and that of the whiteunto those of Leekes, can no way be reconciled, for they are so differing from Dissemble or ours, that we may well fay, we neither have nor know any of both Theophrastus his Ellebors, valeste that

be some errour in the text as many thinke. Diescorides describeth his blacke Ellebor, to have leaves like Platanus. the Plane tree, but leffe, neere unto those of Spondilings or cow Parsnippe, but more rough and blacker, cut into many divisions; the stalke is rough, the slowers, faith he, are whitish, inclining to purple standing in a cluster; the feede is like Cineus or baftard Saffron, which is called Sefamoides in Anticyra, wherewith they make purgations: the rootes are small blacke strings, comming from a certaine head like an Onion, which are in use: thus farre Dioscorides: unto this description our true black Hellebor doth not agree in all things : for the leaves of ours. dovery forrily resemble those of the Plane tree (which is a whole broad leafe cut otherwise in the edges into parts or divisions) or of the Spondilis cow Parsnip, (which is a broad whole leafeconsisting of many much broader divisions in it) neither are the leaves rough, (but cented or toothed at the ends) nor the stalke rough, but smooth, nor do the flowers stand in clusters but one by one each upon their own stalk, or two at the most on a stalk; where-HOON Dodonans would mak our fixt fort here expressed, which is somewhat like the Sanicle or Selfe heale, to be the Verairum nigrum, or Elleborus niger Dioscoridis, because it hath seeds in tustes, which Gesner, Pena, and Lobell, call Afrantia nigra of Dioscorides, and Fuebsius Sanicula famina: but Dodonaus himselse is much puzzled, to make iragree thereunto, finding it to differ in many things, fometimes in making the feed to be like Cnicus; whereunto it hath but little refemblance, as I shewed you in the description, and sometimes blaming the text, (where it is faid to be called Sefamoides in Anticyra, to be corrupt, and that Dioscorides borrowed it from Theophrastus; who faith that in Anticyra, they did give Elleborus Sesamaceus the Sesamoides like Elleborus, that is to say whose fruit is like unto Sesamum, to purge withall: And it is most probable, that the seede of the blacke Hellebors, both the true and the baltard kindes, may fomewhat agree thereunto, and not very unfitly be compared unto the fruit or feed of Selanum, & the feed of Cnicus; but whether the feed of those black Hellebors, have more force in purging than the rootes have, I am not certaine, that any hath made a true experiment, for most of our moderne writers do agree, that both our white and black Hellebors are the true forts, set forth by Dioscorides, (& notwithstanding the variation, as it is before set downe) Theophrastus, also. The first is called Helleborus niger by all that have written of it, some adding thereunto Flore magno purpureo, as Gesner, or Flore roseo as Banbinus, or legitimus or verus as others doe, Dodonaus onely in his French Herball calleth it Planta leonis and Anguillara Elleborus niger annuus, but why I know no reason , the second is called Helleboraster & Helleborus niger aulgaris by Gesner, by Cordus nofirm, by Fuchsius adulterinus hortenfis, and Confiligo by Lugdunensis and Turner : the third is remembred by Aldinus in his horto Farnessano: the fourth is called by Dodonaus in his French Herball Lycottonum primum whom Lobel stemeth in his Adversaria to follow, saying it commeth neere to the Aconites; Gesner in boreis took it to be Pulmonaria Vegetii, Cordus calleth it Sesamoides magnum, and Tragus Pedicularia fatida tertia, Dodoneus and Cinsus Veratrum nigrum tertium, and Casalpinus Encaphyllon Plinis: but generally it is called either Helleborastrum magnum au Tabermontanus, or Helleboraster maximus, or Helleborus niger sylvestris adulterinus or else Consiligo Ruellii, as Lobel, Lonicerus, Lugdunensis and others: yet all the Hellebors both black and white are also taken by one or other to be Confiliges, for in regard there is no description of Confiligo extant it any author, but the vertues and properties onely whereunto it is applyed, divers have written thereof diverily. Tragus, Lonicerus, Gefnerus and others, both Physitians and Apothecaries almost through all Germany, and the parts adjoyning in former times, tooke this fift fort, called Buphthalmum majus, by Anguillara, Clusius, and others; and Helleborus niger firulaceus by Lobel, but Pfeudo Helleborum by Matthiolus to be the true Helleborus niger of Disservices, or at least a kind thereof, and which Clusius faith was soused of all in Vienna and those parts before he came thither, and shewed them their error and the right kind, which they ever after used: Dodonaus also calleth it Bupbthalmam, joyning it next to Eranthemum or Flos Adonis, whereunto it is very like in leaves and feede, but not in rootes to there would make it Sefamoides minut of Dioscorides, whereunto it hath no correspondency : the fixt is called by Fuchfins Sanicula femina, and so doth Gesner, who also calleth it Astrantia nigra, as Lobel doth, following as it should seeme Tragus, who calleth it Ofteritium montanum : Tabermontanus calleth it Imperatoria nigra, Dodonaus as I sayd before, taketh it to be Elleborus niger, or Veratrum nigrum of Dioscorides, and Baubinus in his Pinax calleth it Elleborus niger, Sanicula folio major, and I from him do so likewise, as thinking it a name as proper, if not more then any other is given it: the seventh Baubinus onely hath described in his Prodromus by the fame title that I have given it : the last is the Epipalis of Matthiolus, which Lobel and Pena call Elleborine Alpina Sanicula & Hellebori nigrifacie & commentitia, as counterfeited by him, yet others doe not thinke fo: but whether the Epipalis of Dioscorides, which he faith some called Elleborine should bee referred to the white Ellebor, as Camerarius and others would have it, or to the blacke, resteth doubtfull, because Dioscorides is so briefe in his description thereof, that it cannot certainly be determined, he onely saying it is a small Herbe with small leaves, good for the diseases of the Liver, and against poyson. The Arabians call it Cherbachem and Charbach asued, the Italians Elleboro negro, the Spaniards Verdagambre negro, the French Virare of Veraire noir, the Germanes Zwart Nieswurtz, and Christwurtz, the Dutch Swert Niescruit, and we in English as it is in their titles. The Vertues.

The Theater of Plants.

The true blacke Hellebore is used for most of the griefes and diseases, whereunto the white is available, but is nothing so violent or dangerous : the leaves shred small, or the juice of the leaves made up with flower, into small cakes, and baked, hath been used to good purpose to helpe the Dropsie, laundies, and other evill dispositions of the Liver and Gall : The leaves sometimes also are used to purge and open the body in some cases, as well as the rootes which are of greatest use, and greatest effect, against all metancholike diseases, long lingring Agues as the quartaine and the like, the Meagrime and the old paines in the head, the blacke as well as the yellow Jaundies, the Leprofie, falling fickneffe, Confumption eyther of the Lungs or whole body, or paines in the belly; Sciatica, Crampes, Convultions or shrinking of sinewes, and all other griefes, paines and aches of the joynts or finewes, if the roote be taken in pouder, in infusion or decoction, or in broth, being first prepared in vinegar as is sometimes used to bee done, that is steeped in vinegar for a day and a night, and after dryed up againe, which manner of preparation is according to the antient cultome then used; but wee have not found that the toots of this blacke fiellebore growing in our owne Country, to be deadly to cattle if they east it, or any of the other forts, or that this hath any such strong or churlish operation in working, as the ancients doe attribute to theirs of the hotter Countries, that thereby fuch preparations should neede to qualifie the malignitic thereof for wee have never seene ours, (I thinke the moisture and temperature of our climate, abating and correcting

216 CHAP.26.

the violence thereof) to worke any troublesome fit or passion in any that hath taken it, without any of that preparation aforefaid, (the remedy if any danger be thereby is to drinke Goates milke) yet Masthiolus doth much paration aroterated the tracky of the receipt whereof is in the third booke of his Epiftles namely in that to Hams[chim] whose preparation is to steepe the rootes and take out their pith and dry the barke againe, and preferreth the rootes of that true blacke Ellebor that beareth red flowers, before those that beare white, but in want of the one as he faith himfelfe, the other may be to as good effect taken; for that kind (if it be a kind of it felfe, that will not degenerate, and not the quality of the climate onely cauling the colour) wee have not feene growing in our land, although fuch an one hath beene fent me from beyond fea, but perifhed quickly after the commendeth it for all the griefes aforefayd : yet if an extract be made of the rootes, it will ferve upon all accasions, being ready at hand to be used the rootes applyed in a pessarie mightily prevaile to bring downe womens course; the powder of the roote strowed upon soule Vicers, although they be sistualised by heale them, and if there be any callous or hard sless growne in the Fishula, the roote left in it for two or three dayes will conand it there we any canous or natural growns in the ritting, the lottered in the two three dayes will confirme it quite. Galen remembreth this in 6.de simpl. med facult, and Iulius Alexandrium faith, he often tryed it to be true: the rootes boyled in vinegar, and any place washed therewith troubled with scabbes, wheales or pushes, the lepry or any other such like breaking out, yea although they be gangrenous or eating fores, by staying their eating or spreading, preserve the stell from putresaction: the same decoction also helpeth the Toothach, if the mouth be gargled therewith: as also dropped into the eares easeth the noyse and helpeth the deafeness.

The Second kind which is the lesser bastard Hellebor or Beares foot, for any thing that ever I could finde, by the feverall tryalls made thereof, is more forceable and churlish in working and purging then the former; a dram of the rootes fleeped in wine all night and drunke in the morning, affuredly prevaileth powerfully against all the diseases appropriate unto the former kind: therefore I shall not neede to repeate the same things againe: but besides the things before remembred, the powder of the dryed leaves thereof doth helpe to kill the wormes in children more effectually: a little thereof given in drinke or broth, or in a Fig or Raysins, or strowed upon bread spread with Hony: it is sayd also to resist any poyson that is taken to expell it, or cause that it shall not hurr: the use hereof likewise in outward causes, is the like with the former, as for foule fores and Fishlaes, Scabs, &c. An idle conceit possessed many in ancient times, that he that would digge up the rootes hereof, had neede to eate Garlicke before hand, least the evill vapours that should arise from it in the digging up, did not offend the head and braine: The greater Bastard Hellebor or Setterworte, was held by Dodomens as I sayd be fore to be a venemous Aconite, not to be dealt with, and that it would kill Woolves, Foxes, Dogs, &c. I have knowen little use thereof unlesse in great necessity, where the other forts are not to be had, and onely among country people, whose strong robustious bodies are able to abide the working thereof; but is onely or chiefly used to rowell cattell withall, as Pliny lib. 25. c. 5. faith that a peece of the roote of blacke Hellebor being drawne through a hole made in the care of a beast troubled with the cough, or having taken any poisonous thing curen it, if it be taken out the next day at the same howre. Absyrum and Hierocles declare the same thing and Columela alfo : this manner of curing is used with us : but the place is changed from the care to the dewlap of Oxen, and m the foreleg or hinderleg of an horse above the pasterne. It is thought also by divers of good judgement that not onely all the Hellebors both white and blacke will doe the like if any cure be performed hereby, but many other forts of herbes : yet as the name Lowsewort importeth the herbe made into an oyntment, or the deception of the leaves killeth Lice, if the places be eyther washed or annointed that are chiefly troubled with them. The six here fer forth, which I call purging Sanicle, hath beene often found by good experience to open and purgente body of melancholy humours, & that fafely without fuch perturbation thereto as is fayd to be in the other forms body of Helichors Dodonem likewife supposing this to be Dissorteds his black Helichors Dodonem likewife supposing this to be Dissorteds his black Helichors propriate thall the vertues thereto, that Dissorteds saith they of Anticyra used their Elleborns Sesamacens, the other forts are not used or very feldome in Phyfick now adayes.

CHAP. XXVI.

Helleborus Albus. White Hellebor or Neesewort.

F the white Hellebores there are two principall varieties, as greater and lesser, the greater being accounted with us manured or of the garden, and the other wilde.

1. Helleborus albus vulgaris. Ordinary white Hellebor or Neefing roote.

The first great white Hellebor rifeth at the first out of the ground with a great round which greene head, which growing up openeth it felfe into many goodly faire large greene leaves, plains as it were with eminent ribbes all along the leaves, compassing one another at the bottome, from the middle whereof rifeth up a strong round stalke with divers such like leaves but smaller to the middle thereof, from whence to the top it is divided into many branches, having many small yellowish or whitish green star like flow ers, all along upon them, which after turne into finall long threefquare whitifh feede, standing naked without any huske to containe them, although fome have written otherwise: the roote is reasonable thicke and great at the Alter flore head, having a number of great white strings running downe deepe into the ground, wherehy it is strongly faller also, also, and. Some doe make a varietie in the flowers hereof to be whiter, and so would make a differing fort thereof for that cause onely, but I doe not thinke it worth the name of a differing fort.

2. Hellebor us a dous process five atro-rubente flore. The early white Ellebor with darke red flowers.

This other Hellebor is very like the former, but that it fpringeth up a moneth at the least before it; and that the leaves are longer thinner & no lesse plained, foulding themselves backwards oftentimes, and sooner perish falling. away from the plant : the stalke hereof is higher then the former, with fewer leaves thereon, bearing such stary flowers, but of fo darke or blackish a red colour, that they are scarce discernable but at a neere distance, the feede is very like the former : the roote hath no fuch tuberous head as the other, but as it were a long bulbon fealy head, from whence shoote as many long white strings as the other: both these lose their leaves wholly and gaine fresh every spring.

1. Elleborus albus valgaria. Ordinary white Ellebor or Neclewort.

TRIBE.2.

3. Elleborine major five Calceolus Maria. The great wilde

Hellebor, or our Ladyes Slipper.
The greater of these forts of wilde white Hellebors, riseth up with one two or more stalkes, a foore and halfe high at the molt, bearing broad greene leaves on each fide, one by one, omewhat like those of the former white Hellebor, but smaler and not so ribbed, and each compassing the stalke at the lowerend; at the top of the stalkes standeth formetimes but one flower, yet formetimes two or three at the most, one above another upon small short footestalkes, with a small leafe at the foote of every one: each of these flowers are of a long ovall forme and hollow withall, especially at the upper part, the lower be-ing round and swelling like a belly: at the hollow part there are small peeces like eares or flippets, that at the first doe cover that hollow place, and after stand apart one from another, all which are of a fine pale yellow colour in all that I have feene; yet it is reported that some are found of a browner colour or tending to purple: there are likewise fowre long narrow and darke coloured leaves at the fetting on of the flower unto the stalke, wherein as it were the flower at the first was enclosed: the whole flower is of a pretty sweet sent : the seede is very small, and like unto that of the Orchides or Satyrions, and contained in like pods; the roote is composed of a number of strings enterlacing themselves one within another, lying within the upper crust of the earth, and not spreading deepe, of a darke brow-nish colour. A fort thereof bath beene brought from the North parts of America, differing onely in being greater both in stalkes, leaves and flowers, which are not yellow but white, with red-dish strakes through the bellies of them.

4. Elleborine minor flore albo. The small wilde Hellebor

with a white flower. This smaller Hellebor groweth up in the like manner, and not much lower, bearing the like leaves but smaller, and of a white reene colour like those of Lilly Convally: the top of the stalke hath many more flowers, but lefter growing together spike

2. Helleborus albus vernus atrorubentibus floribus The early white Ellebor with darke red flowers,

3. Calceolus Marie. Our Ladyes flipper.

3. Eleberia

CHAP.26:

8. Elleberine angustifotia. Variable wilde white Ellebor.

TRIBE 2

fashion with small short leaves at the stalke of every flower, which consisteth of five small white leave with a small close hood in the middle without any sent at all: the seede is alike and so are the rootes by

5. Elleborine minor flore purpurante. The small wilde white Hellebor with blushflowers. The leaves hereof are narrower than the last, the stalke and flowers are alike but smaller and f apale purplish

6. Elleborine flore viridante. Wild white Hellebor with whitish greene flowers: This differeth not much from the last, but in the colour of the flower which is greenish on the outside and fomewhat white within.

7. Fleeborine flore atro-rubente. Wilde white Hellebor with darkered flowers. This wilde kinde groweth somewhat bigger and higher, and with larger leaves than any other of these small Wile forts, the flowers likewise are more in number and of a deepe purple colour.

8. Elleborine ungustifolia spicata versicolor. Variable wilde white Hellebor.

This also rifeth somewhat high, having narrower leaves on the stalke, yet ribbed somewhat like unto therewort Plantaire: the stalke endeth in a long spike of fine purple coloured flowers, in fashion like the rest, but the opening hoodes with their labels are white spotted on the inside with purplish spots: the leaves and rootes at

Both the first forts grow in fundry places of Germany and Austria as Clusius saith, as also in some of the Ilani about Ruffia where a good ship might be fraighted with the rootes of the ordinary fort as Master Tradescance the elder affirmed; the other forts grow many of them in our owne land as well as beyond sea, namely the third fourth and fixth; especially the third in a wood called the Helkes in Lancastire neere the border of Torks.

The Time. The first flowreth before the second, although it spring earlier out of the ground, being not in flower until

the end of July, the rest flower about May, some earlyer or later than others.

The Names. I have shewed you in the chapter before that it is called Elleborns or Hellebornm, coc. The first is generally called Helleborus albus, and by Dodonaus, Cordus upon Dioscorides and others Veratrum album, Guilandiuns took " to be the Helleborus candidus of the Grecians, but is affuredly the Confiligo of Vegetius, Abstrus, Columella and Plinge, Gerard tooke this for the next to call it pracox. Baubinus to distinguish them calleth this flore subviridiand the second store atro-rubente & other writers ex purpura nigricante, & Lobel addeth pracox vnto it: the third is called by Clusius Elleborine recentiorum, and of others Calceolus Marie or Marianus, and Lugdunensis, Elleborine ferruginea Dalechampis; Gefner in hore in Germania taketh it to be Alismatis species, and so doth Thalius likewise, and some Dale masonium nothum & Pseudodamasonium; the fourth is taken by some to be Epipatis, by others Alisma or Dana Conium, but generally is now adayes called Elleborine flore albo: the rest have their names in their titles, as they are most usually entitled by others: the controversies hereabouts I have touched in the foregoing chapter, and therefore will not here againe recite it : the Arabians callit Charbachem, the Italians Elleboro bianco, the Spaniards Verdesambre blanco & yerva de balastieros, the French Veraire and Helleboire blanc, the Germanes Weiss Nieswurz. the Dutch witte Nieferwyt, and we in English white Ellebor or Neesewort. The Vertues.

The roote of white Hellebor or Neesewort is of most tife (neither the leaves flowers not seede being used at any time with us that I know) and worketh very strongly and churlishly with any that shall take, it procuring strong vomitings: yet being taken with convenient preparation of the body aforehand; and dieted by adcuring trong to be derived warneth it, may doe much good to strong constitutions that cannot be working of it, by causing much tough viscous clammy and corrupt humours that offend the stomacke to be avoyded, to be taken not falling but for sometime after one hath eaten, for which purposes the Oxymel Helleboratum is a medecine prepared to your hand and fit to be used: it provoketh womens courses and will kill the birth if it be taken inwardly: halfe a dramme of the roote prepared with Oxymel and given in wine, to those that are so deepely posfessed with melancholy that it causeth fits of fury or madnesse, doth much abate the peccant humour giving much ease to the party: being likewise steeped and afterwards boy!ed in broth and given, helpeth those that are troubled with the falling ficknesse, the leprose, and all other breakings out in the skinne, as scabes, &c. quartane. agues, the ptilicke or pining consumption, an old cough, the dropsie, ruptures, sciatica, goute, crampes, paines in the joynts and finewes, and paines and swimming in the head: the best preparation of it is to be infused in the juyce of a Quince, or to be put into a Quince, and either baked in an oven, or roafted under the embers, and halfe a feruple thereof given at a time; and this was as Marthiolus faith, the ancient manner of curing these diseases: but being so dangerous a medecine though sometimes taken with caution, that it putteth many in hazard of strangling, and is onely remedied by eating Quinces, or taking the juyce or the Syrope made thereof, hath made the use thereof wholly almost to be given over and left: the roote saith Dioscorides is put with other things to helpe the dimnesse of the sight; the juyce of the roote dropped into the eares taketh away the noyse and singing in them; being boyled in lye and the head washed therewith it killeth lice and helpeth the running scabbes and fores thereof, being mingled with flower and a little honye or butter, or else boyled in milke and set where flies gnats, &c. doe much refort, doe kill as many as touch it : if hens, duckes, or geefe doe chance to drinke thereof it will kill them likewise: being moulded up with meale and honye, and put into moale holes or the burrowes of field or dormise, or any other such small Vermine will quickly deltroy them: the powder or scraping of the roote by it selfe, or with a few seaves of Marserome put up into the nose, purgeth the head and braines by neesing being boyled in vinegar and the decoction gargled in the mouth, easeth the paines of the tooth ach: the same decoction likewise helpeth the itch and scabbes in the hands, and clenseth soule fores and ulcers in the legges and other parts. The Spaniards and Navarrois doe make a certaine poylon of the juyce of the rootes of white Hellebor which after it hath fermented in a horne or earthen leaded vessell (the time when it is readie to be used they know by this tryall: having thred a needle with thred, and wetted it therein, they draw it through a frogge which if it presently dye, then it is good, and ready) they dippe their arrow heads therein, and then what beast shall be wounded therewith shall suddenly dye: which thing Matthiolus saith, hee also tryed on dogges and chickens, which dyed presently after they were wounded with a weapon dipped therein, in that the venome had peirced the blood, against which poylon no other antidote can be found more fit and speedy, than the eating of Quinces, for even the smell of them being in a house where that poyson is, taketh away the whole force thereof: but is restored againe (as it is said) if ripe grapes be mixed therewith or some pepper cast into it: this poyson is onely used while it is fresh, for it loseth the strength, if the juyce dryupon the arrow heads, and therefore to keepe them the better they use to keepe them in a case, the iron heads being wrapped in wooll and clothes wet therein. but this is the most wonderfull as it is related, that this poyson being drunke, procureth almost no harme to them that drinke it, unlesse they take too much and as it is sayd the hunters often take it themselves to purge them; it is fayd also that the flesh of those beasts killed by this poyson, is more tender and pleasant in eating than of other not killed therewith, and especially that part about the wound. Pausanius in Photicis recordeth a notable stratagem that Solon used in beseidging the Citty of Cyrrheus, viz. That having cut off the River Pliffus from running into the Citty, he caused a great many of those rootes to be put into a quantity thereof, which after they had sufficiently infected the water; he let passe into the Citty againe, whereof when they had greedily drunke they grew so weake and feeble by the superpurgation thereof, that they were forced to leave their walsunmand, whereby the Amphyllions their enemies became masters of their Citty: the like stratagems are set downe by disverse other authors performed by the helpe of other hearbes. The lesser wilde sorts are not knowne with us to beused in Physicke: but if either of these Elleborines be his Epipalis, he saith it is good in the defects of the liver and against peyfons and to procure vomiting; Theophrastus faith the same.

CHAP. XXVII.

Gratiala, Hedge Hyssope.

CHAP. 2.7.

F the true Gratiola or Hedge Hyslope, I dee know but one kinde as all the best authors doe agree. but yet unto it there are added two or three other hearbes, as neerest thereunto, either in face or qualitie, some reckoning the one and some the other; and I in this place bringing them all as firm be ranked under this title.

1. Gratiola vulgaris. True hedge Hyssope.

This hearbe is but a small low plant, seldome growing with his slender bending foure square branches, above. foote high; having diverse small leaves set thereon, very like unto those of the ordinary garden Hyssope, but little shorter and broader, and of a pale greene colour, of a very bitter unpleasant take : from about the middle of these branches, at the joynts of the leaves up to the toppes of them, come forth the flowers, every one at a place. standing upon very short footestalkes, which are somewhat long and hollow, ending in source leaves, two of the lowest standing out as it were lippes, and the other two above, shorter by the halfe, of a whitish yellow colour, tending to a blacke blew, and sometimes more blewish or purple: after which come small round head. wherein is conteined small seede: the roote shooteth forth too and fro under ground very much, with many joynes and small fibres at them, thereby encreasing and quickly spreading largely, especially if it stand in am moyst place, because it will hardly hold long in any dry ground.

Camerarius faith he found by a brooke fide, not farre from Geneva one of this kind with a yellow flower, m

differing in any thing elfe.

2. Gratiola minor five Hysopoides. Small hedge Hyssope.

This small hedge Hyssope, shooteth forth sometimes many, and sometimes but one or two round reddish stalks halfe a yard high, branched toward the toppes; whereon are fet one above another, and sometimes one against another, diverse small and somewhat long leaves, somewhat smaller than the former, and neere resembling Hysope leaves, of a pale greene colour, joyning close unto the stalkes and branches, and without any foor stalke at all: at the joyntes with the leaves come forth flowers, every one by it selfe, standing in a long huste, confifting of four leaves of an excellent blew colour : after which succeede small browne seede, conteined in long round pods: the roote is white and shooteth forth many fibres, whereby it comprehendeth well in the ground: the hearbe and every part hereof is utterly without any smell, and almost without any taste, m fome hold it to have a nitrous or little falt, and some a little sweetish taste: Sometimes and in the moving grounds, this is found with larger leaves, and growing higher; fometimes with smaller and longer leaves, which scarse riseth an handbreadth high, and that in the dry grounds.

1. Gratiola Vulgaris. The true hedge Hyffope. 2. 4. Gratiola augustifolia minor : Et latifolia nofta. Small hedge Hysti pe. The letter broad leafed hedge Hyste.

3. Gratials

3. Gratiola carulea, sive latifolia major. The greater broade leafed or blew flowred hedge Hyflope. This hearbe also is referred unto Gratiola, for some resemblance it hath, both for place, and manner of growing. and especially for the bitternesse thereof, so like it, which by Lobel and Pena their judgements was thought at the first likeliest to be a kinde of Lysimachia, and so entituled it galericulata for distinction sake, but others of good judgement fince, have otherwise thought as you shall heare anon: I have placed it, with the Gratiola, partly led by the authority of others, and partly by the common vote of these times, who as frequently call it Gratiola latifolia, as Lysimachia galericulata: take the description thereof, therefore in this manner. It is a smooth low plant not rifing above a foote high, with many square stalkes diversly branched from the bottome to the toppe, plant not raining at yours and two small leaves at every one, which stand upon short foote stalkes, being broad at the bottome and smaller to the end, a little dented about the edges, (which is not remembred in Lobe e and Pena their description) and full of voines, of a sadder greene colour than the former, longer also and broader: the flowers are gaping, somewhat like unto those of Dead Nettles, of a faire blewish purple colour, with some white foots the ein, every one standing at the joynts with the leaves up to the toppes: after which come forth small

is touched, thewing within it small yellow seede: the roote spreadeth much, and with many branches under ground, quickely thereby possessing a large circuite or compasse, There is a lester fort hereof found in the like places as the former, differing onely in the smallnesse of the

feede vessels, formed somewhat like unto the toppe of the thigh bone of a man or beast, wherein the small nut

or hucklebone is fet; the upper part whereof doth first open, when the feede is ripe, and falleth away when it

plant.

TRIBE 2.

4. Gratiola latifolia sive nostras minor. The lesser broad leased hedge Hyssope. There is also another small hearbe growing in our Land onely, for ought I can either heare or learne which Gerard first found and called Gratiola latifolia, as referring it thereunto, and so doe I also, yet more for the refemblance of the flower unto the last (which was not knowne to him, or at least not mentioned by him) and bitternesse, than any thing else: Out of the wet boggie ground from among the grasse &c. that groweth about it, foringethup one or more small stalkes, scarfe halfe a toote high, round but crested as it were all the length, which foread forth other smaller branches; whereon doe grow many small leaves, set by couples one against another, being somewhat broade, but very short withall, seeming almost round, and ending in a point, a little dented about the edges: at the joynts with the leaves come forth the slowers, every one by it selfe, on a small foote stalke, being in forme somewhat like the last, a gaping flower but shorter, of a pale reddish colour, spotted in the middle of the lower leafe, with many small white spots: after the flowers are fallen come in their places small feede vessels, in shape somewhat like unto the nut of a crossebow; wherein is conteined small yellowish seede: the roote is small long and white, spreading it selfe under ground diverse wayes; which perisheth not in the winter, neither runneth like the last, but spreadeth new branches every yeare; the taste hereof is as extreame bitter as the laft.

The Place.

They doe all naturally grow in moyst and marrish grounds, wherein they will joy best, if you will have them to live. The first naturally groweth in many places in Italy and without Saint Justines gate at Padoa pientifully, and is onely cherished in gardens with us. The second hath beene found naturally growing in some places of our owne Land; but the third in many and fundry places of this Country, in wet low grounds and by waters fides: and the last upon Hampsteede heath in the wet boggie places, and in fundry other partes of the heath. The Time

They all flower in June and July, the first seldome giveth good feede in our land; all the other doe ripen their feede quickely after their flowers are past.

The Names. None of these hearbes are mentioned by any of the ancient Greeke or Latine Writers, nor of Plinge. The first is generally now adayes, as it was formerly called Gratiola by Matthiolus, Gefner, Dodonaus, Lobel, Lugdunensis, and others: it is also called by some Gratia Dei, after the high Dutch name Gotts gnad, which signifieth so much; yet some call it Gratia Dei altera, because there is another herbe among the Gerania fo called: Anguillara thought it might be the Papaver spumeum of Dioscorides: the seede hereof is called as hee faith Gilbenech. Cordus calleth it Limnessum sive Centauroides, because diverse for the bit-ternesse sake thereof, did thinke it a species of Centaurium minus: healfo calleth it Eupatorium Mesues, for so it was generally thought to be, in all the upper and lower Germanie for along time, and among some of our Apothecaries also in times past: which opinion I thinke is worne out, time bringing the truth to light. Gefner calleth it Gratiola five Centaurium aquaticum, and thinketh it may be the Polemonium palustre amarum of Hippocrates (the horse3: Gratio a carulea five latifolia major.
The greater broade leafed or blew flowred hedge Hyffone.

leech, not the famous Physicion) and Fabius Columna that faith it is usually called Gratiola, yet laith it is though reech, not the ramous Phylicon Jaina with the common Hysope; Gesper used to call it Sesamoides: Banhinns in his Phar calleth it Gratiola Centauroides: we call it in English Hedge Hysope for distinction sake, and not for that it grow. eth by any hedge side; for it might more properly bee called Marshe Hysope, from the naturall place of the growing. The second is called by Camerarius Hylopoides, (as if you should say a small Hysope) and so it is called in Italy. Gesner in Collectione stirpium calleth it Gratiola minor, Cordus in his woode of observations, nameth m herbe to be called with them in Germany Graffe poley, with the leaves of knot graffe, growing in moorish place, which doth fitly answer unto this plant; and therefore Banhinus in his Pinax doth fo referre it; but enting leth it there himselfe Hyssopifolia, because his brother Iohn Banhinus, had so called it formerly; when as in his Matthiolus he calleth it Gratiola minor, it is called also as he saith by some at Mompelier, where it growth in the brookes there Anagallis aquatica, and in Hassia as hee saith also, some called it Halimus aquaticus. The third is called as I fayd before by Lobell and Pena Lysimachia galericulata, from some resemblance of the leave. and natural place of growing, but because none of the rest of the Lysimachias have hooded flowers, but consisting of five leaves laid open, I think it fitter to joyne it with thefe then with those, Camerarius calleth it Lyfimachia flor caruleo valericulata Lobelis: Ioannes Thalins in his Harcynia (ylva, calleth it Sideritis carulea, and faith it wasal led alfo by divers, Gratiola carulea. Cafalpinus calleth it Gratia Dei. Tabermontanus Tereianaria, and Dodonani m his French Edition Herba Indaica aliera, With us it is generally called, as well Lyfimachia galericulata, as Gre tiola latifolia, but more properly as I fayd in my judgment Gratiola, both for that this is extreame bitter as they are, and hath hooded flowers as all the others have, yet I have added thereunto major because of the next, in Ene. lish the greater broad leafed, or blew flowred Hedge Hysope. The last is called by Gerard as I sayd Gratiolalis folia, whereunto I have added noftras minor, because if the last or this be to be referred unto the Gratiola, this just lesser. which may stand untill a fitter be found out: The Arabians as is before fayd, call the seeds Gelbenech, the lin lians the herbe gratia Dei and Stancaca vallo, the French Grace de Dieu, the Germans Gottes gnad, the Dutch God gracie, and we in English, Hedge Hysope,

The Vertues. The first hedge Hysop worketh very strongly and churlishly, both upward and downeward, avoiding med tougth and groffe flegme choller and watery humors, thereby giving eafe to those that are troubled with warm humors, paines in the joynts and the hips, the dropfie, the gout and sciatica; if either the decoction of the green herbe be given, or a small quantitie of the pouder of the dried herbe: it helpeth also both tertian & quartaine appo taken in the same manner, but because it is so churlish, it is needefull to put thereto some correctors, as Annised Cinamon or the like: Some also give the powder in broth the leffe to offend. Camerarius commendeth theer tract hereof, made into pilles with the powder of Cinamon, not onely to be availeable against the dropsie, but. gainst all forts of tertian and day agues, if some of the juyce of Calamint be added unto it: it is profitably give for the obstructions of the liver and spieene, by opening and purging the peccant humors: it killeth the worms in the belly, and prevaileth much against all putrefactions, either inward or outward, for the pouder, insufac or decoction, clenfeth and healeth wonderfully all old and foule ulcers, and confolidateth fresh wounds. These cond is not applied to any dilease by any Author or other, that ever I could learne. The other two likewises not remembred by any, whereunto they might be availeable; yet their bitternesse comming so neare unto them Gratiola, induceth me to thinke, that they cannot but be effectuall, if not to purge by the bitterneffe, yet toonfolidate and heale by the temperate heate is joyned with them : the Italian name declareth the true experience they have found in it, that horses will become lancke and leane that feede thereon.

CHAP. XXVIII.

Staphia agria. Stavefacre or Loufewort.

CHAP. 28.

Tavefacre riseth up with a short, but strong blackish greene stalke, branching forth divers wayer, whereon doe grow great large leaves, cut at the edges into five or feven divisions, somewhalke unto the leave, of the great yellow Aconite or Wolfesbane, but deeper edged, and of a sad or dark greene colour, every one standing upon a long foote stalke, the flowers grow at the toppes of the branches one aboue another, upon short stalkes, being somewhat like a Larkes spurre flower, for the stalkes in the stalkes spurre flower, for the stalkes in the stalkes in the stalkes spurre flower.

hath a spurre or heele behind it, of a very deepe or darke blew colour, but much larger: after which come in the places three or foure horned feede vessells, like unto the Aconites but greater, wherein are contained triangled rough great seede: the roote is long and wooddy, perishing every yeare, after it hath borne seede.

The Place.

It is onely nourfed up in our gardens, and that very hardly, for if it be not well defended, it will not abide Winter with us; for it never rifeth to flower or feede the first yeare it is sowen, but in the hotter countries of Italy, as Naples, and in Afria and Sclavonia, and other places it groweth in the open champion grounds. The Time.

It flowreth not with us untill it be late in the yeare, notwithstanding it hath abidden a Winter, and never giveth perfect feede. The Names.

It is called in Greeke saris ayela, Galen hath it danois a yela, but at this day the naturall Greekes call it Vernaus, but more properly one in that is granum pedicularium; in Latine Staphia agria, in the Apothecaries shopes beyond sea Staphusaria, and Pedicularis, and Peduncularis, and Pituitaria sic dicta a viribus quas habet pedicu los enecando, & fervore pituitam educendo, and thereupon Corden on Dioscorides calleth it Pthirocottonon. Plus seemeth to call it Vva Taminia in his 26. Booke and 13. Chapter, but in his 23. Booke and first Chapter, he faiththat Affaphis agria or Staphis, is corruptedly called Vva Taminia. The seede thereof is so called also, being onely in use, and to be had in shoppes. The Arabians call it Alberta Habebras, Muthuzagi, Mibberesh the Italians Staphusaria, the Spaniards Fabaran Paparran yorua pionta is pioybeyra, the French Estaphisaria Panilleuse and herbe aux povileux or povileux, the Germans Bissmints, the Dutch Luyscruidt, and we in English Stavefacre and Loufewort.

The Vertues.

TRIBE 2.

A few of the feed bruifed and strained into posset drinke, and drunke, worketh very ftrongly upon the ftomacke, bringing forth abundance of finnie groffe lague, but there had neede of great caution to be used, of who foever shall take it, for in that it heateth extreamely, and bringeth danger of strangling by the vio-lence thereof; it is not used but by ignorant or desperate Surgions, or countrie leeches, without such correction and things as may mittigate the force thereof, that thereby it may do no harme; which being fo ordered, it is then used to be given to those that are troubled with itch, scabbes, the leprie, or foule scurfe, as well inwardly, as to wash the places outwardly with the docoction of the feede, which helpeth much, as also to kill lice and vermine, growing in theheads or bodies of any, or the feeds mixed with oyle and axungia, and anointed on the places. Some use to make an Electuary of them, by boyling them in water, with some few correctors, unto which liquor being strained, so much Sugar is put, as may be sufficient to make it up with the powder of Aniseede and Cinamon into an Electuarie, whereof a dragme is a sufficient proportion at a time, and is profitable for the difeases \(\frac{7}{2}\) aforesaid, as also to procure womens monethly courses: it is alfo good to wash foule ulcers in the mouth or throate; but if the decoction be too strong, you may alay it with some vinegar, and a little honey mixed therewith and fo use it : the seeds bruised and boyled in vinegar is good to helpe the toothach, if the teeth and gummes be washed therewith, for it draweth downe abundance of rheume, which peradventure was the cause thereof. being bruifed also with a little pelletory of Spaine, or without it. and put into a fine linnen cloth and chewed where the teeth paine you most, doth the like, and often easeth and sometimes taketh away the paine. Some fay that if the flowers be chewed in the mouth; and some of them laid upon the hurt place, of any stung or bitten by any serpent, they will heale them the seede beaten and mingled with meale, and ofit felfe so laid, or made up into a paste with some hony, will kill Mise and Ratts, and such like vermine that doe eate it.

Staphyfagria.
Stavelacre or Loufewort.

CHAP. XXIX.

Euphorbium; The burning thornie plant called Euforbium & Anteuphorbium. The remedy for the Enforbium, or the burning thorny plant.

the most extreme of all violent purging plants, I bring this to your consideration, not having any to exceede it in the qualitie of heate or violence; and thereunto as many other Authors before me have done, I joyne that other cooling herbe, which is accounted the onely helpe and remedy against the fierie heate thereof.

1. Enphorbium. The burning thornie plant called Euforbium. This itrange thornie plant, from a leafe thrust into the ground, will shoote forth rootes, and grow to have divers thicke and long leaves, round also and not flat, halfe a 'yard in length, set with divers great ribbes, which are armed all the length of them, with a double row of small sharpe thornes or prickes, two for the most part fet together, like unto the middle bone of a fish, &c. what fruit or flower it beareth we have not learned of any, that hath seene it growing in Barbery, from whence it hath beene brought, both into our countrie and into others: the rootes are great thicke and long, spreading very much, but impatient to endure any cold, as the leaves are also: there iffueth out of the leaves, as some say, or out of the rootes as others say, a pale yellowish gumme, in small droppes or peeces, most violent fierce even to smell unto, but being tasted doth burne the mouth and throate not to be endured, the dust also and fuming vapours that arise from it when it is stirred, but much more when it is beaten to powder, doe so siercely penetrate into the head and mouth, but especially the nostrills, that it procureth frequent and strong neeling, often times even unto delacrymation; and if any shall touch their face, or any other part of the skinne that is tender, with their hands after they have handled it; it will burne and enflame it so terribly that oftentimes it will raise blisters and wheales, the furie whereof will not be allaid scarse in halfe a day after, although cold water or any other cold thing be applied to mitigate the strength thereof, and therefore in the same naturall places groweth with it as the chiefe and onely remedy thereof, the

2. Antemphorbium. The remedy for Enforbium, The Antemphorbium hath divers fat thicke greene stalkes, with many thicke and long leaves thereon somewhat like unto the leaves of Purslane, but much bigger, both stalkes and leaves being full of a cold and slimit moisture, most fit and ape to temper the heate of the former; we have likewise no further understanding of either flower or feede that it beareth : the rootes are great and thicke, from whence shoote forth many long and great strings and small fibres, but as quickly subject to the cold as the former, and perisheth upon the first cold blast that commeth upon it.

TRIBE.2.

1. Emphorbium.
The burning thorny plant called Emphorbium.

The Place.

Both chefe plants have beene brought out of Barbery as I said from many places there, as also other Hes than abouts, and here they have thrived well all the heate of the yeare, but as I faid will endure no manner of cold and therefore without extraordinary care and keeping not to be kept in our land.

The Time. The time of the well thriving is formerly expressed, for it never bore slower with us, or with any that hath had it. as farre as we can learne.

The Names. The Greeke name is evois fire, and the Latines have no other name than Euphorbium for it, although Pliny called the plant Euphorbia, and the gumme Euphorbium. Iuba that was father to Fiolomy, and first ruled both the countries of Mauritania, is faid by Pliny to have fi ft found this plant, and gave it the name Euphorbium, after the name of his chiefest Phisicion, whose brother Ausa healed Augustus, who also wrote much in commendation of it. I have called it in English rather a thorne or thorny plant than a thisle, for that it hath no refemblance with any thiftle or thiftle like plant, neither is it venemous or poylonous, though violent in heate: the Antemphorbium hath no other name in any Author that hath written of it; onely Dodonau who first gave us the figures of both these plants, thinketh this may be some species of Telephium or Orpine.

The Vertues.

Although neither Dioscorides nor Galen, have made mention of any purging qualitie in the Euphorbium, ya Pling for got it not, making mention thereof in his 26. Booke and 8. Chapter, and Mesues hath found and declared it, and so hath Atim, Paulus and Alluarius, who have exactly delivered their knowledge therein; this it doth mightily purge the waterish humors of the dropsie, and tough viscous flegme from the joynts, and the more remote parts of the body, and therefore helpeth the gout and Sciatica, by cleanling confuming and eradicating those groffe humors, that lie deepely hid in the hollownesse of the joynts and sinewes: but because it her teth the body and fretteth the bowels extremely, corroding them and the stomacke, and inflaming the liver, it is necessary that it be corrected before it be given, and that it be grossely not finely beaten to pouder; as also that fuch things be mixed with it, as may allay the violent heate and sharpenesse, and such are cold and aromatical feedes, and fuch things also as may make it flippery, the more easily and speedily to passe away, and therefore made into pills with hony, may be effectuall, and that the quantities of these correctors be so plentifull, the they may cover the superficies thereof. It being so dangerous, therefore the advise to be taken, is that it bend used inwardly, but in cold windie and temperate bodies, and not in hot and dry constitutions; but outwardly ap plied it is of exceeding good use; as mixed with the cyle of Wallflowers, or any other digesting cyle, it wonder fully helpeth all cold difeases of the sinewes, as palsies and shakings, or trembling of the joynts and sinewes, & also crampes and convulsions or shrinkings, aches & lamenes that come from cold: a plaisfer made up with it, oyle and waxe, is availeable for all these recited griefes, as Galen faith. The pouder of Enforbium mixed with Anxangu and anointed, cureth all scurfes and scaldnesse of the head, and with Beares grease, causeth haire to grow on the head, or any parts of the body, where haire doth usually grow, it being shed or not appearing upon some canse

applied also with oyle to the temples of such as are drousie dull and heavie to sleepe, which we call the Lethargie; doth quicken their fenfes, and caufeth them to be more lively: the nape of the necke being anointed with the ovle of Enforbiams, recovereth their speech againe that have lost it, by reason of the Apoplexie, or any other casisoyle of Englishment with vinegar and applied, taketh away the markes and scarres of wounds, and all other altie: it being instead with vineges and appropriate markets and learnes of wounds, and all other foule spots or blemishes in the outward skin: The Antemptorbium is the chiefest, if not the onely remedy against the violent heate, and piercing qualitie of the Emptorbium; for the juyce thereof being very cooling and sliming tempereth it fo well and speedily, that it never faileth to give ease.

CHAP. XXX.

Sena. Sene or purging Sene.

Here are two forts of this purging Sene tree, differing very little betweene themselves, as also three or foureforts of base or bastard forts, more churlish then the other in working, as you shall heareby 1. Sena Alexandrina. Sene of Alexandria.

This Sene by the judgement of those that have written thereof groweth not above a cubite high, with slender branches, fet with many leaves together on a ribbe, fomewhat like unto Licoris, being narrow and pointed,

which being dryed and brought over unto us, if they bee fresh, will smell very like unto fresh new made hay : the flowers stand at the tops of the branches, one above another being as Matthiolus faith (for wee have never feene them beare flower in England) of a yellow colour, like unto the flowers of Coleworts, that is confifting of five leaves laid open, (but some rather thinke, the flowers are formed like unto those of the Spanish Broome, or of the bastard Sena called Colutea, as most plants that beare cods do) with purveines running thorough every leafe : after which come crooked thinne huskes, fashioned somewhat like a halfe Moone: in the middle part whereof (the skinnes of the huskes growing to close together, that they can hardly be parted) growe flatfeed very like unto grape kernels, but of a blackish greene colour, and somewhat flat: the whole plant perisheth(as it is sayd) every yeare, and must be new

plant periincting as it is in a pay every years, and it is sene of it is sene of it is sene of it is sene of the leaves, which are not for narrow which difference is and pointed, but broader and rounder, which difference is plainly to be differned, by comparing the leaves of that sene that commeth over from Alexandria, with that which groweth in Italy, and therefore there needeth no

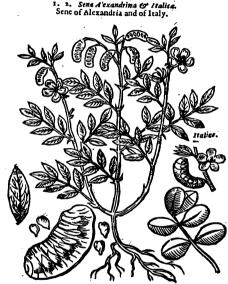

more to be fayd thereof. The Place.

The first groweth (as it is generally thought) in Arabia Falix, and in Syria also, as some say, and brought to Alexandria in Egypt, as many other things are, which from thence is transported unto all other Countries. The other Matthiolus saith, was in his time frequently sowen, in the Duke of Florence his dominions in Italy; many Acres in a field being sowne therewith, they will hardly spring up with any leaves in our Country, for experience hath beene made thereof many times.

They flower in the Summer moneths, but in Italy as Matthiolus faith, it must not be sowne untill May, and will not indure but unto Autumne. The Names.

Mesues and other Arabians call it Sena, but Hermolaus Senna, it is generally held by all good Authors, that is was not knowne to the ancient Greeke and Latine writers, Dioscorides, Theophrasins, Gaien, Pliny, Ge. or others that did transcribe their copies, although some would referre it to Dioscorides his Delphinium, others to Pelecynam, some to Pepliam, others to Empetron, some to Alypon, and others to the Cercis or third Colutes of Thee-phrassus, or to his first Colutes, all which are quite contrary thereunto, and can by no meanes agree unto them. The Arabian being the first finders out thereof, and of the purging quality therein; who did much use the buskes or cods, as wee call them: but later experience hath found the leaves to bee of more effect with us,

The Vertne. The leaves of Sene, howfoever used are a very safe and gemtle purger, as well made into pouder, and the weight of a French Crowne or dramme thereof taken in Wine or Ale, or broth falting; as the infusion of halfe an ounce in Wine or Ale for a night, or the decoction of halfe an ounce, or if need be of fix drammes, with some other herbes or rootes (but because they are a little windie, a few Amised or Fennell seede, and a little Ginger is to be added unto them to helpe to correct that evill quality) and then they purge melancholy, chol-

ler, and flegme from the head and braine, the lungs and the heart, the liver and the spleene, clensing all those parts of such evill humours as by possessing them, are the causes of those diseases incident unto them, and comforting the stomacke, especially if some cordials or stomachicals helper be put with it : for Messes saith it his teth the stomacke, but Monardus and Matthiolus denye that it can doe so, in regard that Sene hath somewhat bitter tafte, partaking of heat and drynesse, all which qualities are knowne rather to strengthen the stomack, then to trouble or weaken it; it strengtheneth the senses both of sight and hearing, and procureth mirth by taking away that inward humour, which was the inward cause of sadnesse in the minde, opening the obstructions the bowells, and caufing a fresh and lively habit in the body, prolonging youth, and keeping backe old age: Divers things are added hereunto to quicken the working thereof, and to make it the more effectuall as Rubark, Agaricke, Cassia Fistula drawne, Syrupe of Roses, &c. according as the nature of the disease, the age, strength, and necessitie of the patient doe require: Serapio saith it wonderfully helpeth such as are distracted of their sense. by the extremitie of the fits in agues, or in other diseases, which wee call raving or talking idle, or fish as are growne fortish, their braines being overdulled, or growing into a frensye or madnesse by inflammation of the braine, the epilepsie also or the Falling sicknesse, and the headach, all sorts of Palsies, which are the refe lutions of the finewes, the lowfie evillalso, and all forts of itches scabs and wheales or pushes, &c. what some Sena likewife is an especiall ingredient among other things put into a bag, to make purging Beere or Ale, fitto be taken in the spring of the yeare, not onely for all those diseases afore mentioned, but also to clense the blood from all sharpe humours, mixed or running therewith : Purging Prunes also and purging Curranes are made Annifeede, Fennell feede, Cinamon, Ginger and Cloves, fome of these or all of them a little quantity, and according to the control of the con ding to the proportion of your Prunes or Currans, being fet to flew with the decoction of your Sene, and other things above specified, these may be given to the daintiest stomack, that is without offence and without danger, open the body and purge fuch humours above specified, as troble the body: And because the decoction of Senein too unpleasant, to many weak and tender flomacks, & even the smell thereof doth cause them to refuse any potion made therewith, the infusion thereof for a night in warme embers, and strained forth in the morning is much less offensive, & yet no lesse purging: In that infusion while it is warme you may dissolve some Manna, or put thereo some Syrupe of Roses and so take it. Cassia sissual so may be drawne with the decoction of Sene, corrected as 1forefayd, & fogiven of it felfe, or made into a bole with Rubarbe poudered, or with the pouder of Sene leaves & a little Annifeed and Licoris together: some also I have knowne, that after they have insused Sene, Rubarbe, App rick, Tamarinds & Tartar, with a few Annifeeds or Fennell feeds, Cina mon and Cloves in white wine, wherem to some have put thereto juice of Fumiterry for a whole day and night, then distilling the water from them, the keepe it to drinke with some Sugar put thereto, as a most dainty and pleasant purge: After this manner warm may be diffilled from other things, as Mecoacan, Turbith, Scamony, and all the forts of purgers, infused in win or the juice of Fumitery, or other herbs as may be thought meete; whereunto being diffilled, Sugar, Manna Syrope of Roses, or Rubarbe may be added, and so drunke for the purposes aforesaid: For the manner of dill ling these things, if they be done in glasse they will be more neate and dainty, and the glasse body to bee set as fand or ashes, the water distilled will be the stronger in efficacy from the ingredients, and the weaker if the glass body be set in Balneo with water; yet may they bee distilled in an ordinary Still, so as it be close. If this set might be made to grow with us here in England in any quantity, or in any of our plantations abroad, whicher more warmely scituate, a water might bee distilled from the whole plant, while it is greene and fresh, according ding to the manner of other waters diffilled from herbs, which would be as dainty a purger as could be take.

The lye wherein Sene and Camomill flowers are boyled, is mervelous good for weake braines, to conform frengthen them, as also for the fight and hearing, if the head bee washed therewith; the same lye also is up profitable for the sinewes that are stiffe with cold, or shrunke with crampes, to helpe to warme; comform the support of the sinewes that are stiffe with cold, or shrunke with crampes, to helpe to warme; comform the support of the sinewest states and the states of the sinewest states are stiffe with cold, or shrunke with crampes, to helpe to warme; comform the sinewest states are stiffe with cold, or shrunke with crampes, to helpe to warme; comform the sinewest states are stiffed with cold, or shrunke with crampes, to helpe to warme; comform the sinewest states are stiffed with the sinewest states are stiffed with the sinewest states. extend them : it helpeth also to take away the itch in the body and the hands, if they bee washed therewith a Durantes faith, and is availeable to clense and cure foule Vicers and fores: The Itilian Sene worketh the sames fects before specified, but more weakely in every part.

CHAP. XXXI.

Colutea. Bastard Sene.

F the Bastard sorts of Sene there are many, differing much one from another, as shall be shewed you in this Chapter. 1. Colutea vesicaria vulgaris. Ordinary Bastard Sene with bladders.

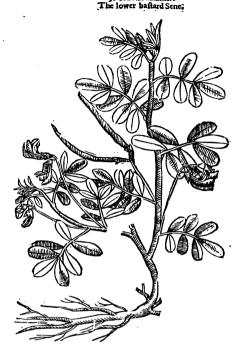

This greater Bastard Sene groweth in time to be a tree of a reasonable greatnesse, the stem or trund being of the bignesse of a mans arme or greater, covered with a blackish greene ragged barke, the wood whereof is harder then of an Elder, but with a pith in the middle of the branches which are divided many wayes, having divers winged leaves composed of many small round pointed or rather flat pointed leaves, set at severall distance, and somewhat like unto Licoris, or the Hatcher fitch, among which come forth yellow flowers like unto Broome flowers and as large; after which come thinne fwelling cods, like unto thinne transparant bladden; wherein are conteined blacke feede set upon a middle ribbe within the bladders, which being alittle crushed betweene the fingers, will give a cracke like a bladder full of winde : the roote groweth great and wooddy, bras-

ching forth divers wayes.

2. Colutea scorpioides major. The great Scorpion podded Bastard Sene.
This bastard Sene groweth nothing so great or tall, but shooteth out sundry stalkes from the roote; the edden whereof have a whitish barke, and the younger a greene, with winged leaves set thereon as in the former but smaller, greener and more pointed : the flowers are yellow like the other, but smaller also, and with a reddin veine or firipe downe the backe of the uppermost lease, the pods are stender and long, with small swelling branches thereon like unto a Scorpions taile: ches thereon like unto a Scorpions taile:

1. 2. Coluites veficaria valgaria & Scorpioides.
Common and Scorpion podded baftard Sene.

3. Colutea humilior

3. Colutea Scorpioides bumilior five minor. The leffe Scorpion Baftard Sene. This leffer baftard Sene is in all things like the former, but lower and imaller both in leafe flower and cods of feede which have not fuch eminent bunches on them as the last. Alpinus hath fet forth another of this fort, having more leaves fet together then the last and the end leafe bigger then all the reft, being all hoarie or of a filver like colour, fweete as the flowers are also.

4. Colutea maritima glaucofolio. Small Sea bastard Sene. The fea bastard Sene hath small slender branches, seldome longer then halfe a yard, whereon grow such like winged leaves, as the former hath, but that they are a little dented at the ends of every one, making every leafe feeme fomewhat likeunto the forme of a hart as it is painted, and being also of a more blewish colour then any of the rest: the flowers are yellow very like unto the former, but not growing fo many together in a tuft, and after them come small joynted or bunched pods, wherein lye fuch like feede.

5. Polygala Valentina clusis. Evergreene Bastard Sene of Valentia.

The neare resemblance of this plant unto the former, hath caused me to joyne it with them, whose description is this: It hath many small weake, but lithy and tough slender greene stalkes, rising scarce a foote high, whereon are placed without order, such like wings of leaves as are in the former, but much smaller, thicker and of a blackish blew greene colour; like as the leaves of Rue are, of an unpleasant and binding tafte, abiding on the branches all the winter, as well as fummer without shedding : at the tops of the stalkes and branches, which are bare without leaves for a good space, come forth many fmall yellow flowers; very like unto the

5. Polygala Valentina Clufii. Evergeene bastard Sene of Valentia.

Colatão

22. 24

flowers of Mellilot, hanging downe round about them in manner of a crowne, after which facceed small long and round podds, with three or fouré divisions or bunches on them, wherein lie the seede, being somewhat long had and black; the roote is long and somewhat thicke, hard and tough withall: Of this kinde Classe maketh mention of an other larger in every part, which he found also in the wooddie hills of Valentia in Spaine, and a third for with stender greene branches full of pith, with sewer softer and thicker leaves thereon, growing on the sea coast by Valentia.

Major montana O maritima.

The Place.

The two first sorts grow about Trent plentifully, and are kept in many gardens with us especially; the third groweth at the soote of certaine hills that are neare the Alpes, among the hedges and the borders of the vineyard about the Danove or Danubins. The fourth groweth neare the Sea shore by Teracinams, and sor the raritie of the brought into Cardinall Bembus his garden at Pados. The last Clussus saith he found in the fields of Salamanca, a also in the kingdome of Granado and Valentia, in the stundry bottomes of the hills.

They doe all flower with us in June and July, or thereabouts, and give their ripe feede the next moneth after, except the fift which being more tender feldome abideth a yeare with us.

The Names. It is called in Greeke χολώ τωα, and in Latine Colutea, The ordinary Colutea Vesicaria is taken of most Writen since Matthio'm, to be the Colmea Lipare that Theophrasius mentioneth, lib. 3. c.1. but I doe rather think the Colmea Scorpioides should be it, because it properly beareth silignas poddes, when as the other hath rather than the colmean state of the colmean stat reficas tumentes, swolne bladders, and not properly podds or cods, and that Theophrassus would have given some proper note of difference from other forts of silique cods, if he had meant these thinne transparent skines or bladders, and not the other which are the more formable; even as his Coiytea and Cercio, which are arboreis liquofe or fi iquate, and by fome thought to be Arbor Iude and Laburnum; if I be mistaken herein let other of better judgement be unpeeres in this case. The other forts received the name Scorpioides, from the forme of the pods, which are diffinguished into bunches or joynts, as a Scorpions taile, and may also be called Siliques, a distinction from the first or greatest: they are called in English Bastard Sene, because the leaves are so like up the leaves of the true Sene tree; Ruelliss as I take it being the first that called it Sene. The first is by most Audin called Colutes yet Cordus in bistoria calleth it Sena, Ruelliss, Sena Mauritanorum, and Gesner in bostis, saith it was called Sena /y/vestrin quibusdam sed male, but others Colutea vesicaria, Casalpinus calleth it Emeri alterum gra the second Emerus vulgo, but by all others Counten scoppioides major, and by Baubinus Coluten fliquosa major, the third being called humilior or minor by all; the fourth is so called as it is in the title by Baubinus: the last is called by Clusius Polygala Valentina, of the people in Valentia Coronilladel Rey that is Sertula regia, where as he in the Apothecaries use the flowers for Melilot, and because he found it plentifully in divers territories of Spain, alfo in Valentia, and that the learned there (as he faith) did referre it to the Polygala of Dioscorides and Plin Lobell calleth it Colutea minima, and therefore I have you fee referred it to the Colutea's, as being in face or the most like unto them, and as I thinke not much differing in vertue or propertie, as by the unpleasant talle, but of leaves and feede may be gathered, I have therefore given it an English title as I thinke not unsitting it. The Vertues.

The leaves of the greater bastard Sene with bladders, as also of the other with Scorpion pods, doe both provoke strong vomitings and purgings downewards, but very churlishly and with some trouble to the stome and bowells; avoiding tough slegme and choller: the seede is more forcible in each of those qualities, and waketh more turbulently in the body, and from the joynts: it is therefore feldome given to any but to strong bods, and where any better or other purgers are not at hand: Let not therefore any take this to be good Sene, or the instead thereof. The sparass saich is doth satten sheepe wonderfully, and therefore muchused in those countries, but seldome proved in ours: the qualities of the other forts of bastard Sene, are not set downe by any, but surely their taste being unpleasant like the other, declare them to be not much differing.

CHAP, XXXII.

Genista & Spartium. Broome.

Here are many forts of our ordinary Broome as well as Spartum, Spanish Broome, reckondimong those plants that doe purge, as also divers others smaller forts called Genistella; of all which I meane to entreate in this Chapter.

1. Genista vulgaria sive Scoparia. Our common Broome.

Our common Broome shooteth forth many woody stemmes or stalkes, of the bignesse of mans singer oftentimes (especially if it be suffered to grow long) at the bottome, rising to be height of a reasonable tall man spreading into divers the like wooddy branches, covered with an hard and thing darke grayish greene barke, which shoote forth a number of stender pliant square, or cornered small twigges branches, like rushes; whereon appeare small darke greene leaves, three or source of sentence stenders at place, abiding but a small time, so that it is seldome seene with leaves on it: the slowers are large, and of a get yellow shining colour, growing one above another for algood space at the toppes of the branches, who turne into hard and star small cods, almost blacke when they are ripe, wherein is contained small and shing brownish seeds: the roote is long and woddy, yet tough withall, spreading many wayes under the groundard perishing but sending forth new shootes every yeare, and more especially when the old stalkes are cut and use away: From the rootes hereof in many places (but more often where no Broome groweth, namely by stelds hedge sides and upon heathes) groweth another plant, whose stalke is of the bignesse of a singer or thumbs solve two foote high, having a shew of leaves on them, and many slowers at the toppe, somewas like unto the slowers of Orchis, but larger and of a deadish yellow colour, as the stalkes and leaves are also which perisheth without seeds, or encreasing the roote, being somewhat round and scaly.

2. Genistaminor folys Hyperici. Small or low Broome,

This differeth from the former chiefely in not growing so great or high, and that the slender branches are thicke stored with leaves like unto Saint Johns wort: the flowers, seede, &c. are like the former.

3. Genista Iluensis. Hand Broome.

This Iland Broome shooteth forth many stalkes, divided into many branches full of great joynts or knees, with divers small and narrow leaves set round about the joynts, of a pale yellowish greene colour as the stalkes are also, this hath yellow showers and seede like the common.

4. Genifia alba tennifolia. White Broome.

This Broome is very like the former, but that it groweth not so great, having many twiggie branches; which in time grow to wooddy stalkes, whereon are set many smaller leaves then the former, somewhat greene on the upperside, and of a gray and shining colour underneath: the flowers, are in forme like the others but somewhat smaller, and of a whitish colour: the seedes and pods are also like the former.

This low or Dwarfe Broome never groweth very great or high, neither come his slender greene pliant branches to be hardor wooddy, but alwayes abideth low, rising little more than a foote in height: on whose greene pliant twigges are set small and somewhat long leaves, of a darke greene colour on the upperside and gray underneath, abiding on them all the summer long, and at the toppes grow small yellow flowers, not so yellow nor so large as the fait, but like unto them for the forme, and so are the pods and seede but smaller: the roote is long, tough, and much spreading in the ground, and long lasting.

6. Chamegenista (retica. Dwarfe Broome of Candy.

The Candy dwarfe Broome hath low small hoary branches lying upon the ground, not exceeding one hand in length, yet divided into branches of two or three inches long, having very small and very narrow leaves set thereon, two or three growing together, one being longer than the rest, all hoary as the stalkes are: from the joynts with the leaves come forth three or source yellow slowers like the other.

7. Genista tinitoria vulgarii. Common Greeneweede of Diersweede.

Our common Diers weede hath a number of finall tough greene stalkes, two soote long or thereabouts, rising from a roote very much dispersed under ground, and wooddy; whereon grow without order many small long leaves of a sad greene colour, and many yellow slowers at the toppes, very like unto Broome slowers, but lesser and somewhatpaler, after which come small pods lesser than Broome, and seede therein not much unlike.

8. Genista tinttoria Hispanica. Spanis Greeneweede.

The Spanish Greeneweede hath more wouldy stalkes, rifing much higher than the former, and bare without either lease or branch for a good space above the ground, and then spreadeth forth may small short and brittle branches, stored with many long and narrow leaves, somewhat like unto the leaves of Flaxe or Spurge stare, greene on the upperside, and of a glittering white or silver colour underneath, somewhat harsh and bitter withall in taste: the flowers are many and yellow, that stand at the toppes of the branches, like unto the former: the whole plant is very beautifull to behold, either in flower or out of flower. Under this herbe when it was in

1. Genifia vulga is & Rapun Genifia. Ordinary Broome, and Broome Rape.

7. Genifia tinderia unigaria. Common greene weede, or Dyers weede,

Rapam Genista.

10. Genifella pimata altera Hiffanica.

flower, Clusium faith he found growing in his naturall place, such another Broome rape, as is before specified, aMiterum
bout a foote high, flored with many large and long gaping flowers, from the middle of the stalke upward; both
Rapum falke and flowers being of a yellow colour, and full of an unctuous or oylie moisture. g. Genistella montana Germanica. Base Broome of Germany.

From a small and much spreading roote under ground, shooteth forth divers greene weake rushy stalkes of leaves, or leafed stalkes (for the whole stalke being about a foote long, considerth onely of small and somewhat long leaves, one springing forth from the end of another, and some likewise comming forth from the joynts of them) branched also here and there; which abide greene all the Winter, new comming up in the Spring: at ot them) braining up in the spring; at the toppes of these stalkes, come forth many yellow flowers like unto Broome flowers, but smaller when they the toppes of the top the first close together in a fost woolly head : the cups or huskes that contains the flowers, are blowen, standing at the first close together in a fost woolly head : the cups or huskes that contains the flowers, are nower, the dead is finall, enclosed in small pods that follow. 10. Genistella altera pinnata, Hispanica. Spanish base Broome.

This Spanish base Broome hath likwise many leased stalks, rising from the roote to the height of a foot or lesses. branching forth in diverse places, the whole plant as the former before, consisting onely of leaves, but somebranching forth in the other, waved as it were a little on the edges, and each leafe rifing from the what greater and bloads, than the other, waste as it we is a fittle of the edges, and each leafe middle rib of the other, being fomewhat hard and rough in handling, thicker also than the former, and each leafe pointed at the ends of them, and fometimes ending in two points: the flowers are small and of a gold yellow colour like the former, foure or five standing together at the toppes of the stalkes enclosed in fost or woolly huskes, some also of the lower leaves of the flowers, seeming downie, the pods and seede are not unlike the o-

buskes, some assort the lower leaves of the howers, techning downing the pour and seede are not uninke the option, neither the roote, but not so much spreading.

11. Pleudo Spartum Hispanicum. Bastard Spanish Broome;

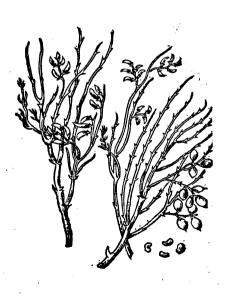

Because this plant doth participate both with the former base Broomes in some things, and with the Spanish Broomes that follow, I have thought good to place it between them both, whose description is as followels. The liemme rileth up to be two foote high or thereabouts, covered with a whitish barke, spreading into many fmall branches, some of them the length of ones hand, and some shorter; whereon doe grow very sparingly a few leaves, somewhat long but very narrow, which doe not abide but fall away, within a very short space after they are forung, so that the plant for the most part is seene without leaves: on the toppe of every branch standers one softwoodly round head, like unto the former Base Broomes, which after openeth it selfe into many small pale vellow flowers, every one standing in a woolly huske, after which come small pods wherein lyeth fmall feede like the others.

12. Spartum Hispanicum frutex vulgare. Ordinary Spanish Broome. The ordinary Spanish Broome groweth to be five or fix foote high or more, with a wooddy stemme below covered with a darke gray or ash coloured barke, shooting forth many pliant long and slender greene twigs, whereon in the beginning of the yeare are fet many small and somewhat long greene leaves, which fall away quickely

12. Spartum hi Spanicum frutez vulgare. Ordinarie Spanish Broome.

23. Spartum Hitpanicum minus monospermon flore lutec. The imaller Spanish Broome with yellow flowers.

not abiding long thereon: towards the toppes of these branches grow many flowers, fashioned like unto Broome flowers, but larger and more spread open, of a more shining gold yellow colonr, and finelling very sweete, after which come small long cods, crested at the backe, wherein is contained blackish flat seede fashioned like unto the kidney beanes: the roote is wooddy, dispersing it selfe diverse wayes under ground.

13. Spartum Hispanicum minus monospermon flore Inteo. The small Spanish Broome with yellow flowers.

This smaller Spanish Broome, groweth with a stemme or stalke of the bignesse of ones thumbe at the bottome, to bee about two foote high, whose barke is rough and straked all along, sending forth many greene slender pliant branches, which divide themselves againe into many other small twiggs, whereon for a while after they are shot forth, abide a few small leaves, untill they begin to shoote out flowers, and then fall away, leaving the branches naked and without leaves, all the rest of the yeare after: from the sides and joynts of the smaller twigges, shoote forth small long stalks, bearing many smaller yellow slowers, than the former Spanish Broome, without any sent for the most part : After which come small round skinnie cods, conteining for the most part, but one seede in every one of them, being blackith and fathioned fomewhat like unto the Kidney Beane, whichwhen they are ripe, will by the shaking of the winde, make a noyse in their pods: the roote is hard and wooddy.

14. Spartum Hispanicum majus flore albo. The greater White flowred Spanish Broome.

The other Spanish Broome (in his naturall place) groweth much higher than the former, even to any mans height, whose branches are more lithy and pliant than the other, having small leaves on them like the other, and as soone fading: the flowers also stand upon long stalkes, and are like them for the forme, but larger and of a white colour, of as small fent as they, which afterwards turne into small round

This small Broome hath wooddy stalkes from whence shoote forth rushlike branches set at distances with three small whitish hairy leaves as small as those of Sothernwood, at the toppes whereof stand yellow flown and hoary hairy huskes fucceeding,

The Place. The first groweth plentifully in many places of our owne Country, as well as in Spaine, Italy, France, and Gamany: The second is found in some places about Mompelier in France, and Friburg in Germany: The third growth in the Iland of the Turrhene Sea called Ilva: the fourth in some places of Spaine only: the fift is found in many places ces of our own Land: the fixt groweth in Candy, as Alpinus faith, and Baubinus faith he had it out of the gardend the Noble Contarenus at Padoa: the seaventh groweth in many untilled or unmanured grounds of our land, as also by the hedges, and way fides, and in some meddowes also plentifully, where they keepe it for the profit is made thereof, even as of Broome: the eight Clufius faith he found in no other place, than onely in the kingdomed Murcia in Spaine, and there also he saw the Broome rape, growing from the roote thereof. The ninth growth in many dry unmanured sheepe pastures, in Narbone of France, as Pena and Lobel say: the tenth Clusius said. he onely found in some rough dry grounds in the Kingdome of Valentia: the eleventh was found in Spain, necreunto a place called Aquas blancas, as Baubinus from Doctor Albinus faith: the twelth in many places of France, Spaine, and Italy the thirteenth is common as Clufius faith, in the dry fandy grounds, of both the contries of Castile: the sourceenth he saith he onely found in the Island of Gades or Cales; the last Columna saith he found on the hils in Naples.

All these flower some earlyer or later in the sommer moneths, and give their seede ripe before winter, but the Spanish kindes are for the most part the latest that perfect their seede.

Genista or as some write it Genesta, agenuum slexilitate & ad nexus utilis haud dubie nominatur, vel potius quia și-The Names. nibus medeatur dolentibus; and therefore diverse in former times did take Spartium Dioscordie, to be the Grafte latinorum, and even Plinge also in his time was doubtfull whether it were not so, for Spartium as Dioscorides faith vinculi u/um in alligandie visibus prebeant, and therefore the controversie among diverse writers, endured until Ruellins, his time, who refuted the opinions of Hermolans and Marcellus, that tooke them to bee both one, but Pena and Lobel fince them in their Adversaria, call the Genista Scoparia (which is our common Broome) Spartium, as if there were no difference, when as yet they appoint the Spartium, or Spartium Hispanicum & Nabonenle, to be the true Spartium of Dioscorides, which many call also Genista Hispanica, Italica and Africana. Many likewise mistooke the Spartum Iuncus, which is a kinde of Rush, wherewith in Spaine they make frailest baskets, to put Raylins, Figges, and other things in, to be the Spartum fruter, deceived by the name onely, with

The Theater of Plantes. TRIBE 2.

our further examining the matter. But now in these dayes, it is evidently knowne to all that are conversant in Herbarilme, that Spartum or Spartium as some write it, is one plant by it sette, and Genisa another, although the one be somewhat like the other; and that Spartum frutes is differing from the other Spartum called Junem; the first here set downe is generally by all writers called either Genissa vulgaris or Genissa angulosa, or Scoparia the nitt the true onely calleth it Genissa minor son non aculoata, and Casalpinus Genissa quadrato junco prima: the Rapum Genific of all forts (I means both of this Broome, and of the other Dyers weede and of the hedge fides, &c.) are called of Clusius Hemoderon, according to Theophrastus lib. 8. c. 8. or Leimoderon as others have it, and of most Orobanche, although according to Theophrassian there is another Orobanche that riseth up among the Eror most Orobai, and strangleth it as Tares doe Wheate, whereof came the name: the second is called by Lugdu. renti Genifia minima, and by Baubinus Genifia ramofa folis Hyperici; the third is alfo called by Lucdunentis Genifia Illerafis : the fourth is by Tabermontanus called Genifia alba, and by Gerard after him Genifia tenusfolia. The fift is the same that Clusius calleth Chamagenista Pannonica 7ª and Gerard Chamagenista Anglica, how soever the figures of them seeme diverse: it is likely also to be the Geniste minor is species of Thal us, and of some is termed Chamesparsium: the fixt is not onely remembred by Bauhinus in his Prodomus & Pinax, by the same name is the title, but called also Spartium Creticum, by Alpin in lib. de plantis exoticis. The seaventh is generally called Genifatintleria or infelleria, and Genifiella tintleria. Flos tintlerius of Brunfelfius, and flos tintlerius of called Longierus and Cafter Durantes; Trague tooke it to be Ferula, & Leonicerus Lysmachia. Angullara and Cafalpinus Corneola, Cordun calleth ir Chamelonce, and Baubinus Genista tinetoria Germanica, in English Greeneweede, or Duers weede, because the Dyers doe due a yellowish greene colour with the leaves and stalkes hereof. and therefore provide thereof good store. The eight is called by Clusius Genissa tinttoria Hispanica, of Lobel Ganissala infestoria. Lugdunensis thinketh it may be the Oricella of Thever; some take it to be the Lucca berba that Plymy mentioneth in 46.33.c.3, but therein they are much deceived, as I shall shew you when I come to speak of that hearb, Banhings calleth it Genista tinttoria frutesceni folin incanis. The ninth is called by many Chamagenista, segles africated Chamegerift a seguetalis Pannonica, by Clusius Chamagenista altera, of Pena & Lobel Genistella of aminua montana, Geforer in boris Germania, calleth it Genifta minima, & Cordus Genifta angulofa, Traque, Lonicerus. Lundoner fir & Tabermentaring call it Chamespartium. The tenth is called by Clusius Chamegenista peregrina, & sodoth Lugdunenfis. Lobet calleth it Genistella pinnata altera Hispanica, Camerarius Genista pumila, Dodona us Genista humiin Tabermonema Chams spartium tertium, and Bauhinu Chame genista caule foliato. The eleventh is called by Bauhinus in Prodrama Genisse Hispanice affinin, and in his Pinax Spareo primo affinis, but because it doth participate both with Sparture in some things, and Genistella montana in others, as I have shewed in the description; I thought good toplace it betweene them both, and call it P/eudo Spartum Hispanicum, in English bastard Spanish Broome. The swelfth is called Spartum Hispanicum, and Genista Hispanica, Spartum Gracorum, and Spartum frutex The thirteenth is called by Clufine Sparium 2 Hispanicum, by Lobel Spartium Hispanicum alterum flore luteo, by Dodoneur, Spireum friera majus, and by Baubinus Spartium alterum mono spermon semine reni simili. The fourteenth is called by Clufter Sparence Hispanicum tereium, by Lobel Spareium 2 flore albo, by Dodonaus Spareium frutex minus. and by Bauhinus Spartium tertium flore albo. The last is called by Columna Spartum Aquicolorum minimum montanum triphyllum. The Italians call Spartum Spartio, and Genista Genistra, the Spaniards the one Spartio and the other Genistra Giesta and Geisteira; the French Geneste and Geneste de Espaigne, the Germanes call Spartum Pfrimmen, and Genista Ginst; the Dutch Brem and Spanische Brem, and so we in English Broome and Spanish Broome.

The Vertues.

Our ordinary Broome doth much offend the stomacke and heart, if Annifeedes, or Fennell seedes, or Roses, or Masticke be not given with it, being taken inwardly: the juyce or decoction of the young branches, as also of the feede, or the powder of the feede taken in drinke, purgeth downewards, and draweth from the joynts, flegmaticke and watery humors, whereby it helpeth those that are troubled with the dropsie, the goute, the sciatica, and the paines in the hippes and joynts: it provoketh strong vomits also, and helpeth the paines of the sides, and swellings of the spleene, clenseth also the reines, kidnies, and bladder of the stone engendred therein, and hindreth the matter from encreasing, or growing to be a stone therein againe, and provoketh urine aboundantly : the continual lufe of the powder of the leaves and feede, doth ture the blacke Jaundife: the young buds of the flowers are gathered, and kept in brine and Vinegar to be eaten all the yeare after, as a fallet of much delight, and are called Broome Capers, which doe helpe to stirre up an appetite to meate, that is weake or dejected, helpeth also the obstructions of the spleene, and to provoke urine that is stopped, opening and elensing the uritory parts, by the use of them very effectually: The distilled water of the flowers is profitable for all the same purpoies, it helpeth alfo furfets, and altereth alfo the fits of agues, if 3 or 4 ounces thereof, with as much of the water of the leffer Centory, and a little Sugar be put therein, and taken a little before the accelle of the fit, first being layd downe to sweate in their bed : the oyle or water that is drawne from the ends of the greenettickes heated in the fire helpeth the tooth-ach: There is a lye made of the ashes of Broome, which by are may be made as cleare as Claret wine, which Camerarius commendeth to be profitable for those that have the Dropie. The juyce of the young branches made into an oyntment with old Axengia, that is Hogges greafe, and anointed : or the young branches bruifed, and heated in oyle or Axungia, and layd to the fider that are pained, either by the wind as in flitches and the like, or in the spleene, easeth them in once or twife using at the same also boyled in oyle, is the fafelt and fureft medicine to kill lice, and other vermine growing in the head or body, of any: the fame also is an especial remedy for joynt aches, and swollen knees, that come by the falling downe of humors upon a commission or puncture; The Broome Rape, is commended by some to be as good a saller as Aparagus, taken when they are young, and easen either raw or boyled, but it is much more kinters. If kine facte thereon it makern them somer desire the bull, and therefore in Spaine they call it gervatira : the decoction thereof in wine is thought to becas effectuall in helping to avoyd the stone in the Kidneyes and bladder, and to provoke urine as the Broome it felte: the juyce thereof is accounted a fingular good helpe to the as well greene wounds a old, and filth fores, and malignant Vleers: the infolate oyle, wherein there have beene three or fopte repetitions of infusion, of the toppe stalkes with flowers strayned and elected, clenter the skinne of all manner of spots markes and freekles that ruse by the heate of the sunne, or the malignity of hamors; All the other forts of lester Broome

Broome, have the like qualities, and may be conducible for the same diseases, but every one in his owne proper existence, some being weaker or stronger than other. The Spanis Broome over and above the same properties, as also to purge downewards and to provoke vomits, especially the seed taken to the quantities of a dramme in mead or honied water, purgeth by vomit as Hellebor doth, without trouble or danger: the flowers thereof boyled in meade and drunke, or the pouder of them taken in a reare egge, or the jayce of the young branches drunke fasting, doe cure the Kings evill and the hippe goure, and an oximell made of them and the seed, often used, breaketh and healeth all impostumes of the Spiecne, by causing the corrupt matter to void it selfe upwards often, and drawerh also slegme and raw humors from the joynts.

CHAP. XXXIII.

Caffia folstiva. Purging Caffia.

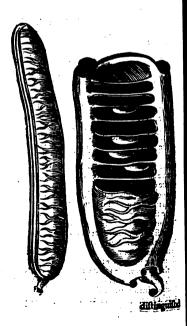

N former times there was onely one fort of purging Cafria knowne, but there hath been brought to our knowledge another, whereof I meane to give you the relation in this place,

The purging Cafisa tree groweth in Affiria about Babylon, and in the finite, Egypt and Italy much lesse, yery growing to be a tree of a large size or bignesse, whose wood is solid and firme, yellowish towards the sappe or outside, and blackish like Lignum vice at the heart, covered with a smooth fost and ash coloured barke, very likeunto the Wallnut tree: the branches are not very great, and but thinly stored with winged leaves, consisting of eight or tenne leaves, for the most part five standing on each side of the stalke, without any odde are at the end, each whereof is larger and longer pointed than the leaves of the Carob or sweete Beane tree, the followeth in the next Chapter to be described: the flowers are yellow and large, many growing together on a long stalke, and hanging downe somewhat like as the Laburnam or Beane Trefolic doth, consisting of segments of five leaves, with many greenish threads in the middle, standing show a small long crooked umbone or horne, of a very sweete sent, especially in the morning, before the Sunne shine upon them, but grow weaker in smell, as the Sunne groweth hotter upon them: the small horne in the middle of the flower, groweth to be the pod, which while it is young is greene, but in time commeth to be of a darke purple colour, and being suffered to grow longer, or taken at the time and kept turne blacke, being of divers sizes both for length and greatnesses, with a season of the length thereof at the backe, eminent to be seene and with another small one a gainst it upon the other side, which causeth it to be easily broken into two parts by the middle long wayes, and

1. Cassa folutiva vulgaris.
The ordinary purging Cassa

2. Cossia Brafiliana. The great Cossia of Brafile.

diftinguished inwardly into many skinny wood-like partitions: on both sides of which partitions grow a soft blacke substance like unto hony and very sweete; which is that part onely that is to be used, and no part thereof else beside: between these cells or partitions lie round and flat gristly seed, of a darke brownish colour; very like unto the seed of the Carob tree: the rootes are great, and grow deepe in the ground: the choise of the best cods or canes, is that they be most within, and that the seeds doe not rattle when they are shaken.

2. Casiia solutiva Brasiiana. Putging Casia of Brasiis.

There is another fort of Calsia, that hath beene brought from Brafsill, which differeth not much from the former, either in the forme of the tree or fruite; for the tree it selfe groweth (as by relation it is affirmed) great, and hath such like winged leaves as the former hath: the fruit onely or chiefely differeth from the other in this, that it is about two foote long; (especially such as we have seene) and more than two inches broad, and about an inch and a halfe thicke; whose barke or outward rinde is much harder, thicker, browner and flatter than the other but with great wrinkles or surrowes crossing it, as the other hath; the seames likewise at the backe, and against it are greater and more eminent, and the seedelying in the cells, larger and flatter also, the pulpe or blacke substance lying upon the wooddy skinnes, is as sweete as the other; but of more force in working by the one halfe at the least.

The Place.

The fifth groweth plentifully in Egypt, but yet not naturally, for it is onely in their orchards where it hath beene planted: for it is generally held to be first brought thither, and to Arabia also, from Syria and Armenia, and they from the East Indies: it groweth also in the West Indies, first planted by the Spaniards in Hispaniola in so great abundance, that from thence the most store that is spent in Europe is brought: The other groweth in Braffill, from whence it was brought into these parts.

The Time.

The first flourisheth chiefely in Iime, and the fruite hanging upon the tree all the yeare, are gathered much about the time of the flowring: for the tree holding his greene leafe all the Winter, hath usully both blossomes and greene struite, and ripe all as it were at one time. The other hath not beene hitherto surther described or knowne.

The Names. Casia or Casia is a word of divers significations, for it is either the Aroma of the ancients, Theophrastus Dioscorider, Galen &cc, like unto Cinamon called Cassia liques in the Apothecaries shoppes, or this Cassia sistula, or else a shrubbe called Cassia poetica or Monspeliaca, but it is very likely that this tree, nor his fruite was knowne to any of the antient Greeke Writers, unleffe as Cordus faith it might be the Faba Indica of Ariftobulus and some others : but the later Greeke Authors, as Alluarius, and others fince his time, called it rearea, therearea, Caffia ntore. from the Arabians, who first brought in the use thereof, and called it Cassia fiftula: and because it was not knowen where else it did grow then in. Egypt, it was called by many Siliana Egyptia, and is thought by diverse that it may be the Siliana called Ficus Egyptia by Theophrastus in his first Booke and 18. Chapter: and of others Cassia foliativa: the usuall name is Cassia fisula in all Apothecaries shoppes: but why the name of Cassia should begiven to this treee or his fruite, is not easie to know or learne: Pena and Lobell in their Adversaria thinke it might come from the Greeke word 1950; quod coriacenm vocant, because the cods or canes are like leather; but I verily believe the Arabians (and it may be those from whom the Arabians had it) called it Cassia in regard of the fweetenesse of the flowers, like unto the Casila aromatica or odorata; and Solomon in the 4. Chapter and 14. verse of the Cantieler, maketh mention of this Cassia tree, as I take it, for in the Latine Translation of Saint Ierome: I find it is filtule, which the Translators make to be Calamus in English: And it is not improbable that the rome; I find it is filtura, which the I ramiators make to be Cambas in length it. And it is first improvable that the true Cassia aromatica, or odorata, was called Fishula, because the peeces of the barke were rowled together, and bollow like a pipe, even as Cinamon (which is congener if not idem) is, which in some countries is called Casella; and I finde that the people both in Italy and in Spaine, doe call the Cassia aromatica by the name of Canella, yet to this day, seither from the forme of Cinamon, which is like unto a pipe, or from Canna, a reede or Cane, as I thinke rather, and the diminitive thereof, is Canella a small Cane reede. They are much deceived that thinke the barke of the pipes or fruite of this Cassia fistula, is of any more force than a dry chippe, to procure womens coarses, &c., as some in former times did, for the error is grosse. The other is called by Lobel Cassia sliqua Brasilians purgatrix compressa, who first gave us the knowledge thereof in his Pharmacopes Rondeletius. The Vertues.

The inner blacke substance or pulpe, clensed from the shells, seeds, and skins that grow together with them, is the onely medecinall part that is used, taken by it selfe in balls, or bits, or in potions or drinkes, and is very effectuall to purge the reines, kidneyes and bladder, for it tempereth the heate of them, cleanseth the summars that lie therein, both by urine and the stoole, and thereby giveth much ease to those that are troubled with the stoole, if they use it often: taken with Rubarbe and a sew Anniseed and Licoris to correct the windinesse thereof, it is an especiall good medecine in gonorrhea to clense the reines, that other helpes may be the more availeable asserwards, as also to clense the liver, the stoomach and mesentery veines, from choller and slegmes, cleaned the bloud and quencheth the heate thereof, and is therefore profitable in all hot agues: it is very effectuall against all Rheumes and sharpe distillations, and against chollericke and melancholike diseases: it is often used, if the kindeso pectorall diseases; as old coughes, shortnesses of bettorall diseases; it is not so convenient for those that have moist, weake and slippery bowells, shelled it be given with Misobalans, Rubarbe, Spicknard, or Masticke: else it may be a farely given to all sorts of popule, ages and conditions, and to prevent the danger of such lubricitie, divers doe life to give it with Hiera piera. The young cods taken while they are shall and greene, boyled a little and then laid in the shadow a while to drie, and after boyled in Suger or Hony, doth purge the body, as the pulpe or blacke substance, and as a clicate medecine fit for tender and weake stomackes, that abstore all manner of Paistekes, and here of the usual quantitie is three or foure ounces to be taken at a time for elder persons, and one one for the younger: the use of Casso outwardly either in ointments or plaisters, is much commended of many for all hot pimples, and other eruptions in the skinne, and also to ease the paines of the gout and hot inflam

other fort of Cassia is more effectuall in purging, for it hath beene tryed by experience, that one ounce hereo, is as foreible as two ounces of the other, and is effectuall to all the diseases aforesayd.

CHAP. XXXIIII.

Siliqua dulcis sive Ceratonia. The sweete Beane or Carob tree.

F this kind of sweete Beane or Carob tree, there hath beene one other also lately found out, and make knowne to the world by Fona: for the ordinary fort, being well knowne to most, especially in Spains and Italy, and other the hotter Countries of the East, is remembred by the ancients.

1. Siliqua dult is five vulgation. The ordinary sweete Beane or Carob tree.

The Carabe or sweete Beane tree that hath beene of longest knowledge to all, groweth in the log Countries, as Spaine and Italy, to be a very great tree covered with an ash coloured barke, spreading very much in breadth with very faire great branches, the younger being reddish at the first, whereon doe grow spassed winged leaves, very like unto the leaves of the purging Cassia tree, but that they are rounder at the endow points, and somewhat harder in handling, of a darke greene colour on the upperside, and of a paler greene underneath: it beareth a long carkin in the winter, like unto that of the Wallnut, which in the spring time opened into many darke purplish slowers, and afterwards bringest crooked cods, of the bignesse of a large beane cod, a some larger in others smaller, greene at the first, and of a brownish colour, when they are ripe; wherein are stat and round seedes, very like unto those of Cassia, and are of an unpleasant taste, while they are fresh, burgather more sweetenesse being kept to be dry: the shell thereof although hard is eaten, as well as the inner substance; which that I may use the words of Plinge, is neither of a stessine woodly or skinnie substance, but of them all as it were mixed together. In the hotter countries of India &cc. as Strabo in his Geoghraphie writing of the trees of India doth report, there is a certaine thicke substance lying within these cods, which being taken sons cods of Cassia, Gingar, Mirobalans, and other fruites withall.

2. Caroba sive Siliqua ex Guinea purgatrix. The Carob or purging Beane of Ginnye.

The Carob or purging Beane of Ginny, groweth no doubt in his natural place, to be a great tree, but in the lesse warme Countries, as stay whereunto it was first brought, it cannot doe so: but sheweth by the growing that it much differeth not from the former, bearing his leaves after the same manner; the fruite (for we haven knowledge of the flower as yet) is crooked thicke and short (and as Pona saith, somewhat like an Anacarde or Cajous) about three inches long, of a browne colour on the outside, very like unto the other, having a bowing or roundnesses all the length of the backe, and an eminence or list as it were in the hollownesse: within which is

foure or five somewhat rounder and not so flat seeds, more pointed below and round at the head: the talkis more sharpe and quicke, even almost burning the throat, which peradventure is but from the nature of the ba Country, where it grew and may grow more milde, after hath beene inured unto a more temperate climate.

The Place. The Place.

The first as is before sayd growth in all the Southard East Countries, as India, Armenia, Syria, Arabia, Eyp, &c., and in Greece, Spaine, Italy, &c. frequently in many places, as both Masshiolm and Clusius make mention: the other is originally from Ginny, and is set forth onely by Fema of Verona, in his Italian booke, who had it from Signa Contarns of Venice.

The Time.

The first flowreth in the very beginning of the spring, and

L. Flores & fraffus Silique dulch vulgarise 2. Et ex Guinea.

0

TRIBE.3.

Снарьзу.

the fruite is riper in the hot time of the Sommer onely: of the other there is no further knowledge as yet, than of the fruite.

The Names.

It is called in Greeke neema, Ceratia of Dioscorides, id off, siliqua, of negamila of riporia Cerationia of fermiagoung commata Siliqua, of Galen, Egineta and others, because the cooks are crooked, or bowing inwards like a fithe or home: But that siliqua whereof Theophrassus maketh mention in his fourth booke and second chapter, and which the some called Ceroma, and some as he saith sicm Egyptia, but falsely, with a white flower and truite growing from the body of the tree, more plentifully than from the branches, cannot bee this siliqua, but some others, even as Lugdanenssis and others affirme also: Plinge calleth it Siliqua dulcis and so doth Aspinus and others: in some Apothecaries shops beyond Sea Nocamalia or rather Nocamalia, the Arabian call it Charnebium, in Italy they call it Carobe and Carobole, and in Naples Salequa, corruptly, from siliqua as Mushibulu saith, the Spaniards call it Assarvous, the Germaines and Dusch call it Saint some fort, that is, Saint solms feed upon the self-upon these fruites, and wilde honey, while he did abide in the wildernesse of sulfating doe note upon the 22 vers, of the 11, chap, of Levitricus is Arbia, (whereof there were source kindes, of each whereof it was law sulf for the Israelites to eate) translated into Greeke weish, in Latine Locasse, which are kindes of grashoppers, peculiar to those Easterne Countries, much differing from ours, but this sitiqua or sweete Beane wee, is the same mentioned in the 15 chap, and 16 vers, of the Gospell according to Saint Luke, whereof the sweete, in the sime mentioned in the 15 chap, and 16 vers, of the Gospell according to Saint Luke, whereof the sweete them, and the hogges for the most part consume the rest: the seede of this Beane, was that kinde of weight in ancient times called Karat, and among the goldsmithes a Carret, weighing sixe graines formerly, although in these dayes they account it to be but soure.

The Vertnes.

The fruite while it is fresh and new gathered, helpeth to purge the belly, but being dryed doth rather binde it, and is then more beneficiall to the stomacke, than while it is fresh, because it somewhat troubleth it with the evill raste, and hard digesting thereof: the sweete substance within them, is often also used as honey, both to loosen the belly, almost as much as the extracted pulpe of Cassia, and is also good for the inflammations of the reines and backe to temper the heate, and is effectuall in the diseases of the chest, as coughes and shortnesses Cassia is, which things also the decoction of the cods, performeth very well: Galen in his second booke of Aliments, condemneth the use of them for meate, saying they are hard of disgestion, and are not easily avoyded forth of the body: and in his seventh booke of simple medicines, hee saith they are of a drying and binding quality, although they conteine in them some sweetenesse, and that they are somewhat like into Cherries, that being fresh they loosen the belly, and being dry binde it, because the moyst substance being consumed, the thicker essente.

CHAP. XXXV.

Tamarindus. The Tamarind or fower Beane tree.

We Tamarind of fower Beane tree groweth to be as great as a Plum tree with many branches thicke feet with pale greene winged leaves, that is many fet together on both fides of the middle rib but smaller, then either those of the Cassia or Carob tree, having alwayes an eddeone at the end, which usually close them leaves together; both at the setting of the sunner, and upon raine, and open againe at the rising thereof, and faire weather, of a sower or acide taste: the flowers are somewhat large and white, like unto flowers of the Orange tree, consisting of eight leaves, smelling very sweete, having source small white threds standing in the middle about the umbone, which after groweth to be the fruite, and when it is ripe, is much larger, than any kidney beane cod, some greater and lesse than others, as in all forts of fruite, somewhat bending or crooked, wherein is contained a blacke substance, not distinguished into cells, as the Cassia south the stede lying dispersed among the pulpe, hath diverse bigge and long strings running through it, of a very acide sower or sharpe sweete taste, very pleasing to the palate and stomacke: the seede or kernels are greater than those of Cassia, and as it were square and somewhat stat also: the tree never looseth his lease, but will endure no cold, as bath beene often tryed in those colder Countries.

The Place.

This tree naturally groweth in many places in the East Indies as Garcial saith sit is onely notirished as a stranges both in Arabia and Egypt in their Orchards.

We have no certaine knowledge of the time of flowring or the bearing of ripe fruite.

The Names.

It is called by the Arabians (for none of the ancient Greeke writers hath made any mention of it) Tamarinalus that is the Date tree of India, for Tamar fignifieth a Date with them, and of the later Greeke writers Oxyphenicon, that is the fower Date tree; but both of them very unfilty, for it may very well be perceived that it is nothinglike unto any kinde of Date tree, Lacana following Mefies, calleth Talifyins Indicus, of the Greeke word hayles that fignifieth a finger, which the fruite doth very well refemble, being bowed or crooked like unto a bowed or bended finger: some take it to be Pala of Pling, whereof he maketh mention in his 12 booke and 6. thap, some againe thinke that it different nothing from the Palmule Thebaica of Dioferides, the Dates of Thebas: and because it should not want an English name, according to the property shereof, I have called if the sowre Beane tree, for that the fruite or cod is so like a great kidney Beane cod.

The Vertues.

The inward pulpe of the Tamarina is very effectual to purge choller, and therefore is of great good use in all hot or pestileptial agues, it openeth the obstructions both of the liver and spleene, and therefore is profitable activities.

Tamarinda.
The Tamarindt or lower Beane tree.

Tamerinds fruitus cum jemene.
The cod and feedes of the Tamarinde tree,

gainst all breakings out of the skinne, which come of the heate of bloud, or of a sharpe or salt water, running in tweene the sless and the skinne, as itches, scabbes, seprye, and the like, and helpeth those that are troubled with the Jaundies, and the stopping of the Spleene: it doth exceedingly helpe to asswage the thirst, if an ounce there of be dissolved in faire water, and a little Sugar mixed therewith, or taken of it selfe; for the people of the ke countries, doe usually eate thereof in their long travells to quench their thirst, which they were never able in indure without it, to refresh themselves in the great heate, both of the Summer, and of those drie places, when no water is to be had. It cooleth all inflammations, both of the liver and of the stomacke, as also of the reim and backe, and helpeth the Gonorpha, or running of the reines: taken with Burrage water, it quicknesh the dulled spirits by melancholy, and somewhat mittigateth the fits of frensie and madnesse: it doth stay all theume and distillations, being taken with some Suger and the water of Maiden haire: if a small quantity of the pulpe of Tamarinds and Cassia, and the pouder of Rubarbe be mixed together, it maketh a delicate medicine to purpe the stomacke and liver, and is very effectuall to helpe to expell all hot or burning agues, and procure an appetite it staicth also vomitings, and taketh away the loathing of meate: the leaves as well as the pulpe serve instead vinegar, with many of the Indians, Ethiopians, Arabians and others, they give the leaves also to children for the wormes, and both leaves and pulpe serve outwardly to coole all hot inflammations, and wheales, pimples, and such like. The young cods of the Tamarinds are preserved in Arabia with the hony of the Carobs, or with Sugar, which serve for all the purposes before recited.

CHAP. XXXVI.

Nux Ben sive Glans un guentaria. The oyly Nut Ben.

His only Nut Ben hath undergone much controversie, and contrarietie among those Author that have antiently written thereof, as namely Dioscorides, Theophrassus, Pliny and Gases, for Dioscorides saith that the tree is like unto Tamariske, Theophrassus (aith it hath leaves like unto Mirtel leaves, Pliny saith like unto the leaves of Heliotropium or Turnesole: but that may compose this controversie and end this contrarietie betweene them. I will show you here the true description and figure thereof, such as Doctor Tobias Aldings the Cardinall Famessus his Phisticon as

Rome hath fet it forth being well growen, for that which Honorim Bellus a famous Philition, living long in Candie had growing with him from the Nuts, which he planted, (and fent the figure thereof to his friends in divers places, & especially to Iohannes Pona, an Apothecary in Verona, who in the description and catalogue of the names of those plants that grow upon Mount Balass, which he set forth himself, hath inserted the figure hereof, a

Nux Ben five Giuss unguentatia cum fitiqua integra, & nux exempta feorfim.
The oyly nut Ben with the whole cod, and the nuts taken out and let by themselves,

he received it from the faid Belliur) was but a young plant, of not above a yeare or two's growth. The ophraft in deferibing the tree growen great, faith it groweth crooked. and not fraight upright spreading rather in breadth than in height, whose leafe is like those of Mirtles, but longer as by this figure that you here see you may well perceive, and nothing like unto those of Tamarisks, and that the comparison of Pliny in the leaves like Turnfole, is not much amiffe, for if they be both compared they will note be found much to differ in the forme, I meane Turnefole leaves, from the larger Mirtle leaves, but the difference betwixt Dioscorides, and Theophrastus riseth as it is thought from the errour in the Writers out of the coppie of Diescorides; the Greeke word in Diescorides and Theo. phrastus, being so neare and like the one unto the other. that it might easily be mistaken, which are pueite, in Dio-Scorides Myrica, five Tamarifeus, & puppin Myrtus in Theophrefim, yet it is more probable that there is no errour in the Text of Dioscorides, in that his comparison of this tree unto Tamarike is not unto the forme of the leaves. as Theosbraft whis is, but unto the forme of the whole body, and growing thereof: the true description therefore here-of as Aldina hath most accurately fer it downe is thus. The first two or three yeares saith he, it sprang up and withered or perished downe every Winter to the roote, and rose agains a fresh every Spring, but after it became three or foure yeare old, it grew more woddy and more likely to sbide without decaying : it role up yearely after the first, with one stemme shooting forth branches of winged leaves, or rather winged branches of leaves, the barke being whitish as the leaves are also, but they are composed after fuch an order as no other tree doth the like; for the branches rife up with the stemme or body, divided into fundry other smaller twigges no bigger than rushes, set with two leaves at severall spaces distant farre in sunder,

ending in small long points like haires, but have no eyes or buddes at the feete of the leaves, as the small branches of all other trees have, which sheweth that the whole branched stalke or divided branch, is but as one winged kafe: the leaves first falling away, leaving the branches bare, which then shew like unto ordinary or Spanish Broome when it hath loft the leaves; and after the leaves the stalkes likewise perish that held the leaves wholly unto the very stemme, and therefore sheweth to be but as one winged leafe of a tree, as in the Ash, Wallnut, &c. the lowest of these leaves are somewhat round pointed like the herbe Helistropium Suntamer, those on the middle of the branch more sharpe pointed like unto Myrtle leaves, and the uppermost smallest somewhat like unto Knotgraffe: it hath not borne either flowers or fruit in our Christian countries as yet so far as I can heare: the roote is thicke, long, white and tuberous as it were, yet ending in fome forayes being not much wooddy but rather fleshie and tender; but the nuts or fruits, such as have been brought over to us enclosed in their hisks, as also out of their huskare expressed here by themselves that is, that many, of them grow single in the husks & some two together, and that the mes enclosed in every huske each by it selfe have their place bunched forth where each of them lie, and straightned betweene them both, the lower and upper end of the huske being small and sharpe pointed. and about an handbreadth long, round and of a darke africolour on the outside, and somewhat reddiffy on the infide, of the substance of leather, lither or easiers bow, rugged on the outside with many long streakes in it, but smooth on the inside: the nuts themselves are three square, for the most part, covered with a whitish fost and somewhat tough wooddy shell, wherein the white kernell lieth, which is not altogether insipid, but somewhat that pe in talle and oylie withall, cauting a kind of loathing upon the talling almost ready to provoke vomiting; out of which is pressed an oyle, as Dioscorides and Galon affirme, like as is pressed out of Almonds; and not from the shells or burks as some formerly supposed for it is commonly knowne to many here in our owne land, and to my felfe alfo, who have prefied as good oyle out of the kernells of the nutts, as any hath beene brought from beyoud feas : and therefore Theophraftus was herein much militaken, or at least milinformed, that faid the oyle that ferved for fweete cyles and continents, was drawne from the hiskes and fiells and not from the Nurts themselves, and Pliny also who saith the same doth erro in that, although he saith that an oyle is drawen out of the nuts, which the Physicions doe use : for the oyle to both uses is one and the same.

The Place.

Thele trees grow in Syria, Arabia, Arbiopia, and India, and although fome say in Egypt also, yet I think E Profession, which was curious to set down all the rare trees, and plants unknowne in Fally that grew there, would have given us some knowledge thereof, among other Egyptian plants, if they had been there in his time.

We have as I fayd before, no knowledge of the time of flowring hereof.

It is called in Greeke by Dioscorides, Galen and others Benard populate Balanca Myrepfied, that is Glant Va-

240

quentaria, and by Lobel Glans unquentaria cathartica siliquata; by Theophrastus Bandro onely, and by Plan Myrobolanus Troeloditis, in his 12 booke and 21. chap. but why the Grecians should call it Balanos an Acom being like unto none of the kindes of Acornes, nor the fruite it felfe, nor shell or huske I know not, for if the that doe fo call it, had ever feene the huskes, wherein the Nuts are enclosed, they would furely have given it. more proper name. Monardus tooke them to be the Avellana purgatrices of the West Indies, because the fruit is more like an Hafell nut than an Acorne, and called them Ben Magnum, but he was much mistaken there and therefore the Arabians called it Ben and Habben, which fignifieth a Nut with them, yet Pena seemeth make the name and forme to agree together. Kaumolfius called it Machalep album saying it is three square, and like a Beech mast or fruite of the Beech tree, for which cause onely as it is likely, Bellonias compared the tree, a Beech, it is called either Balanus myrepsica or Glans Vnguentaria, after the Greeke fignification of most wei ters, but we in these dayes more usually call it Nux Ben, and the oyle Oleum de Ben, or as the ancients called Oleum Balaninum, I have given the English name to it, according to the most proper signification as I thinke, or ling it rather a Nut, than an Acorne as Gerard doth after the Greeke name. The Vertues.

The kernells of the nuts bruifed and drunke with Pofca posset (that is water and vinegar mingled together Mon purge the body from groffe and thinne flegme also, and thereby is helpefull to those are troubled with the wind collicke, if a few Aniseede and Fennelseede be put unto it: the oyle that is drawne out of the nuts doth the same also, and provoketh vomiting, clensing the stomacke, of much foule matter gathered therein, yet it doth much trouble the stomack in the meane time: but the nut being toasted at the fire loseth much of that evill quality, often times caufing them to purge downewards only: it is with very good effect also put into glifters for the same poses, the oyle dropped into the eares, helpeth the noise in them, and the deafenesse also : a dragme of the kerns taken in posset, doth soften and dissolve the hardnesse of the spleene and liver. Messes commendeth the driepres. fing after the oyle is taken from it, being of a clenfing as well as of a cutting qualitie, & by reason that the mostling is taken from it, of a drying effect also, for to helpe the itch, the lepry and running fores, and to take awayth ruggednesse of the skin, morphew, drie scabbes, scarres, freckles, wheales and pimples, from the face or body; es pecially if it be used with vinegar and niter, with which it well agreeth, and performeth the cures much better It is also used with the meale of Orobus the bitter Vetch, or the meale of Darnell in manner of a plaister, to be laid to the fide to consume the spleene; It helpeth the gout also used in the same manner; used with barly meak it comforteth the sinewes, that are pained with cold, and all spasmes or crampes, and used with hony dissolved all knots and hard swellings, the shells or huskes are of an exceeding binding propertie, fit to be used when occasion serveth for such purposes: The oyle that is pressed forth out of the nuts is much used of Person mers, although it have no sweete smell of it selfe to commend it, yet it is of so excellent a qualitie, that being ken never folong, it will not grow ranke, and therefore it doth both preferve the fweete fents of Muske, Cive, Ambergrise and the like mixed with it, and keepeth that the gloves, leather, or other things, shall not gather spon or staines in them, nor ever grow mouldy, as those things that are perfumed with oyle of Almonds will doe This cycle likewise is much fitter than cycle of Almonds, to receive any sweet thing to be stieped in it, and to keep the sent thereof in it, for being utterly without sent of it selfe, neither growing ranke by any time, the sent of any thing will be the sooner insused, and the longer also retained and kept therein.

CHAP, XXXVII.

Frangu'a sive Alnus nigra baccifera. The blacke Alder tree.

He black Aller or Alder tree, rifeth feldome to be of any great bignesse, but for the most part abideth like a hedge, bush or tree, spreading into branches, the wood of the body being white, and of a darke red at the core or heart, the outward barke being of a blackish colour, whereon many white spots

are noted to be seene; but the inner barke next unto the wood is yellow, which being chewed will turne the spittle yellow, as much or more than Rubarbe, neare unto a Saffron colour, the leaves are somewhat like unto those of the ordinary Alder tree, or those of the female Cornell or Dogge berry tree, but blacker, and not fo long but rather rounder, the flowers are white comming forth at the joynts with the leaves which turne into small round) berries, greene at the first, and red afterwards, but blackish when they are thorough ripe, divided as it were into two parts, wherein is contained two small round and flat seedes: the roote runneth not deepe into the ground, but fpreadeth rather under the upper crust of the earth.

The Place.

This tree or shrubbe groweth in woods in many places of our land, as in Saint lohns wood by Hornsey, in the woods upon Hampsteed heath, &cc.

It flowreth in May, and the berries are ripe in Septem-The Names.

It is called Frangula quiacito frangitur, that is, the branches be brittle and easie to breake, and Alman nigra baccifera, that it might Alaus nigra baccifera seu Frangula. The blacke Alder tree.

be knowne from the Alma valgaria, whose barke is whitish and the wood more red, and beareth not berries as this doth: Tragms calleth it Faulbaum that is fould tree, of the evill sent and taste, the Idea firm nostra sive Francola valge of Lugdanensis, differeth not from this, although he would seeme to make it. The Italians call it Frangola, the Germans, as is before faid with Tragus Fanthaum, the Dutch Sporrekenhout and Hondesboom; and we in Emili the blacke Aller or Alder tree.

The Vertnes.

The inner yellow barke hereof as Matthiolus faith, purgeth downewards both choller and flegme, and the warry humors of hydropicke persons, and strengthneth the inward parts againe afterwards, even as Rubarbe doth: if the barke hereof be boyled with Agrimonie, Wormewood, Dodder, Hoppes, and some Fennell and Smallage, Endive and Cichory rootes, and a reasonable draught taken every morning for some time together, is very effectual against the I aundise, the dropsie, and the evill disposition of the body, so as some especials purging medicine, have beene taken before to avoyd the groffer excrements, and then it will the better loofen the belly, and keepe it foluble without trouble or danger to the stomacke, purging and strengthning the liver and spleene, in so good manner that diverse have beene cured by this onely medicine, who have had their livers and fpleenes (wolne with humors and hardnesse; by opening all obstructions in the inward parts, and clenfing them from such evill humors as they were full of before: the dried barke is onely fit for those purposes, for the fresh or greene barke being taken inwardly, provoketh strong vomitings, paines in the stomacke, and gripings in the belly; yet if the decoction thereof may stand and settle for two or three dayes, untill the yellow colour be changed into blacke, it will not worke so violently by much as before, and in not provoking vomiting or purging, it will strengthen the stomacke, and procure an appetite or desire to meate: the outer barke contrariwise doth bind the body, and thereby is helpefull for all laskes and fluxes thereof; but this should be given after it hath beene dried also, to worke the better : the inner barke hereof boiled in vinegar, is an approved remedy to kill lice, to cure the itch, and take away scabbes, and drie them up in a very short space: the same also is singular good to wash the reeth, both to take away the paines, to fasten those that are loose, to clense them from corruption, and to keepe them found : the leaves are faid to be good fodder for Kine, to cause them give the more abundance of milke.

CHAP. XXXVIIII.

Evonymus. The Spindle tree or Pricke wood.

Lithough the former ages, were content to know but one fort of this Evonymus, or Spindle tree, yet Clusius in his Panonicke travells, hath set forth two other forts, not knowne before to any, which I will here shew you together.

1. Evonymus vulgaris. The common Spindle tree. Our ordinary spindle tree, is also but a shrubbe or hedgge bush, rising up with many stemmes, or sometimes 3. Evonymus Pannonieus latifolius Clufii. Broad leafed Spindle tree of Hungary.

1. Evonymus vulgaria. The common Spindle tree.

but with a few, the elder boughes, having a whitish barke, and the younger greene, with foure brownish line like lifts, running all the length of them, which make them seeme foure square, the wood is somewhat which hard, and yellow, it hath diverse branches, whereon doe grow faire and darke greene long leaves, broadest in the middle, from among which come forth long italkes, whereon ftand foure or five white flowers, clustering to ther, consisting of foure leaves a peece, with fome threds in the middle, after which come round hard into or red berries, divided into foure parts, in each whereof lieth a white hard feede, covered with a yellow skim, which will give a yellow colour, if it be put into water: the rootes are many, not running deepe into the ground but spreading rather under the upper face thereof.

The Spindle tree of Hungary, hath diverse gentle and pliant stemmes, rising from the roote, which grow to be three or foure foote high, and of the thicknesse of ones thumbe, covered with a thicke greene barke, with blacke foots therein, divided into many other lesser branches, set in a seemely or comely order one above another about which grow many leaves, set opposite one unto another, somewhat likeunto the greater Mirtle leave but more gentle in handling, lightly dented about the edges, of a drying talte at the first, but afterward fomewhat bitter, and hot, from among the leaves at the joynts of them come forth small long stalkes, with the or three flowers on each of them, confifting of foure leaves apeece, of a shining purplish colour hanging down their heads, and with a square umbone in the middle, which grow into a foure square head or berrie, like forme unto the former, somewhat spongie or light, of a faire yellow colour on the outside, wherein lie shim round seede, blacke on the outside, two or three lying in one cell or partition, which are very like unto the seed of bastard Dittany.

3. Evonymus Li tifolius. Broad leafed Spindle tree of Hungary.

This broad leafed Spindle tree, rifeth up (if it be manured) to be higher than any man, fpreading his stender pliant branches, uneasie to breake, whereon doe grow many faire broad greene leaves, set by couples, and a bitter tafte: at the joynts betweene the leaves and stalkes spring forth long stalkes, with diverse flowers at the end of them, hanging downe their heads, confisting of foure white broad leaves, tending to a flesh or blush or lour, very like unto the common Spindle tree, which turne into foure square heads of berries, and sometimes in to five square berries, but much larger, having certaine lists like to winges on every of them, wherein are me tained white graines or kernells, covered with a yellow skinne as in the first. The Place.

The first groweth in many places of this Kingdome, in woods and untilled places, and serveth among one thrubbes for hedges; the second Clusius found both in the upper and the lower Hungary, upon those hills the runne to the Alpes, as also in Moravia in the woods there. The last was found by Clusius also, in a wood in the part of Hungary that is called Interannis, and which the Germanes call Windeschlands beyond the rive Dravus.

The Time.

They doe all flower about May, and their berries are ripe in September. The Names.

This is generally by most Writers called Evonymus, and taken to be the true Evonying of Theophrastu, que boni nominis in lib. 3. cap. ultime, and which hee calleth Tetragonia translated Quadratoria by Gaza in histin Booke and fixt Chapter; but there are diverse, and Lugdunensis with them, that have rather judged an other shrubbe to be Euronymus, which Gesner in his Epistles, and Clusius in his history of Plants, thinke to be a kinded Ledum, and is by Clusius called Ledum Alpinum, (which I have remembred before in the former Classis) Visses Abdroandus Nerium Alpinum, as Gesner in descriptione montis fracti doth record, and is probable with Chamerhododendros Alpina odora of Pena and Lobel in their Adversaria, and which Lobell in his Observations calleth Balfamum Alpinum: but Clusius sheweth plainely, that it cannot agree therewith, not having a four square head or huske. It hath beene corruptly called Anonymus of diverse, instead of Evonymus, as Cordui Hist. saith, Tragus mistaking it called it (arpinus. It is called also Fusanum and Fusoria, because the Italius che led it Fusaro, as being used by Turners and others, to make spindles for spinning wheeles and other things, and by Baubinus Evonymus vulgaris granis rubentibus. The second is called by Clusius Evonymus alter, vel second by Camerarius and Tabermontanus Evonymus Pannonicus, and by Baubinus Evonymus granis nigris. The likis called Evouymus five latifolius by Clusius and all others. It is called in English Spindle tree, Pricke timberus and Prickwood, and in some countries of this land Dogge wood, and might from the forme of the beries, a well be called Square berried tree. The Italians call it Fusano, the Prench Fusano bonnes depresse, the German Spindelbaum, the Dutch Papenhaut

The Vertues

This is feldome used in Physicke with us for to helpe any disease; yet it is found by experience that three a foure kernells will purge both by vomiting & by the stoole, causing much choller and slegme to be avoided. The phrassius, and from him diverse others, have said that the leaves hereof are pernicious and deadly, especially to Sheepe and Goates, unlesse they be purged by Anochus (which word is not well knowne what it meaneth) Dedonaus interpreting it, that they should be purged upward and downeward, and others understanding it, that they should be purged by want or abstinence from meate. Dalechampine as Lugdunensis setteth it downe, confirmed that faying of Theophraftsa, to be hurtfull to Goates by his owne experience, who faw flockes of Goates feeding upon the shrubbes that grew with this, but none of them to touch it, and that they refused to eat it being cast uno them, but Clusius saith the cleane contrary, that hee understood the Goates in Hungary did greatly desiretoest the leaves thereof, and tooke no harme thereby, and that the Hungarians in their language call this shrubs Kechke rago fa, id est capris rosa arbor, the Goates Rose tree, so diverse be the writings and opinions of men · whereof in many other things we have fufficient experience.

CHAP. XXXIX.

Rhammus folutions five Spina Infectoria. The purging Thorne.

Here are diverse forts of Rhamnus, some for this Classis, others for another, as shall be shewed in their places: Of this thorne formerly, we had the knowledge but of one fort onely, untill Clusius in his Pannenicke observations set forth two other, the one whereof shall be here expressed, for I must referre the other to another place, that is to the kindes of Lycium, where you shall finde it.

1. Rhamius folucious wilgaris. The common purging thorne.

The purging thorne, that is frequent in our owne Land, is for the most part but a low shrubbe or hedge bush,

Interpulging interior, the bigge or like a tree, having many stemmes or branches rising from the roote, covered with a smooth blackish red barke on the outside, and greene on the inside, the innermost being yellow, the wood whereof is of a whitish yellow, toward the outside, and of a reddish yellow inward, and at the heart

1. Rhammu folatious feu Spina infelloria quigaris. The common purging Thorne.

2. Rhamaus felutious minor Pannonkus. The leffer purging thorne of Hungary.

1. Rhamni fel tivi vulgaris Exactioricom cum floribus. A more exact figure thereof.

firong, and not easie to bend or to breake, whereof strong bowes may be made, and hath beene in times past the smaller branches are furnished with many scaves like unto those of the crab tree, but smaller, with small long thraight thornes in many places fet with the leaves, the ends of the branches ending in a thorne also; among the leaves come forth many flowers, every one upon a feverall foote stalke, consisting of four leaves a peece, of whitish greene colour; after which come small round berries, greene at the first, and blacke when they are fig. full of pulpe or juyce that is greene, with one or two small graines within them of an unpleasant taste.

2. Rhamnus folutions minor Pannonicus. The lester Purging thorne of Hungary. This leffer Rhammus groweth much lower than the former, with smaller branches, not above a yard and halfe high, having many leaves thereon, smaller and narrower than the former, almost as small as those of the haire high, naving many leaves thereon, minute and hair and there upon the branches, but ending alwayes in thorne: the flowers are like unto the other but smaller, and of an herby, or whitish greene colour, with smaller berries also succeeding them.

The first groweth in many places of this land, but especially in Kent, as at the hither end of Dartford next mi to London, Farningham upon the Connie burrowes, and in a narrow Lane neere South Fleete, and in many other places. The other Clusius found in Pannoniu, and in Germany neere the bathes at Baden. The Time.

They flower in Aprill and May, their fruite is ripe in September and October. The Names.

It is called Rhammus, although it can be referred to none, either of Dioscorides or Theophrastus, yet all agre, it is a species or kind of Rhammus, and so even the thornes declare, and therefore the word solvers is added then. unto, to denominate the difference. Matthiolus I thinke first called it Spina infestoria, and is by many followed therein. Tragus calleth it Rhamni alia species, yet knew not of any purging quality in it. Dodoneus called it Rhamni Solations, and Lugdunensis Rhamins Catharicus & so doth Bauhinns; Corans calleth it Cervi spina, Gesner Spina Co. vins, and Cafalpinus Spina Cervalis vulgo, and some also Burgi spina, from the French word Bourgespine wherey they call it as also Nerprun. The other is called of Clusius Spina Infectoria pumila prima: although Gerard bathcle led it in English Laxative Ram and Bucke borne, yet I have rather entituled it a purging thorne, as most fitting to:

The betries hereof dryed and a drame of the powder, given in wine or the broth of flesh, doth purge both flegme and groffe thicke humors also, yet Pena saith it rather draweth forth thinne flegme, and that fromthe joints and Arteries, and therefore is fingular good for dropfies; fome doe make an Electuary and fome a Symp of the juyce of the berries clarified, and Sugar or Honey put thereto, but because it worketh a little trouble somely, some spices are to be added thereto to aromatise it, as Cinamon, Ginger and Cloves, and some added the source of the source of the berries clarified. Malticke and roses also, which doth correct the evill quality therein, and canse it worke without paine : an our or more of either Electuary or Syrupe may be given at a time, dissolved either in wine or in the broth of fell which will draw forth raw whayish humors, and choller aboundantly, as also thicke clammie flegme, for it was keth not with any trouble ome heating of the parts, but doth strengthen them after purging, not causing an flux to follow: Of these berries are made three severall sorts of colours, as they shall be gathered; that is being gathered while they are greene and kept dry, are called Sappe berries, which being steeped in some Allomew ter, or fresh bruised into Allome water, they give a reasonable faire yellow colour, which painters use for the workes, and Bookebinders to colour the edges of bookes, and leather dreffers to colour leather, as they used to make a greene colour called Sappe greene, taken from the berries when they are blacke, being bruifed and me into a braffe or copper kettle, or pan; and there suffered to abide three or four dayes, or a little heated upon the fire, and some beaten Allome put unto them, and after pressed forth, the juyce or liquor is usually put up into great bladders, tyed with strong thred at the head, and hung up untill it be drye, which is dissolved in water wine, but facke is the best to preserve the colour from starving as they call it, that is from decaying and to make it hold fresh the longer: the third colour (whereof, none that I can finde hath made mention, but onely Trage) is a purplish colour which is made of the berries suffered to grow upon the bushes, untill the middle or endo November, that they are ready to droppe from the trees.

CHAP. XL.

Anagyris & Laburnum. Beane Trefoiles.

He Anagyris and Laburnum are such congeneres, so like the one unto the other, that diverse writen doe call that Anagyria, which others call Laburnum, and indeed I know no other diftinction be tweene them, than of fatens & non fatens, major & minor. 1. Anagyris færida. Stinking Beane Trefoile.

The stinking beane Trefoile in his naturall places, which are the hot Countries of Spaine and No. bone in France, seldome groweth to be higher than a man, but transplanted into more cold and temperated mates, riseth twife so high; having the barke of the body, and elder boughes, of a darke grayish greene colour, the younger of a fresher greene, from whence shoote forth at diverse places three somewhat large leaves toge they, standing upon a pretty long stotestalke, of a greene colour on the upperside, and of an hoary or silver shining colour underneath; of a strong unpleasant sent, like unto stinking Gladwin especially in the hot countries, form the colder countries it is nothing fo much, and very little in ours, as I have tryed, who have had it many time growing with me: at the joyles with the leaves come fouth many flowers, standing upon slong stalke, onely another, which are larger than in any Cyrifus, amost as great as the Colarea, the lower leaves being of a play yellow colour, and the upper and which cover them, of a deeper gold yellow, which after turne into large and long flattish cods; wherein lye foure or five seedes, twife as big as in the other, almost as big as Kidney beanes, and more discoloured than the other, that is of a darke purple spotted, which were of a fairer purple, before the

were thorough ripe : the roote thrusteth not deepe into the ground, but is well fastened with branches and fibres within the ground. Of this kind there is one growing in Candy, whereof Honorsus Bellus gave knowledge to Clusius, that hath rounder leaves, which as yet I never saw.

2. Anagyrin non fatida five Laburnum majus. The greater lesse stinking Beane Tresoile.

This Beane Tresoile groweth larger in body and branches, than the former, and sometimes shooteth forth diverse stemmes from the roote, the wood whereof is very sirme and hard, yellow toward the barke, and blackish at theheart, (whereof the strongest bowes are made, and stakes that will abide hard in the ground longer than others) with leaves larger than either the former or the smaller sort, of a darkish greene above, and silver colour underneath like them: the flowers are more in number, and smaller than in the former, the stalkes of flowers, hanging downe and not standing up, being sometimes almost a foote long, and not so long as in the former, and are for the most part all of one pale yellow colour, the cods likewise are blacker, shorter and smaller, and so are the feedes within them also, yet greater than in the leffer fort, else much alike, being blackish and very hard, scarce yeelding to be mollified in water: the leaves and flowers have but little fent at all to discommend them, in any that I have feene and fmelt.

3. Laburnum minus. The lesser Beane Trefoile. This leffer Beane Trefoile is in most things like unto the last described but that it groweth not so great, nor are the leaves fo large by the halfe, nor yet either flowers or feede,

The Place . . The first as is before said groweth in hot Countries: the second, and so doth the least also, in many of the woods of Italy, and the higher parts of France, and other places, and upon the Alpes.

The Time The first seldome abideth with us to shew his flower: but in his naturall places, it flowreth early even in Ianuary and February, in Spaine as Culsius faith, but in Aprill and May, in other places; and the seedes are ripe in the Summer time after in Spaine, but not untill September in other places : the other flowreth in May and Iune, and the seede sometimes ripeneth well, but not untill September, but the least ripeneth well-

The Names. The first is called of Dioscordes ardyness & diayui Anagyris & Anagyros, which Pliny saith some called Acopon: vera of fatida, is usually added to it to distinguish it from the other, which is also called Anagyris of fome, but altera or non fetida which second or non fetida, Matthiolus calleth Anagyrin prima & major, as he calleth the least Anagyu altera, but he contendeth against Gesner who did in following other mens opinio, make the great Labarnum of Anagyris altera to be Laburnum of Pliny, which is the least and called Eghelo of those that dwell about Trent. Camerarius in horto calleth it Laburnu, when as he calleth the leaft, Anagyru altera of Matthiolus, Anguilara. faithit is called by the inhabitants Egano, & thinketh it may be Ebeni fecunda species Theophrasti; Lugdunenses alfa, calleth it Laburnum primum, and the least Laburnum alterum, and faith it might be called Anagyrin Alpina: Cordue

Laburnum minus.

calleth it Arbor trifolia, diverse doe call the least Laburnum, Fabainversa Gerard his figure of Anagyris fatida, and calleth it Arbor trifolia, diverie doe can the least Laurinning, a contrary, for Gerard his Anagyrin facida, and Anagyrin, are the same that are in Matthiolius, but the titles are contrary, for Gerard his Anagyrin facida, is the

Eghelo or Anagyris altera in Matthiolus. It is probable in my opinion, that the smaller Laburnum should be thate. I stea of Theophrastus, which is set down in the 14.c. of his third book, with a willow lease: for if you take any on leafe by it felf, it may wel refemble a Willow leafe; both for forme and colour, and beareth small seeds in cods, lib. unto polle as that doth: Gester did referre this kinde unto the mountaine Crissus, but Matthiosus reproovethin for it: the great booke of Eystetensis calleth it Anagyris latifolia, but I call it Laburnum majus, as I doe the la

The Vertues.

3. Myrobalanu

Myrobalenorum 5. Genera.

Frullus Embilcorum cum nuclea interiore barbato.

TRIBE.2.

The leaves as well as the feede of the first Beane trefoile, are a strong vomit, especially in the hot Countries where it groweth, and Honorius Bellus writing thereof to Clusius, faith that in Candy, where that kind growed with rounder leaves, if the Goates or sheepe do chance to feed thereon, the milke which they give will cause an that shall take it, to fall as well into extreame scouring downewards as strong casting upwards, and that may thereby have beene brought in danger of their lives: the young leaves saith Dioscorides applyed unto tumong fwellings, discusseth and represent them; and if a dram of the powder of them, be drunke in wine, as he said alfo, it expelleth both the dead birth, and the secondine, and likewise bringeth downe the monethly come of women; if some of the leaves, be bound to those that have hard and uneasie travell in child bearing, it cauch a speedy delivery of the birth, but they must bee taken away presently afterwards; they are likewise given wine to those that are short winded, and to such as are often troubled with the head-ach: the barke of the room hath a digesting ripening and discussing quality: both the other forts here set downe, have the same property for they are also of the same temperature, but Matthiolus saith, that he hath knowne, that some that havetake ignorantly of the feede of the leffer Beane trefoile, have had flrong vomitings even unto blood: Solerius in the lis in Atium faith, that by certaine and undoubted experience it hath beene found, that a dramme either more leffe, of the dryed bark thereof made into powder, and taken in any kind of drink, purgeth very strongly bothin wards and downewards, but in a diverse manner; for if as he saith, (which I take rather to be but a conceint he barke be pulled off from the tree upwards, it will cause vomitings, if downewards great purging of the believe downewards: the Bees saith Pliny, resuse to touch the slowers of this Laburnum, which is the lesser Ben Trefoile, but it hath beene truely observed, that both in the naturall places where it groweth, as also with a that the Bees doe not refuse to seede upon them: the Grecians have an usuall proverbe with them, Anagon commovere when they would fignifie one, that worketh as wee fay his owne woe, or is the cause of his own harme.

CHAP. XLI.

Myrobalani. Myrobalans or purging Indian Plummes.

Lthough there be none of these Myrobaland trees (whereof are 5 forts of fruites well known & dillis guished in the Apothecaries shops) growing in any of these Christian Countries of Europe, as size ever I could learne, yet I could doe no lesse than make mention of them here both because the sime are often used in Physicke among other purgers, and to make it knowne to all that might be militing by the name, and thinke that the Myrobalane Plummes, the red and the white that I have remen

bred in my former book, be some of these kindes: but so they are not, neither for forme nor quality: as also fir up some ingenious mind among our Merchants, that trade to Aleppo & Cairo, & into Persia and the East India, to give order to their factors, if they doe it not themselves, to enquire and seeke out such of the forts that are be found in the places of their abode, and either to plant the stones of these severall kinds in those warms countries, if they abide any time in them, that when they are a little growne they might then fend them hither or fend the fresh stones over hither to us (for those are too dry that are brought for physicke use) that weems plant them here to try if they will not growe and abide with us, that at least, having but a fight of the formed the leaves of any fort, we might compare them with the descriptions that writers have made of them, whether they are answerable thereunto; I must in the meane time therefore but shew you them as Garzias and other before me have done, with such descriptions as they gave of them, and are extant, not knowing whether the be true or no.

1. Myrobalanus Citrina. The yellow Myrobalane or purging Indian Plum. The tree that beareth these yellow Myrobalanes is said to grow as great as a Plum tree, having many but ches and winged leaves on them like unto the true Service tree: the fruit is for the most part as bigge as reale nable Plums, somewhat long and not fully round, but having many faire ridges on the outside, especially what it is dryed, shewing it to be five square though round, of a yellower colour on the outside then any of the res; the flesh or substance being of a reasonable thicknesse, yet not so thicke as the Chebuli, or Emblici, nor so thin as the Bellerici; the stone is white, thicke, and very hard to breake, with emniences and ridges also therein, and avery fmall long kernell lying in the middle, of an instringent taste as the dryed fruit is also, but much more then it: hath no such kernell that thereout may be pressed an oyle, as Bellonius noteth of the kernells of that fruit that he tooke to bee the yellow Myrobalane tree, in the plaines of Hiericho as he notethir, in lib. Observationnes. сар.86.

2. Myrobalanus Chebula. The purple Myrobalane, or purging Indian Plum. This kind of Myrobalane tree growing in stature and branches like a Plum (as Garzias faith all the forts at) bearing leaves on the branches like unto the Peach tree: the fruit hereof is the greatest and longest of all the five forts, of a blackish purple colour on the outside while it is fresh, which it holdeth in the dry fruit; (which Matthiolus commended for the belt) being five square as the former, of the thickest substance, and more flely then any other, and with the smallest stone in the middle, not fully so hard to breake as the former, but with the smallest kernell therein.

Myrobalanus Bellerica. The round Myrobalane or purging Indian Plum. The round Myrobalane is like the rest for growth, but bearing leaves like the Bay tree, yet of a paler greene tolour, and somewhat ashcoloured (underneath peradventure) withall; the fruit is of a meane bignes, round and smooth, yet being as it were three square in many, and of a pale russettish colour when they are fresh, but of a darke or dusty whitish colour on the outside, being dry, of the thinnest substance or least fieshy of any of them: the stone whereof is thicke greater then any other, proportionable to the fruit, very hard to break, with

kemell within of a reasonable bignesse. 4. Myrobalanus Emblica. The bearded or fix fquare Myrobalane or purging Indian Plum.

The tree that beareth this Myrobalane or delicate Plum, being like a Plum tree for height and manner of growing (as you have heard before that Garzias faith fo of them all) hath leaves of a palme or handbreadth long, very finely cut in or divided on the edges : the fruit is round in shew, but doth separate or will be broken into ix parts, as both we have observed in the dry fruit, alwayes brought unto us, broken into small peeces, without any stones: and more plainely in the fruit preserved, whereof good store hath beene brought over many times unto us, which will be divided into many parts: the ftone whereof within it is fix fquare, with three greater ridges, and three leffer lying betweene them, and bearded at the head of the three greater ridges, the kernell within it being (eparated into the three feverall divifions, having each of them two calls, wherein the parts of the kernell lye almost three square,

5. Myrobalanus Indica. The blacke Myrobalane or purging Indian Plum. The blacke Myrobalane tree is like the reft; whose lease (as Garzias saith) is like unto a Willow lease: the fruit faith Garzias is eight square, which may be when they are fresh, but they cannot be so plainely discerned in those that are brought over unto us dry, the smallest of all the rest, somewhat long, altogether sleshy, without any stone in the middle, and the blackest of any.

The Place. All these fruits grow in the East Indies wild and not manured, but in divers provinces, as some in Goa and Batecala, others in Malavar and Dabul. Yet Garzias faith foure forts grow in the kingdome of Cambaya, and the Chebuls in Bisuagar, Decan, Guzarate (which we call at this time Surrate) and Bengala : Bellonius saith in his booke of observations that the yellow Myrobalanes grow in Arabia and Syria, and also in the plaines of Hicricho, but I doe much doubt of the certainty thereof and thinke rather that he was mistaken.

We know so little of the trees, that we know lesse of their time of flowring or bearing fruit.

The Names. These kind of fruits were not any of them knowne unto any of the antient Greeke writers, as Dioscorides, Theophrass were not any or them knowned the maketh mention of a Myrobalanus, yet hee addeth Troglodytes, which is the Now Ben, Balanus Myrepsica, or Glans Vnguentaria, as I shewed you a little before,

yet both Balanus Myrepfica and Myrobalanus have but one fignification in the Greeke tongue. The Arabian were the first that made them knowne to the world, and called them all in generall by the name of Delegi, ash the writings of Messes and Serapio doe appeare; but the Greekes that translated these Arabians, gave the name of Myrobalanes unto these fruits, because (asit is likely) they thought the fruit was like unto an Acorne, and therefore gave the name Balanus; but why they should give the other word Myros, which signifieth an oyn. ment. cannot be understood by any. for none of these were ever used in any pretions or sweet oyntment, and Myrobalanos signifieth as much as Balanus Myrepsica Glans unguentaria, the Acorne for oyntments. Alluaria among the latter Greeke writers maketh mention of them, but that none of these did grow among the Arabian their ignorance of their growing declareth plainely : for Mesnes writeth that the Citrini Chebuli and Nigrida all grow upon one tree, and for that they beare twice in a yeare, the Citrini are the unripe, and the Wignin the ripe of the first bearing, and the Chebuli the fruit of the later bearing, which how contrary unto trus it is, Garzias doth declare, in his booke of the Drugges of the East Indies, where hee plainely shewed that all the five forts, grow feverally each upon a feverall tree, as I have shewed you before: the Indian cal the Citrini or Flavi Arare, but the Physitions Aritiqui, and the Indici or Nigri they call Rezenvale, the Release Gotimi or Gotni, the Chepuli or Chebuli Aretca, and the Emblici or Amuale as Garzias hath it, or Anuale as Acole I have you fee intituled them all purging Plums, as most proper for them in my judgement, and given them the fundry Epithites according to their quality as I thinke. The Vertues

All these forts of Myrobalanes have a gentle purging quality, some more and some lesse then others, some also purging choller, some slegme, and some melancholy; but they have in them also an astringent quality, much more then is in Rubarbe: the Citrines and Bellericks, that is the yellow and the round Myrobalanes doe pure choller gently: the Chebules and Emblici that is the purple and fix square Myrobalanes doe purge slegme: and the Indies or black ones melancholly: the decoction or insusion of them all dorn purge better then any wayesels, yet fo gently that in evacuating the humors, they strengthen the stomacke, the liver and the heart, but given in pouder they binde the body more then purge it, and indeed the binding quality in them all, especially in the dryed fruits, is more prodominant, and as Garzias faith, the Indians wholly use them for that purpose; and therefore they are the best medecines to be mingled with Scamony and all other violent purgers, to restraine ther violence and to correct their fierceneffe, and yet as Mefues faith the y are often put with Caffia, Manna, & Tome rind, to helpe the working of them, as a most safe medecine: the Bellericks and Emblicks by purging the stomat from rotten flegme lying therein, and strengthning the braine and joynts, the heart and liver, and binding all other loose or fluent humors in the parts of the body, are very effectuall, as also for the trembling of the hear. and to stirre up the appetite, stay vomiting and restraine the sury and belchings of choller, to increase the power and facultie of the spirits, to qualifie the excessive hear of the inward pares, and the thirst is raised thereof, and doe helpe and give ease to those that are truobled with the hemorrhoides or piles, by restraining the siercenessed choller flowing unto them, and for this last effect, the Cirines are most used : also for all hot constitutions, and in all hot agues where there are no obstructions, for (they as all the other forts also) doe rather cause obstructions. ons, and therefore in all such when they are to be used they are to bee corrected with Wormewood, or the Juice of Furniterry, or with Rubarbe, Agarick, Spiknard and the like, as also with other opening and diure call things: the Chebules in especiall doe purge slegme, sharpen the memory, cleare the eye sight, clense and strengthen the stomacke, and are very espectuall against the dropsie, and all old agues: the Indies or blackeMyrobalanes in speciall, doe purge melancholy, and blacke or burnt choller, and thereby are availeable forthe quartaine Ague, the Lepry or foule evill, and all paralaticke diseases: the Embliks and Bellericks in especial purge flegme and comfort the braine very much, as also the heart and flomacke, stay vomiting and stirre up the appetite. They all of them in generall are of especiall use in all Fluxes both of the stomack and belly, by gently purging the maligne fluxibilitie of the humors, and strengthning and binding the parts afterwards; but as a especiall receit to binde or stay an old continued Laske, I have knowne this medicine doe much good. Take and burne a pint of Claret wine, with a little Rosemary and Sugar, whereinto put to steepe all night one drams Rubarbe, first fliced and tosted at the fire, and halfe a dram of Chebule Myrobalanes, which standing by the fire all night, and strained forth in the morning, is to be taken at two severall times, a draught in the morning falting, which if it helpe not sufficiently the first time, being renewed and taken two dayes more, will certainly stay the laske wholly, if the malignity and sharpenesse of the humors bee not so strong that scarse any mode. cine will cure it. The Chebule Myrobalanes broken and steeped in Rosewater, or in the clarified juice of Fernell for two or three dayes, and after strained forth; this water dropped into the eyes doth clere the sight, and a fine cloth wet therein and often applyed, taketh away the heat and inflammation in them, and flayeth theum and distillations into them : the pouder of any of the Myrobalanes and Masticke, put into running Vices and fores, dryeth up the moysture and consolidateth them: The Chebules and the Emblicks are often broughtown unto us preserved, whereof the Chebules are more used Physically for such purposes as are before set downt. then the Emblicks are, which being nothing harsh in taste as the Chebuls, but being very pleasant, are more of ten used as a delicate preserved Plum, among other junckets, then for any Physicall respect.

CHAP. XLII.

Agaricus & Terebinthina ex Larice. Agaricke growing on the Larch tree, and the fine cleare Turpentine taken from it also.

Ecause the Rosin or Turpentine of the Larch tree doth gently open and purge the belly; but more possibly the Agaricke that groweth thereon, I must to shew you the manner of growing of Agricke, give you also the view of the body of the tree, from whence it is taken, and some branches at leaves thereon to be knowne by but the description of the tree it selfe, shall be shewed you among the claves thereon to be knowne by but the description of the tree it selfe, shall be shewed you among the characteristic of the street of the stree

is extracted a cleare liquid Rofin or Turpintine, called in shoppes Fenice Turpentine, by boring the tree to the heart, and receiving it into vessels, and from the body of the tree when it is growne great and old in many places, and from the greater armes and boughes also, groweth certaine excressences like Mashromes but greater, called Agaricke of divers and severall sife, that is from the bignesse of ones hand lesse or more, to be as bigge as any mans head, and sometimes greater, covered with a hard blackish barke, which being cut and pared away, the substance under it appeared very white, and if it be of the best fort, very light also, easier to breake, loose or spungie and without series through it, somewhat sweete in taste at the first, but very bitter afterwards, and not having any hard barke on the outside the blacke, heavy, and hard, is utterly unsit to be used in Physicke.

The Place.

The Larchtree groweth in many woods about Trent and Brivia in Italy, and neare the rivers Benacion and Padius, and in Galasia a Province of Afia, as Dieferrides and Galen doe record, and in Agaria a country of Sarmania, from whence the Agaricke tooke the name; in Silefia also Moravia, Lusaia; And the Agaricke is gathered in most of these places, so is the Turpentine likewise, but especially from the woods about Trent, &c.

The Time.

The Rolin or Turpentine is gathered in the hottest time of the years, and the Agaricke at the latter end thereof, that is November and December especially.

The Names.

The Names.

This tree is called Names. This tree is called Names. This tree is called Names in Greek and Larix or Larice in Latin. Pliny hath in no one thing in all his Hiftory, shewed his inconflancie and repugnancie, more than in this one tree, not onely in not knowing that whereof he writeth, but denying that which is found true by good experience, and faying that in one place, which hee contrarieth in an other, as in his 16. Booke and 21. Chapter, hee reckoneth the Larch tree among those wild trees, that doe not shed their leaves, and are sharpe pointed, where it founds the Pine tree, as hee doth

Agaricus ex Larice. Agaricke growing on the Larch tree.

seemeth he tooke the Larch tree, for the Pine tree, as hee doth in the so. of the same 16. Booke: and whereas Theophrass un his third Booke, and tenth Chapter, speaking of the difference betweene the Pine and Pitch tree, faith, that the Pine tree being burnt downe to the rootes fpringeth not from them againe, but as fome fay the Pitch tree doth as it hapned in Lesbos, when the wood Pyrthems wasfired, which was stored with Pitch trees. This very narration Pliny lib. 16. cap. 139. in citing, applieth to the Larch tree, which Theophrasting doth to the Pine tree. And in another place Theophrasting saith, that a kinde of femall Pine is called Egin or Egida; and Pliny faith the femall Larix is called Egida, by all which places it may be plainely feene, that Pliny miltooke the Larch tree for the Pine tree. For Theophrasty hath not made mention of the Larix, in all his History, whereby many did judge that it did not grow in Greece, for else he would have knowne it, and spoken of it. In one place againe Pliny maketh the leaves of the Larch tree to be soft, woolly, thicke and fat, and in another place hard & drie: againe he faith that the Larch tree hath not flowers nor any cones to commend it, when as they have cones, and the bloffomes on them are very beautifull: and lastly Pling faith (it should seeme following Vitravim, who before him said the same) that the wood of the Larch tree, will not burne, nor make a cole, nor will confume in the fire, any otherwife than a stone, when as himselfe saith and acknowledgeth, as Virnoises also doth, that it yeeldeth forth a Rossen; and how could any man thinke, that a tree yeelding Rollen should not burne, when as the very earth and stones that have any bituminous or resinous qualitie in them, will burne exceedingly, as is plainely seene in our turfe, in pit and sea coales which maintaine our fires, in many places of our Land, and elsewhere also. This I thought good to set downe, not so much to declaime a_ gainst Pliny, as to forewarne others that translate or write others opinions, to be judicious and examine by reasons whether that which others have written agree with the truth of the matter, and not hand over head either beleeve or fet downe, what soever others have written, be it true or false. Concerning the cleare Turpentine, of this tree called Venice Turpentine, there is some controversie among Writers, some alleadging it to be taken from the Firre tree, as Fusching and others, and Matthiolus contending there against, that of his owne knowledge and experience, it is onely taken from the Larch tree and no other, for no other Turpentine was to be had in the former times for many ages, because the Merchants neglected to bring the true Turpentine of the Terebinebus Turpentine tree, and therefore this onely was used : and no other fort of Turpentine was fit to be taken inwardly in ftead of the true from the Turpentine tree, which we doe usually call Copresse Turpentine, because as it is thought the best is gathered in the Iland Coprus, those about Trens as Masthielus saithuse to call it Larga, derivers as in likely from Laricea, yet Pliny, Galen, and others of the ancients have fet downe, that the Larch yeeldeth whitish yellow Rollen like unto the hony of Athens or Spaine, but in little quantitie and soone waxing drie, which is that Gumme or Rollen that sweateth out of the tree in Summer of its owne accord without boring: There is also fome controversie and contrarietie both in the ancient and moderne Writers, concerning Agaricke, Diefogrides and Galen thinking it tobe a roote, like unto that of Silphium, yet doubting somewhat thereof. Diescorides faith that some hold it to be a Mushrome, or Excrescence engendred from the rottennesse of the trees, as Mushromes are from the earth, Pliny Writeth, lib, 16, cap, 8, that it was faid that those trees, that bare Acornes in the counTRIBE.2.

CHAP. 42.

CHAP.43.

tries of France, did beare Agaricke : and in his 25. Booke and 9. Chapter, he faith that Agaricke was but a Mon rome of a white colour, growing upon a tree about the Bolphorus, and in another place that it groweth upon Cone-bearing trees, among the which the Larch tree is the chiefest; whereby it is plaine, that the ancient di Cone-bearing trees, among the which the Latentree is the chiefett's whereby and plante, that the ancients do not well know it. Brafavolm faith, that in riding neare Cosmeleb, he found Agaricke upon diverse Oakes, and nespecially upon lex or evergreene Oake, which saying Matthiolus contradicteth, saying that in all Tusken, and other places of Italy, as also in diverse countryes of Germany, Carniola and Dalmania which abound with a other places of Italy, as and in diverte continuous with at the kindes of Oake, he could never fee, nor fo much as heare that any Agaricke grew on them; but that he few diverfe other hard dry Mushromes, both white and blacke called touchwood growing upon diverse, wherewing the people use to take fire, that the steele and flint doe give, and use it in stead of March to discharge their for. ling peeces with all. As also that he never saw Agaricke growing upon any tree, but the Larch tree onely, in all the mountaines of Trent and Anania, where there be many Oakes growing, as well as Firres, Pines, and Pitch trees, and Larch trees abundantly: yet many doe affirme there is growing in many places upon the bodie of many trees a kinde of white Mushrome, to like unto Agaricke, that many miltake it for Agaricke.

Theatrum Botanicum.

The Vertues. There is in the leaves, barke, and fruit of the Larch tree, the same temperature that is in the Pine tree, the Turpentine thereof taken to the quantitie of an ounce will gently open the belly, and move to the stoole, provoke urine, clense the reines kidnies and bladder, and helpeth to breake and avoid the gravell and stone, and to give ease to those that have the gout : if it be first washed with Plantaine and Rose water, then made into pills, with the pouder of white Amber, red Corall, Masticke, and a little Camphire, it doth wonderfully helpe to stay the Gonorrhea or running of the reines, if they be taken for certaine dayes together, and taken simply rowled in Sugar it helpeth it well: it is profitable also for the Ptisicke or Consumption of the lungs, being taken with hony in a Electuary, it helpeth to expectorate rotten flegme, from those are troubled with a continual cough: the Turner, tine as it is the clearest for inward uses, and serveth in stead of the true Turpentine, so is it the best also for our ward falves, and doth both draw, clense and heale all fores or ulcers, either new or old, and greene wounds also. and therefore there is scarce any salve made for ulcers and greene wounds, wherein Turpentine is not put, there is likewise an ovle drawne chimically from Turpentine, which is singular good to be used in wounds, being more drying and confolidating than the Turpentine it felfe, as also to warme and ease the paines of the joynts and she newes caused of cold: the water that is distilled with the oyle, is used for freckles and spots in the face, a scruple in waight of that water, taken in white wine procureth a vomite, thereby giving much ease to such as have their ftomacks overcharged with flegme, the oyle is profitably used in hollow ulcers, being dropped into them, or a tent dipped in it and put into the ulcer: it is good also for the wormes and deafenesse of the eares used with a little Oxe gall : some use to mingle bay salt and Turpentine together, and therewith spread a girdle of leather and tie it about their wastes that have an itch, which by wearing some small time, will cure the itch that is spread over the bodie, as well as the hands. Agaricke is a medicine of frequent and familiar use, often by it selfe, but most commonly with other purgers, to open obstructions of the liver, spleene, and intralls, purging slegme in efpeciall, but in generall all other vicious humors, offending any member of the body, and because it doth some what trouble the stomacke, and procure casting, it is usually corrected with Ginger, and given with Oximel that is syrupe made with vinegar and hony: for it purgeth both thinne and rotten tough slegme, both yellow, hard, blacke, and burnt choller from the head and braine, from the breaft and lungs, from the fromacke, liver, and spleene, from the reines and blacke, and from the wombe, as also from the joynts, sinewes and muscles, and here by helpeth to cure the diseases that proceede from them, that is such as are troubled with the gout, dropsie and filling ficknesse, jaundise, the chollicke and hardnesse to make water, the sciatica or paine of the hips, the pale color in women caused by the staying of their courses, the shortnesse of breath, the cough and consumption of the lungs, the spitting of bloud, the paines of the mother, the sharpenesse of urine and the wormes: it is helpeful also to cure all forts of agues, either tertians or quotidiaus, to ease the griping paines of the stomacke and belly, or such as have had falles or bruises, or are bursten bellied, all which actions it chiefely performen, by purging those grosse and vitious humors that trouble the parts and members of the body, and are the causes of all these diseases; it is an antidote against all poisons, and cureth the bitings of Serpents very quickly, halfe a dram, or two scruples being taken in wine, either by the infusion or the pouder: for the other diseases afore specific a dramme fliced, and put into a gentle purging decoction but not violent, or into an infusion, is the most general manner of preparing it to be given; if it be boyled in lye with other Cephalicall helpes, it much comforteththe braine and memorie, and giddinesse of the head to be washed therewith, as also helpeth to stay the rheumes and catarrhes thereof, and clenfeth it much from scurfe and dandraffe.

CHAP. XLIII.

Zizyphus sive Injuba. The Injube tree.

Lthough in former times, there was but one fort of lujube knowne, yet now we have two or the which shall be shewed in this chapter.

The Iujube tree groweth forestimes to be very high, but more often to a reasonable height, by ving his stemme or body, bowed or crooked, and spreading rather in breadth, the wood whereoff whith and hard, covered with a rugged barke, from whence spread great branches, and from the less and from the l flender whitish twigges, about a foote long, full of leaves set on both sides, not usually directly one against ano ther, but one alittle above another, with an odde one at the end, each whereof is small, somewhat broad and pointed at the end, dented or finely nicked about the edges, with long veines in them, smooth and somewhat hard in handling, each standing on a short foote stalke, and very like unto the leaves of Paliarne or Christs thorses

at the foote of every leafe towards the toppes of the wigges come forth, small yellowish flowers, of five leaves apeece, where afterwards stand the fruite, which is somewhat like unto a small Plumme or Olive, but a little long, what like first, and then it is somewhat harsh, and yellowish after, but red and of a reasonable sweetenesse, vet fharpe withall, and somewhat clammy when they are ripe, flat as it were at the lower end, next the stalke, whose skin is thicket and harder than a plumme, and the stone within it is small firme and solid, long, round and pointed like unto an Olive or Cornelian Cherry Stone, both for forme and hardnesse: all the branches both greater and smaller are armed with thorns, two alwayes at a joynt, wherof the one is long, firong, fharpe pointed and staight, and the other crooked, both of them of a blackish red colour, like unto the elder branches: the rootes are long and firme in the ground.

2. Zizzphus sive Iujuba minor. The lesser Iujube tree. This lesser lujube tree is very like unto the former, both for the forme of branches, leaves and flowers, but lower and fmaller in all parts, the fruite also is alike, red when it is ripe, with such anhard firme Olive like stone, as the former, but the fruite hereof is smaller and rounder, and not long like as the other is: it is as thickely and ftrongly armed with thornes though somewhat shorter than the other.

3. Zizjohus sive Iujuba sylvestrus. The Wilde Iujube tree.

This low Wilde Injube tree groweth much lower and more like a shrubbe than the last, and more cruelly armed also with small sharpe thornes: the leaves are like but small, growing in the same manner, but fewer on a twigge: the lowers are like the other, the fruite is round and red like the last, and somewhat lesser, but dryer of substance, not having such a pulpie substance as either of the former have, and more austere even when it is ripest.

The Place. The first groweth naturally in Africa, Egypt, Arabia, & Syria & those more Easterly Countries, fro whence as Pliny faith

it was brought into Italy, and planted there in his time by Sextus Papinius, in the latter end of Cafar Augustus his reigne, which now a dayes is very frequent, not onely in many gardens, and Orchards of Italy, but in Provence of France alfo: it is fo tender that it feldome abideth long in our Country, because it cannot endure the cold; The other likewife was brought into Italy in these later times from Syria, where it is onely to be seene, but with a few that are lovers of rarities. The last groweth wilde, in the fieldes by the hedges, not farre from Verona; aboundantly as Pona faith.

The Theater of Plants.

The Time.

They all shoote forth in Aprill (for none of them doe hold their leaves all the winter) and flower in Mat; their fruite is ripe in September.

The Names. It is called in Greeke & Loga & Li Loga & Zizypha & Zinzipha, of Columella Ziziphus, of Clusius Ziziphus rutila, of others Rubra and Punicea, and of the Arabians from whom the Apothecaries tooke it lujube, and so doe Lobel and Pena, Anguillara thinketh it to be the Lotm of Atheneus, as also the Lotm of Theophrastun, that grew in the Mand Pharis, mentioned in lib. 4. c. 4. which is most likely, for it hath a dented leafe as he saith like unto Ilex; whereunto this is more like, than the leafe of the Lotus arbor, whereof I have made mention in my former booke. Some doe thinke that this fruite is that which Galen in 2; alimentorum calleth Serica, and unto this opinion many doe adhere, especially because Avicen entreating of Injubes calleth them Serica, for his title is thus; Delnjubin idest Scricin, yet it is no other likely, but that he was mistaken, for many worthy and learned men, doe doubt of it: but Pliny maketh mention of Sericum, before Galens time, in his 15. booke and 14. chap. to be one of the kindes of Tuteres (which we take to be Nuci perfice Netterins, for in his 16, booke 25, chap, he reckoneth the Tuberes, with the Almonds, Peaches, and Apricocks, as if they were all of one kindred, and in his 17 booke and 10. chap, he faith that the Tuberes, are best grafted on the Wilde Plumme &c. and therefore it is like ly he thought them of that kinde of Plummes) of the colour of raw silke (and we have a yellow Nettorin neere unto that colour) whereof came the name; which maketh me thinke that Galen his Serieum should not differ from Plinger, seeing they lived not any long time, one before the other in Rome, and therefore the name could not bee there altered: for Galen rather allowing of those things that were conducible to medicine, (and we know that Injubes are (o) then of furth as did pleafe the palare onely, as Nettorius are, and were fit and defired of wanton women and children onely as he faith, did not greatly commend the fruite for any good to the bodies health, yet I verily thinke, and of this opinion is Cornarius also, that his and Plinyei Serieum are all one. And although Matthiolus feeneth to finde fault with Pliste his booke to be falle, in naming but one fort of Ziezphus, and two of the Tuberes, when as Calumella, Avicen, and Sethi, make two forts of Ziejphus, yet afforedly their other white Zizyphus is good onely to kill all foure footed beafts, in the same manner that Oleander doth. The other Cordae in his hillory of plants maketh mention of, and calleth it Injuba minor, and whichmaketh me to thinke it to bee a Tuber, it is very probable to be the Paliurm Africanus of Theophraftu, and the Zizyphus filvestrin of Lugdanishis.

for I thinke he knew not the next hereunto which I call fylveftris, and is called Zizyphus fylvestris also of Com rarius, of Lobel & Pena Injuba sylvestris, who think it to be Rhammus altera of Paliurus Theophrasti, mentionedia his 4. booke and 4. chap. of Iohannes Pona in the description of Mons Baldus Chamazizapha and Zyzypha silve. stris. The Arabians call it Hanen and Hanab, and Zufalz, of the Italians Guggiole, the Spaniardes Azafoslas Acofeifo, the French Injubes and of some Guindoules, the Germanes Rollinfibeere, and Bruftbeerlin, the Duch Injuben and in English Injubes.

The Vertues.

The Injubes (especially while they are fresh much more than being dry) doe open the body and gently pure choller, and clenic the blood, thus faith Allmarins and Simeon Sethi, yet Matthiolus following the opinion of Avicen, denyth that they have any purging quality in them at all: all authors doe agree, that they have any purging quality in them at all: all authors doe agree, that they could the heate and sharpenesse of the blood, and therefore good in hot agues, and doe helpe them that have a count to expectorate tough stegme, and is good for the other diseases of the chests and lungs, as shortnesse of the chests and lungs, as shortnesses of the chest and lungs, as shortnesses of the chest and lungs, as shortnesses of the chest are chests and lungs, as shortnesses of the chest are chest and lungs, as shortnesses of the chest are chest as t distillations,&c. proceeding from hot humors it is also to good purpose used to clense the raines and the blad der from gravell, which it performeth by the viscuous quality in them, in making the passages slippery, and the gravell and stones to avoyd the more easily, they also stay vomitings procured by sharpe humours; but they at hard of disgestion, and doe not easily passe out of the stomack, being eaten either fresh or dryed, they are therefore used in decoctions alwayes with other things, fit and convenient for those griefes aforesaid.

CHAP. XLIIII.

1. Myxos five Sebesten. The Sebesten or Assyrian Plum.

T

He Sebesten tree groweth somewhat lower then the Plum tree, covered with a whitish barke, the branches are greene, whereon grow rounder thicker and harder leaves then they; the bloffomer are white consisting of five leaves a peece, growing many together on a long stalke, which afterward turne into small Berries rather then Plums, of a blackish greene colour when they are ripe, every one standing in a little cup, of a sweete taste, and glutinous or clammy substance, and a very thick

skinne : within which lyeth a threefquare hard ftone, with a thicke shell and a small kernell: these are gather and laid in the Sunne, whereby they grow wrinkled, and

fo they are kept, and brought over unto us in boxes. 2. Sebesten /ylvestris. The wilde Sebesten.

The wild Sebesten is in all things like the other, but that it groweth lower, more like unto a hedge bush, and with leffer and thinner leaves; the flowers and fruit are alike but leffe.

The Place.

The first groweth in Syria, and is but planted in Egypt, as Alpinus faith, and from thence were brought into Italy, in Plmy his time, which were grafted on the Service tree, and do now grow in many places there in their Orchards: it is so tender, not enduring the cold with us, that wee can as hardly keepe it, as cause it to spring, the shell of the stone being so thicke and the kernell so small : The other as Alpinus feemeth to averre, is naturall of Egypt. The Time.

They flower in May, and the fruit is gathered in September.

The tree is called in Greeke μίξω and the fruit μύξαι μύξα and υυξαεια a muccofo fructus lentore : μίξον enimmuccum significat, in Latine myxos for the tree, and Myxa and Myxaria for the fruit : it is thought as Ruellius faith that the Syrians in honour of Angustus, called them Sebasta, from whence the Arabians called them Sebastan; and the Apothecaries in their shops use that name onely.

The Vertues. The Sebestens by the judgement of both Arabians and Greekes doe open the body in the fame manner, or rather more by reason of the muccilagines in them, then Damaske prunes, yet more while they are greene, and lesse when they are dry, yet the decoction of them, or the infusion of them in broth, although dryed and taken whole

worketh effectually, which Fuschism denyeth, affirming that they binde rather; they serve to coole any interperate heate of the fromack or liver; and therefore are good in hot agues, and to purge choller whereof the come : Matthiolus faith that he hath often found by his experience, that ten drams or twelve at the most of the pulpe of Sebeltens, taken from the skins and flones, worketh as well and to as good purpole, as the pulpe of Caffia Fiftula: they are very effectuall also to lenifie the hoarfenesse and roughnesse or the throate they help the cough and wheeling of the lungs, and distillations upon them, by lenifying the passages and carding such flegme to be avoyded: they also give ease to them that are troubled with paines in their fides, and increasing helpeth them that are troubled with the sharpenesse of their arine, proceeding from choller or fair segme

Sebeften. The Sebeften or Affirian Plum.

TRIBE 2.

they also drive forth the long wormes of the belly. There is a kinde of Birdlime made of these fruites, by boyling they allouist to take away their skinnes and stones, and after boyling them more to a confistence, the them a util as Matthielus faith was used at Venice to catch birds, but Alpinus faith they use it in Egypt, as a plaister to dissolve hard comors or swellings.

CHAP. XLV.

Ruscus. Butchers Broome.

He first shootes that sproute from the roote of Butchers Brome are thicke whitish and short, somewhat like unto those of Asparagus, but greater, which in some places are eaten in the same manner that Asparagus shootes are; these rising up to be a foote and and a halfe high are spread Rafina. Butchers Broome.

into diverse branches, greene and somewhat crested with the roundnes, tough, what crefted with the roundnes, tough, pliant, and flexible, whereon are fer fome what broad and almost round, hard leaves,

sharpe and prickely pointed at the ends, of a darke greene colour, and fornewhat like unto Mirtle leaves. two for the most part set at a place very close or neare together: about the middle of the leafe on the backe or lower fide from the middle ribbe breaketh forth a small whitish greene flower consisting of foure small round pointed seaves, standing upon a very thort or no foote stalke, and in the place whereof commeth a small round berry green at the first, and red like an Asparagus berry when it is ripe, but greater wherein are two or three white hard round seedes contained: the roote is thicke, white, and great at the head, and from thence fendeth forth diverse thicke, long tough white

The Place.

This groweth generally throughout this Land, in copies, and upon heathes and walte grounds, and oftentimes under or neare the Holly bushes.

The time.

It shooteth forth his yong buds in the Spring, and the berries are ripe about September, the branches and leaves abiding greene all the winter.

The Names.

It is called in Greeki 5up poin Oxymyr fine, i, acuta Myrtu wpowa ay pla Myrtin fylvestris, (but there is another Mirine /ylvestris accounted of among the ancients. which is like unto the tame or manured kinde;) and Pling in his 15. Booke and 7. Chapter, confoundeth both these together, in giving to the one the faculties of the other.) puraus da Myrthacantha, Myrtus spinosa, puus da Murinassina and of Theophrastus xurroquopiun Centromyrrhine, Pliny faith they called it Chame myr fine,

and Acaron or rather Aceron which is one of their baltard names, of the Latines Ruscus and Ruscum, in the Apothecaries (Kops Brulem, and of some as Marcellus faith Scoparegia. The Arabians Scrapio, and others fowly erred in calling the berries hereof Cubebe, which are certaine aromaticall graines or berries like unto Pepper, but with a small point or end Ruellius translation of Dioscorides Greeke coppie is faulty herein, that he saith the berries hang downe from the leaves, when as the Greeke words are, it hath round berries in the middle of the leafe. which Theophrassus confirmeth in his 3. Booke and 17. Chapter, saying it is proper as well to Laurus Alexandria as Ruscus to beare the fruite on the leafe. The Italians call it Rusco and Pongitopo, as if you would say Prickemoufe, even as the Germans doe Muessdorn, and both from the Greeke pudage Murina spina qued arcendia muribus a falfacarne appensa circumlicetur: the Spaniards call it lus barta & Gilbarbeyra: the French Buis piquant. the Dutch Stekende palinre : and we in English Kneeholme and Butchers Broome,

The Vertues.

The rootes and leaves of Butchers Broome are hot in the second degree, and dry in the first with some tenuitie of parts: the young shootes are eaten like unto Asparagus, but because they are more bitter, they are rather used Phy-fically, and are very profitable to open obstructions, to provoke urine, and to amend the strong smell thereof, and is one of the five opening directicall rootes in the Apothecaries shoppes, helping to expell gravell and the stone, strangury, and womens monethly courses by drinking the decoction of the rootes made with wine: the same also helpeth the yellow jaundies, and the head ach, and with some sugar or hony put thereunto helpeth to expectorate flegme, and to clenfe the chelt of much clammy humours gathered therein : Dioscorides attributeth to the leaves & berries the same effects: yet some doubting of the operation hereof to such purposes as afore is said, do hold it to be as effectual in knitting and confolidating of broken bones and parts out of joynt, as Solomont feale Comfrie or the like, so drinke the decoction of the rootes, and apply them poultis wife unto the affected place. The pliant twigges or stalkes with leaves served in former times for many uses, to binde their vines of other things, as Wirgil his Venice doe tollifie in the second of his Georgicks in these words, ---- Nec

Vimina per fylvam, & ripis flavialis arando.

Cedatur;

and to preserve hanged meate from Mile eating, from whence came the Italian name of Pongitopi, and for to make Broomes to sweepethe house, from whence came the name of Scoparegia, but the Kings chamber is by tevo lution of time turned to the Butchers stall, for that a bundle of the stalkes tied together, derveth them to clerk their stalles, and from thence have we our English name of Butchers Broome,

CHAP. XLVI.

Sefamum. The oyly purging Pulse Sefamum.

His plant upon the first springing thereof from the seede, riseth up with foure small long and somewhat broad leaves, betweene which come forth other, that when they are full growne, are as large and log as the great Nightshade leaves, but some deepelier dented than others, and even almost torne; especially at the lower end of the lease next the stalke, each standing on a long sootestalke; the stalke right from among the lower leaves, being straight, thicke, fat, strong and round, two or three foote high; from whence shoote forth on all sides (if it obtaine a strong fat ground, and a warme place) diverse stalkes of leave Sefanum. The oyly purging pulse Sefamum.

like unto the other, (or else abideth bare or without branches) two for the most part set at a joint, and at each joynt of the stalke up to the toppe, commeth forth one flower, of a whitish colour, which is somewhat long like vnto a Bell slower, made of one leafe without division at the edges, having a few long without opening the flower: after the flowers are pall; there come up in their steede, small long hard cods, having three or source or five ribbes or crestes, which doe open themselves into fo many parts, having in each part small whitish yellow flat feedes lying therein: the roote is somewhat great and long, with many strings and sibres at it, taknig as fast hold in the ground, as a Sowthistle doth: both leaves, stalkes, and feedes are very bitter while they are greene, that cattle will not touch them, but being dried they become more pleafant for them to eate: and the feede becommeth more oyly than Linseede, from whence is pressed forth a whitish oyle, very sweete while it is fresh, and will not in a long time decay or grow stronger.

The Place.

It groweth naturally in the Indies and other Easterly countries, but is onely fowen in the fields, of Syria, Egypt, Sicily, Candy, Greece, and other places there abouts, it is to be had but in the gardens of lovers of rare plants in all Italy, neither in the transalpine countries: the Apothecaries in our land doe seldome use either seed or oyle, few or none of them ever saw the seede. much leffe the plant.

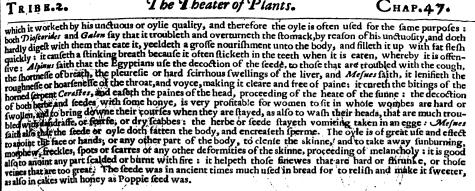

It floweth not untill July, and ripeneth not the feede untill September.

The Names.

It is called onounor and onoun in Greeke, and Sefamum and Sesama in Latine of all Writers thereof. Alpinus saith it is called in Egypt Sempsem, the oyle thereof Syris, and the footand grounds of the oyle Thaine. All Authours almost doe number it

among the graines and cornes, as a kinde thereof, and not of the pulse, which doe all for the most part bear cods, yet of diverte fashions but why they should doe so, I cannot conceive any other reasons, than that it was put into bread as Poppy seede was, the seede being somewhat like unto Millet, and that it was sowen in the sields, as other graine and pulse were; for Theophrassus in distinguishing the kinds of graine, sie. 8, cap 1, maketh 3. forts, the first wheate, barly, &c. the second beanes, pease &c. the 3. Millet, Panicke and Sesamon, where of corne beareth spikes or eares, pulse beare cods, and those that are like Millet, Panicke, &c. doe beareajale or maine, for so he calleth that reede-like tuft or bushy feather like toppe which the Millet and Panicke or beare, and setteth downe Sesamum omong them: now Sesamum hath no such bushy feather toppe as Panicke or Millet, or as the like have, but rather severall cods as the pulse, allthough in differing manner; but Galen in prime Alimentoria doth number it among the pulses, and faith it was in his time eaten of many as pulses are, Bellominia the 29. Chapter of his third booke of Observations, setteth downe the manner of making the oyle of Sesans, which if any be defirous to know, I referre him to the Author.

The feede and oyle of Sesamum are all of one qualitie and temperature, being neere the second degree of heate and moisture, both mollifying and disfolving : but the leaves especially while they are greene, are more cooling, fit to represe the inflammations and griefes of the eyes, by way of fomenting them, the seede is taken inwardly in decoctions or other wayes, or used in glisters to loosen the belly, when it is bound or pained by the cholists.

CHAP. XLVII.

Iris. The Flowerdeluce.

Here are so many forts of Flowerdeluces, that to shew you them all here againe (having described them all exactly in my former booke) would make this booke, too voluminous, I must therefore referre you thereunto, and give you here fome descriptions and figures with the vertues.

1. Tris major latifolia. The greater broade leafed Flowerdeluce.

This Flowerdeluce hath many heads of very broad and flat greene leaves enclosing or foulding one another at the bottome, and after divided in funder with thinne edges on both fides like a fword and thickeft in the middle: from the middle of fome of these heads of leaves riseth up a found stiffe stalke two or three foote high bearing at the toppe one two or three large flowers out of severall huskes or skinnes consisting of nine leaves, three whereof fall downe, having a freeze neere the bottomes, three other smaller than they bowed or arched cover the bottomes of the falling leaves, each of them divided at the ends and turning up a little, and three other the largest of them all stand upright but bow themselves a little that they may all for the most part meete together at their toppes or ends in some white,

1. Irin major latifolia. The greater broad leafed Flowerdeluce. 2. Iris major angustiselia.
The greater narrow leased Flowerdeluce.

3. Irusbiftora Lufitanica.
The Portingall Flowerde uce.

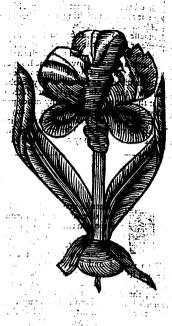

Chame Iris anguifti folia. The narrow leated dwarfe Flowerdeluce.

4. Chameirie: latejoita.

Dwarfe Flowerseluct winh broad leaves.

5. Xyris five Sparula fatida. Stinking Gladwin.

in others biew or purple, or blackish purple spotted, and in others of such varietie of mixture in colour that it is admirable, as you may see in my former booke, where I am too copious to bee here expressed, and therefore must referre you thereunto: the feede is enclosed in thicke short pods, being flat, and lying in rowes close one mon another: the roote is tuberous shooting forth on all sides the like knobs.

2. Iris major angustificia. Narrow leased Flowerdeluce.

This other fort of the greater Flowerdeluces, different not in roote, lease, flower or seede from the former, but in having the leaves narrower than it, and the flowers to be various as the former yet not so much.

3. I'm billor a Luftranica. Portingall Flowerdeluce.

This also hathno greater difference to diffinguish it than that it will sometimes flower twife a yeare, and the This also nature greates a distribute that the transfer of the flowers former increases and the flowers former increases, 4 falling downe, 4 flanding up, and 4 arched to cover the falls,

4. Chame in larifolia. Broad leafed dwarfe Flowerdeluce.

The dwarfe kinds likewife grow both in roote, leafe; flower and feede like unto the greater kindes in all respects

except the lownesse, for some will scarse rise above a foote high, others not halfe a foote, and some scarse so high as their leaves, which in this fort is broader, in others narrower: the flowers also varying in colour one from another but not mixed with that variety that is in the former.

5. Xyris five Spatula farida, Stinking Gladwin.

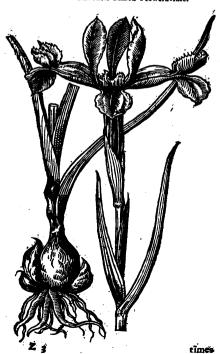

The stinking Gladwin is one of the kindes of wilde Flowerdecluces, both in forme and propert e, as I faid be-The tunking of adwin is one or the kindes of winde Flowerdelices. Both in forme and properte, as 11 and perfore, and therefore must be numbered among them. It hath diverte leaves riling from the rootes, very like unto a Flowerdelice, but that the leaves are sharpe edged on both sides, and thicker in the middle, of a deeper greene colour, narroweralso and sharper pointed than the leaves of most of the Flowerdelices, and of a strong or evill fent, if they be rubbed or bruifed betwixt the fingers: in the middle rifeth up a reasonable strong stalke three foote high at the least, bearing three or foure flowers at the toppe, made somewhat like the flower of a Flower deluce. having three upright leaves, of a dead or fullen purplish ash colour, with some veines discoloured in them, the other three doe not fall downe, nor the three other small ones are not so arched, nor cover the lower leaves, as those doe in the Flowerdeluce, but stand loose or a funder from them: after they are past, there come up three foure hard hiskes, opening wide into three parts when they are ripe wherein lye reddish feede, and turning blacke, when it hath abiden long: the roote while it is young is but small, and still of strings, but being growne elder they are greater, and fashioned like unto a Flowerdeluceroote, but reddish on the outside and whitish within, very sharpe and hot in taste, and of as evill a sent as the leaves.

6. Iris bulbosa latifolia prima Clusis. The first broad leased bulbed Flowerdeluce of Clusius. This kinde of Flowerdeluce hath diverse long somewhat broad and hollowish leaves not stiffe like the other forts but soft, greenish on the upperside, and whitish underneath: among which riseth up one stalke and some-

6. 1122 bulbofa prima latifolia tiufit.
Clufus his first bulbed Flowerdeluce with broad leaves.

CHAP. 48.

rimes more, not above halfe a foote high, bearing at their toppes one flower a peece, and feldome more, fores what like unto a Fowerdeluce, confifting of nine leaves, whereof those three that stand upright are shorter, and more closed together than in others, the three that fall down turne up their ends a little, and those three that inc thers doe cover the falls at their bottomes, hand like the upright leaves in other Flowdeluces, and are parted inc two ends like unrotwo eares: the colour of the flowers is blew, either paler or deeper, or white, which is more rare. (melling very sweete; the roote is round and white under the blackish coates that cover it, having fundry long white rootes in steede of fibres like unto an Asphodia.

7. Fris bulbosa major Anglica. The greater bulbed Flowerdeluce.

This hath five or fixe long hollowish or guttured whitish greene leaves, broader than in any of the leffer fort, among which rifeth up a stiffer round stalker two foote high sometimes, at the toppe whereof, out of a skinne huske breaketh forth one or two flowers confisting of nine leaves likewise, standing in the same manner that the former forts doe, but each of the falling leaves have a yellow spot neere their bottomes, and the three upright leaves are small, and narrow at their bottomes but broad upwards: the colour whereof is all blew, purple, or white, or mixed very variably, as is in my booke expressed: the heads for seede are smaller than the former, and is the feede, and not fo flat : the roote of this is usually greater than in the other smaller bulbous forts with loss haires or threds, in the outer browne coates which are not in the others.

8. Iris bulbofaminor five angustifolia Hispanica. The lesser bulbed Flowerdeluce.

This leffer fort groweth in the fame manner that the greater doth, but hath narrower long pointed leave, the flowers likewise are smaller, horter and rounder than in the other, but of the same fashion, and vary made more in the diversitie of their colours than it : the seedes are smaller, and the pods longer and senderer, and the roote also smaller, but more encreasing in bulbes.

The Place.

The Flagges or Flowerdeluces here mentioned as well as the bulbous kindes grow in diverse Countries Africa, Greece, Italy, and France, and some in Germanie, and in our owne Countrie, but are chiefely nursed upin their gardens that are lovers of such delights; the Gladwin groweth as well upon the upland grounds, yet in moyst places, as in woods and shaddowie places by the sea sides in many places of this land, and is continually mufed up in gardens; yet in paticular you may finde it growing, by a foote path, not far from the hither end of Det. for a towne in Kent; as also neere to Kentife towne, which is hard by London, if it be not digged up and carried away, for I doe verily thinke, it is not naturall in that place, but fome feede by chance, hath beene brought mong the foyle, whereby it grew there. The Time

The dwarfe kinds of Flagge Flowerdeluces flower in Aprill, the greater in May, and the bulbous forts not us till June, the Gladwin flowreth later than any Flowerdeluce doth, that is to fay not untill Iuly, and the feeden ripe in the end of August, or in September, yet the huskes after they are ripe opening of themselves, will hold their feedes within them for 2 or 3 moneths, and not shed them.

The Names.

The greekes call it I'els as also I'ee's Iris and Hieris, quasi facra, which made Gaza finding it so written in some coppies of Theophrastus, to translate it Consecratrix; but it was called fris, a calestis arcus similisudine, quam funt ejus representant, from the Rainbow whose various colours the flower thereof doth imitate, the old ignorant age made a difference betweene Iris and Irees, according to the Latine verse extant thereof, which is this, Iris per pureum florem gerit treos album. The Iris tuberofa, which is a peculiar kinde, as you shall finde it in my former booke, is called of Matthiolus Hermodallylus verus, because the rootes are like unto fingers, and from him divest did so call it, but most erroniously: for a while Dodoneus tooke it to be a kind of wild Flowerdeluce, and that me ly: yet some did take it to be Lonchitis prior of Dioscorides: the Arabians call it Asmeni juni or Ajersa, the Italian Iride & Giglio azurro & celefte, the Spaniards Livii cardeno, the French Flambe, the Germanes Gilgan and Himnel schwertol; but why Lobel should call the Iris bulbosa Anglica by the name of Hyacinthus poetarum, I fee no reason for it hath none of those mourning markes are in the Iris, nor is it of the forme of a Lilly. Gladwin is called in Greeke gieu, Xyris ob folii similitudinem quasi rasorium cultrum, ant novaculum dixeris, and in Latine Spatulat Spathula fætida, for Spatha is taken for a sword as Gladium is, and for that the leaves being bruised smell very ftrong, his denomination in Latine and English, hath rifen futable thereunto: Theophrastus calleth it Iris aria, Tragus in mistaking it did take it to be Gladiolus, the Arabians call it Casoras, the Italians Spatola fatida, the French Glarent puant, the Germanes Wendeleufkrant.

The Vertues.

All the Flowerdeluces especially the Flagge kindes are very neere of one quality, but of the bulbous kinder I finde no Author to write, or experience to teach whether they be of the same or differing propertie. The juyor or the decoction of the greene rootes of the Flag Flowerdeluce, with a little honey drunk, doth purge and clent the stomack of grosse & tough slegme and choller that lyeth therein, which might be the cause of diverse agues? helpeth the Iaundise also, and the dropsie, by evacuating those humors both downwards and upwards; and be cause it doth somewhat hurt the stomack, it is not to be given but with honey & Spiknard: the same being drunk, doth ease the paines and torments, or wringing of the belly, and sides, the shakings of agues, the diseases the liver and spleene, the wormes of the belly, the stone in the raines, convulsions or crampes that come of cold humors, by warming them and comforting the parts; as also helpeth those whose seede passeth from themuna wares or unwillingly, yet as one faith, it doth confume and waste it very much also; and is a remedy against the bitings and stingings of venemous creatures, being boyled in water and Vinegar and drunke: the same room being boyled in wine and drunke provoketh urine, helpeth the collicke, bringeth downe womens defired fidnesse, and made up into a pessary with honey, and put up into the body, draweth forth the dead childe : it is much commended against the cough, to cause tough stegme to be the more easily extenuate, and to be expectorate and spit forth; and therefore the Disiress in the Apothecaries shoppes, either in the powder, or made into a Labor of licking Electuary, is effectuall for the same purpose; it conduceth much to ease the paines in the head, and to procure sleepe and rest: being applyed with rosewater rosecake and vinegar, to helpe watering eyes, by clement the moylt sharpe humors, and drying them up : being put up into the Notrils, it procureth neelings, and thereby

also purgeth the head very much of flegme: the juice of the root applyed to the Piles or the Hemorrhoides, giveth much ease : and for the Dropfie, an Electuary made of the juice thereof, with other things in this manner. is held very effectuall: Take of Galange, and of Zedoarie, of each two drams, of Cinamon and Cloves of each one dram and a halfe, of the leaves of Sea Bindweede called Soldanella in the Apothecaries shoppes, halfe an ounce: make these into ponder, and with so much hony, wherein three drams of the juice of the rootes of Flowerdeluces hath beene boyled, and is sufficient, make them up into an Electuary; whereof halfe an ounce taken in the morning falting, for divers dayes will doe much good : it doth allo wonderfully helpe the paines and fwellings of the cods in this manner, Take foure drams of the pouder of the rootes thereof, of Cinamon and of Dill, of each two drams, of Saffron one feruple, mix these well together and apply them to the code, being first laid upon a scatter cloth, moitted in white wine, and warmed in a dish, over a Chasing dish with quick coales therein : the decoction of the rootes gargled in the mouth caseth the toothach, and a strong or stinking breath; the oviccalled Oleum Iriman, if it be rightly and truly made of the flowers of the great broad Flagge Flowerdeluce. of what colour I thinke it greatly mattereth not (but not of the flowers of the greater blew English bulbons Flowerdeluce, is I know some Apothecaries have and doeuse) and rootes of the same forts of Flowerdeluces is very effectuall to warme and comfort all cold joynts and finewes, as also the Gout and Sciatica, and mollifierh. diffolveth and confumeth tumours or swellings, although they be scrophulous in any part of the body, as also of the matrix: It helpeth the Crampe and Convulsion of the sinewes, warming them, and helping to extend them: the head and temples annointed therewith, helpeth the Catarrhe or thin Rheume distilling from thence; anduled upon the breast or stomack helpeth to extenuate the tough cold flegme, making it easie to be spit our it helneth also the paines and noyse in the eares, and the stench or evill savour of the nosthrills; it giveth also much easeunto the painefull Piles : The roote it selfe either greene or in pouder, helpeth to clense, heale and incarnate wounds, and to cover with flesh the naked bones, that ulcers have made bare, and is also very good to clense and beale up Fishulaes and Cankers, that are hard to be cured : divers doe use to beate the greene rootes, and soapply them to the face or other parts, but it is better tyed in a faire linnen cloth, and laid for a day and a nigh in faire or Role water, with which water you may wet or moisten the skin of the face, hands or neck, that are innourned or deformed with the Morphew, black or blew markes or fearres, or any other discolouring of the skinne, but they that use it had neede to take heede that they use it not too strong, nor let it lie on too long, but rather wash it off againe with faire water, within two or three houres after it hath beene used: The dryed rootescalled Orris, being beaten either alone of themselves into pouder, or with other sweete things, are used to be layd in preffes, chefts and wardrops, to sweeten and perfume garments of linnen, and filke especially, and all thing that you will put it to, and thus much of the Flowerdeluce. But there are but few that have written of the Gladwin, or that have remembred the purging qualitie therein, yet many of our country people in many places, doe with the decoction of the rootes purge themselves, and thereby avoyd much corrupt tough flegme and choller : yet some that will not have it worke so strongly, doe but insuse the sliced rootes in Ale, and some take the leaves which serveth well for the weaker and tender stomacks: the juice hereof procureth sneezing being putup or snussed up into the nose, and draweth downe from the head much corruption, and the pouder thereof doth the same : the pouder also drunke in wine helpeth those that are troubled with Crampes and Convullions, or with the Sciatica or Goute, and givethease to those that have any griging paines in their body or belly: and helpeth those that have the Strangurie, that is, that cannot make their water, but by drops: it is with much profit also given to those that have had long Fluxes by the sharpe and evill qualities of humors, which it stayeth having first clensed and purged them, by the drying and binding propertie therein, even as Ribarbe and foncother fuch like things doe; the roote procureth womens monethly courses very effectually, if it bee drunk after it hath beene boyled in wine, and some of them shred and boyled in wine and vinegar, in equall parts that shee may fit over the hot fumes, being close covered untill it grow neare cold; the roote used as a pessarie, worketh the same effect, but in women with child it causeth Abortion, that is, the delivery afore the due time; the feed beaten to pouder and taken to the quantity of halfe a dram in wine, helpeth those that cannot make water very effectually: the same taken with vinegar disolveth both the hardnesse & the tumors of the spleene; the root is very effectuall in all wounds, and specially of the head, as also to draw forth any splinners, thornes, broken bones, or any other thing slicking in the sless without causing any paine, used with a little Verdigrease and hony, and the great centory roote : the fame also boyled in vinegar and layd upon any hard tumors, doth very effectually dissolve and consume them, yea even those swellings of the throate, called the Kings Evill : the juice of the leaves and rootes is profitably used to heale the itch, and all running or spreading scabs or fores, and blemishes or fearres in the skinne : fome doe suppose by the sharpenesse of the taste in the roote (especially more then in the feede, which is more drying) that it hath as well a corrofive as opening quality therein : some also doe appropriate it to the effects of the chells and langs, for which the Iris or Flowerdeluce is more proper and effectuall: fome also to flay the involuntary passage of the sperme, following Pliny therein: and some also to heale the hemorrhoides, and others the diseases of the fundament : It is thought also to bee effectuall against the poyson of Serpents; and thus much for the stinking Gladwin.

CHAP. XLVIII.

Cnicas five Carthamus. Bastard or Spanish Sastron.

Lthough thele forts of Criew might well be placed among the Thiftles, as other Authors doe, and with these that other wildekind, called Attractylis, but because these onely have purging qualities; I thought it best thus to separate them, and intreate of these in this place.

1. Caicin five Carthamia faitum. The manured baftard Saffron.

The manured baftard Saffron hath fundry large leaves lying next the ground, without any pricks, or with very few white ones at the corners of the leaves and divisions, among which rifeth a strong hard round stalke three or foure foote high, branching it felfe up to the top, bearing shorter seaves, sharpe point

1. Cricus five Carthamus Jarivus.
The ordinary Spanish Saffron.

2. (nicus alter Greskus.
Wilde or bastard Saffron of Candye,

ted, and prickly at the edges, and at their ends a great open fealy head, out of which thrusteth forth many gold yellow threds, of a most orient and shining colour, which being gathered in a dry warme time and kept dry, will abide in the same delicate colour that it bare when it was fresh for a very long time: the seed when it commets to maturity, is white and hard, somewhat long and round, and a little cornered: the roote is long white and wooddy, perishing yearly after seede time. This hath beene found with a white flower but very bare.

2. Cricius alter Creticus. Wildor baltard Saffron of Candy. This other baltard Saffron of Candye, from a thicke and long blacke root rifeth one straight round stalke, halfe a cubit high, sethere and there with long sharpe pointed leaves, thicke set with prickles at the dentes of the edges, at the toppe whereof standeth a scaly head compassed with prickly leaves, of the bignesse of the Attrassylvior Distasse Thisse, out of which breake forth divers thicke yellow Saffron like threads thicke thrust together, after which the seede groweth therein being white, and as great as the greater Centory seede.

3. Cnicus alter perennis Clusis. Clusius his everli-

This bastard Sastron vision with divers hard strong and round stalkes, without any branches at all from them, to the height of three or soure some bearing thereon at severall places somewhat large and long leaves, dented about the edges, of a sad or duskie greene colour: at the top of every stalke, standeth one great close hard scaly head, but not prickly at all, not so great as the other Cnicss or bastard Sassron, never opening the scales of the head as it doth; from the middle whereof commeth divers threds, yet nothing so many as in the other, of a sad blewish as shooting, and whitish at the bottome of them, the seede which lyeth among the downe in those heads is greater, sathough Clussins saith smaller, for I see

you forth the plant as it groweth with us) then of the other thick and short, but not white, and in lesser quantity then it: the rootes runne downe deepe into the ground, and being there encreased doe runne and spread themselves, taking up a great deale of roome.

The Place

The first is generally sowen in Spaine, Italy and other places, for the especialluse thereof: The second Alpinus saith was brought out of Candye: The last groweth wilde in Spaine, as well about Sevill as Cordula, and in other places as Clussus saith, Powa remembereth it to grow upon Moura Baldus.

The Time

They flower in the end of Inty, or about the beginning of August, and the feede is ripe about the end thereof.

The Names.

It is called in Greeke who and wine of (nicus and Cnecus, either opin it all us and eft punters vel mordere, or amino unnotation and praviginem excites, but is more properly to be unique and of the wilde kind: or rather a flow colore, cum united exponents crocess vel rutilus; it is called from any Checus, also in Latin, and Carthams in the Apothecaries shops, and violance as it is thought, and of program, but more truly from the Arathan Aratim. The first is called Concus Saracenicus. The second is presented by the name of Corous Saracenicus. The second is presented by the name of Corous Saracenicus. The second is presented by the Arathan doe all other after him without any great variation. The Arabians call it Kartans; the Inthians Saff man Sarafe and graine de Perroquets because they after they use to feede Parrats with the seede; in English Wilde Saffron, Bastard Saffron, Spanish Saffron, and Catalonia Saffron.

The Irit Spanish Saffron flowers are much used in Spaine and other places, to bee put into their brothes and meates, to give them a yellow colour, which doth much please them for as for anytelish of spiegor hot quick take they have none, nor any comfortable qualities, that they should be desired to mether have they any colour: the seede is chiefly used in Physick, or rather the kernells within the teast, which beaten and the emulsion thereof with honyed water, or wicksche broth of a puller, taken falting, doshopen the body, and purgeth waterie and stegmatick humours, both upwards and downewards, which humors also it voyden if the emulsion of the seede given in a glister, and thereby helpeth the colline and dropse, and those other diseases that monds and pine kernells; it clenseth the brest and lungs of slegme sticking therein wonderfully, causing it to be easily spit forth, it also cleareth the voyce, and encreaseth sperme, by the often use of it; but it doth somewhat trouble the stomacke, and therefore some stomachicall helpers are fit to be given with it, as Aniseede, Galanga, Massicke, or if neede be of more forcible, Cardamons, Ginger, sale spines, e.c. a dram of the flowers in pouder taken with an ounce of the Syrupe of Wormewood, doth the like also: the confection made of the seede called in shoppes Diacarthamum, is an especiall good medecine both to purge choller and seagne, as also to cleare doth in not move their bodies a white. The second for Alpinus saith is used by the naturalists in the same manner, and the same purposes to purge that the first is used. Of the last there is little written, but we may onely suppose that being so like in forme, it should so be also in quality.

CHAP. XLIX.

Papaver corniculatum, Horned Poppie.

Here are at this day two or three forts of horned Poppies knowne to us, whereas there was but one fort knowne to Diofeorides, and other the antient Greeke and Latin writers.

1. Papaver corniculatum luteum. Yellow horned Poppie.

This horned Poppie hath divers long and fomewhat large which he hoavy leaves, lying upon the ground, very much cut in or torne on the edges, and fomewhat rough or hayrie, from among which rife up divers weake round (talkes, leaning downe rather then (tanding upright, fomewhat hayrie allo, spreadayes of a fine pale yellow colour, with a few threds in the middle, standing about a small crooked pointell which in time groweth to be a long naked round pod, halfe a foote long or better; with a small head or button, for the preading divers wayes, enduring maps yeares, and keeping his leaves all the winter; every part hereof yeel-deth forth a yellow juice being broken, of bitter tast.

The red horned Poppie hath fewer, lesser and more jagged leaves then the former, nothing so whirish, but of a slike the other, and consisting of our eleaves a peece, but much smaller and of a pale reddish colour, for the most having such like small blackish seed within them: the roote is long and slender, perishing every yeare, and raights side sides in owner so when it is broken like the other; when it is broken like the other.

The blew horned Poppie groweth much lower, and with finaller leaves, very much or finely cut and divided many parts; of a fad greene colour : the stalkes are low and slender, yet somewhat hairy, rising not much

1.2. Paparver corniculatum luteum five rubrum. Horned Poppie yellow and red.

3. Papaver core is plature violaccum. Blew Horned Poppie.

above a foote or halfe a yard high at the most, with small flowers at the toppes of them, like unto the last for forme, that is confifting of soure leaves, but of a faire deepe purple colour, almost like unto a violet : after which come small slenderer and shorter pods, not above a singers length, wherein lyeth such like blackish seede, be finaller: the roote is finall and perisheth every yeare.

The first groweth naturally by the sea side, as well beyond sea, as on the coastes of our owne country in many places, both of the Kentish and Essex shore, as at Rie and Lid, at Harnich and Whitstable, in the Iles of Tennet and Shepey: and is much desired and planted in Gardens, for the beautifull aspect thereof, as well as the vertues: the other two Clusius saith, hee first found in Spaine, growing by the way sides, and in the corne fields; as also in Austria and Bohemia, that with the red flower, Matthielus long before his time remembreth to have found there.

The Time.

The first flowreth from May all the Summer long, untill the end of August oftentimes, and his seede ripered in the meane time. The second flowreth seldome before Iuly, and giveth ripe seede every yeare, if the time prove not too unkindly thut the last as it is late before it spring, so it commeth late in the yeare to flowring, and feldome giveth good and perfect feed with us.

The Names.

It is called in Greek with a regations, and in Latin thereafter Papaver corniculatum, or Cornutum, a filiquarum of gie in corniculorum modo inflexa, because the pods are crooked like a Cornet or Horne, Pliny and others say it wis called also Paralion, that is marinum, and of some papaver sylvestre. Divers doe thinke that Glaucium was made hereof, as Dioscorides faith himselfe; Pliny faith in his time it was so called, deceived as Dioscorides faith by the likenesse of the leaves: but Dioscorides in describing Glancium, faith it is the juice of an hearbe, that hath leaves somewhat like unto Horned Poppie, but fatter, yeelding a yellow juice, so that if it bee but like it, it cannot be the fame thing : Cluffus faith that the Spaniards called the last Rofetta, and some Amapoles morades, because the flowers give a juice like Mulberries : It is called in English of some Sea Poppie : they of Mompelier u Pena faith, were wont to call it Anemone corniculata: The Arabians call it Almacharam, the Italians Papaven cornuto, the Spaniards Dormidera marina, the French Pavot cornu, the Germans Gelb Dalmagen mon and Gelb demagen samen, the Dutch Geel Hent oft Harne hent, and we in English Homed Poppie.

The Vertues. The feede of the Sea or Horned Poppie, doth purge the belly gently, if it be taken in meade or honyed water the roote thereof boyled in water unto the halfe, and drunke, helpeth the obstructions and other diseases of the ver, and the paines of the Sciatica or hucklebone : it provoketh urine allo, and is very good for those that void foule matter, like ragges in their urine; the leaves and flowers as Diofeorides and Galen fay, clente fowle and it rulent Vicers, and that so powerfully, that Gales adviseth that they should not be applyed unto those fores a

C HA P. 50. alcers, that are already clenfed, left they confume the quicke flesh also, it taketh away also by the thrength and force of the clenting qualitie, even those crusts that ulcers many times doe get by sufferance or ill looking unto: the leaves and flowers faith Diofeorides, being used with oyle, cleanse the eyes of eattle, that have spots or filmes

CHAP. L.

Papaver Spumeum sive Ben album vulgo. Spatling Poppie.

TRIBE 2.

His small low herbe hath diverse weake tender stalkes, full of joynts, about halfe a yeard or two soote long, usually lying on the ground, whereon grow many pale whitish greene leaves, two alwayes let together at the joynts, one against another; having many times upon the leaves, but more often about the joynts of the stalkes a certaine white frothy substance, like unto that is called Cuckow spirtle: at the toppes of the salkes stand many flowers together, every one on a pretty long foot stalke, hanging down their heads, which are white, composed of five small white leaves a peece, with a deepe notch in the middle of every

one of them, making it seeme to confist of more than five, standing in a large loose huske striped, the flower scarseappearing above it, wherein afterwards is contained blacke feede: the roote is white and fpreadeth in the ground abiding fundry yeares. The Place.

It is found generally through England, in many places and pastures, and by the hedges sides, yet it is much defired to be planted in gardens.

The Time

It flowreth from June untill the end of July or later, and the feede ripeneth in the meane time, the roote abideth all the Winter, and so doe some greene leaves

The Names.

It is generally called Papaver Spumeum, and of some Ben album, as a difference both from the Valeriana rubra Dododonei, red Valerian, and Muscipula Lobelij, each of Dodowni, rea vaurian, and orinjurant of them is the true them called Benribrum, yet neither of them is the true Benalbum or rubrum of the Arabians. Dodonaus taketh it, as others doe also, to be the Polemonium of Dioscorides, but heistherein more mistaken in my judgement, than those hethinketh are, that take it to be the Papaver Spumeum or Heracleum of Theophrastus, Dioscorides, and Galen: but Plin heweth his mistaking the Greeke words 5883 tor in the description thereof wonderfully, comparing the leaves to the wings of Sparrowes or birds, when as Dioscorides intendeth the herbe Struthium, called Radicula or Lanaria herba, (which some with us take to be Saponaria,) because in ancient times, they used to whiten linnen clothes with the rootes thereof, and Theophrassus, if Pliny had regarded the place, lib. 9, cap. 13. (speaking of Papaver Heracleum, suth it hath leaves like Scruthium, called Radicula, wherewith they use to whiten linnen) might have eschewed that errour. It is accounted a kinde of Lychnin by most of the

best Herbarists, and therefore Baubinus namerh it Lychnis sylvestris que Ben album vulgo: some with us call it

The seede of spatling Poppie purgeth slegme saith Galen, and causeth vomitings saith Dioscorides, being taken in meade or honied water, and is especially good for those that are troubled with the falling sicknesse.

CHAP. LI.

Thalittrum sive Ruta pratenfis. Medow Rut.

Here are fundry forts of Medow Rue, some growing in our owne Land, others in severall coundries abroad as shall be described in this Chapter.

This Medow Rue rifeth up from a yellow firingie roote, much spreading in the ground, and shooting forth new sprouts round about, with many herby greene stalkes, two stoots high, as well as below, being divided into smaller leaves, nicked or dented in the forepart of them, of as greene colour on the nonerside and male greene underneath a toward the toward the toward of the stalke there shownth and greene colour on the upperfide, and pale greene underneath : toward the toppe of the flake there shooteth

Papaver spumeum:

forth diverse short branches, on every one whereof stand two or three or foure small round heads or button which breaking the skinne that enclose the them, shew forth a tuft, of pale greenish yellow tufts or threds, which falling away, there come in their places finall three cornered cods, wherein is contained small long and round feede, the whole plant as well leaves, as flowers, have a more strong unpleasant sent than the next Spania

2 Thalistrum latifolium Hifpanicum. Tha iffrum majus vulgare. Spanish Medow Rew. Ordinary Medow Rue.

There is another of this kinde whose leaves standing one against another are not divided at all but are whole and longer, a

branch whereof I give you here to fee.
2 Thalistrum majus album Hispanicum. Great Spanish white Medow Rue.

The leaves hereof are much larger than the former, and more divided at the edges, and so like unto Columbine leaves that they easily deceive one not well acquainted therewith, yet are they leffer and of a fadder colour standing on long stakes, a-mong which rifeth up a strong round stake three foote high at the least, branching forth into two or three parts, with leaves at the severall joints of them, at the toppes whereof stand many fmall round yellowish buttons in a tust together enclosed in a white skinne, which breaking each button sheweth to be a small tuft of threads like the former but greater, and of a white colour tipt with yellow and somewhat purplish at the bottome, of a strong sent abiding long in flower if it grow not too open and then fall away like short threads: the seede is like the former but greater, and so are the rootes likewise and yellow like it, which retaine neither stalke nor leafe all the Winter, but shooteth a new in the Spring.
3. Thalistrum montanum majus.

The greater mountaine Medow Rue,
This Mountaine kind hath as large stalkes as the former great kinde, and rifeth up as high, but are not crefted or cornered at all, the leaves are divided like unto them, and of a fad greene colour alfo; the flowers are white, which smell # ftrong as they, and the leaves are rather stronger than the first ; the rootes likewise are yellow, and spreadings most as much.

4. Thalittrum montanum minus album, The lesser mountaine Medow Rew. This is like unto the last in all things, but in the smallnesse of the plant, and in the smell, which is nothing to fitrong or unpleasant, for the leaves are greene as they, and the flowers white in the same manner; and the control of the con

Thalittrum latifo ium non incifis folijs. Medow Rue with uncut leaves.

vellow and fomewhat creeping: There is also another fort hereof differing little from it, but in the colour of the Flores.

hower which is of a pale Violet colour with yellow tips. . Thalistrum minus. The smaller Medow Rue.

This small kind is almost in all things like unto the former, but smaller both in leaves, being of a little fresher greene colour, somewhat more shining; and in the stalkes being round and not crested, and in the slowers being somewhat whiter: the rootes likewise are yellow, but doe not spread or creepe, so much as the former. 6. Thalittrum minimum. The least Medow Rue.

The smallest kind of Medow Rew, hath such like small or rather smaller, divided and notched leaves than the fourth kind hath, but they are of a whitish greene colour; the stalkes rise not above a foote high or a little more, the flowers are more yellow, and the rootes runne in the ground, rather more than any of the former.

7. Thalistrum angustissimo folio. The narrowest leased Medow Rue. This kinde of Medow Rue hath yellow stringie rootes, like unto all the former forts, from whence springets This kinds of Medow the hard yellow transfer footes, like unto all the former forts, from whence ipringeth up a salk, very much crested or cornered, three foote high, bearing many sad greene leaves at the joynts, which are smaller and longer than any of the former, and ending most commonly, in three points longer than any of the refliche toppe of the stalke is branched, bearing many small pale yellow tusts of slowers, like unto the others. Of this kinde there is another whose leaves being smaller than of that former sort, with uncut leaves or without Manager this kinde there is another write care so being minuted that to that for the kinde there is any division in them likewife, doe not otherwise differ either in height or colour of flowers from the fourth fort; milit jo. both these forts with uncut leaves, I saw in a Booke of dried herbes, belonging to Doctor Foxe, President of the lift.

8. Thalittrum minimum fatidissimum. Stinking Medow Rue.

The stinking Medow Rue hath his stalke round and greene, which is sometimes purplish, not above a soote high with diverte leaves thereon, divided for the most part into three parts, each whereof hathtwo dents or notches, of as fad a greene colour on the upper fide, and of as pale a greene underneath; as the first kinde here fet downe, the toppe of the stalke is branched and on them stand small round mossive or threadie flowers, like the reft, of a pale yellow colour; the small cods that follow are cornered with a crooked end, fixe or seven standing together, wherein is inclosed small seede : this smelleth most strong and unsavory of all the rest, in his naturall together, wherein is inclosed iman leede: this inhelicin more throng and uniavory or all the reit, in his natural place, but by transplanting and manuring, it loseth part of the virulencie and becommeth lesse offensive.

9. That stranger is in face and offensive Americanum. The American Medow Rew.

This stranger is in face and offensive habit so like a white Spanish kinde, that they can hardly be knowned.

This trianger is in race and our ward about to take a winter spannin kinds, that they can hardly be knowne afunder, but that it is fuller of stalkes and leaves; the flowers of the toppes of the branches are at the first of a pale blush colour, but being blowne open confilt of five white leaves, and a number of white threds in the middle, tipt Alter middle, with yellow. There is another smaller fort hereof whose flowers are purple tipt with yellow.

The Place.

The first as I said groweth in many places of our owne Land, in the horders of moult Medowes, and by dirch fides. The second was sent in out of Spaine, is found likewise in our moilt Medowes and by dirch sides, but nea-rer the sea, and at Margate on the chalkie cliffe on the left hand, as you goe from the towne to the sea side; and in other countries farther from the sea side. The third and fourth were found by Clusius on the hills in the lower Assiring and Hungarie. The fift and fixt was found by Cluster also in the lower grounds, by the rivers sides. The fewenth is said to grow in the fields by Mychsteld in Switserland. The eighth grew in the countrie of Valesia; and the two last came from Virginia.

They doe all flower about July, or in the beginning of August. The Names.

It is generally held by our best moderne Writers, to be the Thalistrum of Dioscorides, called in Greeke Salarya and Salarpov a Salario vireo, as some thinke, eo quod dam germine protrudit eleganter vireat. Some also have called it Pigamum quaft minaror, that is Ruta, for the forme or likenesse of the leaves, and so have entituled it Ruta palastru or pratensis; others from the yellow colour of the rootes, have called it Pseudo rhabarbarum Bassard Rubard: but I thinke more truely of the purging and binding qualitie, both joyned together like unto Rubarber Most Writers now doe call all these kinds of herbesby the name of Thalittrum or Thaletrum, with their feverall diffinctions. For the first here set downe is called by most Thalittum jus, and of some Ruta pratensis, as Lobel doth: of Casalpinus Ruta sylvestria, of Lugdanensis, it is set forth for Pigamum quasi myavov, i. Ruta, and of some as Gener saith Saxifraga lutea, Camerarius calleth it Thalistrum Germanium latifolium, and the Hispanicum which is here the second he calleth Italicum. The fift is Lugdunens in his Hypecoum, in his Booke de palustribus, and is the minus of Dodoness, or Ruta pratensis teninifolia of Lobel and others. The third is the first great Monout, and is the minus of Dodoness, or Ruta prateries tenuifolia of Lobel and others. The third is the first great Mon-tanum of Clusius, and the fixt of Camerarius flore albo. The fourth is Clusius his small Mountaine kinde, with a white slower, as the purple slowed kinde is his third Mountaine fort. The fixt is Camerarius his Thalistrum tertium angusti folium and Clusius his seventh or last. The seventh Bauhimus calleth Angustissimo folio, as he doth the cight minimus foridissimo as their titles declare. The worlds are called by those that sent it us, as it is in their titles. The Vertue's

Diescorides saith that being bruised and applied to old sores, it bringeth them to cicatrizing, that is doth perfectly cure them: and the distilled water of the herbe and flowers doth the like, for as Galen saith it drieth without any heate or sharpeneffe: The berbe is of some ised to be put among other pot herbes, to helpe to move or open the body, and make it soluble: but the rootes washed cleane and boyled in ale and drunke, doth provides to the like. voke to the floole more than the leaves, but yet very gently! It is faild (according to many other superstitious conceits inother things) that if the whole plant both herbe and roote, be hung up in a chamber, or tied to the necke of any person doth free them from any danger or harme. The rootes hereof boiled in water, and the plantes of the body and the plantes of the plantes of the body and the plantes of the tes of the body most troubled with vermine or lice, washed therewith while it is warme, destroyeth them utterly: the body most troubled with vermine or lice, wained the Jaundise as Camerarius saith: Lugdaniens in transferring the name rigamentherunto doth therewish set downe a vertue proper to Rue, as if it did belong to this, that is, that it raiseth up him from his sit that hath the falling seknesse, it some of the juice be put up into his nostrille, and should be put up into his nostrills, and there kept a while.

CHA P. 52.

CHAP. LII.

Afarum. Afarabacca.

Have in my former Booke given you the knowledge of this Afarabacca, but because I have no there expressed it so sufficiently, as it ought to be, I have here amplified myselfe in some particular, Now although there was but one fort of Afarms, with all Writers now adayes, yet wee haven ceived annother fort out of Virginia somewhat differing from the other; and although the mine ceived annother fort out of Virginia somewhat differing from the other; and annother for out of Virginia somewhat differing from the other; and the same that he other is same than the same that it is so sufficiently knowne, there is the former tribe, and shall be further declared in this; yet now I hope that it is so sufficiently knowne, there in cause of errour, but Matthiolus doth adde another herbe somewhat like unto it in leaves, whereof I means to

1. Afarum vulgare. Common Afarabacca.

Afarabacca hath many heads rifing from the rootes, from whence come many smooth leaves, every one upon his owne footestalke, which are rounder and bigger than Violet leaves; thicker also, and of a darker greene his ning colour on the upper fide, and of a paller yellow greene underneathe, little or nothing dented about the

I. Afarum vu'gare. Common Afarabacca.

2. Afarum Americanum. Virginia Afarabacca

edges: from among which rife small round hollow browne greene huskes upon short stalkes about an inch long, divided at the brimmes into five divisions, very like unto the cuppes or heads of the Henbane feede, but that they are finaller, and these be all the flowers it carrieth : which are somewhat sweete being smelled unto, and wherein when they are ripe is contained fmall cornered rough feede, very like unto the Legnelle or stones of Grapes or Raisins: the rootes are small and whitish spreading diverse wayes in the ground, and increasing into diverse heads, but not running, or creeping under ground, as diverse other creeping herbes doe, which are somewhat sweete in fmell, refembling Nardus, but more being drie, than when they are greene, and of a sharpe but not unpleasant taste. Comer wise saith that Gener found a greater kinde hereof, and more sweete, upon the Alpes in Switzerland, which Baubines as it should feeme never faw, and therefore doubted of the truth.

2. Afarum Americanum, Virginia Afarabacca. The Afaram of Vivginia groweth very like the former, but the leaves are a good deale larger, fiffe also and thicke, somewhat crumpled about the edges, of a darke greene colour, but not fo much thining as it, and not fo

Afarina Matthioli Baftard Afarum of Matthiolus.

round but a little pointed at the end, some also will be spotted or straked : the flowers have usually but three divifions or points of a paler greene colour: the rootes are somewhat greater and fuller of substance spreading in the finns or pointer and smelling somewhat more fragrant, and a little hot in taste biting a little the tongue.

3. Afarina Matthioli. Bastard Afarum of Matthiolis.

Bastard Afarum is a low herbe also, creeping upon the ground, somewhat like unto Afarum, having such like leaves upon long hairy footestalkes, but rounder and rougher than they, and somewhat dented about the edges: the flowers are like unto Camomill flowers, but that they are finaller by much, and wholly yellow, as well the border of leaves as middle thrume, and are not unpleasant in smell; the rootes are slender small and long, creeping under the upper crust of the earth, and not shooting downe deepe somewhat of a sharpe taste, and a little bitter The Place

The first groweth under trees and upon shadie hills, in Pontus and Phrygia, as Dioscorides faith, and in Italy ale fo, and in fundry other places, and is frequent in gardens, The second came from the parts in or about Virginia, The third as Matthiolus faith is found upon some mountaines of Bohemia and likewise in Somersetshire in our owne Land, found by Dr. Lobel,

The first and second keepe their greene leaves all'the winter, but shoote forth new in the spring : and with them come forth those heads or flowers, which give ripe seede about Midsommer, or somewhat after: the other doth follow much the fame courfe.

The Names. It is called in Greeke A ouego quast doughous in ornatum non veniens, as Plinge faith because in coronin non addatur; but thetext of Dioscorides is flat against him, for he saith it is med dedons suparandum, a sweete herbe audatin; but meters of properties is that against finite for the fails in the acapity superforming a tweeth herbe used in galands; it is also called Napols a yea, in Latine Afarum & Nardus filesfiris or Nardus rustica, and as Macer saith Vulgago, as by his verse appeareth; Est Afaron Grace Vulgago, dith Latine: The former times as I sayd before, thought Afarum and Baccharis to be one herbe, and therefore not knowing what Baccharis was, they called his Afarum Asarabaccara, which imame is continued both in Spaine and other places, and with us also to this day: but the descriptions of them being so diverse (if they had beene regarded or lookt into, which was utterly neglected, and those times led onely by tradition, without searching out the veritie of things) would make one mervaile how they could be so much mistaken, as from the ignorance of some that called Asarum Bacchar, to make one name of both : but the errour being so old even before Plinye his time, may seeme to make it the more excusable, but we should not continue in the same course, they formerly did: seeing Plinge sheweth the etrour, and findeth fault with them that were so led, as is shewed in the chapter of Baccharis. The fiftis called Afarum by all our later writers, except Lobel that calleth it Afarum Baccharis five Bacchatus, The second we have imposed the name according to the forme it carrieth as it is in the title. The third Matthiolus first called Afarina, and so doe others that set it forth after him, onely Clusius doth much suspect it, to be his second Tuffilago Alpina, and that his figure was taken from a dry plant, and before it had brought forth the flowers to perfection: but by the sharpe taste and creeping roote, it may more probably be taken to be the Catyledon palustris acris or urens. The Arabians call it Asaron, the Italians Asaro and Bacchara, the Spaniards Asarabaccara, and we in English Asarabacca or Asarobacca.

The Vertues. Disserides faith it hath an heating quality, where or howfoever applyed, and that it provoketh urine, & easeth the paines of the stone; is profitable for dropsies, and for the old paines of the Sciatica: and that sixe drammes of the rootes being drunke in honeyed water procureth womens courses, and purgeth like unto blacke, Hellebor: Mefact placeth it among other purging heatbes and so doe I, for being drunke it not onely provoketh vomiting, but worketh downewards, and by urine alfo, purging both choller and flegme: it is made the more ftrong if fome Spiknard be added, with the whey of goates milke or honyed water; but it purgeth flegme more manifestly than choller, and therefore doth much helpe those that are troubled with the paines in the hippes, and the parts thereabout, especially if it be either steeped or boyled in whey: it doth wonderfully helpe the obstructions of the liver and spleene, and therefore profitable for those that are troubled with the dropsie, and the overflowing of the gall, which is the I aundife, being steeped in wine and drunke; it helpeth those continuall agues, that come by the plenty of flubborne humors. An oyle made thereof by fetting it in the funne, and whereunto some Ledanum is added, provoketh sweating, if the ridge of the backe be annointed therewith, and thereby driveth away the shaking fits of agues. It will not abide any long boyling, the chiefest strength thereof vanishing, thereby; nor much beating, for the finer powder doth provoke vomits and urine, and the courfer purging downewards, thus faith Mefues: hereby as Matthiolus faith, the Germaine Country people were taught to cure, both tertian and quartaine agues, by drinking a draught of the decoction thereof made with wine, wherein a little Mace or Cinamon or honey is put, either every day or every other day, which pargeth the body and often procureth vo-mitings: as also they anoint the ridge of the backe, and the soles of their feete with the warme oyle made thereof by long funning, upon the accesse or comming of the fit, being in their warme bed, whereby they prevent the shaking fits, and provoke much sweate, and are thereby cured, that have long lingred under the disease: It is profitable for those that have convulsion of the sinewes, and an old cough. The common use hereof is to take the jayee of or 7 leaves in a little drinke to cause vomitings: the rootes alloworks in the same manner, but not so formally the country of t fo forcibly; but all extract made thereof according to art with wine, might be more fafe and effectuall, and may be kept all the years, to be at hand ready to be given, when there is occasion, the quantity onely is to be proportioned according to the conflictation of the patient, as the learned Phisticion can best appoint : It is also effectuall against the bitings of ferpents, (the roote especially) an therefore is put among other simples, both into Mitoriatum and Andromachus Treakle, which is usually called Venice Treakle: Galen saith that the rootes of Against have the Color of rum, have the fame property that Acorus hath but more strong, and Paulus Agineta agreeth with him; but Lugdanensis findeth fault with them both, because they have a purging quality, whereof they make no mention, A dramme of the roote in powder given in white wine, alittle before the fit of an ague, taketh away the that king fit, and thereby causeth the lot fit to be the more remisse, and in twise taking expelleth it quite It is said that

the leaves being a little bruifed, and applyed to the forehead and temples, doe ease the paines of the head, and procureth sleepe; and applied to the eyes, taketh away the inflammation of them: the juice with a little Tmia prepared, put to it and dropped into the corner of the eyes, tharpneth the eyefight, and taketh away the dimners prepared, put to it and toppe unitary and make and militinesses and too tes being boyled in lye, and the head washed therewish often while it is warme, comforteth the head and braine, that is ill affected by taking cold, and helpeth the me often while it is warme, comfortest the head and braine, that is ill affected by taking cold, and neighbit memory also. The Virginia Asarum hath beene but little experienced by any that I know, and therefore can say nothing thereof, but it is probable to be of the like effects, being so much more aromaticall and sweet. The Bastan Asarum as Matthiolus saith, hath a little clensing quality, but a greater propertie to attenuate, or make thin that which is thicke, to cut or breake that which is tough, and to open that which is obstruct: a dram of the pouder hereof taken in sweete wine, or honyed water doth loosen the belly, and purgeth from thence tough and thicke stegme, and blacke or burnt humors: It is to very good purpose and profit, given to those that have the Yellow I aundise, to those that have the Falling sicknesses, and to those that have the Passes, the herbe eyther taken of its content of the passes of the little tables to be the state of the little tables to be a profit of the state of the little tables to be a profit of the state of the little tables to be a profit of the little tables. felfe, and eaten as in Sallets, or the decoction thereof made and drunke: It killeth also the wormes of the belly: I confesse I might have placed these herbes among the other forts of sweete herbes, but the purging qualities in go prevalent, both in procuring vomit and working downewards by the stoole, hath rather moved me to infert them here.

CHAP. LIII.

Brassica. Colewort.

L1 the edible forts of Coleworts and Cabbiges with some others of delight, I have mentioned in my former worke to amply, that who fo will may finde them there at large declared, I will onely in this place give you fome figures of them and their vertues more amply, because I was then so briefe, and with them show you some wilde kinds, as also the Sea Colewort, which for the purging quality is first for this place.

1. Brassica sativa, Garden Cabbiges and Coleworts. The Cabbige (as I have shewed) is of many sorts, some greater others small, some white others red orbi tween white and red, and all these close their innermost leaves so intricate that they grow into a round head, the ontmost leaves onely abiding loose and open. The Colewort is well knowne never to close the leaves, but on grow alwayes spreading: the second yeare after the sowing they shoote forth stalkes, bearing pale yellow flowers, and afterwards small long pods with small round seed in them.

Besides those sorters are others also as the Coleslowers and the Colerape delicate meates: There are like

wife fome garden forts of Coleworts not so much used to be eaten, as pleasant to the fight in regard both of the

Bassica sativa, Garden Coleworts.

Brasfica capitata. Cabbiges.

Brafica florida. Coleflower.

TRIBE 2.

4. Brafica marina monofermos.

Sea Colewort.

CHAP. 52.

fine crumpling forme of the leaves, and of the variable mixture of colours in them, as greene, white, red and yellow, which maketh them to be beheld with the more admiration : of all which I have spoken in my former book, unto these I must jovne the wilde forts.

2. Braffica Sylvestris. Wilde Coleworts.

The wild Colewort groweth with many long grayish round leaves, much gashed or torne on the edges, among which rife the stalkes bearing such like but smaller leaves on them, and yellowish flowers at the toppes, succeded by fmall rough pods with fmall round feede in them: the roote is white, hard and somewhat woddy.

. Braffica spinosa. Thorny Coleworts.

The whitish woodly stalke of this thorny Colewort rifeth to be more then two foote high, branching forth into fundry striped or crested branches, and they againe into other leffer flender twigges, each of them ending in small tharp white thornes, and on each of them under the thornes groweth one flower, in forme like unto an Hiacinthe of a pale redde or blush colour, from which rise small round

peafelike heads pointed, wherein lyeth the feede: the leaves that grow without order on the branches are fore: what long and narrow, a little dented or waved about the edges, and with other smaller sometimes settings. ther, of a gravish greene colour.

4. Brassica marina monospermos. Sea Colewort.

The Sea Colewort hath divers somewhat broad and large thicke wrinckled leaves, or as it were curled abor the edges, growing each upon a feverall thicke footstalke and very easy to be broken, of a grayish greenem lour; from among which arifeth up a strong thicke stalke two foote high and better, with some leaves thereon w the toppe; where it brancheth forth much, and on every branch standeth a large bush of pale whitish flower confifting of foure leaves a peece; after which come small thicke and short pods, conteining but one rounding grayish seede a peece, much greater then Soldanella or Sea Bindweede seede; the roote is somewhat great and shooteth forth many branches underground, keeping the greene leaves all the winter.

The manured edible forts are onely nursed up in Gardens: the second groweth wilde on many ditch banker as well in the uplands as neare the fea fides: the third is nourfed in the curious Gardens of Italy : the last grow eth in many places upon our owne coasts, as well the Kentish as Essex shore, as at Lidde in Kent and Cokhelin in Effex, and in other places also, and in other countries likewise.

The Time. Their flowring time is towards the middle or end of Iuly, and the feede is ripe in the end of August. The Names.

The Greeks call it reduln and Attice registry, or redulen fo called as it is supposed by some greed registic. pupillas obtundat & bebetet, because it dulleth and dimmeth the eyesight, which Columella signisieth by this Di frichon, Oculis inimica coramble, but he doth contrary himselfe: for both he and other good authors say that it igod for dim eyes, as alfo to take away the canker in the eyes; others fay quod To rep aufi vel rettim dertan quide puls satietatique adversatur. Theophrastus and other Greeke Authors before him, doe call it idoar & Rabum ob mutuam (as some thinke) quondam amicitiam & affinitatem utrinsvis seminis, vetustioris prasertim, utramvis pla tam generandi because of the like effe of the seed, they supposing that if it were old, the one would degenerate into the other; which error in this as in many other things, is fatall to the old world, and I would to God it were not so also to ours; for the opinion is almost hereditary, at the least growne so old by custome, that there is small hope to roote it out of the mindes of a great many, that the feeds doe often change into other herbes, then find as they were taken from, which is quite contrary to the Text of the Scripture, Genefis 1, 29, that faith God did appoint every herbe and tree to have the feede of his owne kind within it felfe, and not of another kind; and would faine have any man of judgement, to tell me if hee thinke it possible that the seede of Cabbiges should bring forth Raddishes, or Raddish seede Cabbages, but Pl. 11 and others also before him, mistaking the Greek word of Theophrass and others, which is understood by all of good judgement to be Brassica, transferreth all the properties of Braffica to Raphanm, that is, to Raddish It is called also in Latin Braffica, quasi prafeca as Varre faith, quod bujus scapus minutatim presecatur; or as others thinke of Passica, quod ex cause minutatim presecato passis or as some ம் இர் இத்திய, id est, a vorando, because poore people did most of all call for them to eate them: It is called also in Latin of many Causin quia preceteris grandi, validoque turgescit cause. And from thence as I thinke came out English word Cole, whereby anciently the Colewort was called the second is usually called Braffica streeting all, or Arvensis as Bauhimus hath it but that it should be that of the auncients I make great doubt : the third is all called Braffica spinofa. both by Alpinus and Banhinus, who onely that I know have written thereof: Thelalis thought by some, as Turner, Anguilara and Casalpinus to bee the neguen ayeia of Diosecrides, and that not with out good reason, the face thereof so well relembling a Colewort, and the bitternesse answerable likewise. Lake calleth it Bassica marina squestry multistora monospermos, but Bauhinus Brassica maritima; Gerard calleth it Bristca marina Anglica, as if it were onely proper to our coasts. The Arabians call Cabbiges Corumb and Karani, the Italians Cavolo and Verza, the Spaniards Colbes and Counes, the French Choulx, the Germans Koll, the Duth Cabuischoolen, and wee in English Cabbige and Colewort.

The Vertnes, The Cabbiges or Coleworts (for they are in a manner of one operation) themselves being boyled gently it

broth, and eaten doe open the body; but being twice boyled or the second decoction of them doth binde: the nibrom, and eater the first doth of the nitrons quanty the full terms in the following the following the followers bringeth downe womens courfes, and hindreth conception as it is faid, if it be used as a pessary: being taken with hony it recovereth the hoarfenesse or losse of the voyce: it helpeth those that are entring into a Consumption, if they use to eate them well boyled and often: the pulpe of the middle ribbes of Coleworts boyled in Almond milke, and made up into an Electuary with hony, is very profitably used by those that are shortwinded and are pursie, if they often take thereof, being also boyled twice and an old Cocke boyled in the broth, this being drunke helpeth those that are the troubled with griping paines in their stomacke, or belly: the same broth or decoction is very good, for those than are troubled with the paines and obstructions of the liver and spleene, and the stone in the backe and kidnies: the inverthereof boyled with hony, and dropped into the corner of the eye cleareth the light, by confirming any filme or cloud beginning to dimme it, as also consuming the kanker growen therein: the juyce is safely given to those that have eaten Mushroomes, if they prove offensive unto them they are much commended being eaten before meate, to keepe one from furferting, as also from being drunke with much wine, by restraining the vapours that else would intoxicate the braine, or being drunke, will disperse the vapours and make them quickly rise sober againe; and even Galen himselfe applied the juyce thereof, to the temples of them that had naines in their heads caused by drunkennesse; for as they say there is such an antipathy or entitly betweene the Vine and the Colewort, that the one will die where the other groweth: swollen and gouty legges and knees, whereinto many groffe or watery humors are fallen, being bathed warme with the decoction of Coleworts have found ease thereby, for it taketh away the pame and ach, allayeth the swelling and wasteth and disperseth the humors: it helpeth also old and filthy fores, being washed therewith, it healeth all small running fores and scabbes, pullules or wheales that breake out in the skinne ; yea it clenseth so strongly saith Galen, that it will cure the lepty : the ashes of Colewort stalkes, are of such a drying quality, that they become almost causticke, or burning, and being mixed with old greafe, are very effectuall to anoint the fides of those, that have had long paines there-in, or any other place pained by the accesse of melancholike and windie humours, helping mightily to diget them: It is thought to be effectuall for all the diseases of the body, either inward or outward, and therefore (by fippus wrote a volume of the vertues, applying it to every part of the body: and the old Romanes having expelled Physitions out of their territories, did for fixe hundred years maintaine their health, and helped their infimities, by uting and applying it, for their onely medicine in every disease. The broth or first decoction of the sea Colewort likewise doth by the sharpe nitrous and bitter qualities therein, open the belly and purgeth the body, (but the second decoction is said to bind the body,) yet as Galen thinketh not without some hure thereto, because it much varieth as he saith from the temperature of our bodies, being hotter and drier than the garden kindes, and therefore as all other wild herbes, are stronger in operation, and so this clenseth and digesteth more powerfully than they : the leaves while they are young, although bitter, being boyled (in lye faith Diofcorides but in faire water, is most usuall with us in these dayes) are eaten as other Coleworts are, by diverse poore people neare the sea, the boyling, taking away much of the bitternesse thereof: the seede hereof bruised and drunke killeth wormes; the leaves or the juyce of them applied to fores or ulcers clenfeth and healeth them, and diffolveth tumors or swellings, and taketh away the inflammations.

CHAP. LIV.

Centaurium minus. The lesser Centory.

Here was formerly but one kinde of small Centory knowne, but there hath beene since found out diverse other fores, referred thereunto, both for forme and qualities.

ΣΤ. 1. Cemaurium minus vulgare flore rubente. The red ordinary small Centory. The common small Centory groweth up most usually but with one round and somewhat crested stalke about a foote high or better, branching forth at the toppe into many sprigges, and some also from the joynts of the stalkes below, the slowers that stand at the tops as it were in an unibell or tust, are of a pale red, tending to a Carnation colour, confilting of five, or fixe fometimes small leaves, very like unto those of Saint John, wort, opening themselves in the day time and closing at night: after which come seede in little short huskes, in forme like unto wheate cornes: the leaves are small and somewhat round, very like unto Hypericum, but without any holes therein as it hath: the roote is small and hard, perishing every yeare : the whole plant is of an exceeding bitter tafte.

2. Centaurium minus flore albo. White flowred Centory.

This small Centory differeth not from the former, neither in stalke or leafe, neither in forme or height, but onely in the colour of the flower, which is white, as the other is red.

3. Centaurium minus spicatum album. Small spiked Centory.

The spiked Centory hath his crested stalke divided at the bottome, into two or three branches, and they againe into others, having his lowest leaves next the ground, somewhat broad and round, yet pointed at the ends; but those which are upon the stalke, and are for the most part two at a joynt, are smaller, long and narrow: at the joints with the leaves all along the stalkes up to the toppe, most on the one side come forth the flowers, one only at a place, which stand in small huskes, made as it were of small leaves divided, which confist of five white leaves, and after they are past, come such like small seedes as is in the former.

- Centaurium minus luteum. Small yellow Centory. The small yellow Centory, is somewhat like unto the former, but somewhat greater, the leaves being larger and broader, and broad at the bottome, vet not compassing it as the next: the flowers likewise are somewhat greater and yellow, wherein it differeth from the other, and is not so bitter.

5. Centaurium minus luteum, perfoliatum ramosum. Small yellow thorough leased, branched Centory. This yellow Centory hath some small leaves next the ground like unto the former Centories, but somewhat

greater:

1 Centaurium minus vulgare. The ordinary (mall Centory.

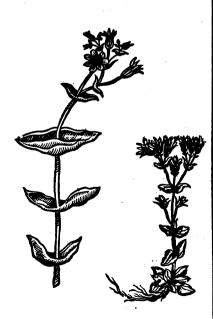

4 Centauriam minus luttum vulgare. Small yellow Centory.

3. Gintaurium minus fpicatum album. Small fpiked Centory.

5.7. Centeurium minus luteum perfoliatum & minimum luteu. The furall yellow thorough leafed and branched Centern and the leaft yellow.

greater: the stalke sendeth forth, sometimes diverse long branches' from the joynts, and sometimes but onely at the toppe, at the joynts whereof stand two somewhat broad and long pointed leaves, so compassing the stalke about the bottome, and making it seeme as if it ranne thorough them, that they will hold the dew or raine that salted upon them, the flowers that stand at the toppes of the small branches, are somewhat larger than those of which come bigger heads, and somewhat greater seed than the other: the roote is small and white like the former: this is not so bitter as the former.

6. Centaurium minus luteum non ramosum. Small yellow unbranched (entory.

These is another of this kind of yellow Centory sound, that different not in lease or flower from the former, but the stalke bearing personal leaves, brancheth not forth, but beareth onely one flower at the toppe, which hath made it noted to be a different kinde from the other.

7. Centaurium minimum luteum. The least yellow Centory.

The least yellow Centory differeth not much from the last described, saving that it is lesse in every part, and beareth two or three or more small flowers, at the toppe of each stalke.

The Place.

Most of those Centories are found in our owne country in many places, the ordinary fort almost every where infields, passures, and woods, yet that with the white flower more sparingly by much than the first: the spiked kindegroweth about Mompelier, and upon the Enganean hills neare Padoa: The first yellow Centory groweth in many places of Kent, as in a field next unto Sir Francis Caren his house, at Bedington neare Croydon, and in a sometimes found.

Charles of Kent, as in a field next unto Sir Francis Caren his house, at Bedington neare Croydon, and in a sometimes found.

The Time.

They doe all flower in July or there abouts, and feede within a moneth after.

The Names.

It is called in Greeke Karriveen 78 wegor. Centaurum parvum & minus, Pliny maketh three forts, his Centaurea Chromia is Dioscorides his Centaurium maj us, his Centaurium is this little Centory, and his third he nameth Cen-Tauris triorchis miltaking Theophrassus his meaning, lib. 9, cap. 9. where he speaketh of that kinde of Hawke called in Latine Butto a Buffard, and in Greeke reforms of whom they that did gather this Gentory should take heed to behurt, Gesner and Dalechampins doe both note Pliny of this his errour herein : of some Centaurea, and for know not; Dioscrides saith it was called Limnesson, and Pliny Libadion, because it lovethto grow in moist places: It is thought to be that herbe that Theophrastus, counted among the Panaces, and called Leptophyllum: Pling faith it was called of the Gaules in his time, Exacon because it did purge by the belly, all other evill medicines our of the body: It is called in Italian Biondella, because women did with the lye thereof cleare and whiten their haire as Matholus faith, but Lugdunenfit faith, it doth make the haire yellow: Banhinus calleth the third Centanrismminus picatumalbum: Lugdunenfis calleth the fixt Centaurium luteum a terum, and Fabius Columa the last, Centagrium minus Inteum non descriptum, or Centagrium Inteum novum. The yellow Centory is called by Mesnes, Commission floribus luteis five citreis pallidis, and is thought by some to be the Achylleos vera, that Pliny mentioneth in his 35. Booke and 5. Chapter; and therefore Gesner in hortin calleth it Persoliata Achyllea. The Arabians call it Kantarion sages & Canturion sege or Segir, the Italians, as is before said Biondella & Cantaurea minore; the Spanard, Cinoria & felde tierra; the French Petite Centoire; the Germans Tansent guldenkrant and Fieberkraut; the Dutch Klein Santery unde Eerdegall; and we in English small Centory.

The Vertues. Dioscorides, Pliny, Galen, Mesues, and the other Arabian Physicions with diverse others doe all agree, that the leffer Centory being boyled and drunke, purgeth chollericke and groffe humors, and helpeth the Sciatica; and yet Dodoness seemeth to averre, that it hath no purging qualitie in it, that he could finde by much experience thereof: which words and faying Gerard fetteth downe, as if himselfe had made the experience, when as they are the very words of Dodoness : it is much used with very good effect to be given in agues, for it openeth the obfructions of the liver, gall and spleene, helping the jaundite and easing the paines in the sides, and hardnesse of the spleene used also outwardly; making thinne both the bloud and humors, by the clensing and bitter qualities thereiniit helpeth allo those that have the dropsie, or the greene sicknesse as the Italians doe affirme, who much use it for that purpose in pouder; it is of much use to be boyled in water and drunke against agues as all know: it killeth the wormes in the belly found true by daily experience; it helpeth allo to drie up theumes as Galen faith, being put with other things for that purpose: the decoction thereof also (the toppes of the stalkes with the leaves and flowers are most used) is good against the chollicke, and to brring downe womens courses, helpeth to avoid the dead birth, and easeth the paines of the mother, and is very effectuall in all old paines of the joynts, as the gout, crampes, or convulsions: a dramme of the pouder thereof taken in wine, is a wonderfull good helpe against the biting and poison of the Adder or Viper: the juice of the herbe taken while it is greene, as is used in other herbes, and dried in the Sunne, or by decoction and evaporation by the fire, as was used in ancient times, worketh the same effects: but the distilled water of the herbe, as it is more pleasant to be taken, so it is lesse powerfull, for any the purposes before spoten of, because it wanteth that substance and bitternesse that is in the herbe the fuice thereof with a little hony put to it, is good to cleare the eyes from dimnesse, mistes, or cloudes, that offend and hinder the fight, it is singular good both for greene or fresh wounds, and also for old ulcers and force and hinder the sight, it is singular good both for greene or fresh wounds, and also for old ulcers and force and the sight, it is singular good both for greene or fresh wounds, and also for old ulcers and force and the sight, it is singular good both for greene or fresh wounds, and also for old ulcers and sight and the sight of the sight fores, to close up the one, and clense the other, and perfectly to cure them both, although they be hollow or fiftulous, the greene herbe especially being bruised or laid too: the decoction thereof dropped into the eares, clenseth them from wormes, clenfeth the foule ulcers, and spreading scabbes of the head, and taketh away all freekles, spots, and markes in the skinne being washed therewith. The yellow Centory saith Messes worketh the same effects, that the other with the red flowers dothe

TRIBE 3.

CHAP. LV.

Rubia major. Madder.

Esides the manured and wild Madder, which were both knowne to the ancients, there are at this time many other forts found out, not knowne to them, as well of the greater as lesser kinde, some growing on mountaines, fome in Medowes and pastures, and some by the sea side: but because I would not cus-ber one Chapter with too many of them, let me onely in this shew you the greater sorts, and in the next following the leffer.

T. Rubia major sativa five bortensis. Garden Madder. The Garden Madder shooteth forth many very long, weake, soure square reddish stalkes trayling on the group. a great way, very rough or hairy (which therefore Pliny calleth fino me prickly) and full of joynts; at every these joynts come forth, diverse long and somewhat narrow leaves, standing like a starre or the rowelloss fourre, about the stalkes, rough also and hairy: towards the toppes whereof, come forth many small pale yellow flowers; after which come small round heads, greene at the first and reddish afterwards, but blacke when the are thorough ripe, wherein are contained the seede: the roote is not very great, but exceeding long, runne downe halfe a mans depth into the ground, red, and very cleare while it is fresh, spreading diverse wayes.

2. Rubia (ylvestris. Wild Madder. The wild Madder is in all things like unto the manured, but that the stalkes are smaller, not spreading so find nor yet fo rough or hairy; the leaves are lesse, the flowers are white, and the roote groweth greater, but not filly fo red, nor cleare as the Garden kinde.

3. Rubia Sylvestris longioribus folijs. Wild Madder with long leaves. This wild Madder hath diverse round joyned stalkes, two or three soote long or there abouts, somewing smooth, or at least nothing so rough, as the other wild fort: the leaves that stand at the joynes, are somewing the standard or the stan rough, narrower and longer than the other, feven or eight at a distance : at the toppes of the stalkes, stand may white flowers, made of foure small leaves a peece, which turne into small round seede like the other : the rou is smaller, but red like the former.

This smooth Madder hath diverse round smooth stalkes, two or three foote long, pointed in like manner and other, but not fo frequent, whereat stands four leaves usually, not rough at all but smooth, larger and broader the the Garden Madder : towards the toppes of the branches, and at the joynts with the leaves come forth diver flowers, standing round about the stalkes, which consist of five or fixe small pure white leaves: the rootes are ind ler than the other, and runne not farre in the ground.

5. Rubia Levis arborescens Cretica. The great smooth Candy Madder. This Madder hath a thicke short stalke about a fingers thicknesse, from whence issue fundry straight smooth 1. Rubia major fativa. Garden Madder. 4. Rubia la vis Taurimenfium. Smooth leafed Madder,

branches with finall florr leaves, fet at diffances like the former forts, at the toppes of the branches come forth branches with the control of the con a certaine auftere tafte alfo. 6. Rubia Marina. Sea Madder.

The Sea Madder spreadeth many square hard, somewhat rough stalkes; round about the roote, upon the ground and full of joynts, from whence grow many imall long leaves, fourewhat rough, broadeft at the bottome and pointed at the end, more white in the naturall places, then being transplanted, from among which growing leffer towards the toppes, come forth small whitish flowers, starre fashion like the other, but longer: he roote is more red on the outside than within, harder and more wooddy than the other. The Place.

The first is onely manured either in gardens or larger fields in many Colintries of Europe, for the profit that is made thereof. The lecond groweth in fieldes and by hedge fides neere Spire and many other places in Germanye. made thereon; the territory of the property of the parish of Stompaine, a miles from Blandford; at Warham like wife, in the parish of Stompaine, a miles from Blandford; at Warham like wife in the same shire, on that side is next to the river, in the parish of Stompaine, a miles from Blandford; at Warham like wife in the same shire, on a mud wall in the same towne; and at a place called Somerpill, neete to a Chappell, which is by the landing place, as ye come from Afferry to Chefell in great aboundance. The fourth as Lobel and Remain, groweth by Turia, on the hils of Piemont. The fift in Candye, and the last by the sea side in Provence, and neere Mompeller; and in Spaine also as Clusius saith.

They flower toward the end of Sommer, and the feede of fome of them ripeneth quickly after, but the fea Madder, doth feldome give ripe feede in our Country The Names.

It is called Greeke 1909 eight now or aparoly development. Erustredamum and Erenthedamum. Nicander in Theriacis calleth it enters, in Latine Rubea and Rubia, and both Greeke and Latine from the colour of the roote, and of the dying cloth, or leather into a red colour. The first is generally called Rubia satire, and Rubia tinctorium in shoppes: The other have their names in their titles, as most writers doe call them by : The Arabiani doe callit Pave and feve alfa hagin: the Italians Rubbia and Robbia, the Spaniards Rubia and Granta; the French Garance; the Germanes Terberroes: the Dutch Crappe Roote oft Mer. and we in English Madder. The Vertues.

There is some controversit betweene our moderne and the ancient writers concerning the vertues of Madder, whether it open or bind the body : the ancient writers Dioscorides and Galen affirming, that the roote hereof doth open and clenfe the body, of much tough and groffe flegme, that it provoketh orine plentifully; and hath fo frong and powerful an opening quality, that it bringeth downe womens courses, driveth forth the dead childe and afterbirth: but others, and Dodoness among the rest, denyeth it to have any such strong opening quality, and such that both Dioseorides and Galen were much mistaken therein; because that Dioseorides saith, it expelles in anime ven unto blood, it being but the tineture of the roote in urine, and no blood that is voyded, at all, faying match that onely a binding or aftringent quality, infomuch that it helpeth ruptures, flayeth the fluxe of womens courfes, the fluxe of the hemorrhoides or piles, the laske, and the abortment, or untimely delivery of women: wholevery words and fayings, Gerisid translateth and fetteth downe in his booke, as if he had nade the experience, and this controlling with Diofeorides and Galen, had beene out of his owne judgement and tryall but we neath needes fay according to the truth, that it hath an opening quality, and an aftringent property alfo: the opening quality is well perceived, by colouring the urine red, even as Rubarto will dye it yellow; the poperty in them both being a like, to open and then to binde and ftrengthen: it is an affured remedye for the yellow aundife, by opening the obtructions of the Liver and gall, and clenfing those parts; it openeth likewise the obstructions of the special parts of the second diminishes the melancholike humour; it is available also for those that have the palse, and by falls or blowes, and inwardly felt as much as outwardly; and therefore it is much used in value and formises, the roote for all these purposes aforesayd, it to be boyled in wine or in water, as the cause doth require, and some honey or fugar put thereto afterwards t the feede hereof taken with vinegar and honey, helpeth the fivellings and hardnesse of the spleene: the decoction of the leaves and branches, is a good fomentation, for women to six over, that have not their courses: the leaves and rootes, bearen and applyed to any part that is discoloured, with freekles, morphew, the white scurse, or any other such deformitie of the skinne, clenseth them throughly, and taketh them away.

CHAP. LVI.

Rubia minor. Small or little Madder.

He smaller madders are many that have beene lately found out, by the diligence of paintfull Herbarifts or lovers of herbes, some in one Country, some in another; all which I meane to comprehend inchie Chaptery that fo you may have them all recorded together; but although there be diverse of them have them all recorded together; but although there be diverse of the hinters and finally grants, Galling, Mollage, and Crossista, that may be reckoned as kinds of Madder; and might and should be joyned together, if I follow the course of other, Herballs, that doe or should joyne the congenerative because I have tyed my selfe to another course; let me referre them to another states and the course of the course of

ther fit place, but not expell them from your fight and knowledge.

I. Rubis spices of writes a latter felic. Candy bisded, with a spiked head and larger leaves.

This small Madder shootesh forth diverse source file funder stakes, full of forms, from whence grow many branches, and where also stand 4 or 5 small leaves compassing them, and somewhat rough the top branches, end in small long spiked heads source square, composed of many thort rough tankes, set close together one above another; and the square, composed of many thort rough tankes, set close together one above another;

1. 2. Rubia spicata Cretica latifolia & anguili felia.
Candye Madder with lipited heads, and with larger and imaller leaves.

y. Rabis prateufis minorcarules. Small Madder with purplish blew flowers.

ther; from whence come forth small whitish greene flowers, scarce to be seene: after which come forth small greeniss seede: the roote is composed of many small fibres, set unto a reddish bigger sprigge, somewhat word and perishing every yeare.

This spiked Madder is a kinde of the former, differing in this onely, that it is less both in stalkes, branche, al search, not growing above an hand breadth high, and with as small leaves as Knawell, perishing every yeare.

3. Ribia praients levis acuta folio. Small smooth Madder with sharpe pointed leaves.

This smooth Madder shootest forth, one smooth square joynted stalke, for the most part; halfe a yadea length; from the joynts whereof grow other smaller branches, whereat are set some small long leaves shall and no more, ending in a small point: the slowers that come forth at the toppes are small and yellow at the sale and of a pale white colour afterwards, made of source leaves.

This other small smooth Madder, hath many square stalkes, halfe a foote long, sending forth other smalle brother, and at every joynt, foure small round pointed leaves, that are not altogether so smooth as the last, but there a little rough: at the toppes whereof stand small white slowers, upon small threddie foote stalkes, made of source leaves a peece; the roote is small, threddie and reddish.

5. Rubia minor pratenfix carulea. Small creeping Madder with purplish blew flowers.

This fmall Madder creepeth upon the ground, with many small square smooth branches, much divided or be parated into other small ones; full of joynts and at every of them, sive or six small round and very fresh grees smooth also, or but very little rough: from these joynts and roundels of leaves, as well as from the toppe of the branches come severall small showers, made of five blewish purple round pointed leaves, with some small and of a reddish yellow colour, abiding all the winter with greene leaves thereon, and will encrease plantifully from the seede it sheddeth every yeare.

6. Rubia minima (axatilia. The small rocke Madder.

This smallest Madder, groweth not much above an hand breadth high, with a square stalke, spreading small branches from the joynts, at which grow 70 8 small long pointed leaves, even the smallest and near owested to standing in tustes or simplest rough also: the slowers are very small, and of a pale red or blush color, franding in tustes or simbels, at the top; es of the branches: the roote is small and reddish as all the other are.

7. Rubia Echinata faxatilis. Small Rocke Madder with prickely heads.

This small Madder shooteth forth from a small whitish threddie roote, many tender square branches, small selected below, next unto the roote, and thicker up higher a distinguished by many thicke and hayric joynt whereat grow foure small leaves lesser than those of Rue: between the leaves and the branches come small leaves lesser than those of Rue: between the leaves and the branches come small leaves.

fmall greenish flowers for the most part standing together upon a foote stalke, each of them consisting of foure leaves, with certaine small threds in the middle, after which rie small heads somewhat rough, which when they are thorough ripe and dry are more sharpe and prickly, divided into source parts as arms or wings on each side of the head, the middle part also being prickely, wherein is conteined small yellow seede: it showreth by degrees, the lowest joynts sirft, and the higher afterwards.

8. Rubia argentea Cretica. Candy filverleafed Madder.

This small Madder is like the former small Madder, but that the leaves are longer and whiter, and the flowers yellow.

The Place.

The first groweth in Candye, and abideth well with ns: the second groweth upon the hils not farre from Mompelier: the third in Germany in the sields neere the bathes of Luke, and by Lipsmick also: the fourth on the hils in Smitzerland, & about Strasbourg likewise: the fift groweth plentifully in many places of our owne land the sixty groweth also in diverse places with us, and upon the chalkie hils nerre Drayton, over against the Isle of Wight; the searenth was found by Fabina Columnus, on the ruinous moyst walls of Dioclesians bathes in Rome: the last in Candy as Alvinus saith.

The Time.

They all flower in the Sommer Moneths, and give their feede shortly after.

The Names.

The Vertues.

These small Madders, as by their taste and temperature may be gathered, are of the same property with the greater kindes, but are lesse effectuall in every respect,

CHAP. LVII.

Psyllium. Fleawort.

He ancient writers have delivered us, but one fort of Fleawort, but there hath beene in later times, ome others knowne, which hallbe here fet forth together.

1. Psyllium vulgare. The ordinary Fleawort.

The ordinary Fleawort rifeth up with a stalke two foote high or more full of joynts and branches, on every side up to the toppe, and at every joynt two small long and narrow whitish greene leaves, somewhat hayrie: at the toppes of every branch stand diverse small short, scalie, or chassie heads, out of which come forth small whitish yellow threds, such as the Plantaine heads doe give, which are the bloomings or slowers: the seede enclosed in those heads is small, and shining while it is fresh, very like unto sleas, both for colour and bignesse, but turning blacke when it groweth old: the roote is not long, but white hard and wood-die, perishing every yeare, and raysing it selse againe of it owne seede, for diverse yeares if the suffered to shed; the whole plant is somewhat whitish, and hayrie smelling somewhat resinous or like Rossen.

2. Pfyllium majus semper vivens. The greater ever greene Fleawort. This Fleawort differeth not from the forgiet in the mannet of growing, but onely that his stalke and bran-beads somewhat greater doe a little more bow downe to the ground; the leaves are somewhat larger, the beads somewhat lesser, the seede alike; and the roote and leaves abide all the winter, and perish not as the some.

3. Pfyllium Indicam foliss crenatis. Indian Fleawort with dented leaves. Indian Fleawort with dented leaves. Indian Fleawort hath a wooddy reddish rough stalke, next to the ground, about a foote high; spreading forth and notched, or rather somewhat torne on the edges, and hayric also like the former; the toppes of the branches are more some with heads than the former, but of the same bignesse and fashion, with slowers and seede shining like the other.

The small Fleawort hath small round reddish branches, leaning downe to the ground not above a handbreadth ligh, spreading into more branches, as having three or foure at a joynt, and two leaves standing at every of them, one against another as in the former, but very short and narrow: the small heads that stand at the tops of the stalkes, have two small long leaves, and sometimes more, set under every of them, one longer then another.

6. Rubia minima faxatilis.

ther, and in time bowing downewards and fomewhat hard : the bloomings or flowers are white. and the feede that flowreth is fhining, and like the other, but smaller: the roote is small and white with divers Fibres thereat.

The Place. The first groweth in the fields and untilled places of Spains and Italy, but with us no where but in gardens: The fecond groweth more plentifully in the fields that are neare the fea. The third is thought to come out of the Indies, as the name importech, but we are not fire thereof. The last is naturally of Egypt or Arabia, and grew in the most noble Signior Bembo, hisgarden at Padoa.

All these Fleaworts flower in July or thereabout with us, but in their naturall places, all the Summer long, yet the kat, is the latest with us. The Names.

It is called in Greeke LUNNOV, in Latine Pfyllium, Pulicaris berba, & Pulicaria, because the seede is like unto Fleas, and not because it driveth away Fleas, being brought greene into the house, for that is false: there is also another Pulicaria called Conyza. which we have shewed before : The Arabians call it Bazara Chatama, and Bezercothune. The Italians Psyllio, the Spaniards Zargatona, the French ! Herbe aux Poulx. The Germans Psilienraut; and wee in English Fleawort, and not Fleabane, for that is Conyea, as is shewed before: The first is generally called Pfyllium of all writers. Gefner in hortis Germania calleth it (mops of Theophrastus. The second is called by Matthiolus P/yllium alterum. Gesner and Camerarius call it P/yllium pereune; Lobel in his Adversaria calleth it Psyllium Pliniana forte maius radice perenne : the third is Anguillara

his first P/yllium, and thought by Bauhinus to be the true Pfyllium of Dioscorides and by him called Indiana, cause the seede came to him under that name. The last as Baubinus saith he had from the most noble Bandul Garden at Padoa, under the name of Gottne rabrum, as he had another called album, which is a kind of Habilim, Raubinus mentioneth Prosper Alpinus to call it Gottne rubrum, but I can finde no other then Gottne megiar Gf. sipium arboreum in his Egyptian plants : he saith also that it was sent him from Heidelberg, by Sprengerus, with it name Botrio rubro.

The Vertues, All Authors doe confirme that the feede of Pfyllium is cold which Mefues attributeth to the barke or outfit. faying that the inward pulpe thereof, is hot sharpe and drying, but divers docutterly missike and refuse that opnion: the muccilage of the seed made (but indeed the seede is seldome buised by any Artist, but alwayes steps whole) with barly water, and some syrupe of Roses or Violets put thereto and drunke, doth purge downers groffe flegme and burnt choiler; but the feede being fryed and to taken hayeth the flux or laske of the belly, me the corrolions that come by reason of hot, chollericke, sharpe and malignant humors, or by the superpurguing of any violent medicine, such as Scamony or the like worketh: the muccilage of the seede made with Row water and a little Sugar Candy put thereto, is very good in all hot agues, and burning feavers, and other inflammations, both to coole the thirst, and to lenisse the drinesse and roughnesse of the tongue and throate: it height also the hoarsenesse of the voyce, and diseases of the brest and lungs caused by heat, or sharpe salt humon, we the Pleurisie also: the muccilage of the seede made in Plantaine water, whereanne the volke of an egge two, and a little Populeon is put, is a most safe and sure remedy to ease the sharpenesse, prickings, and pas the hemorrhoides or piles, if it bee laid on a cloth and bound thereto it helpeth also all inflammations may part of the body, and the paines that come thereby, as the headach and meagrime, and all hot impollumed fwellings, or breakings out in the skin, as blaines, wheales, pushes, purples and the like, as also the paines of the joynts, and of those places that are out of joynt, the paines of the Goute and Sciatica, the bursting of your children, and the swelling out of the navell, applyed with oyle of Roses and Vinegar; the same also is vayor ten and with good successe applyed to heale the Nipples, and the sore breasts of women laying it often that was the juice of the herbe with a little hony put into the cares, helpeth the running of them, and the wormes breeding in them : the same also mixed with Axungia, and applyed to foule corrupt and filthy Vicers and fores, cleaned and healeth them, by cooling the heate and repressing the sharpenesse of the humors; slowing unto the Whereas divers have written that the frequent use of the seede inwardly taken is very dangerous, it is no other wife true, then as it falleth out in all other great cooling herbes, as Nightshade, Houseleeke, Henbans, and it like, which are all safe herbes, being wisely and conveniently applyed t but ignorance, rashnesse and indiscretes in the applying of remedies, hath alwayes done more harme and brought more discredix unrothem, then any danger in them can threaten it : and therefore it is not sufficient to know that a medicine is good for such as

feale, if there want judgment and discretion, how, to whom, and when to apply it and this I thinke is a good leate, it was women leeches, and impudent bold practifers of Philicke and Surgety.

CHAP. LVIII.

Kali. Glassewort or Saltwort.

Here are diverse forts of Kali, with the ashes whereof they use to make glasse, and other things which were none of them knowne to the ancient authors, but remembred onely by the later Arabian Philosophers and Chymickes, of which I meane to entreate in this Chapter, and becanse diverse doe thinke, that some of these is the Anthyllis altern Ajuga folisis of Dioscorides, for the likeneffe they have with them; I will in the next chapter, shew you all those herbes called Anthyllides. that are most worthy of that name; for unto some herbes the name Antophis is fallely imposed, whereof I

meane not here to speake. . Kali majus cochleatum. Great Glassewort with Snaile-like seede.

The great Kall rifeth up with a biggeround reddish fleshy stalke, very like unto Purssaine, two foote high or thereabouts, divided into many branches, whereon doe grow many thicke, long, round fleshy leaves, pointed ar the ends, growing without order, fometimes but one or two, and more often, more flanding at a place; here and there also dispersed upon the branches, come forth small yellowish flowers, and after them small brownish heads, nurned round like finailes, wherein lye finall round feede: the roote is formewhat long, with many fibres therethe and perifficit every years, after it hath given feeds for the most part: this hath an evil taste but fal-

2. Kali minus album. Small white Glassewort. This leffer white Kali, hath diverse whitish greene branches rising from the roote, nothing so high as the former, and bending or leaning downe to the ground, fpreading it felfe into other smaller branches, full of joynts; whereon grow more store of smaller and shorter, round and pointed leaves, nothing so sleshie as the former, and of the same pale greene colour with the stalkes: the slowers are white, and stand singly on the mer, and of the branches: after which come small huskes, wherein lyeth the seede, which is small blacke and shining, like unto Sorrell seede: the roote hereof likewise is small white and wooddy, and perisheth after it hath

3. Kali Ægyptiacum. Glassewort of Egypt.

The Egyptian Kali groweth up with one sender stalke, bending it selfe downewards, and branching forth at the joynts into other small ones, which for the most part stand more upright, and at every of the joynts, two very long and somewhat hayrie leaves, bowing themselves downewards, because of the length of them: the small branches are bare without leaves unto the toppes or ends of them, where there grow many small and long branches are bare without leaves unto the toppes or ends or them, where there grow man, harrie flowers, leaves, layrie like the former, but nothing so long: from among which grow small whirish purple flowers, with many small threads in the middle of them; Of this fort there is some other with shorter leaves differing died for the middle of them; Of this fort there is some other with shorter leaves differing the brevi-

1. Kall cochleatum mujur. Great Glaffewort.

े ये बीटी वर्त

280

4. Kali geniculatum sive Salicornia, Toynted Glasseworts

This joynted Kali rifeth up usually, but with one upright round thicke, almost transparent stalke, a foote high or better, thicke fet and full of joynts or knots, without any leaves at all on them, but shooting forth joynts; one out of another, with short cods at the heads of them, and also such like smaller branches on all fides, and they also divided into other smaller ones: this is thought to beare neither flower nor feede, the roote is small long and threddie.

There are some other kindes hereof found, differing a little Ralige- in the forme of the jovnts one from another, and one that is wholly reddiff not differing in any thing else from the forme of the other joynted ones.

> The first groweth by the sea sides, in diverse places both in Syria, Africa, Italy and Spaine, as also in Provence and Aquitaine or Gascoione, where also they sow large fields therof, for the profit is made thereof. The fecond groweth not onely in those places, but in other colder climates also, and not onely by the Sea, but by the Salt pits in Saxonie as Camerarius faith, and upon our owne coasts likewise in many parts, especially of the West Countries; the third is more particular to Egypt as Alpinus faith, yet Columna faith it is frequent on the Neopolitan West shore. The last is generally growing among other Sea plants, in all Countries almost, and on our coasts in many places, as also in Saxony and other places of Germanye, where there are lakes of falt water; whereof they make falt. The Time.

They all flourish in the Sommer, and those that perish give their seede in August and sometimes later: the last abideth the Winter.

The Names. The name Kali came first from the later Arabians, as it is commonly thought (for Pena thinketh that noted the ancient writers either Greekes or Arabians; have made any mention of them, or of their propertie to make glaffe, which was not made but of the afhes of this hearb; of the fame afhes also made into a lye being boyled wi oyle was used to be made our ordinary sope; out of the said ashes also they extracted a sait called Sai Kais Sai Alkais, so much desired and used by Chimists: for the herbe being dryed and burnt in great quantities ther, doth melt, and runne into a lumpe of a blackish ash colour, and is called by diverse Soda, and of some Alumen Catinum, or peradventure Calinum, onely by the alteration of one letter and of the ashes of any ofthe herbes, but especially of the 3 former forts, beaten to powder and mixed with a certaine kind of fand, the guille men by the heate of fire, in their fornace being molten, doe make those fine Christall glasses serviceble to drinke in (but those other glasse bottles, &c. which serve to keepe Rosewater, and other distilled waters in are made of other things, as also that glasse which serveth for the Windowes of houses) and from this glasse, while it is in the furnace a boyling and refining, rifeth a kinde of fcumme, which they that tend the furnace, doedigently take of; and this is called Azungia vitri, in French Suin de werre; the falt of glaffe, and wee in English much thereafter Sandiver, and is indeed but the falt part of the ashes separated by the fire from the resolute molten substance, for it tafteth like salt, and will relent, grow moyst, and consume like salt, if it be not continuely kept dry as it is: Of the ashes of the Kali like-wise relented into a lye, and boyled with oyle of Olivestry Spaine, &c. ule to make a kind of hard fope towash with, the one fort comming from Spaine, &c. we call call fope, another from Venice, &c. white or Venice sope, but now it being for the most part spent in making of glass. there are found out other things sufficient, to make our ordinary sope, at a farre easier and cheaper rate. These is called of Lobel and Pena in their Adverfaria, Kali magnum Sedi medii folisis semine cochleato : Matihislu (w Cafter Durantes following him in all things) in describing this kind confoundeth it with the last, making him feeme but one. Camerarine nameth it Kali cochleatum major, and faith it is that Anthyllis falfa, that Iohannes Mig doth mention in these Epicaphicall verses.

> E cineris massa, salsaque Authylidis herba Formari slammis lucida vitra solent. Sic cinis ater eram, cineres nunc folvor in atros; Sed nitidum (ummo corpus babebo die.

Baubinus calleth it Kali majus cochleato scrimine. Casalpinus Salsole genus in borsis, and is generally called of mit in Italy where it groweth Isgaro: the second is usually called Kali album, 8c in French as Pena saith Blanchus, 18 distinction from the former: it is also called minist for the same cause, & is usually called in Italy where it growth Borda: it is very likely to be Anthyllis Chamepity smalls of Cordas, in his Annotations upon Diescribes, and likely also to be the Anthylloides of Thalism in his Harcynia splea, Bashinsus calleth it Kali minus villosius, the third out of Kali Egyptium with Profest Alpinas, because it is more proper to Egypt than to other plants. as he thinketh: Banbinus calleth it Kali Leipriacum felis valde longis hirfatis. The last is called of most with

The Theater of Plants. TRIBE 2.

Keli geniculatum, and of fome Salicornia, of Cordus in Observationum sylva, Anthyllis constant veluti tritici ora-Kali geniculation, allows, Salfole genus alind, it is called in English Glassewort and Saltwort of some; the people m, and of the Sea fide, call it Frogge graffe and Crab graffe. The Vertues.

All these forts of Kali have a clenting qualitie in them, without any manifest heate; the pouder of any of them, or the juyer which is much better, taken in drinke doth purge downewards flegmaticke, waterish and adust or or the juyer to provoke urine, and therefore are often used for the dropsie, to provoke urine, and to expell the dead birth. metanement the obstructions of the liver and of the spleene, and to consume the hardnesse thereof; they are formtimes mixed with those things, that are used as corrolives to consume proud or spongie superfluous flesh that tomours and virulent ulcers, but the after themselves are very sharpe and biting like a caustike, and the growers and the hereof is fo ftrong, that it will fetch off the skinne from the hands, or any other part of the body; and therefore if any use it to clense the skinne from spottes, freekles, morphew, or the like, they had neede to and unclose in the using of it, and apply it very sparingly, or delay it sufficiently, and so it may doe good. If the Sope that is made of the live of the ashes of these Katies or Saltworts, be spread upon a peece of thicke course browne paper cut into the forme of their shooe sole that are causually taken speechles, and bound to the soles of prowne paper will bring againe the speech and that within a little time after the applying thereof, if there be any hope of being reftored while they live this hath beene tried to be effectuall upon diverse persons: Sandiver worketh much to the same effect with Kali: it is used often being made into pouder either to be blowne into horses eyes, or being diffolved squirted into them, to take away any skinne that beginneth to grow there. and dimme the light : both of them likewise serve to drie up running fores and scabbes, tetters, ringwormes and the like, and to helpe the itch.

CHAP. LIX.

Anthyllis maritima. Sea Chickweede and sea ground Pine.

forcerides maketh mention of 2. forts of Anthyllis only the one with leaves like Lentilles, the other with leaves like unto Ajuga or ground Pine, unto each of these some have appropriated certaine herbes, and called them after those names, because they nearest resemble them; but it is judged an hard matter certainely to affirme any of them for the right : of the most likeliest of them, as I said before I shall speake in this Chapter, and referre these other forts that are not properly called Anthyllis, unto their proper places.

I. Anthyllis maritima incana. Hoary sea Chickweede. This [mail Anthrilie also hath diverse hoary branches, fet with many small whitish or hoary leaves by distances

I. Authyllis maritima incana. Hoary Sca Chickweede.

2. Anthyllis maritima lentifolia.
Sea Chickweede with Lentillike leaves.

about

about them, as small as any Chickweed almost, the slowers are white, and stand at the to ppes of the state after which come fmall feede.

2. Anthyllis maritima lentifolia. Sea Chickweed with Lentill like leaves. This Lentill leafed Anthylis, hath divertie flort crefted branches lying upon the ground, of a pale greene of lour, and not much above an hand breadth long, spreading forth diverte small branches, whereon are set may small winged whitish greene leaves, many together upon a stalke, somewhat like unto those of the lefter Lentill. fmall winged whittin greene leaves many together upon a traine, somewhat have unto those or the lener Dentile formewhat narrow: the flowers fland at the toppes of the flalkes and branches, like pointed flarres, of a yellow greene colour, after which come three fquare heads, like unto a Tishymad or Spurge, wherein is contained find

greene colour, after which come three iquate neads, like unito a 1 min man of span 50, which is also is falt in the tastes, but somewhat bitter and hot withall;

3. Antilysis after a bord ariorum. Sea ground Pine.

This Antilysis (which is referred unto the second Antilysis of Dioscorides, and that not without good substitution shall be a substitute of the second Antilysis of Dioscorides.) ment) hath divers hard hairy stalkes, without branches upon them, whereon doe grow many somewhat in and narrow leaves without order one above another, thicke bushing at the toppe, somewhat like unto those and narrow leaves without order one above eleges and hairy also, somewhat of a warming hot taste, and stone unpleasant savour: the flowers stand among the leaves upon the branches, like unto the flowers of Chamaphing. ground Pine, but of a purple reddish colour, after which come small grayish rough seede, somewhat long, for the most part in every huske: the roote is somewhat thicke and white. The Place:

The first groweth neare the sea in Narbone of France as Pena saith, as also in the kingdome of Valentia in Spaine, as Clusius faith. The fecond hath beene found in the Iland of Portland in the West parts of this land by Lobel, and fet forth in his Adversaria: the last groweth about Mompelier, and was also found by Clusius in Potugall and Valentia.

They flower in July and August, and their seede is ripe in September.

The Names.

It is called in Greeke ar 36 has; in Latine also Anthyllie, quasi storida dista videtur. There is much como versie among Writers, concerning these Anthyllides, imputing them to be some of Dioscorides, every one almost fetting forth some herbe or other, under the name of the one or other Anthyllis; supposing them to be the rich or at least wayes, to be referred for its likenesse unto them: Lobel and Pena set forth three forts, whereof the first two here mentioned are two of them. The first is called by Lobel and Pena, Anthyllis marina incana Alfaes. lio Narbonensium: of Mutthiolus and Angu: llara, it is set forth under the name of Paronychia altera of Dissente. and by Casalpinus called Centum grana: it is thought also by Anguillara to be the Gramen secundic Plinis, where he maketh mention in his 24. Booke, and 19. Chapter. The second is called by Lobel, Anthylia prior lentiful maritima Peplios effigie; by Durantes Anthyllis minima & is the Anthyllis Portlandie lentifolia Pene of Lugannia.

The last is called by those of Mompelier Iva Moschata, and is with them also accounted to be the Anthyllis alterid Dioscorides, Pena callethit Anthyllis Chamepityoides, Clusius Anthyllis altera, and saith it is very like unto Chame tys. Lugdunenfis saith it is called Anthyllis 2, herbariorum: Banhinus in his Pinax refuseth to name this among Anthyllides, but putteth it among his Chamepisyoides, and nameth that for Anthyllis Chamepispides fratescent, which Pena calleth Sedum marinum vermiculatum, doubting to call it Chamepitys major Dioscorido, but tather Chameter a vermiculata, Sedi efficie; for he himselfe missiketh to call it Authylio, saying it hath no likenesse this unto, in comparison of the other he calleth Anihyllis Chamepityoides, and called 104 Mosehata by those of Mompelier; but assuredly the Anthyllis astera Chamapity similis of Cordus, expressed in his annotations upon Da oscorides, and the Anthylloides minor of Thaliss are none of them frittescentes planta, which Baubiniss makehole all one with his Anthyllis Champtyoides fritescents, whereunto he referreth his Anthyllis, as I have shewedy. The Vertues.

The likenesse of these Sea Chickweedes unto the Anthyllis prior of Dioscorides, as also the falt taste persuada diverse, that they are not inferiour in qualitie unto that of Descorides; who faith that both his Anthyllian me very helpefull to the raines and bladder and to provoke trine, as alfo to mollifie the hardnesse of the matrix, and being used with oyle of Roses and milke, to heale up wounds in the body or flesh; and besides these properties he faith that his fecond Anthyllis, doth helpe the falling ficknesse being taken with Oxymel or honied viness, but Clustus faith he learned both of the Portugalls and Spaniards in Valentia, where he found it growing the they used it much and to every good purpose, to purge and clense the bloud, when it waxed foule; which she eth that most of the sea plants, whether saltish or not, have a clenting quality in them, and might be to good esta applied, if wifely confidered, and experience made of them.

CHAP. LX.

Chamapitys sive Iva Arthretica. Ground Pine or herbe Ivie.

Log Ioscorides setteth downe three sorts of Chamepitys, whose descriptions I will here expresse; that comparing them with those here set downe, you may see how fitly they doe agree unto them: the fath paring them with those here set downe, you may see how fitly they doe agree unto them: the management of the process seems of the process seems of a contrary opinion of the final House leeke, but much thinner or smaller, fatter also and hairy, many growing about the roote smelling like the Pine tree leaves, (so hath Matthiolus, but Lungdamens hath the Pitch tree, for it is generally held that Thin is Greeke signifies the Pitch tree, and Tables the Pine, although some are of the contrary opinion) the flowers small and yellow, or white, the roote is like that of Succory, the other is a kinde of Ajuga and hath very small branches of a cubit long crooked like an anchor; the reft is like the former, but hath a white flower and black seede, and smelleth also like the Pine tree (or Pitch tree as Lungdamensis) leaves: the third which is called the male which is a small herbe, having white hairy small leaves, the slake also rough and white, with yellow flowers; the seede groweth under the leaves, and smelleth also as the Pine so Pine so Pine see hot these are in flowers; the feede groweth under the leaves, and finelleth alfo as the Pine (or Pitch feaves) both thefe are in quality like the former but weaker.

1. Champitys villgari Common Ground Pine.

2. Chamapirys odoratior. The fever Ground Pine.

I. Chamapitys vulgaris. The ordinary or common Ground Pine. Our common Ground Pine groweth low, seldome rising above an handbreadth high, shooting forth diverse mall branches, set with slender small long narrow grayish or whitish leaves, somewhat hairy, and divided into three parts many times, many bushing together at a joint, and sometimes also some growing scatteredly upon the falkes, finelling formewhat ftrong like unto Roffen; the flowers are very fmall, and of a pale yellow colour growing from the joynes of the fratkes, all along among the leaves, after which come fmall long, and round takes the roote is small and wooddy perishing every yeare.

2. Chamberji'ji oderatior. The sweete Ground Pine.

This other Ground pine is also a small herbe, growing up with many hairy and hoary white slender branches, not above an hand breadth high, whereon are fet many small long leaves, yet shorter than the former, hairy also and hoary white not in tuffs or buffees, but growing by couples close together all along the stakes, cut in, or divided into some parts, of a strong but sweeter sent, by much than the former: at the toppes of the branches grow the slowers many together, of a pale yellowish white colour: the roote is somewhat long and slessly like the roote of Succory or Dandelion, with many fibres thereat, but smaller.

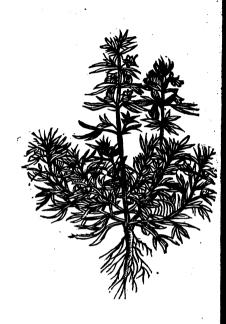

3. Chamapitys Austriaca Clusij, Clusius his Ground Pine of Austria. This kind of Ground Pine hath diverse fourer frong hairy stalkes, a foote long, with many joynts on them, whereat grow, two somewhat long and hard leaves, somewhat like unto the first but broader, greene and shining on the upper side, and somewhat hoary and full of veines on the underside, divided into three or foure parts, or former into more, formewhat hot in talke but not unpleasant, nor of any displeasing sent: from the joynts form form smaller branches, with the like leaves on them but lesser divided, and toward the toppes nothing at all but smooth, and long like unto Rosemary leaves; from the upper joynts and ends of the stalkes and branches. fland diverse gaping flowers, like unto Germander, of a deepe purple or violet colour, for the most part, but fometimes of a lively red colour, and sometimes of a bleaker blew, or skie colour, the lower leaves or chappes of the flowers being whitish, sported with reddish spots : after which come blacke shining somewhat long and cornered feede, foure for the most part enclosed in every of those rough huskes, wherein the flowers stood before the roote is composed of many blacke and hard strings, growing somewhat deepe in the ground, and springing a

4. Chamepitys adulterina seu Pseudo Chamepitys. Bastard Ground Pine. The batterd Ground Pine is a small low bushing herbe, very like unto the common kinde, having small hairy stakes, ict full of long hairy leaves all alongst them, parted into three long parts, of no fent almost, but an un-pleasant berby one rather, the flowers stand at the joynts with the leaves, at the toppes of the branches, very like unto thole of the common Ground Pine, but of a white colour, and fomewhat greater; the feede that follweth is grayish, greater than the common and rounder, foure for the most part contained in every huske : the roote is somewhat thicke and white and abideth the Winter,

The first is the most common in our land, yet nor growing in many other shires thereof then Kent, as farre as erer I could yet have or learne; but there it groweth in many places, from on this fide Dartford along to Southflere, Cobban and Rochester, and upon Chattam downe hard by the Beacon, and halfe a mile from Rochester in a field night a house called Selfey. The second is more rare to be found saith Pena, who onely saw it on the dry hills and 3. Chamapitys Auftriaca Clufij. Glufus his Auftrian Ground Pine.

4 Chamapirys adulterina fen Pfeudo Chamapirys.
Baftard Ground Pine.

and higher medowes of Savoy, but heard it grew also by Genua. The third Cluffur faith he found plentifully mile and a halfe from Vienna in Austria, and in other places there abouts. The last Cluston faith growethings unmanured places of Spaine. The Time.

They all flower and give their feede in the Sommer moneths.

The Names.

It is called in Greeke zaunanus, and in Latine also Chamepitys, quasi humipinus, vel picea as I said before itial led also in Latine Ajuga and Abiga, ab abietis odore, as Pena thinketh, but of the molt, ab abigenda partu & pun rando abortu : and as Pliny faith, Dicitur propeer abortus, & ab alijs Thus terra : fome allo, (as it is likely by Ecclipsis of Ajuga) call it Iva, and adde thereto Arthretics or rather Arthretics, because of the propertie one cing helpe to the gout and other joint aches: the first is generally in these dayes helde by the best to be thethin kind of Dioscorides, and not the first as Matthiolus and others make it: the second is Chamapitys prima Dissente of Pena, and called odoratior for the fents sake, and is the third fort both with Mathiolus and Dodoness. The third is remembred first by Clusius, from whom others call it Champings Austriaca, and carnies of Banking, and is most likely to be his Chamedrys Austriaca, mentioned in his Pinax, and described in his Profromme. The also Clusius calleth Pseudo Chamepitys and Lobel Camepitys adulterina: Dodonaus calleth it Champitys spuria, in putteth two figures thereof, whom Lugdunensis followeth therein : it is called in English Ground Pine, and Ground Jvie after the Latine word Iva: and field Cipreffe after the low Dutch name Vels Cypres; and forgets not after the Grmane name Vergifs mien nicht ; for which name Matthiolus findeth fault with Brafavois. whose Germane Apothecary so informed him; and saith it is called by the Germans Ie lenger, je lieber, that uthe longer the more lovely, which as Pena and Lobel faiy, is the more proper name of Dulcamara, the wool Nightshade; it is called of the Italians Chamepityo, and Iva; and of the Spaniards, Penilho and Iva artetica; d the French Iva Moschata and artetique: and of the Arabians Hamasiteos and Chamasithius. The Vertues.

The decoction of Ground Pine drunk, doth wonderfully prevaile against the strangury and stoppings of trine, or any inward paines rifing from those diseases of the reines and urine, and is specially good also for all oblimition of the liver and spleene, for it clenseth the grosse impure bloud, and expelleth that which is congealed, and good openeth the body, to which purpose they were wont in former times, to make pilles with the pouder thered and the pulpe of figges: it doth also mervelously helpe all the diseases of the mother, used inwardly or applied ourwardly, procuring the courses, expelling the dead child and afterbirth, yea it is so powerfull upon those the nine parts, that it is utterly forbidden to women with child, in that it will cause abortment or delivery before the time : It is as powerfull and effectuall also in all the paines and diseases of the joynts, as gouts, crampes, fies, sciatica and aches, either the decoction of the herbe in wine, taken inwardly or applied outwardly, or both or fometime together for which purposes the pilles that are made with the pouder of Ground Pine, and of Herfor formetime rogerners to which purposes the patterners that are that the pointer of Ground Pine, and of Her-dailyles, with Venice Turpentine are very effectually these pilles also are of a speciall good use for those that have the dropsie, to be continued for some time: the same also is an especiall good helpe for the jaundise, and also for bedropne, the any griping paines in the belly or joynts, or any other the inward parts ! it helpeth also all difeases those that have proceeding from cold and flegmaticke humors and distillations, as also for the falling sicknesse: it is of the orange of the poison of the Aconites of all forts, and other poisonfull herbes, as also against the fire an election removed the state of the firesing of the Scorpion, and all other venemous creatures; it is a good remedy for a cold cough especially in the besing of the scorpion, and all other venemous creatures; it is a good remedy for a cold cough especially in the beor that it bee nor growne inveterate ; it procureth also sweate if it bee anointed, saith Pliny, but applied like other sudorisicks, it is likely to bee more convenient: for all these purposes aforesaid the herbe being tunned up in new drinke, and drunke, is almost as effectuall, but farre more acceptable to weake or dainty being tuning And the diffilled water of the herbealfo hath the fame effect but more weakely; the conferve of florackes: the trace which Matthiolus much commendeth against the palsie: the greene herbe or the deco-the flowers doth the like, which Matthiolus much commendeth against the palsie: the greene herbe or the deco-tion thereof being applied, difforeth the hardnesse of the wemans bress, as also all other hard tumors in enon mercus any other part of the body : the greene herbe also applied, or the juyce thereof with some hony, doth not any cuter putride and ftinking, foule and malignant and virulent ulcers and fores of all forts, but healeth oney current part of fodereth up the lippes of greene wounds in any part also: Matthielus commendeth certaine pilles against the Pallie, which are made in this manner; Take faith he, of Ground Pine, Stachas, Betony and Rolemary flowers, of each one dram, of Turbith one dram and a halfe, of Agarick two drams, of Colocumbia and Roberts, of Ginger and Sal gemme of each ten graines, of Rubarbe one dram and a halfe, of Spiknard seaven names of the pouder called Hiera piera fimplex halfe an ounce, of diagridium one dram; let all these be made up mo a masse, according to art, with the juice of Ground Pine; (but I would and thinke it more convenient. I am more durable, that it be made up into a masse, with a Syrupe made of Hony or Sugar and the juice of the herbe,) for so they will not dry or wax hard so soone, of a dram whereof let nine pills bee made, and three of them taken by those that are paralitick, every night when they goe to bed; and this saith he will give a present and speedy helpe.

CHAP. LXI

Cochlearia. Spoonewort or Scurvigraffe.

TRIBE 2.

Lthough our English Scurvigrasse groweth plentifully in the fair marshes, in many places of our land, and might therefore be fer among the other marth plants, yet because I am to set downe the other forts, let it also take up place here for companies sake.

I. Cochlearia vulgaris. Common Scurvigrasse.
Our ordinary English Scurvigrasse hath many thicke fat leaves, more long them broad, and fometimes longer and narrower, fometimes also smooth on the edges, and other whiles a little

1. Cochlearia vulgarà. Common Scurvigraffe:

2. Cochlearia major rotundifolia five Batanorum. Dutch or Garden Scurvigraffe.

waved.

TRIBLE waved, for all these formes are to be seene, as also plaine smooth and pointed, & sometimes a little hollowed in waved, for all these formes are to be seems, as any plante into the property of the servery one franking by it is middle, and round pointed, or a rau green coour, or rouse what now among which rife finall flender stalke, be upon a long foote stalke, which is brownish or greenish also, from among which rife small slender stalke, be upon a long toote traine, which is showning or greening and leffer for the most part; at the tops whereof growning a few leaves thereon like the other, but longer and leffer for the most part; at the tops whereof growning a few leaves thereon like the other, but longer and leffer for the most part; ring a few leaves thereon the the other, but longer and tener for the first party and which becommen the middle; flanding about a greene head, which becommen the ny whitifh flowers, with yenow tineus in the minute; iterioring about a given which will be formewhat flat when it is ripe, very like unto forme of the kinds of Thinks or Treakle is veffell, which will be somewhat nat when it is ripe, very like unto some or the almost of a major or treakle he start, wherein is contained reddish seeds, talking somewhat hot: the roote is made of many white strings, white strings in the mode, wherein it chiefly delightesth; yet will it well abide in the more upland and on grounds, and tasteth a little brackish or saltiss even there, but nothing so much as where it hath the salt warm

2. Cochlearia major rotundifolia sive Batavorum. The great Dutch or Garden Scurvigrasse 2. Cochlearia major rotundifolia five Batavorum. The great Dutch or Garden Scurvigrafie.

This Dutch or Garden Scurvigrafie (which is most knowne and frequent in gardens) hath divers fress great and almost round leaves rising from the roote, nothing so thicke as the former, yet in some places, as in the strong dunged ground, very large, even twice so bigge as in others, nothing at all dented about the edge, with any sensible hollownesse, perceived in the middle, every one also standing upon a long societalities among these rise up divers long stender weake stalkes, higher then the former, and with more store of the property of the standard stalkes. white flowers, at the tops of them, which turne into smaller pods, and smaller brownish seeds then the former the roote is white, small and threddy: the tast of this is nothing falt at all, but hath an hot aromatical taste almost

3. Cochlearia minor rotundifolia. Small Dutch Scurvigrasse.
This small Scurvigrasse groweth like the last, with many small roundish leaves, sometimes a little crumples. the edges, not bigger then the nayle of ones litter finger, every one upon his owne foote stalke, which ables the winter if it be fowed before winter, or that it rife from it owne fowing; otherwife if it bee fowen in the the winter it it be lowed before winter, or that it the from it owne lowing; other when it becomes in the fpring, it should be forth diversiong stender stalkes lying on the ground a foote long or better, whereon gwinted like small round leaves, very thinly set up to the tops, whereon doe stand many small white slowers, like last, but much smaller, according to the proportion of the plant, with small seede answerable thereumo: the roote is very small consisting of a few Fibres, which perish as soone as it hath perfected the seede; and will force is very small consisting of a few Fibres, which perish as soone as it nam perfected the seede; and we firing up againe in the same place owhere it doth shed it selse; for doe what you can almost, if you will guide any ripe seede, there will be some shed before you can gather it.

4. Cochlearia minimary outstiffelia. The least Scurvigrasse.

The least Scurvigrasse is in all things like the last, but that it is much lesser, not growing above three or some

inches long, but lying upon the ground like Herniaria or Rupturewort; Baubinus in his Prodromus fetteth find another small one, as though it differed from this last, which therefore he calleth erette upright, wherein is the ed no other difference, and therefore I thinke may be the very same growing in another place.

The Place. The first groweth all along the Thames side, on both the Effex and Kentife shore, from Woolnich wherehi brackish Sea water is felt, round about the Seacoasts even to Dover, as also from Dover, round about the con to Portsmouth, and even to Briston where it is had in plenty: but I have not heard by any that it groweth on the Northern coasts at all: But the other with round leaves groweth in the marshes in Holland in Lincolnessire, as well as in the Low Countries Holland, as also in the other places of Lincolesbire, by the Sea side and thereabouts: It had been also found growing upon Ingleborough hill in Lancashire, assured me by a worthy Gentlewoman Mn. Thus been allo tound growing upon inguevorouge nut in Lancajore, assured me by a worting Gentiewoman Mariana in Tunstall, remembred in my former booke for many things, found growing in those parts by her mean, which were not knowne to be growing in England, and thereof shee sent me up some for a manifestation of the truth; I heare also that it groweth night unto a Castle in the Peake of Darbisoire, which is 30, miles dilar at the least from the Sea, and that the late Earle of Rutland, and divers other personages of good note, had one brought from thence for their owne use; it prospereth well in Gardens being sowen in some moist and call shadowed places, and yet it will endure the Sunne also : many in many upland countries of this land, doesno use to sow good quantities thereof, for their owne spending, or to make profit thereof to sell unto other : It fmaller forts have beene brought unto us from Denmarke, where they grow in an Iland called Almagria.

The Time. They all flower betimes even in Aprill oftentimes and in May, and give their ripe feede quickly after. The Names ..

It is thought that none of these were knowne unto any of the ancient Greeke or Latine writers, for although fome doe imagine it to be the Britannica that Pliny maketh mention of in his 25. and 3. Chapter, wherever Cafar Germanicus his Souldiers were cured of the difease that raigned amongst them, called by the Physician Stomacce and Sceleterbe, in plaine English the Scurvey; (which is a disease incident and more frequent those that are at Sea, then that live upon the land, but yet many have it that never went thither, or ever sawing sea,) which Pliny describeth to have a blackish lease somewhat long and a blacke roote, &c. which it is my likely he taketh from Diofcorides his Britannica, whom Galen also followeth, faying it hath leaves like a will Docke, but hairy, and a small roote : Gefner also taketh it to be Britannica, yet assuredly this our Cochlesia, a you may well perceive by comparing them cannot be Britannica; it is so called from the forme of a spoone, being round as well as hollow; we call them most commonly Scurvigrasse, and not spoonewort after the Latin name. to diftinguish them, call the one English, the other Dutch Scurvigrasse: Lacuna tooke the round leafed kindule Telephium: the Germans call it Lesselmans, the Low countreymen Lepeternie, and the French L'berte as

The Vertnes. The English Scurvigraffe is more used for the falt taste it beareth which doth somewhat open and clense, but the Dutch Scurvigraffe is of better effect, and chiefely used, if it may be had by those that have the Scurvie, esperally also to purge and denie the blood, the liver and the spleene; for all which diseases it is of singular good effect, by taking the juyce in the pring, every morning falting in a cap of drinke; the decoction is good for the fast purpose, and the herbe tanked up in new drinke, either by it selfe, or with other things, for it openeth other sign and evacuateth cold clammie and flegmaticke humors, both from the liver the feate of blood, and the sions and the live of blood, and the five ling and hardnesse thereof, and thereby bringing to the body a species, waiting and the residual to the body a more lively colour: the juyce also helpeth all soule ulcers and fores in the mouth, if it be often gargled theremore were adulted outwardly doth clenfe the skinne from spots, markes or scarres that happen therein: the conwith, much of the leaves thereof I meane the round leafed kind, is a fine delicate medecine for weake and tender homekes, and worketh to the fame effect, although a little flowly.

CHAP. LXII.

Fumaria. Fumiterrie.

Here are diverse kinds of Fumicerrie, as they shall be declared by and by: but there are accounted askindes thereof, the Fumaria bulbofa, or Radix Cava, whereof I have fet torth all the forts in my former booke: I will therefore here only give you some figures of them without further descriptions: per of each of these kindes we have received from Canada, one which shall bee set forth accor-1. Fumaria vulcarit. Common Fumiterric.

Our common Fumiterry is a tender Jappy hearbe, fending forth from one fquare flender weake stalke, and lea-Our commune of the control of the co winting result forwers, as it were in a long toke, one above another, made like little birdes, of a reddift pur-ple colors with whitifu bellies: after which come final round huskes, contening small blackish seeds: the corubense roote is yellow small and not very long, still of juyce while it is greene, but quickely perishing with the ripe seed: alba. In the cornefields of Cornwall this beareth white flowers.

2. Fumaria minor five tenuifolia. Fine leafed Fumiterrie. This small Fumiterrie groweth not to high but more upright than the former, with slender square stalkes, whole lower leaves are very like unto those of the former Fumiterry, & of the fame colour but smaller, but those that grow above upon the stalke, are smaller and siner cut in, and the higher the smaller and smaller, the highest even as small as Fennell leaves: the flowers grow in the same manner that the other doe, but rather more store together, of a deeper reddish purple mixed with white and yellow, the seede and roote is small and white, but like the former: this is not altogether so bitter, but more sharpe than the other.

3. Fumaria major Cretica. Candie Fumiterry.

This Candy Furniterry groweth with crooked bowing square stalkes, like the common, and of the same

1. 2. Funaria vulgaris & tenuifolia.
Common and fine leafed Fumiterrie.

4. Fumaria lutea montana, Yellow Fumiterrie,

height,

Fummia tetifolia alba. Climing Fumiterry.

Radix Cava : u garis. Hollow roote.

7. Fumaria tuberofa flore viridi. 7. Radia Cava viridi flore. rooted Furniterry with greene flowers.

beight, the leaves are as finely cut in and divided as the last, and of the fame colour, but fomewhat harder, and not for the dame and fappie: the flowers at the toppes of the branches, are like the other for forme; but of a white colour, marked with brownish spots: the seede and rootes differ not from the former.

colour, mainter of the Fumeria Intermediate. Yellow Fumiterrie.

The yellow Fumiterry groweth like the other Fumiterries, about a foote high, with many leaves like unto the common Fumiterry, or like unto those of the Fumeria bulbofa, or Radix Cava, the hollow roote, but smaller & of the same belowish greene colour with them: the flowers are yellow and in some places white, and grow at the pranches like the other, in forms of little birdes as Markhish. South for the same and grow at of the ismediewilli give in cooking in forms of little birdes as Matthiolus fetteth it forth, both by his dethe toppes of the Lobel and Lugdenens say they are there fashion, like unto the Chelidowium miriss or scription and figure, but Lobel and Lugdenens say they are there fashion, like unto the Chelidowium miriss or feription and ugue, out to both of them give the figures of Matthiolus, with the flowers of Common Furniterry fmall Puewort, and not flarre fashion like the Pilewort: after the flowers are past come small hornes of like linds birds, and not flarre fashion like the Pilewort: like lines onto. The Chelidonium majar, or Radix cava, but leffer, wherein is contreyned small whitish greene long pods, like unto the Chelidonium majar, or Radix cava, but leffer, wherein is contreyned small whitish greene long pous, and somewhat flattish seede: the roote is composed of many white long strings, and thicke fibres and round, and white long strings, and thicke fibres bushing thicke together, which perisheth not as the former, but abideth many yeares; shooting forth new stalkes, the old ones alwayes perishing.

The stalke hereof riseth to be about a foote high, the leaves are in forme and colour like the ordinary or the lat but larger enduring greene all the winter: the flowers grow spike fashion on the toppe of the stalke formed likethose of the Hollowroote, whose bellies are blush and mouthes gold or paler yellow: the seede is conteined in gooked long pods, being round, flattish and yellowish: the roote is thicke and fibrous, the whole plant is more biner than the ordinary, and therefore more effectuall.

6. Fumaria alba latifolia. Climing Fumiterie.

The climing Fumiterrieriseth up with small sender stalkes, not able to sustaine themselves, but catching hold by certaine small tendrels, it sendeth forth at the ends of the smaller branches, on any thing that standeth nigh untoit, whereby it climeth upon the hedges or other hearbes, it sendeth forth diverse stalkes of small leaves, set to it, whereby it contents of divided on the edges at all, of a blewish greene colour, very like unto a formitteny; at the toppes likewise of the small branches come forth many small whitish flowers, tipt with Funnterry: at the copy of the former, but made like small long hollow huskes or Bell slowers, ending in five small points: after which come small seedeen closed in small broad huskes or pods: the roote is small and long growing downe deepe into the ground, and abideth the winter, shooting forth new branches, for the old perish every yeare.

7. Fumaria tubero/a flore viridi. Bulbous Fumiterry with a greene flower.

This hath diverse greene stalkes, with such like leaves thereon as the small Ho'low roote hath, but somewhat larger and greener: at the toppes of the stalkes fand finall greenish flowers at severall places with diverse small greene leaves set under them the roote is two or three times bigger than the roote of the finall Capnes fabacea radice, but yellow like unto it, and the stalkes with leaves and flowers, perishing as quickely as the others.

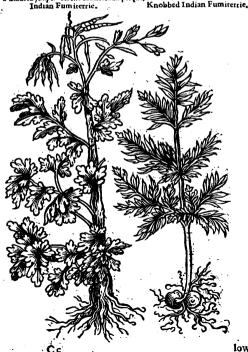

8. Fumaria tuberofa Americana. Knobbed Indian Fumiterry

This kinde of Furniterrie hath two fmall round folide rootes like testicles, with diverse small fibres thereat, from betweene which rifeth up a falke of fundry winged leaves, two fet toge-the at a joynt, variously divided, and so smally that they almost refemble Juniper leaves, of a blewish greene colour, the flowers have fundry colours in them, but supposed of some to be but white, it is almost without either fent or

The Place.

The first groweth as well in the corne fields, almost every where, as in gardens also, and that with white flowers in Cornwall in their corne fields. The second groweth in the helds of Smine in many places, as also in the fields and Vineyards about Mompelier, and in other places also. The third groweth in Candy from whence Clufiu faith he had the feede. The fourth growchoine intine that the seede. The routing row-eth on the hils in Applies and Calabria, in the Kingdome of Naples and some other places in Italy and in Illyria also. The fift growth in Virginia and the backe parts thereof called Ca-nada. The first by the hedge sides, and among bushes, in some places of Braban, in the lower Countries and above Exercise and Monage line. Countries, and about Frontignana, and Mompelier in France, it is found about Naples with a yel-

5. Fumaria femper virens Americana filiquofa. 8. Et Bulbofa Americana.

low

low flower, as it is reported : the seaventh is found likewise in the woods of Germany : and the last in Annie or the West Indies.

The Time.

They all flower early even in May for the most part yet the yellow flowreth much later, as many times notes till August, and their seede ripeneth shortly after.

The Names,

It is called in Greeke zizvos and zizvos. Capnos and Capnion, quasi sumus, eo quod succus occulis into lachrimationem monet sicut sumus, & claritateme corum essicit, in Latine Funnaria & Funnum Terre; of the Arabians Scheiteregi; of the Italians Funneture and Funnsstone Spaniards, Palonima, of the Find Fumoterre, of the Germans, Erdrauch and Danben Kropf as Tragus faith, and of the Dutch Grifting Fumoterre, of the German, Ermanna and London or Capnor Fumaria of Lobel. The second is cild Funaria minor, or tenuifolia, to distinguish it from the other. The third is remembred by Custime by the lange in the title, and it may be also the Syriaca of Camerarius. The fourth is called Fumaria Coridalis of Matthials and of some as he saith Split; of Gesner and Tabermontanus Funaria montana of Lobel Funaria lutea montan who taketh it also to be Chelidonium capnitis of Atius, of Camerarius and Anguillara Corydalis, of Celd. pinus Split vulgo, and Split Illirica or Sclavonica herba of others. The fifth hath its name in the title, and reckoned a kind of the fourth. The fixt is called Capnes of Lobel, who faith it is also called of some Spiral buni; of Dodonesse it is thought to be the first Capnos Plinij, which hee faith was called in his time peter gallinaci, and faith also that some called it Corydalis, and Splith; and the common fort Corydalism, hee called it also Fumaria altera, and Capnos phragmites, as Gesner doth also: but divers of the best moderne Herberth doc rather thinke that the Radix Cava, is the Capnos prior Plinij then this; Camerarius Fumaria Clematics, and Baubinus Fumaria claviculis donata, and is his fixt Fumaria, and yet is the same with his second, if there beam greater and a lesser as some doe set it downe The seventh is the Radix Cava viridi flore of Lobel, which although Baubinus thought it to be referred to the Radix Cava as a fort thereof, yet the roote sheweth it to belong up the Capnos fubacea radice, and so both his description and the title which afterward he amended do declare. The Arabians call it Schehiterig, and Sabeteregi. The Italians Fumoterra; the Spaniards Palamilha; the French Fun, terre; the Germanes Erdtrauch and Katzenkernel; the Dutch Erdtrook and Duynekervel.

The Vertues. By the bitternesse of common Fumiterry, (it is by diverse of the best moderne Writers held to be hot and we cold, as diverse others from the Arabians have set downe) and sharpenesse joyned therewith, it doth openal clense, and by the drienesse doth strengthen and binde after the clensing. The juyce or syrupe made thereof, a the decossion made in wheye by it selte, with some other purging or opening herbes and rootes, to cause it worke the better, it selfe being but weake, is very effectuall for the liver and spleene, opening the obstruction and clarifying the bloud from faltish cholericke and adust humors, which is the cause of the lepry, scabbes, mo ters, and itches, and other fuch like breakings out in the skinne, and after the purging doth strengthen all the is-ward parts, not leaving any evill qualitie behind it, and therefore is reckoned a most fate remedy against all the diseases that rise from those humors, or from obstructions that are the cause of cholericke and putride season the same is good also for the jaundise, and spendeth it by the urine, which it procureth in abundance as Finds faith. The juyce thereof faith Tragus and the pouder of the roote of Ejula prepared in equall proportion, the is a dramme, provoketh vomiting where there is cause, being taken in warme water and cureth the dropker because it is somewhat windie it is good to use aniseede and tennellseede with it the pouder of the dried bath given for some time together, hash cured a melancholy person as Brasavola saith, but the seede is strongelia operation for all the purposes as forefaid. The distilled water of the herbe is much used also, and thought to can good effect in all the former diseases; and beside, as Tragus saith, conduceth much against the Plague or Pelilence, being taken with good Treakle, which it driveth forth by sweate: the same water also with a little war. and hony of Roses, helpeth all the fores in the mouth and throate, being gargled often therewish: the juye dropped into the eyes cleareth the sight; and taketh away the rednes and other defects in them, although it po cure some paine for the present, and bringeth forth water or teares : Dioscorides saith that it hindereth any field fpringing of the haires on the eye liddes, if after they be pulled away the eye browes be anointed with the juye that hath Gun Arabeck dissolved in it; the juyce of Fumicerry and of Docks mingled with vinegar, and theps. ces gently washed or wet therewith, cureth all fores of scabbes, itches, wheales, pimples or pushes that nie in the faceor hands, or in any other part of the skinne of the body. The lesser or fine leased Fumitterry, stallo the climing Fumiterry worke to the same purposes but more weakely: the yellow Fumiterry is also essential in most of the diteates aforesaid, and besides that it provoketh urine abundantly; it is very effectual for the cholickeraken greene or dry in wine for many dayes. Those Fumiteries with hollow and firme rootes are each of them effectuall, both against poison and thepestilence being made into poider and drunke, and afterwardte party laid to sweate : the same also provoketh urine and helpeth the jaundise; the seede being bruised and drunk helpeth fluxes and laskes: the rootes are also fingular good to heale and drie up putrid and running ulcers.

CHAP LXIII.

Aristolochia: Birthwort.

Lthough divers doe thinke that none of the Ariffolochia's or Birthworts, doe purge or open the belly at all, yet because Mesus the great Arabian Physician, numbreth it among his purging plants, and Dodoness doth in the same manner: I thinke it not amisse to doe so likewise. Of these Birthwork, Dissection and Gales have onely made three fores, which are the round, the long, and the running Birthworts. Pliny hath added a fourth, which he calleth Pifesochia, or Polyrrhizes, of all which

there are some differences observed in these latter dayes, which shall be declared in this Chapter. I. Aristolochia rotunda unigatior. The more ordinary round rooted Birthwort.

This round rooted Birthwort, sendeth forth diverse long trayling square stalkes, sometimes halfe a yeard long

or better, not able to ftand upright, but lie or leane downe to the ground, with few or no branches iffuing from or better, not are the branch of the beautiful greene leaves full of veines, franching at diffances without order one benem, but with the cher, every one upon ashort footstalk; at every joynt with the leaves, from the middle of these stalks upo you die other, every one upon amore rooticalistatevery joyne with the leaves, from the middle of these stalks upawards to the top, commeth forth one long hollow slower apecce, smaller at the bottome, broader at the top, with along peece or slippet as it were, at one side of the top, bending downe, both of them of a deadlish yellow or somewhat brownish colour, and somewhat blackish purple on the inside: (this slower Dioscorides compareth to a cap or hood, which as it should seeme was their fashion in his time) after the flowers are past come in their places, small hood, when so it is the second in their places, imall round and formewhat long fruite of diverte fifes, forme as bigge as a Wallnut without the fitell, forme as bigge as it is with the outward greene fitell, and some leffer than both, which when it is ripe openeth into three parts, the wing the feede lying in order within it, separated by certaine skinnes somewhat stat and round: the roote is mberous, banched out diversity, of a darke or swart colour on the outside, and more yellow within.

5. Arifeolochia Clematitu. The running rooted Birthwort.

2. Aristolochia rotunda altera. Another round rooted Birthwort.

This other Birthwort is like the former for the manner of growing, but the stalkes are more and shorter, the leaves are fomewhat greater, and have each alonger foote stalke; the flowers are of a pale or whitish purples the outfide, and browne on the infide, with a few haires fet therein, fearle to be differented as is usuall to all the forts: the fruite is somewhat longer and peare fashion, more pointed at the end: the seede is flat, somewhat lesse and red: the roote is like the other, but a little yellower.

3. Aristolochia longa vera. The true long rooted Birthwort.

The long rooted Birthwort is so like unto the round, that it is very hard for one not throughly exercised the knowledge of both to diftinguish them: the chiefe differences be these, the stalke is shorter, the leaves fmaller, harder and paler, the flowers are more whitish and greenish, but like in forme, the fruite is somewhere long like a peare, formewbar like the other, or last round rooted Birthwort, but not so much pointed a the feet differeth not, but the roote hereof is long and not round or tuberous like the other, as bigge as a mans wreft form. times or bigger, but most usually lesse, of halfe a foote or a foote in length fometimes.

4. Arifolochia longa Hispanica. The Spanish long Birthwort.
This Spanish kinde differeth very little from the last recited long rooted Birthwort, for in the flower and rooted is the onely difference to be observed; the flower in this is somewhat more purple, both the flippet or eare, and the innerfide of the toppe of the flower; the roote likewise is shorter for the most part, and blunter at the lower end, or nothing fo much pointed.

S. Aristolochia Clematitis. The running rooted Birthwort.

The running rooted Birthwort, groweth with longer, stronger and rounder stalkes than the former, even three or foure foote long, branched oftentimes like the long rooted kind, whereon grow much larger and broader leaves, and of a paler greene colour, then any of the other: at the joynts with the leaves come forth the flower, as the other forts doe, but whereas none of them bring above one flower at a joynt, this bringeth three or form like unto the reft for forme, but of a pale greene colour like the long : the fruite hereof likewise is greater the any of the other, as the feede is likewife: the roote hereof hath a stronger sweete sent than any of the far. mer, and is smaller, of the bignesse of the bigness of Asparagus, many growing from one head and running very farre under ground, and springing up againe in many places, of as induring a nature are Couch grasse almost, for if never so little a peece, be left in the ground as broken off from the rest, that is take up, it will shoote forth leaves, and there grow againe, so that oftentimes it becommeth no lesse a plague ma ground, than a couch, or any other such like running or creeping herbe. 6. Aristolochia Clematitis Betica. Spanish Climing Birthwort.

The Spanish climing Birthwort, hath diverse small long twining branches, spreading into many other small ones, running upon small trees and hedge bushes, winding themselves very much about them, like unto the greatest and hedge bushes, winding themselves very much about them, like unto the greatest and hedge bushes, winding themselves very much about them.

ter Bindweedes, or like unto Hoppes, and often overno-7. Pistolochia unigatior. ping them, whereon doe grow feverall leaves, upon The bushie rooted Birthwort. like unto the Scammony of Mompelier, or unto the other Birthworts, but sharper pointed, smooth and greened the upperfide, and of a whitish purple underneath; the flowers stand fingly at the joynt, as the former forude, and not as the last, having the longest footestalke of any of the same forme, but of a sad or darke purple color, and hairy on the inside; the fruite is as great as the last, and so is the seede, but openeth it selfe, at the bottom, contrary to all the former forts: the roote runnething the ground like the rough Bindweede, whereuntoit is very like, of a pale whitish colour on the outside, and of the bignesse of the last, of nothing so strong a sent sit, and of no unpleasant, but of a sharpe and an astringent

8. Pilislocuia Cretica femper virens.

7. Pifolochia vulgatior. The buffly rooted Birthworte.
The buffly rooted Birthwort hath many flender long branched stalkes, a shore long or more, straked and cree fed as sooth the long and the round, whereon grow at distances as in the former, diverse round leaves, maller. ned as is word as it were about the long, whereunto it is most like, but a little waved as it were about the edges : the rougher, and are very like them, but in some very darke, and in others of a greenish yellow colour: the struite is flowers and one what long; and round at the end or point, like unto the fruite of the first round kinde but smaller, which opprett it selfe also as the last before doth at the bottome next unto the stalke, and shewing such like feede within but smaller: the rootes are many, and small bigger than bullrushes for the most part, shooting from one head with many small sibres thereto, of a yellowish colour as all the rest are: this looset the leaves in winter as all the former doe.

8. Pistolochia Creticasemper virens. Ever greene bushie rooetd Birthwort of Candre The ever greene bushie rooted Birthwort of Candye, sendeth forth many very slender flexible and trayling cornered stalkes, branching into diverse other smaller, about a foote long or better, and of a sad greene colour, whereon are fet round leaves long pointed, full of veines, but leffer than the former, and of a fad greene colour, fo abiding all the winter; the flowers are like unto those of the long kinde, standing upon long footestalkes, of a very fad red colour on the outfide and yellowish within: the fruite and seede is smaller than in any other; the rootes likewise are like the last but smaller, and smelling somewhat sweet.

The Place. The three first more ordinary kindes grow as well in Narbone and Provence in France, about Mompelier in the fields and vineyards, especially the running kinde, that it maketh their wine, where it is frequent, to taste thereof as also in Spaine and Italy: the other three that are like unto them, Clusius faith he found in Spaine in diverse place; and Honorius Bellius faith in Candye alfo, in his first Epistle to Clusius, and Petrus Bellowins in his first book of observations and 17 chap, doth also. The seaventh groweth in the stony Ollive yards of Provence and Spaines and the last in Candye. The Time.

These doe not flower with us untill the middle or end of luly, and their fruit doth hardly ripen before the winter, yet in the warmer countries they flower and feede early: fome of thefe doe flower much later with us. if with all the care we can use unto them, we can preserve them in the winter, as both the forts of long rooted and bully rooted kinds, for the other are more hardy.

The Names. It is called in Greek dessupply a quasi dessu ros horaises, i. e. optima puerperis, but not pragnantibus as Pling hath it. it is good to helpe women that are ready to be delivered, and that are delivered, and not those that are with child, not ready to be delivered, for in such it may cause abortment, or delivery before the time: In former times, when ignorance had hid in a cloud all forts of learning and knowledge, from all our Christian world, many falscherbes were obtruded for the right, and in those errours many lived and dyed : but the industry of this later age, hath fearthed out, found and detected many, and among others this of Ariffolochia; many taking the Rad x Cava major to be it, and the minor to be the Piftolochia of Pliny, but all now by the fight and knowledge of the true, are afhamed that any fuch errour should at any time creepe in among wife men: There is also some controversic among the later authors, which should be the Aristolochia Clematitic of Dioscorides; the Apothecaties of Half in and before Matthiolus his time, uled this roote of Aristolochia Clematitis in stead of the true long Birthwort, not knowing either the true long or that this their longa was Diofcorides his Clematitis: Lonicerus and others found out this errour, wrote against it, and shewed that is was not the long one of Dioscorides, but his Clematitis; but Masthiolus contesteth against them with many words, both for it, and because they found fault with the text in Dioscorides, who faith that Aristolochia Clematicis hath slender branches, somewhat round leaves like unto Houseleeke, and the flowers of Rue: The Greeke word is ant on unity aizoon or sempervivum parvum and they thought it should be rather dower unepot afarum parvum, because the Aristolochia Clematicin hath round leaves like Afarum : but Matthiolus in shewing that the words are the same that Oribasius hath also who wrote the same that Diescorides did, as also that Serapio and Avicen have the same words, and that therefore the text is uncorrupted, would thereupon conclude, that the Aristolochia longa, then used in the Apothecaries shops, could not bee Dioscorides his Clematitis, and the rather, becanfe the flowers of his Clematitis are like Rue, which those of their Aristologhia long a are nothing like, againe he saith the rootes are small, longer then the other; and have a thicke barke that covereth them, but the longe Ariftologhia of the shops hath a thinne rinde as all know, that have feene it: yet Matthiolus is forced to grant, that the Ariftolochia longa, that was used in the Apothecaries shops, was not the same Aristolochia longa, that Dioscorides maketh mention of, how then could be not perceive it to be his Clematitis, when he had fet forth both the long and the round, and knew that the Arifolechia longa of the thops, was like unto the other two forts, but differing in rootes onely from them; but faith, he thinketh it might be the Piftalothia of Plint, or a species of that kind of long, whereof no mention was made by the antient writers yet how far from like inood these words of Matthiolia are, let others, judges but assuredly the text of Dioscorides, and so likewise of those that have followed him, cannot be exempt from blemish, or elle neither we,neither any before us have or know Dioscorides his Ariftolochia Clematitis : for he in describing the three forts of Arifolochia, maketh the two former to agree in leafe, flower and fruit, and to differ onely in the roote, whereunto all doe agree, but in declaring the Clemento, he fetter downe the leafe and flower, to be farre differing, but sheweth nor what fruit it bearets, yet maketh it agree with the other two in properties, although lefte forcible : but feeing there is another herbe knowne to be fo like the other two Arifolochias, and to differ in nothing from them, so much as in the robte, which is sweete, small and longer then any of the other, as Discorder maketh his Clematitis to bee, and the very name Clematitis answerable to the plant, what thould let us be the right and indeede it is so accounted of all hold a dayes without doubt or queltion not with flanding the text of the legislate; as also than their driftelessia larger of former times, according to Lonicerus judgement; and thou Monkey, that commented upon Moluses; is Diologicaler his Chinatita. Another doubt there is likewise riten of late dayes, what Ariftolochia was ment by Andromachus senior, that he appointed to be put into his Theriaca; for his elegiacky exists maketh no distinction; and because Orden doch thew in Itematorum

7. Piffelt

TRIBE. alimentoru that Andromachus junior, Adromachus senior his son, in setting downe his fathers Theriaca in proseded explaine divers things, that were doubtfull in his verse, as for the Mel Georgium he expressed it Mel Airing. for Centaurium without difference either of greater of leffer, he fetteth downe the leffer, and for Arifidation which was left indefinite, he setteth downe lepte tennis, the small. Now here lyeth the doubt, what Arifus which was left indefinite, in testitude which this lepte tennis: Matthiolis seemeth to answer this doubt, in the tha Andromachus and Gates mount means, by this ing that they would not meane any other Ariftolochia, then the Clematicis, because they mention but three form and this Clematitis is the smallest roote of the other, and that the tennin Ariffoliochia, is not the Long of Disso and this Clemann is the imalicatione of the chicknesse of a singer; when as of the true Long none are found a rider, whose rootes he saith were of the thicknesse of a singer; finall unlesse they be very young rootes, nor yet any other different kind from the Clematics, as divers the thinke : and yet Galen in lib. 6. simp, med. in setting downe the properties of all the three sorts of Ariffolicia. thinke; and yet yaten in to. o. prop. mos. in tetting downs the properties and to all purposes more effectuall then both the other : the Long he faith is nothing fo fubrill, or of fo thin parts, but is more hot and clenting; and of the the other the Long ne tath is nothing to mothin, or or to thin parts, and therefore is more used in sweeten in smell then the other two, and therefore is more used in sweeten the other two, and therefore is more used in sweeten the other two. ments then otherwise, and is more weake for medicines, or the cure of any disease; why therefore the Che titis should be taken for Andromachus Treacle with our Apothecaries I doe somewhat admire, seeing Gales for that the other are more effectuall for all purpoles: The feverall appellations of authors of these Arifoletis, are not fo divers that they neede any long repetition, for they all as it were agree together, the variation being fo small, that it is not worthy the reciting; onely I will shew you how Baubinses in his Pinax doth distinguishing them severally differing from the titles I give them; the first here set forth, be calleth Ariffolochia rounds for ex purpura nigro: the fecond he calleth Arifolochia rounda flore ex albo purpura ficene : the third hee ciles Aristolochia longa vera: the fourth Aristolochia longa Hispanica: the fift Aristolochia Clematitis rella: the firstolochia Clematitis rella: the firstolochia Clematitis (and is Aristolochia Polyrrhizos of la Personna Ciemanno ser pens : the seavening or special The Arabians call it Zaranna Massocra and Zaravel the bel and Pliny) the last he calleth Pistolochia Cretica. The Arabians call it Zaranna Massocra and Zaravel the Italians Arifologia: the Spaniards Aftronomia, the French Sarafine and Fozerne, the Germans Ofterlucy and Holtwortz ; the Dutchmen Ofterlucye and Sarafinernide.

The Vertues. Galen, lib, 6, simpl, med, as I shewed you before sheweth the severall properties of these Aristolocbia's, the roote faith he of Aristolochia is of most use for medicines, being bitter and somewhat sharpe, the round is the most fubrill of them all, and of more effect for all diseases; that which is called Clematic is sweeter in sent the the other two, and therefore those that make sweete ointments, doe use it in their ointments, but it is of less force and vertue in the curing of any difease; the Long hath less tenuity of parts in it, then the round, but ye is not without efficacy, for it hath a clensing and heating power therein, yet it clenseth and digester hessens the round, but healeth no lesse, yea peradventure more, and therefore the long is of more use, for those the have neede of a meane clenfing in the tuberous swellings of the flesh, and in fomentations of the mother, by where there is neede of a stronger extenuating faculty, there theround is of more use and therefore the road Birthwort, doth more helpe to cure those greeses and diseases, that rise from the obstruction or aboundance, and groffenesse of raw and windy humors: it draweth forth thornes, and splinters, &c. out of the sless, it health all putrefactions, it clenfeth and maketh found foule and filthy Vicers, it clenfeth the gums, and the teeth, and maketh them white; it is profitable for those that are troubled with the shortnesse of breath, with the hickory, with the Falling ficknesse, or with the Gout, if it be drunke with water, (or wine rather) as also for those the are bursten or are troubled with Crampes or Convulsions, or shrinkings of the sinewes and veines, and isago fitable as any other medicine what foever : and thus farre are the words of Galen, in the place before recied: Mesues, Paulus Agineta and Atim do shew the purging qualitie therein, which Dioscorides and Galm eing knew not (as in Rubarbe) or past it over in silence, who saith, that the roote either of the round or running Birth. wort, doth purge downeward flegmaticke and cholericke humors also : it clemeth the lunges and the parisofte breaft, from the toughnesse and rottennesse of humors; whereof a plaine demonstration is, that it helpethtose that are flegmaticke or shortwinded very much; if it be taken inwardly or applyed outwardly to the pan, it mightily draweth downe womens courses, expelleth the dead child and afterbirth, and in the paines of delivery hath very good effect to cause the more speedy case and delivery, and to cleare the parts, of what is accessary the roots in pouder taken with Mirrhe & Pepper in wine, is used also for the same purposes, it resisteth poylog of all forts, the long refilteth the venome of Serpens, and other living creatures, the round refilteth all other forms, poyfon: but Pliny inverteth this order: the roote of the round being taken in water, helpethythose that are but fed by falls, blowes, &cc. as also the paines of the sides; the running Birthwort helpeth the falling downs of the mother, being eyther applyed in peffarie or in fume, and the place bathed with the decocition; it is faid that the vers in Spaine doe use the rootes of the Spanish running Birthwort with notesse good success, then they does rootes of Sarsaparilla, to all the uses whereunto the Sarsa seitneth: the distilled water of the greene herber what tis in flower is profitable for all the diseases aforestaid, and in especiall preserveth from the Plague, and in especial good remedy for the winde collicke; the Pistosethia or bushy rooted Birthwort, is commended by Plague for all the aforesaid womens diseases, to be as effectuall as the other, and that it is very profitably applied those that are troubled with Convulsions and Crampes, or those that have beene bruised by stroakes of the those that are troubled with Convulsions and Crampes, or those that have beene bruised by strokes or falls if it be drunke with water, the seede worketh more strongly i the roote of the round Birthwore helpesh to draw forth broken bones, or any other hurtfull thing lying in the fields of the roote bet applyed and bond thereto: the pouder of the dryed roote is of singular good nieth all earling; or running, soule and rorten. Vien, as also that are hollow and Fishlons, by clenting and silling them in p, or runsing the field to grow soundly sipportally or Fishlaes, if a little Hony, and the roote of Iris or the Flowerdelases between within it is helden also railly for Fishlaes, if a little Hony, and the roote of Iris or the Flowerdelases between which it is helden also thinne rheume from the head; and it is an usual laying, there without Birthwore no Chimpion can perform any great cure: the long Birthwore is used as the round in most of those differes either inward or one ward, and some also doe hold that the Clemanics or running kind is no besset the former in Companied and the concerning it. Plus in his 25. Booke and B. Chap. Saith that the fiftermen in Companied all the roote of the round Birthwort the yeaunns of the earth; and thus having bruised is and miness it with

Line and Chalke, and call it into the Sea, all the Fishes within a great way the col would with incredible de-Line and Chainer and preferred upon the taking thereof become as dead, whereby they might early heraken but Lonicerus moteth it as an errour in Pliny, who referreth that quality to the roote of Aristolochia which hould be attributed to Cyclamen, which he faith is called by the Greekes 123voooch aid eft, pifcium venenution because it killeth them.

CHAP. LXIIII.

Mercuralis, Mercurie.

New Mer the titles of Mercuries I must comprehend also the Phyllon of Theophrassus and Dioscorides, for that they are out of doubt congeners of the same kindred : they are in face and forme the one so like the other s and with them I thinke it not amisse to remember in this place also, the Mercurialis street is altera of Trague, called by Lobel, Noli me tangere: for although Banbinus place it with the Balfamina, yet others reckon it with the Mercuries.

1. Mercurialis vulgaris mas & famina. French Mercury, the male and female. I comprehend as you fee, both the male and the female Mercury under one description, because as all do agree. they both rife from the feede of the one as Hempe doth, and they both are so like, that but for the flowers and feede that shew their difference, they could not bee diltinguished the one from the other it riseth up with a four greene stalke full of joynts, two soote high or thereabouts, with two leaves at every joynt, and bran-ching like wife from both sides of the stalkes, set with fresh greene leaves, somewhat broad and long like unto the leaves of Pellitory of the wall, but lesser and much about the bignesse of the leaves of Bassill, finely dented about the edges towards the tops of the stalkes and branches, at every joynt come forth, in that which is called anounce and the state of the st ferround about with small greene huskes, which are the slowers made like small branches of grapes, which give no seeds that ever I could finde, but abide in that manner a great while upon the stalkes without shedding: the roote is composed of many small Fibres, which perisheth every yeare, at the first approach of winter, and partich it esterwards, even of it owne fowing, for where it is once suffered to fow it selfer the ground will never want it afterwards, even of both forts, for I yet never faw it grow in any place, where either of them was

2. Mercurialis sylvestris Cynocrambe dicta vulgaris. The ordinary wilde Mercury or Dogs Mercury. This Dog Mercury is likewise distinguished into male and semale, and rifeth up with many statkes, slenderer and lower then Mercury, and without any branches at all upon them; the male is fet with two leaves at every

joynt somewhat greater then the female, but more pointed, and full of veines, and somewhat harder also in handling, of a darker greene colour, and leffer fnipt or dented about the edges at the joynts, with the leaves come forth longer stalkes then in the former, with two hairy round feedes upon them, twife as bigge as those of the former Mercury : the talte hereof is herbie; and the smell somewhat strong and virulent : the female of this kind hath much harder leaves, and stand upon longer footestalkes, and the stalkes also are longer; from the joynts come such like long or rather longer spikes, of greenish flowers as are in the former female Mercury, with many small threds in them, which give no feede, no more then the other Mercury : the rootes of them both are many, and full of small Fibres, which runne under ground, and mat themselves very much, not perifhing as the former Mercuries doe, but abiding the winter, and shoote forth new branches every yeare, for the old dye downe to the ground.

3. Conocrambe legitima Dioscoridis Bauhino. The true

Dogs Mercury by Banbinus. The true Dogges Mercury is atender small and sappie herbe, and rifeth up like unto the ordinary Mercury, with a round greene crefted stalker about a foore high fet with many joynts, branching forth from every joint; whereat commeth forth at the first two final leaves, and somewhat round like unto Chickweede, after which two other fpring forth from the fame joynt, which are mitch larger and broader, and from the fame place also afterwards come divers other maller leaves then the first, and this proportion is holders, not at one joynt alone, but at every one thorough the whole plants from the lowest joynt almost of the stalke and branches, up to the top, where come forth under or four small whitish greene slowers, with many threds in the midit of them, which turne into small hard round feede, like unto those of Mercury but somewhat leffer, greene at the first, but of a blackish ashcolour when they are ripe : the roote is white long and fibrons

1. Mercunalle mas & femina.

The ordinary wilde or Dogs Mercury.

hy um marificum & feminificum. Childes Mercury male, and female.

3. Cynocrambe legitima Dioscoriais Banhina. The true Dogs Merettry by Banhina.

TRIBE

9 Mercurialis fylveftris Noli me tangere dilla foe Perficari : filiquofa. Wilde Mercury called Quicke in hand.

4. Bbyllum marificum & faminificum. Childing Mercury male and female.

Childing Mercury also is divided into two kindes, as the former Mercuries are, whereunto it is so like in all the parts thereof, that many have beene of opinion, that it is but plaine Mercury, growing in a hotter Counthe parts that they a branched fquare stalke (I give you one description for them both, as I did in the former, although ry: It natural manufactures and branches, in the male lower and more upright; in the female higher others give talk in the joynts fland alwayes two foft woolly leaves, fomewhat narrower and longer, than in and more difficult and for the feldome about the edges, of an acide and faltish taste: at the joynts in the male the former, and the joynts in the male come forth (hortfalkes, bearing two small round seedes together at the toppe, like unto the male Mercury, come forth thornal colour forms from the male Mercury, (for it doth not give any flowers) which are of an ash colour before they are perfect ripe, but then they turne to be more blew; in the female the stalkes are longer, and beare many small pale mossie flowers, which seldome be more new; which when it doth it is small and round like the other, sometimes two and sometimes more growing together: the roote is white, hard and wooddy; of the bignesse and length of a singer, perishing evegrowing together: the former from it owne feede, in the naturall places: this hath a stronger fent and taste, than any of the former Mercuries to Dioscorides his description of this Phyllum is inverted, for unto the male he giveth spiked or bushie heads, and unto the female seedes like poppie: but as hee saith himselfe Cratevas was giveth finetto or bother control of the sound for the sound of the owne knowledge.

5. Mercurialis structure notione tangere diffa five Persicaria siliquosa. Wilde Mercurie

called Quicke in hand.

This kinde of wilde Mercury (which for the varietie of the forme hath beene diversely named of writers) rifeth up with a round joynted stalke, two soote high sometimes, branching from thence in many places, whereat continually flandeth but one leafe upon a very flender rough foote stalke, most like unto those of French Mercury but longer pointed, and somewhat smaller at the stalke, not so finely, but as it were grossely indented about the edges, being thinner, fofter, and of blewifh greene colour; from every joynt with the leafe from the middle unwards, and at the toppes of the branches also commeth forth one long browne foote stalke, as small and fine as any haire, bearing one flower thereon, and fometime two or three, fomewhat close together, hanging downewards, composed of fixe leaves a peece, formewhat like unto those of the Hollow roote, but greater) of a faire gold yellow colour, Baubinum faith it is found also of a paler colour: two of them that stand like winges at the fides, are larger than the other two that stand under them, which are small and round, the lowest is longer than the other two small ones, and broade at the end: the uppermost endeth in a short crooked home or heele behinde : the bottome on the infide is whiter than the reft, which have fometimes fome red spots in them; after these flowers are past, there come up in their places, small long joynted pods, hanging downewards, striped as it were all the length of them, wherein is conteined small long and somewhat flat seede, of a duskie colour, which it were all the length of them, wherein is contenied imail long and iomewhat hat leede, of a duskie colour, which is so hardly gathered, in regard that even before it be thorough ripe, if it be but very lightly handled, the pods will breake, and twine themselves a little, as the pods of some certaine pulses will doe, and the seed will leape forth, yea for the most part, the very shaking of the branchea by the winde, causeith the pods to breake open, and shed their seede on the ground, where the ripest may best be gathered if they be taken in time: the roote is blackish and threddie, perishing every yeare; the taste hereof is small and waterish, as Columns saith in the greene hearbe as my felfe can testifie, and little otherwise in the dryed, and which gave him no offence nor me alfo, either in the tasting or handling, but whether there were any further danger in taking a greater quantity, becanse Lobel saith it was venemous, was I doubt but onely an heare-say by tradition, yet neither he nor I would make any further experience therein.

The two first Mercuries are found wilde in diverse places of our owne Country, as very plentifully by a village called Brookeland in Rumney Marish in Kent; the other called Dogge Mercury is found in sundry places of Acri alfo, and elsewhere, the semale kinde is more seldome found than the male: the true Dogges Mercury is not found wild with us, neither the childs or childing Mercuries, but grow about Mompelier in France, and in Spaine and Italy: the last groweth in the shadowie woods of Italy, France, and Germany: it hath beene found likewise by the shadie woods sides, of the mountaines and their vallyes in Wales, by an industrious Gentleman, and Herbarist, Mr. George Bowles; and will abide in our Gardens, every yeare sowing it selfe being set in a shadowie place.

The Time. They all flourish in the Sommer Moneths, and therein give their feede; but the Childs Mercury flowreth fo late with us, that it hardly beareth ripe seede. The quicke in hand flowreth and presently after seedeth, in his naturall place about the middle and end of August, but in gardens in lune and luly.

French Mercurie is called in Greeke Antologie Linosoftin & iquoi Birmor icua nou, Mercuris herba & megartor Parthenium; in Latine Mercurialis, because as Pliny saith it was found by Mercury: Dogges Mercury is called ania & uveraguen. Cynes and Cynocrambe which is Canina Brassica, but because it hath no agreement with any Cabbage (unlesse you would say it were meate, or a Cabbage for a dogge) others have called it in Latine Mer-curialist (anina, propter ignobilitatem, others Mercurialist sylvestris: The childs or childing Mercury is called in Greek ounds & inasounder Phyllum & Eleophyllum quass Oleofolium. Theophrass us in his ninch booke and 19. chap. saith that they called one herbe Phyllum Arrhenogonou, and another Thelygonou Mariparia, & Faminarum, Which diverse doe thinke is but the former French Mercury, because he saith they have leaves like Bassill, whereunto the French and not the Childs or childing Mercury is most like, and the rather for that Dioferrides appropriateth to his Mercuries those effects of bearing male and female children, that the Phythum of Theophraftus and Dioscorides hath. The French Mercury is generally of all writers almost, called Mercurialis mas & femina; Cordus upon Dioscorides thinketh them to be the Phyllum Arrbenogonon, and Thelygonon of Theophrasius; and Banhinus calleth them Mercurialis resticulate & spicate: the Italians call it Mercurialis testiculate & spicate: the Italians call it Mercurialis testiculate & spicate: the Italians call it Mercurialis testiculate & spicate: riale: the French Mercuriale & Fignolie; the Germanes Bengelkrant, and the Dutch men Bingelcruyte & Mercurial. The second is called Mercurialis fylushris by Trugus, Lonicorus, Cordus & Thalius & Cynocrambe by Macibiolus, Fuchsius, Dodonaus, Camerarius and Lobel, who in one figure represente the both the male and semantical fields. 208

Divisio prima. The first Division.

TRIBE 2 Columna calleth it Mercurialis Canina, and Bauhings Mercurialis montana testiculata & spicata, neither of the both thinking it worthy of the name of Cynocrambe, for that they knew it was not answerable to Dioferia both thinking it worthy of the make it a Mercury, whereof there is male and female, for if it had beene lobe would have remembred it, but he putteth it indefinitely not naming either male or female : The third is called Would naverememore it, out its pure and description thereof in his Mathiolas, Cynerambe vera Dissented and Pona in his description of Mont Baldus, Cynocrambe legitima Belli. Cesalpinm tooke it to be an Alfine, and Poss in his description of the state of the fourth is generally taken of all to be the Phyllam of Digital, and Theophrastiu. Baubinus calleth it Phyllum testiculatum and spicatum, as he did the former Mercurica; and Theophrastus. Banhinus calletin it e nyumin septementum and specium, as he call the former mercuries: The last is called of Trague Observarials sploestin altera, in his Chapter of Mercury, but purteth the figure thereof a the chapter of Esula; of Lonicerus Tishymalus sploesting of Camerarius, Taben, and Gester, he me tangere, who also called it Milium Caprearum. It is also called Perficaria ssliguos of Camerarius, Tables, and the chapter of Columbia of Called Perficaria ssliguos of Columbia. me tangere, who also calleen it waterim caprentum. It is also called a especial juignoja of concernins, Thelin, Lugdinensis and Lobel; of Dodoneus Impatiens berba, of Cefaipinus Catanance altera, of Columna Balfamite altera and of Lugdinensis (hrysea; Banhinus calleth it Balfamina lutea, five Noti me tangere. I have called it Noting and of Linguisters (miller of Mercuries, and given it an English name, proper for it as I take it has

The Vertues. The decoction of the leaves of Mercurie, or the juyce thereof taken in broth or drinke, and with alittle & gar put to it, to make it the more pleasant, purgeth chollericke and waterish humors: Hippocrates commende gar put to it, to make it the more postating properties of the Physicians of our dayes, I thinke ever put in practife, it wonderfully for womens diseases, which none of the Physicians of our dayes, I thinke ever put in practife, it it wonderfully for womens uncates, which home of the raylitians of our dayes, a thinke ever put in practic, in he applyed it to the fecret parts to eafe the paines of the mother, and used both the decoction of it to prome womens courses, and to expell the afterbirth, and the fomentation or bathing for the same causes; he allogn the decoction thereof with Myrrhe or pepper, or used to apply the leaves outwardly against the strangury, we the diseases of the reines and bladder; he used it also for fore and watering eyes, and for the deaseness we paines in the eares, by dropping the juyce thereof into them, and bathing them afterwards in white wine; it decoction thereof made with water and a cocke chicken, is a most fafe medicine to be taken against the hoth of agues : it also clenseth the breast and lungs of flegme troubling them, but it doth a little offend the stomath of agues: It also element the breatt and lungs or negme troubing them, but it dorn a little oftend the itomach, the juyce or diffilled water thereof, caft or finified up into the nostrils, purgeth the head and eyes of causing and rheumes, that diffill downe from the braines into the nost and eyes, as also sometimes into the eares: Some infe to drinke two or three ounces of the distilled water with a little Sugar put to it, in a morning falling, open the body, and to purge it of grosse viscous and melancholicke humours; as also mixing it with Mayden taken from Rose bushes, and Manna dissolved therein, for the same purpose, which thereupon some call the domanna, which purgeth choller also; It is wonderfull (if it be not fabulous) that the ancient writers, Dissolvent des, Theophrastus and others doe relate, that if women use these herbes either inwardly or outwardly, for the dayes together after conception, and that their courses be past, they shall bring forth male or female children according to that kinde of herbe that they use: Masthiolus saith that the seede of both the kindes of Mora, that is both male and female, boyled with wormewood and drunke, cureth the yellow I aundife, in a molifedie and merveilous manner: the leaves themselves or the juyce of them rubbed upon wartes or bound an them for a certaine time, doth take them cleane away: the juyce mingled with fome Vinegar, helpethallming feabs, tetters, ringwormes and the itch; Galen faith that who so will apply it outwardly in manner of a puli, to any swellings or inflammations, shall finde it to have a digesting quality, that is, it will diffest and spendible to any avenings or innaminations, than independent of have a suggesting quanty, that is, it will ungert and appending mours, that was the cause of the swelling, and alay the inflammations proceeding thereupon, it is frequently at to very good effect given in glisters, to evacuate the belly from those humors that be offensive therein, and we keth as well after that manner, as if so much Sene had beene put into the decoction. The common Dogges Me. cury is seldome used, but may serve in the same manner, and to the same purpose that the other is putto, for purging waterish and melancholicke humors. The childes Mercury, although no other hath written of any preging qualitie in it, yet the forme thereof so like unto Mercury, and the faltish acide taste, should demonstrate in my particular than the faltish acide taste, should demonstrate in my particular than the faltish acide taste, should demonstrate in my particular than the faltish acide taste, should demonstrate in my particular than the faltish acide taste, should be something that the faltish acide taste acide t ging quantie in the total configuration and Disserting sand the lattin actor talled nonlined committation opinion an irritating quality: Theophraft w and Disserting have onely mentioned the childing quality, for women to be are either males or females, that use this herbe, according as is before sayd of French Mercury. The Meline Lonicerus and Tragus, have put it under the names of Tubymales, as neerest partaking of their name, which caused Lobel and Pena to say, it was venemous and deadly, and yet say it wanteth not his prayle for our effects, but shew not what they are: Camerarius in horse saith some doe apply the distilled water of theheate upon the places pained with the goute, with good successe.

CHAP. LXV.

Malva. Mallowes.

Here are three kinds of Mallowes, one with whole leaves, but little incided or cut in on the edges, called Here are three kinds of Mallowes, one with whole leaves, but little mented of the information of the reges, name (Maloa); an other more deepely jagged or tit called Aleea, the third more foft in handling called the analog of each of these divisions the varieties shall be reckoned together by themselves, that sould thea. Of each of these three divisions the varieties shall be reckoned together by themselves, that soud kinde may be separated. Some of each of these kindes I have set forth in my former Booke, whose defect or this characteristic to be here repeated, and those are Malva Hispanica store same ample: The Spanish shall mallow, Alcea vulgaris store carnes, Vervaine Mallow with blush flowers. Alcea perceptina store Vesscaria, Vessi Mallow, or good night at noone. Alcea sentent pentaphylica, cinque soile Mallow. Sabdarista sen Alcea Amicana. Thorny Mallow. Bania sen Alcea Experisa. The Mallow of Egypt. Althea sentent sentent sentent shallow of the sentent sent that are next at hand I will infert here: those which remaine to be intreated of I shall remember in this Chaput.

1. Malva vulgaris flore purpures. The common Mallow with purplish flowers. The common Mallow hath many large foft greene roundish leaves, yet somewhat cornered and dented about the edges, standing upon long foote stalkes, next the ground, from among which rise up, diverse round greene flakes growing in time to be three or foure foote high, especially in good grounds, and to be more hard and almost wordy, especially at the bottome, divided into many branches, towards the tops and with many lesser leaves,

and more divided upwards; where it bringeth forth many flowers, standing in soft huskes, which flowers twine themselves, at their first shooting forth before they open themselves into fine large, broad pointed leaves. of a fine delayed purplish red colour, with many stripes or veines running thorough every leafe, of a deeper colour, which maketh the flower seems very beautifull: after which come round flat cases, with many blackists feeds, fet in order, round about in them: the roote is long and white, growing downe deepe into the ground, tough and somewhat wooddy.

2. Malva vulgaris flore albo. Common Mallow with white flowers.

This Mallow groweth like the former, both for leaves and height of stalkes, the cheefest difference consisteth in the flowers, which are not fully fo large as the former, and are of a pure white colour, without any ftripe of veine, of any other colour running thorough them, the feede and rootes are also a like. 3. Malva Sylvestris minor. Small wilde Mallow.

This small Mallow lyeth with his branches upon the ground, having many smaller and rounder leaves, not cut in or very seldome, and lesse dented on the edges than the common: the slowers hereof are very small and white: the feede and rootes are like the common.

The mountains Mallow, hath his lower leaves as large as the common wilde Mallow but longer, with forme round divisions or cuts therein, but nor deepe, somewhat like unto an Ivye leafe : the stalke groweth not so great and high as the common, with smaller seaves thereon, upwards somewhat rounder and lesse: the slowers are like the common, and so is both seede and roote.

The Sommer Mallow hath foft round greene leaves, without divisions, yet dented about the edges, somewhat paler underneath; the stalke riseth up to but halfe a yard high, bearing smaller leaves, and a little divided somewhat like those of Marsh Mallowes : the flowers are of a paler purplish colour then the common and lesser, the bottome of whose leaves are of a deeper colour, standing upon longer foote stalkes, and not so many together, the seeds small, and so is the roote, and perisheth with the first cold or frost that commeth; but sometimes if the Sommer be kindly, it giveth his ripe feede, before any frosty nights doe come.

Malva Arborea Tree Mallow.

The met Mallow groweth with us to be a great tall tree more likely than an herbe, having his stemme some what wooddy, and oftentimes fo great in compasse that no man can graspe it round with both his liands, the

TRIBE 2.

5. Malva trimestris sive Æstiva. Summer Mallow. Malva Rojes fimplex. Single Hollifloches.

Malva Rojea multiplex.
Double Hollihockes.

3. Malva refea erborea Indica fumpliei co dupliei fon. The Indian tree Hollihocke with fingle and double flows

leaves are twife as great and large, as any common Mallow, and as foft and woolly in handling as the Marsh Mallow but not to white or woolly, yet often somewhat crumpled about the edges this flowerth not the first yeare of the foringing up without, but in the second Sommer, if the sharpe Winter hath not rotted his stalke in the first year (not then being gray en to his ful strength) being more tender than afterwards; it spreadeth some branches, with leaves on them, but similar anioning which stand faire great and large deepe purple slowers, with stripes and veings in them like the common Mallow; after which rise such like round cases, with blackish seede in them, but larger according to the proportion of the plant, but seldome commeth to maturity in our countrie: the roote and stake perish shally with us, after it hath abiden two years at the most with its; whereas in the warner and natural place, it abide the diverse wearing and growesh to be as high and great as many prees.

This tree Mallow of our dwine countrie, is very like the former tree Mallow, having a wooddy stemme, as

This tree Millow of our owne countrie, is very like the former tree Mallow, having a wooddy fremme, as great as a man arme; of a tuffet or hoary colour; whereon grow foft whitifh woolly leaves, almhft as large as the other, and as smooth as velvet; the flowers hereof are large, and of a whitifh or delayed purple colour, like in forme unto a wild Millow flowers, but somewhat large, yet not so great as the former; the roote is white, great and woodly, with diverse long strings annexed unto it.

If I flould Bapilfa, Firmini-like of a mole hill make a mountaine in the description hereof, I might be held over tedious, how soeve he by his elegant Latine stile, may passe with greater delight to his reader, both in his ample narration and fabulotis concertation betweene Art and Nature, in that he giveth a greatfull Vehiculum to case the long Journey: but this large volume will not admit such spaces relations; and therefore I will abreviate his long discourse, with as briefe a description as the subject will permit, and referre those to the author that list to reade all at large. In a small rime (that is in two or three yeares in a warine country) this rifets up to be like a pretty great shrubbe or small tree, whose stemme of trunke being somewhat white andwooddy, sive or sixe inches thicke covered with a smooth whitish barke whose lower branches being pruined the upper boughes spread into a round compasse, whereon are set diverse broad rough leaves somewhat like to Vince leaves out into several partitions and nicked about the edges; of a faire greene colour on the upper side and grayish underseath, on thicke, long and rough reddish soot stakes, sometimes but one, and often two or three area jourt, which doe abide the Winter without falling away; at the toppes of the branches come forth the flowers standing in greene huskes divided at the toppes into five parts: in some of these plants the slowers will be surely shown on the state of the same state of the same day, yet many times not in two or three dayes abiding in the middle of the showers share share have a while blowen open they change more blush and on the fading deeper, these changes are often sent sounds and the same day, yet many times not in two or three dayes abiding in the middle of the showers share share had some day, yet many times not in two or three dayes abiding in the middle of the showers share share manded to be taken out of one seed eversell: the roote is long, white and woody diversly spread under grounds with some small long round and

Divisio secunda. The second Division.

1. Alcea vulgaris sive Malva Verbenaca. Fine cut of Vervaine Mallow.

The lower leaves of this Vervaine Mallow are foft and greene, fomewhat like unto the wild common Mallow leaves, but leffer and more cut in on the edges, befides the denting, but those that grow up higher upon the falke, (whose barke may be broken into threds like hempe, and is sometimes as high as the ordinary wild kinde is) are more cut in and divided, somewhat like unto Vervaine: the flowers hereof are of a paler purple colour than the common mallow, but in most not so much divided into several leaves, and laid so open, but abiding more close, or lesse spread, and without those stripes oftentimes, being smooth and somewhat shining the seede and seede vessels are like the common Mallow, the roote also is long tough and white, but somewhat more wooddy within.

This Vervainte Mallow that beareth white flowers, doth somewhat differ in leaves from the former, for that they are more finely cut in on the edges, then it is; in the flower consistent a chiefe difference also, which is white, yet tending alittle to a blush: the seedes and rootes differ not.

3. Alcea minor. Small Vervaine Mallow.

There is a leffer kinde of the Vervaine Mallow, never growing so great or high, but alwayes abiding lower, like as the small Mallow doth; the leaves hereoff, are more divided and cut in on the edges, and most usually into five parts, and deepely dented also: the flowers are purple like the ordinary Vervaine Mallow, but lesser, and that maketh the difference.

The small hairy Mallow, hath many very low and hoary stalkes, not above a soote high, divided into lesser branches, set with diverse small hoary hairy leaves, cut into three or more divisions: at the tops of the stalkes and branches, grow diverse large purple slowers, like unto the sirft, but every one standing in a hairy buske, almost prickly, after which comments black seeds, contained in those hairy busks, that bore the flowers, but more closely inclosed in them: the roote is of a pale browne colour, about the length of an hand, with small sibres hanging at it.

One fort of Egyptian Mallow I have, as I said, in the beginning of this Chapter set forth already, but this different from that in these particulars, both stalke and seaves are all hairy over: the seaves are parted into seven or eight parts or corners; the flower is sharper pointed, more yellow, and as sweete as Muske, and so is the blacke seed also, but more near unito Civet, which is like unto the seedes of Mirtle berries, but greater: the roote is great and sibrous; the whole plant is full of slimic juyce, and of an herby taste.

Divise

Fine cut or Veryaine Mallow

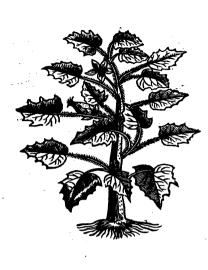

Alcce Ægyptis volgeris. The ordinary Egyptian Mallow.

S. Alcea Avoris molchara Abelmarch diffa The Egyptian Muske Mallow.

Divisio tertia. The third Division.

1. Althan vulgaris. Common marsh Mallowes.

The Theater of Plants.

Our common marth Mallowes hath divers foft hoary white stalkes, rising to be three of soure foote high; spreading forth many branches, the leaves whereof are soft and hoary, or woolly, somewhat lesser then Mallow leaves, but longer pointed cut for the most part into some sew divisions, but not deepe: the slowers are many but smaller then those of the Mallow, and white or tending to a blush colour, after which come such like round cases, and seede as is in the Mallow: the rootes are many and long, shooting from one head, of the bignesse of a thumber singer, very plant rough and bending like Licoris, of a whitish yellow colour on the outside, and more white within, full of a slimie viscous juice, which being layd in water, will so thicken it, as if it were

2. Althea Pannonica. Marsh Mallow of Hungarie.

This Hungarian Marth Mallow differethroot in rootes, stalkes or feede from the former, but onely in leaves? that they are somewhat harder in handling and in the slowers which are much larger and greater then those of Vervaine Mallow, and of a purple colour for the most part : yet there is some that beare white slowers as large is the former, and some that have not so large flowers as they, yet larger then those of the common kind.

This Mallow shooteth forth about May sundry round greenish foft branched stalkes, like the former marshe Mallow, befor with divers foft greene leaves, and gray underneath, resembling the other but longer pointed : at the tops of the stalkes and branches stand severall white slowers, made of five large leaves a peece, somewhat like a Hollihock with a tuft of white threds, compassing a middle pointell, issuing out of a greene button or huske, which is as it were ribbed and broad at the bottome, narrowing to the toppe before the flower blow, without any fent like the Hollihocke: all the stalkes die downe every yeare to the ground, the roote is thicke white and fielhy abiding fafe in the earth all the winter.

4. Althe semper virens Bryonie folio. Ever greene marsh Mallowes.

This evergreene marsh Mallowe, harh many faire large whitish greene leaves, somewhat thicke, full of veines and rough or hairy, but whitish or hoary underneath, cut in or divided into five parts usually, somewhat like a Bryonic leafe: the stalkes are hoary white and round, rising to be two or thee foote high, having such like large leaves upon them, and smaller also among them, standing all of them upon long footestalkes: the flowers are like unto those of the Mallowes, and much about the same colour, consisting of five broad pointed leaves, having many red threds in the middle : after which come flat leafed heads, such as other Mallowes have, wherein is conteined fuch like small seede : the rootes are dispersed into severall parts under ground, and dye not, but retains some of the leaves upon them all the winter, although the stalkes dye downe and perish to the ground.

I. Althee vulgaris.
Ordinary marth Mallowe

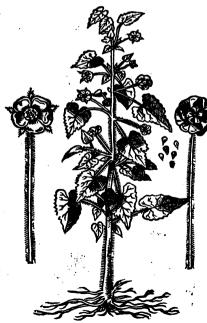

3. Althou roses peregrina.
The strates marth Mallow Rose.

5. Althan luten five Abutilon Avicenne putatum.

7. Alibes palufris Cytini flore.

Althea frutex. Shrubbie marth Mallow,

5. Althea lutea five Abutilan Aviceme putatum. Yellow marth Mallow.

Theyellow Mallow or marth Mallow rifeth up with one fost woolly greene round stalke for the most part, and fedome with more divided oftentimes even from the bottome into divers branches at every joynt stand severall large round leaves as foft as velvet, pointed at the ends, and dented about the edges, hanging downe at the end of long stalkes, which stand forth right; the flowers stand simply but one at a joynt with the lease, which is small and yellow, composed of five small pointed leaves, standing in a small greene huske, which being past, there fuccede loft greene pods or feede vessels, turning blacke when they are ripe, composed of many small hornes or poss, set together like unto an head or seede vessell of Fraxinella, in every one whereof is conteyned small

or pods, let together like unto an head or seede vesses or Fraxinessa, in every one whereor is conteyned amais blackeroundish seede: the roote is not great nor long, but with divers fibres at it, and perisheth every yeare.

6. Abution Indicum Camerary. Cameraryis; his white Indian marsh Mallow.

This Indian marsh Mallow rifeth up with an upright straight hairystake, shooting from the joynes in divers places small branches, whereat likewise are fet such like soft round and pointed leaves, as are in the last hanging downwards for the most part, at the end of long stalkes which are somewhat hairie also: the flowers stand in the fame manner that the other doe, but are somewhat larger, and of a white colour, and yellow at the bottome, with divers threds in the middle : the roote is full of small fibres, and perisheth every yeare, in the like

7. Althea palustris Cytins flore. Red flowred marsh Mallow.

The red flowred marsh Mallow sendeth forth many soft leaves, somewhat like unto those of the ordinary marsh Mallow, but not so soft or whitish, but of a pale greene colour on the upper side, and whiter underneath longer allows, out not to tort or within, out or a paie greene colour on the upper nice, and winter underneath longer allo and dented somewhat deeper about the edges, standing upon long societalkes, among which rife up divers round greene stalkes, three or source foote high, bearing the like leaves on them at severall distances; from the joynts of the leaves towards the tops of the stalkes, and at the tops of them likewise come forth the flowers, confiling of five leaves longer and narrower then in other Mallowes, not broad but pointed at the ends, of a deepe reddish purple colour, tending to an orenge, and sometimes paler or more delayed, and in some plants of a white colour, with divers threds standing in the middle, about a small greene head, which in time becommeth the feede veffel, growing like the cod or feede veffel of the Birthwort, of a fad brownish colour on the outfide, parting into five divisions, wherein lye small brownish feede: the roote is long, white and tough, somewhat like a marsh Mallow, but nothing so great, or Muccilaginous, that is slymie.

8. Althea arborescens Provincialis. Tree marsh Mallow of France,

This tree marth Mallow is very like unto the Shrubbe Mallow, fet forth in my former booke, but yet is not the same, differing in some not able points from it: for although the stemmes thereof are more wooddy then the former tree Mallow, yet are they not altogether so hard and woody as the shrub Mallow, but groweth much higher, even to a mans height sometimes, having many whitish hoarie leaves in the naturall places, but of a whitish greene growing in our climate and not hoary at all, somewhat rough broad and round, and not fo long pointed as the Shrubbe Mallow, yet cut in into fome divisions, and dented at the edges; at the toppes of

Снар. 65.

the stemmes and likewife from the fides growe many flowers like unto those of the marsh Mallowes, but of as deepe a colour almost as the wilde mallow, yet smaller then those of the shrub mallow, after which come fuch like flat huskes and feede as the other mallowes give: the roote is great and wooddy, spreading many branches under ground, abiding long, and sometimes holding the stalkes, with the leaves upon them all the winter, the tops being cut off, yet fometimes also if the winter be over sharpe or it bee not planted or remouved into a warme place, or defended from the extremitie thereof, they will perish downe to the ground, but the next yeare fresh ones will arise agains from the roote.

9. Althea fruite of Cretica. Shrub marsh Mallow of Candy.

The Shrub marsh mallow of Candy, in the second yeare after it is sowen rifeth up with divers wooddy grove stalkes, covered over with much downe, or woollinesse, three or foure foote high, whereon grow hoary large leaves, cut into corners, and dented about the edges, ending in a point the flowers grow at the tops of the stalkes, made of five leaves like mallowes and broad at the points, but of a fine delayed red colour, tending m a blufh. having a ftile or pointell in the middle, compassed about with whitish threds, which flowers are nothing so great as the former, being not much bigger then the flowers of the ordinary marsh mailow, also which come fuch like round cases and seede as they give : the roote is long, tough and white like the common marsh mallow, but more wooddy, and endureth divers yeares, shooting forth new branches in the spring. The Place.

In the first division common Mallowes are knowne to grow every where a but that with a white flower in more rare growing not in very many places, but in Kent in diverse places, as at Afford and at Thrapfine in Norhamptoushire, e.c. and in diverse other places; the third is found under hedges and walls in many places; the fourth is offiner found upon hils: the fift in Spaine; the first tree Mallow groweth neare Venice, all along the Tirrhene shore, and on the African shore also in which places it abidest many years: Our owne Country we Mallow, groweth in an Island called Dinnie, three miles from Kinge Roads, and five miles from Briffen, and so about the Cottages neare Hurst Castle, over against the Ile of Wight. The eight was first brought from Japa I meane the feede, unto Rome or fome parts of Italy where it was fowne; whole tigened feede afterwards wa communicated into fundry Countries. The first of the second division, is very familiar in Kent, as in many other places of our owne Land, being in some places more frequent, than the common wilde kinde : it growthin a field, as you goe to Hamfred Church from the towne; but the second which beareth a white flower, at we. fterham in Kent, the third is likewise found in some places of Kent, the next two are sometimes sound wild also with us. The fourth groweth at the foote of the mountaine Isra in Helvetia by Savoje: the fift in Egypt, The first of the third division or marsh Mallowes groweth in most of the Salt marshes, from Wolwich downs to the fea, both on the Kentish and Effex shore : the second in Hungary; the third was brought out of Africa as Come. tus faith; the fourth is not knowne from whence; the fift groweth in many places of Italy, in the wer ground, neere unto lakes, rivers and ponds; the fixt is thought to come from the Indies, but is more likely to be found some places of Italy, it is so like the former, and tent by Iosephus de Cassabone, to Camerarius, who onely bet fet out the figure thereof. The seventh Camerarius saith he found in Isaly aboundantly about the river Amit, hard by Anguilara, where men passe the river; The eight groweth in Provence of France, as Lobel and Pensis, but in Turin among the Switsers as Camerarius saith, who hath set forth a figure, which is very likely to bette fame as he faith, with that of Lobel; The last was fent to Cluster by legators de cafe bone, which he gathered The Time.

They all flower all the Sommer Monethes, even until the winter pull them downe, yet the tree Mallowersal the tree marsh Mallow, and Egyptian Mallow, doe flower later than the rest; the yellow, the Indian, and red flowred Mallow, doe flower in the latter end of Sommer, yet so as if the yeare be not kindly, there is neverted gathered ripe from them, but from the tree and Egyptian Mallowes never with us, except that tree Mallow of our owne Land.

The Names.

It is called in Greeke undan abemoliendo ventre, yet it is written worken in Epicharmes and Antiphanes copies, in the Aulularia of Plautus they are called Molochinaris, that dyed cloth into a purple colour, and Laws, Columella hath this verse, which is not easily interpreted, except of the Malva horacia.

Et Moloche prime sequitur que vertice solem.

Tragus thinketh that he meant it by the leffer Mallow, and that it turneth his leaves and flowers with the Suns Plinye hath Molope quasi mover, which he referreth to the manured, and in Latine Matva quasi Alova, que alvum molliat, in English Mallow quasi Mellow, either from the softmesse of the leafe, or from the softmist the belly and hard tumors, or peradventure from the Latine. The Arabians call it Cimbers and Chubes, and it seede thereof Bizeri Chubeiz, the Italians, Malua, The Spaniards Malua, the French Manue. The German Pappeln, the Dutchmen, Malme, and Kerkens cruye. The Garden Mallowes, which we call Hollihockes, are call Malva fativa, Malva Romana, and by the vulgar in Italy in admiring the beautie and varietie of their colors, Rofa ultramarina or Transmarina, beyond Sea Roses, and some also as the Datch men doe Winter Roses, for the their beautifull flowers flew themselves, from the end of Sommer untill winter : A'Anie in Greeke as also Anie in Latine, is taken from dand robur, prasidium, quasi caterie robustior & efficatior foret, faith Lobel and Poun; of Italians Bismalua and so doe some in Latine call this quasi bis efficacion Mulva (but others more truely referre the word to the Althea) and Malva salvatica and buon Vischio, of the Spaniards Malva de Vagria and Malva Multip word to the Germanus Symanus wanted and Symanus wanted, that is Radix Simeonio or herba Simeonio, and of for Malva Vngarica: A'Nous Althea in Greeke, grafi medica Lative die: poffet, of the healing and venedying mindicates tit is also called island and island, Ibifom and Ebifom, and island Hibifom, with the appraisant in the same of the healing and venedying mindicates tit is also called island and island. also of some Latine writers, of Barbarus Ariffalthea from the excellencie of the effects, of Galor it is called Anadendromalache Malva arborea, but that is thought more fitly to agree to the Hollibecke, which as The phrasius saith, groweth in a few moneths to be so great, that the stalkes served as staves for men to walke with and of some Olus Indaicum the Iewes pot-herbe; Pliny in his 19. Booke and 5. Chapter calleth it Pastimers, fork

Sith it different from the Par/nep root, in being more small and flender, not to be used in meates but good for medecines, and in his 26. Booke and first Chapter, he faith Ibifem is like unto Pastimaca which sheweth a wonderous great errous in him, that from the whitenesse, length and likenesse of the roote of Alihea, unto the Passing. rous great et not in a land on the rajima-ca, would conclude it a Parinep, without regard of other forme or qualities; of the Arabians Chitini Chateni, and Reja assessi, and Serapio in one place Alfam; of the Italians Malvavijco, and I thinke from them divers La-tine Anthors call it Malvavijcous derived as it were from Malva and Ibijcous, of the Spaniards Malvavi vice: of the French Guimanve, of the Germans Ibisch and Heilwartz or Hisfaurtz, of the Dutch mitte Humf and witte Malwe, wee in English call it marsh Mallow, from the place where it chiefly groweth in the fall marshes as I faid before, or white Mallow from the colour of the leaves, and of some Wimste. In the first of the first division is called of all Malva onlears, and of some friently major, of Brunfiffun Malva Capina. The third is called Malva friends or Agressia minor of most, and of Lobel and others Malva filessia or Agressia minor of most, and of Lobel and others Malva filessia or Agressia minor of most, and of Lobel and others Malva filessia. repeat panulla. The fourth is Matthiolus his fourth Mallow, which he calleth also Hederaces and Montana, but of Lugamentis Malva major tertia Matthioli : the fift is called by Clufint Malva trimeftris, and of Baubiniu Maiva folio vario, The first of the tree Mallowes is called by Matthioliu Malva major, altera and Arborea, and so likewife of Label, of Dodonesse & Camerarius Malva arbore fcens. The next never had any other author to expresse it before now we therefore call it Noftras or Anglica, the eight is called by Baptifta Ferrarino in his booke de florum cultura Rola Sinenfis, because he first received the seedes thereof from China but as he saith some called it Malva Isponica, others Indica, of the naturalls Fujo: I have as you see joyned it to the Hollihocks, and because it abideth greene alwayes like the tree Mallow, I have intituled it Indian tree Hollihock, if any think better to alter it. per me licet. The first of the second division is called Alcea and Alcea vulgaris or major of most authors; but of Anquillars and some others it is called, Canabis fylvestris, and thought to be that of Dioscorides, he also calleth it berba Vnearica. The third is the Alcea of Matthiolou, Tragun, and others : The fourth Lugdunenfis calleth Alcea villofa Dalechampii : thefift is thought by Pona, in his Italian description of Mont Baldus, to be Abusilon Avicenne. which as he faith the Ægyptians call Abelmosch, because of the fent like Muske, and faith that the Turkes doe counterfeite Muske with the seedes thereof, and contendeth that it is the true Abusilon of Avicen, and not the other that is so called; this is very like unto the Alcea Agyptia, shewed you here and in my former booke, but more hairy as I said in the description, and therefore Banhings in his Pinax calleth it Alcea Agyptia villofa: The first of the third division is called Althea, and vulgaris of most Writers; yet Cordus upon Dioscorides, and in his Hillory of Plants, calleth it Malva palustris, and Gesuer in hortis Germanie Malve agressis genus, of Anguilbern Malvaviscan, of Lobel Althea Ibeseus, as is before said. The second Clusius maketh his Althea Pannomica focunda, as I think, but is his third in his History, according to Banhinus, who calleth it Atthea flore majore, of Camerarism Althea flore grandi Alcoa, & Althea Thuringica. The third Iacobus Cornutus expresseth in his History of Canada plants under the same title here. The fourth Banbinso onely setteth forth under the name of Althea frutestens Bronie folio. The fift is called Abubilon Avicenne of Anguillara; Matthiolus, Dodona us and Camerarius, of Label Alibea floribus luteis; Gesner in hortis Germanie calleth it Althea peregrina, as also Althea Theophrasti; but Pous in his Italian description of Mont Baldes, contesteth against those that call it Abutilon Avicenne, saying that it is but an Althee paluftrie, with a yellow flower, in that Avicen attributeth to his Abutilon or Arbutilon, the leafe of a Gourd which he faith this hath not, and the fruit long, like a Medlar, (where as this is round) and not long : Dedonesse likewise contendeth that it cannot be the yellow Aithea of Theophrafins, because the rootes of his Althan, will condensate water, which the rootes of this will not. The fixt, Camerarises who had the seede fent him, from Joseph de casa bona, chiefe Herbarilt to the Duke of Tuscanie or Florence, by the name of Abutilon Indicum, doth lo call it alfo, faying it may be referred to the Althon's: the feventh is thought to be the Sida of Theophrassus, which he mentioneth in his 4. Booke and II. Chapter, for Camerarius calleth it Sida vulgo, but Dodonau is against that opinion ; for in reciting the text of Theophrassus, he sheweth that Theophrassus maketh his Sida, tobe an herbe growing within the water, and lifting up the leaves above the water, and bowing downe the head after it hath done flowring unto the water againe, which this doth not : fome therefore thinke that Theophrastus meaneth the Nymphea Intea, or yellow water Lillie, which hath the like propertie, and the rather because it is a water herbe as all know, and that Theophrastus mentioning those plants that grow in the famous lake of Orchomenia maketh no mention of water Lillies, which as it is thought, that lake is not without; the chiefe repugnancy may feeme to be in the colour of the flower, which yet he plainely mentioneth not, but not in the forme; Dodonesse therefore calleth it Althan hortenfts five peregrina, and Lobel Althan paluftris Critis flore as I doe, and Banhinsse Althan paluftris. The eight is that Althan arboren, that Penn and Lobel fee forth to grow in Provence in France neere Olbia, and different from Cluster his Althan france feemed (let forth in my former Book) as he doth plainely thew in his Hittorie of plants, Camerarism calleth it Althea arborefcens, and fo doth Tabermentanus. Engdunenfis envendeth the first of Clusius which bee nameth Althea lignosa Dalechampi having round leaves and a white flowergreater than the common Althan; for Banhimm maketh his fourth and fifth Abbeafunefeens, to differ from themselves, naming his fourth Althea francfeens, folloretundione incano, and referreth it to Clusius his Althe a fraces prime, in his Hiltory of plants, which Clusius faith himselfe is not the fine that Lobel calleth Althea arborea Olbia; but maketh his fifth Althea francfeens, follo acute purve flore, to be Label his Althes arbores, which Camerarius also doth acknowledge, calling it Althes arborescent, yet Label would feeme to make them both one. The last is called by Cluffus Althea frates tertia, differing from both the former fores, for Clustons there faith the feedle came to him from Candy, and grow onely in his friends garden, to whom he imparted it. The Vertues.

Theyoung leaves both of the common and fine cut Mallowes, as also of the French Mallow and the garden Hollinotte, were in former times, and yet are in forme countries carery as a faller herbe, so mollifie and open the belly, either greene or boyled, as Mar stall the Poet toftifieth in these Verses.

Exeneraturus alvum mihi vilica Malvas. Attulit, & varias quas habet hortus opes.

The leaves of any of the Mallowes, and the rootes also boyled in wine or in water, or in broth, with Parly

Theatrum Botanicum.

or Fennell rootes, doth helpe to open the body, and some also apply the leaves warme after they are boyled, to the belly for the tame purpose, and is very convenient in hot agues, and other distemperatures of the body; for by the

mollifying quality, it not onely voideth hot cholericke and other offenfive humors, but ealeth the paines and the ments that come by obstructions and conftipation of the belly; and therefore they are used in all glisters conducing to those purposes: the same used by Nurses that give sucke to children, procureth store of milke in the

breatts : the decoction of the feede of any of the ordinary Mallowes made in wine or in milke, doth mervellous help all the difeates of the cheft and lungs that proceede of hot causes, as excoriations, the prificke, plurisie, and the

reft, if it be continued for some time together; the leaves and the rootes worke the same effects, let any one the which of them they thinke best, or most ready at hand, agreeing to their disposition : they helpe much also in the

excortations of the guts and bowells, and hardnesse of the mother, and in all hot and sharpe diseases thereof, and

fo the Alcea fruicoja pentaphyllea: the juyce drunke in wine, or the decoction of them in wine, doth help wone

to a speedy & easie delivery: the common Alces or Vervaine Mallow is thought to be most effectuall for building

or ruptures, and the bloudy flixe, and also for the shrinking of sinewes and the crampe: the distilled water of

them when they are in flower, worketh to the same purposes, but more weakely, yet it is much commended in be used in hot agues or fevers. Pliny faith, that who sever shall take a spoonefull of the juyce of any of the My lowes, shall that day be free from all diseases that may come unto him; and that it is especiall good for the in ling sicknesse. The syrupe also deconserve made of the slowers are very effectuall for the same diseases, and

to open the body when it is constructed and laid to the eyes with a little hony, taketh away the impoliseaten with falt as a fallet: the leaves bruifed and laid to the eyes with a little hony, taketh away the impolis-

mations of them, which by fufferance might grow to a Fiftula: the leaves bruifed or rubbed upon any plantung with Bees, Waspes, or the like, yea of the Scorpion, and the biting of the deadly Spider called Phales.

gium, and is faid presently to take away paines, rednesse and swellings that rise thereupon, and keepeth them from

ftinking, if they be rubbed therewith aforehand; and as Dioscorides faith, the decoction of the leaves and room,

helpeth all forts of poylon, so as the poylon be presently voided by vomite; a pultis made of the leaves of Make

lowes, boyled and bruised, whereunto some Beane or Barley flower and oyle of Roses is put, is an especialin.

medy against all hard tumours, and inflammations of impostumes and swellings of the coddes and other para

and easeth the paines of them, as also against the hardnesse of the spleene or liver, to be applied to the place;

the juyce of Mallowes boyled in old oyle and applied, taketh away all roughnesse of the skinne, as also the falling the juyce of Mallowes Boyled in Old Oyle and applied caketh away an longuistic of the daine, and other rains of the haire, the fourfe, dandruffe, or drie feabbes in the head, or other parts, if they be anointed therewith, a wrafted with the decoction: the fame also is effectuall, against the scaldings by water, and burnings by fire, and to helpe also the disease called Saint Anthonies fire, and all other hot, red and painefull swellings, in any part of the

bodie : the flowers of Mallowes boyled in oyle or water, (as every one is disposed) whereunto a little honyand

allome is pur, is an excellent gargle to walh any fore mouth or throate, for it clenfeth and healeth them in a flor

space; if the feete be bathed or washed with the decoction of the leaves, rootes and flowers, it helpeth much the

defluxions of rheume from the head, which role out of the stomack; & if the head be washed therewith, it slayed the falling and shedding of the haire thereof: the greene leaves saith Pliny, beaten with niter and applied drawn out thornes or prickes in the sless. The French and curled Mallowes, and the Hollihocks, are of the same nature and

quality, and work to the fame effect that the other do. The Marsh Mallow is the chiefest Mallow, of all other, and most effectuall in all the diseases before specified, and therefore as I said before, it was called Bismalva, for the

it was twife as good in effect as the other; the leaves are likewife used in stead of the common Mallower, w to was twife as good in energy as the other; the leaves are likewise used in itead or the common manows, we looken the belly gently, and are effectuall in decoctions of glisters for to ease all the paines of the body, opening the straight passages, and making them lubricke, whereby the stone may descend the more easily and without paine out of the reines and kidnies and the bladder, and to ease the torturing paines comming thereby; but the

rootes are of more especiall use for those purposes, as well as for the diseases of the breast and lunges, as coughs, hoarsenesse of the throate and voyce, wheelings and shortnesse of breath, &c. being boyled in wine, or house

water and drunke : the rootes boyled in water very well, and after they be strained forth the decoction being

boyled againe with Sugar to a just confistence and thereof made into rowles or trochifces, or the like, are 1/2

lychreston and much used for all the purposes aforesaid: the rootes and seedes of the Marsh Mallow, boyled is

wine or water, is with good effect used by them that have any excoriations in the guts or the bloudy flixe, not

fo much by any binding qualitie in them, as by qualifying the violence of the sharpe cholericke fretting humon,

that are the cause thereof, and by the sliminesse easing the paines and healing the forenesse, and in some fortlay-

ing the further eruption of bloud therefrom, at that time, or any other after: it is profitably taken of them the

are troubled with ruptures, crampes or convultions of the linewes, and boyled in white wine for the impollune

of the throate, called the Kings evill, and of those kernells that rise behind the cares, and inflammations or swe ings in womens breafts : the dried rootes boyled in milke and drunke, are specially good for the chin countries Hippocrates used to give the decoction of the rootes, or the suyce thereof to drinke, to those that were wounded and were ready to faint, thorough the expense and losse of bloud, and applied the same mixed with hony andro

fen unto the wounds : the rootes boyled in wine he gave also to drinke, to those that had received hurt by bris-

fes or falls, or by blowes and stripes, to those that had any bone or member out of joyne, and to those that had any

fwelling paine or ach in the mufcles, finewes, or arteries of the body; it is good also to be used in all the ulen and fores that happen in any cartilaginous place: The Muccilage of the rootes, and of linefeede and fenegrets

put together, is much used in pultises, ointments, and platters, that serve to mollifie and digest all hard tumo

and the inflammations of them, and to give ease of the paines in any part of the body: the seede either great or drie, mixed with vinegar clenseth the skinne, of the morphew, and all other discolouring thereof whatsome

being bathed therewith in the Sunne, the feede of the yellow Mallow hath beene tried (even as the feede of the

Marsh Mallow hath beene also) to be of singular good effect against the stone, if a dramme, or a dramme and halfe at the most being made into pouder, be given at a rime, and if the effect presently follow not, let it be reper

ted the second time, or the third, and it will give helpe; it provoketh also urine, and easeth the paines that come

thereof, and of the flone; it is used by the Turkes to procure rest and sleepe, as Paludonnu saith; the leave of juyce or pouder of them, or of the seede, is used with good effect, to clense and heale greene wounds, by solvering up the lippes of them quickly; The rest of the Mallowes doe participate of the properties of the common

in that all of them have in some measure or other that clammie juyce that is in them.

CHAP. LXVI.

Melochia five Corchorus. The Iewes Mallow.

He Iewes Mallow (for unto that family I referre it, both for some forme like thereinto, but more for the properties) is a small low hearbe, rising up a soote and a halfe high, from whose stalkes hoote forth diverse branches on all sides, whereon grow many leaves without order, up to the toppes, which are somewhat longer and broader than the leaves of Bassill some likewise shorter and toppes, which are consevered and broader than the seaves of saint tome likewise inorter and broader, all most round, yet all of them pointed, and finely nicked about the edges, having at the bottome of each leafe, a small thred as it were on each side, which are of a little fowrish taste, the flowers come forthingly for the most part, but one standing at a place, every one upon a short foote stalk; consisting of s broad small pointed leaves, of a yellow colour, with some threds in the middle, which being past, there rise up slender long

point a few shat like unto those of Swallowwort, which when they are ripe, open into five partitions, thewing within them small seede, somewhat like unto Nigella, but leffer, and of a blewish greene colour: the roote is somewhat long, with many threds or fibres

thereat, which perisheth every yeare. The Place.

TRIBE 2.

It proweth in Afia, Syria, Egypt, and those places aboundantly, in the gardens where it is fowne, as alfo in many places of Spaine and Italy, but the naturall place is not knowne : It is fo familiar in Egypt, as Alpine faith, that the feast or meales meate that is made without a dish thereof, being boyled in water or fresh broth, is not thought to be sufficient plenti-

The Time.

It seldome flowreth with us in regard that our Sommers are not hot enough to bring it to maturity, for having often fowen it, we could never have it grow above an nano mg., fing it to perish quickly.

The Names. above an hand high, the first cold ayre in the night cau-

It is called of most Melochia or Molochia of Serapio. it is thought by Lobel to be the Corchorus or Corcorus of Playe, which he mentioneth in his 15 booke and 22 chap, but not that which he speaketh of in his 25. booke and 13 chap, which is that of Dioscorides and Theophrast in his 7 booke and 7 chapter; for that is generally thought to be Anagallis or Pimpernell, as you shall heare when we come to it; Raumolfius saith in his Jenrual that in Syria, Egypt, &c. they call it Molnchi, and is that Olus Indicum that Avicen speaketh of. Matthiolus thinketh that Halimus Sea Purssane is the Melochia of the Moores and Arabians, because it was usually eaten as a sallet herbe.

The Vertues.

It is as Alpinus faith in faculty very like unto the marsh Mallow, for it is much used to suppurate, digest, resolve, and mollise all hard tumors in that the muscial lage thereof is more slimite than that of the marsh Mallow, 2 drammes of the seede he saith is usually taken at a time to purge plentifully all forts of humours: the decoction of the leaves is very familiarly used against dry coughes, hoarfenesse of the throate and voyce, and shortnesse of breath, and with sugar candy is a present remedie: the oyle thereof is used so familiarly by the Egyptians in their meales as Alpinus saith, and that they seldome eate withourit, notwithstanding that it breedeth many obstructions, and the viscous nourishment that it

Vnto this Classis also might be added diverse other herbes, some whereof are set forth in the foregoing, and others in the facceeding Classis, each as they doe more especially partake with that Tribe wherein they are placed, as Epithymum before, and Pollipodie afterwards, and diverse others also among the bulbous and tuberous rootes, fet forth in my former booke, as Daffodills, Sowbread, &cc. And thus have I shewed you not onely all the strong purgers, but many others that are but moderate, conducing or helping, to open or loofen the belly. And now it is meete that knower my stile to another Classis, or fort of hearbes, which are those that are vencmous, and deadly, or dangerous at the least; as also sleepie and hurtfull Plants, and after them with those that are Alexiphermace, the Antidotes, or Counter-poyfons, of poyfonfull or dangerous Hearbes.

CHAP. I.

Aconitum Lycoctum. Wolfes Bane.

Have in my former booke given you the knowledge and description of some of the Aconites or Wolses bane, and therefore I shall not neede to describe them againe, I will onely recite them unto you, and so follow on with the rest: those already set forth are these, Aconitum byemale, Winter Wolses bane, Aconitum luteum Ponticum precox. The earlier whitish yellow Wolses bane, Napellus verus flore caruleo, Blew Helmet slower, or Monkes hood, and Anthora, the holsome helmet slower or counterpoys on Monkes hood; yet some of their sigures I will insert among the rest.

1. Aconitum Ponticum store albido. Late slowing Wolses bane.

This late pale yellow or whitish Wolses bane, hath as large leaves as the other, that

this late pale yellow or whitish Wolfes bane, hath as large leaves as the other, that I have set forth in my former booke, and divided into as many partitions, cut also on the edges somewhat deepely; but of a fresher greene colour, and not rising or springing up out of the ground, for almost a moneth after the former is come up; the stalke with leaves thereon, riseth to be foure or five foote high, as the other doth, and with as long a branched head, of pale yellow coloured flowers, almost whitish, as it doth; but flowreth later by almost a moneth, than the other: the cods, seede, and rootes, differ not from the other.

2. Acceptions flore Delphinis majus. The greater leafed Wolfes bane, with Larkes heele flowers.

This Wolfesbane, hath diverfe greene leaves, rifing from the roote, of a very fad or darke greene colour, flanding upon reasonable long foote stalkes, cut in on the edges, into sive deepe divisions for the most part, even to the stalke, somewhat rough or hairy, each part whereof is also dented about the edges: from among which riteth up a reasonable great and strong hairy round stalke, about two foote high, having some such like leaves thereon, as grow below; at the toppe whereof is set many flowers spike sassing, one above another, which are sassing to a very dead or sad blawish purple colour, seeming as if they were rugged or crumpled withall, which addeth a greater evill savourednesse unto them, of a very dead or sad blawish purple colour, seeming as if they were rugged or crumpled withall, which addeth a greater evill savourednesse unto them, on the outside, but of a little fresher or more lively blew colour, and smooth on the inside: after which doe come diverse small rough cods, standing together like as other Aconites and Columbines doe, wherein is conteined a rugged blacke seede: the roots is somewhat thicke long and blackish, with diverse fibres and long stringes sastness could be very yeare, and shoote forth new every spring.

blackith, with diverse fibres and long stringes fastned thereunto, whereby it taketh strong hold in the ground: both stakes and leaves due all downe to the ground every yeare, and shoote forth new every spring.

3. Aconism flore Delphinii minus. The siner leased Wolfes bane with Larkes heele flowers.

The lesser Larkes heele Wolfes bane, hath diverse smooth greene leaves, upon young spote stakes, but they are not altogether so large, or of so sad a greene colour, and much more smely cut in and divided into many jagges or parts, than the former: the stalke also riseth not up so high, and beareth some smaller and siner leaves thereon, which endeth in a smaller spike or head of almost as large flowers, with a short spurre or heele behind, as the other, but of a sairer blewish purple colour, and more lively, as well on the optime as inside: the code and seede are like the former, but the roote different having three or four esticks floor blackish rootes, ending in small long points, fastned together at the head.

1. Acomitum luteum Ponticum ferotinum. Late flowing Wolfes bane.

4. Aconitum ceruleum minus five Napellus winer The imall blew Helmet flower-

The early flowing Wolfes bane.

6. Acquitum caruleum autumnale The harvest Helmet flower.

7. Acenteum maximum coma mutante. Great Woolfes bane with a bending top.

Aconitum caruleum minus, five Napellus minor. The small blew Helmet flower. The small blew Helmer flower rifeth up with a round greene stalke, two or three foote high, whereon grow

divers darke greene (hining leaves, cut into five partitions very deepely, each of them formewhat cut in on the edges, very like unto the leaves of the greater blew Heimer flower, but that these are not so finely devided, and the divisions are somewhat broader: the top of the stalke is divided into two or three branches, each where of beareth one flower, and feldome two or three, of a very faire deepe blewish purple colour, very like in forme man the other great Helmet flower, but that the flower is smaller, and the crest of the Helmet riseth higher, then in that; after which come small pods like the other, and such like seede: the roote is round like a Bulbous; big below and small above, and encreaseth thereby, giving such like rootes, with smaller fibres thereat, then at the greater rootes,

5. Aconsum lycottonon precox. The early flowring Woolfes bane.

Thecarly Helmet flower or Woolfes bane, rifeth up very early in the spring, with many thicke shining darke greeneleaves, cut into five divisions, and they againe somewhat devided or cut in on the edges? but not so finey as those of the greater Helmet flower, neither whitish underneath as they are, but rather of a paler greene on the underside and shining, as well as the upper side the shining round greene stake riseth not fully so high as the Helmet slower, being not much above two soote high, having divers leaves thereon, like those below, but smaller, and at the top but a few slowers, in comparison of the other Helmet slowers, but are like unto them both for forme and colour, being of a most brave, deepe blewish purple colour; after which come three pods, standing together for the most part, and no more, wherein lyeth such like round blackish seede, as are in all the rest: the rootes are very like those of the greater Helmet flower, and encreaseth as much, by setting of fundry fuch like heads.

6. Aconitum caruleum Autumnale. The Harvest Helmet flower.

This late flowring Helmet flower is very like also unto the smaller Helmet flower, rising as high and having fuch like darke greene leaves fomewhat shining, devided in the same manner, but somewhat larger; the slowers grow in long spikes, of a faire blewish purple colour, the pods and seede are like, but the roote hath onely divers blackish strings or fibres, set at the severall rustres of heads, which are not Turnep like nor bulbous like. as the greater and lesser Helmer flowers are, which maketh the difference, besides the time of the flowring which is later then either of the other, that is not flowring untill August.

7. Aconitum maximum coma nutante. Great Woolfes bane with a bending top. This great Woolfes bane hath very long and slender stalkes, even three or foure foote high, devided at the tops into fundry branches, with long spikie heads, of very large slowers, which for the weakenesse of stalkes and the manufacture of the stalkes and the stalkes and the manufacture of the stalkes and the stalkes are stalked as the stalkes and the stalkes and the stalkes and the stalkes are stalked as the stalkes are stalked as the stalkes and the stalkes are stalked as the stalkes are stalked as the stalked falkes and the weight of the many flowers growing together, bow downe their heads: for the flowers are greater and larger then in any other Helmet or Woolfes bane flowers, and of a paler blewish purple colour, then in the Helmet flower: the leaves also are larger, and more devided then in any, except the letter Woolfes bane. TRIBE 2.

Repelles Veras. The true Helmet flower.

Ch a p. 1.

Anthers. The counterpoilon Monkes boode.

8. Aconitam purpureum altud. Another purple Helmer flower.

with Larkes heele flowers: the pods are greater and stand three or foure together; with larger rough blackissificede in them; the roote is thicke and long, somewhat like unto the rootes of the greater Helmet flower, and encreaseth such like heads by it in the same manner.

8. Aconitum purpureum aliud. Another purple Helmet flower.

This other purple Helmet flower hath larger leaves then the other, of a fadder greene colour and thining withall, but incifed after the fame manner: the stalke likewise groweth very high and often spreadeth into sindry branches, bearing large purple blew flowers in longer spikes then the other: the seedes and sootes be much like the other Helmet flower.

Aconitum hyemale. Winter Woolfes bane.
This is described in my former Booke.

Unto these kinds of Aconites may be referred the Anthora or Antithora, set forth in my former booke, for that in the outward face and forme of growing, it doth so nearely represent them, that it made Clusum thinks it must also be of the same deadly quality with them; and although the name dorth import it to be the remedy against the poyson of the herbe Thora, which shall be shewed in the next Chapter; and so might challenge to be rather inserted among the Alexipharmaca, Counterpossons, yet because both it is as I said so like unto those former Aconites in the slowring, and yet is the remedy against the poyson of these Aconites, as well as of that Thora, I thinke it sitter to mention it here then there, and give you the figure and properties thereof likewise, among the vertues, although I have said somewhat of them formerly.

None of these plants grow naturally wilde in our country that ever I could certainly learne, although Doctor Penny in his lifetime, seemed to affirme, that he saw some of their kinds growing on certaine hills in Northumberland: they all grow in woods and shadowie places in trait, Germany, and other places.

The Time

Some of these flower earlier and some later then others, according as their titles testifie; the rest slower in the end of May or beginning of Iune.

The Names.

It is called in Greeke and trov Aconitum, it a diffum faith Pliny, quia in nudis cautibus nascitur, quas aconas nominant, ubi nullo juxta ne pulvere quidem nutritur, which Ovid expresseth in the seventh booke of his Metamorphosis in these veries.

Que quianascuntur dura vivacia cote
Agrestes Aconita vocant

Theophrastus saith it tooke the name ab Aconis ubi plurimum nascitur, Is autem vieus est Peryandinorum, qui ad Herackam Ponti eft, which Pliny faith againe in his fixt booke and first Chap. Portus Acone veneno Aconito dirus. Herausmi sont est, which some terms in the sound and the Chap. Lower stone venero revento al mobile But Pene milliking thefe derivations laith, Aprior fluerit Nomenclatura interpretatio, si cam ab herba sacco, vel radice, quibu quass core picula a venatoribus affricta & subatta, calerius subirent, & perniciem adferrent, quam si a causibus, aut a page cognomine deducas: yet saith he possit etiam and të anovit suv deduci, quemadmodum tostico αποτου τοξιομό & non a taxo. For even fo Xenophon in Cyripadia faith, έδε καις τοξά ανοντίζει ανθεωπον επετεκπριβο vili. Neque enim jaculari neque in hominem collimare permittebamu vobu: it is cal'ed Lycottonon & Cynottonum becauseit killeth Woolves and Dogs; in Latine Aconitum & Iuparia, for the same causes; But the name of Aconitum was referred to many forts of poylons, and poylonous herbes, one much differing in face, though not quality from another, as hath beene shewed before in the white Ellebor and others, and may be hereafter more as accassion shall serve; It is called of the Arabians Chanach adip or adib, id est, strangulatorem lupi, of the Italians Mounte & Luparia, of the Spaniards Yerua matta louo, of the French Tue loup, of the Germans Wolffs wurtz, of the Dutch Woolfmurtel. The first kind here set downe is called by Gesner in bort Ger, Aconitum primum flore albo. Camerarius un horto under the name of Aconitum Lycottonum flore luteo diftinguisheth both the kinds very well, saying the greater hath the largest lease and fairest greene colour and flowreth later then the other, it is thought to be the fixt kind of Aconite that Matthiolius giveth onely the dumbe figure thereof: The second is cal-led of Clusius Aconitum Lycostonum store Delphinii jm. Silesiacum; of Camerarius Aconitum store Delphinii: of Gesmer in horin Germaina Aconitum caruleum aliud. of Baubinus Aconitum caruleum hirsutum flore Consolida regain the third is the Aconitum flore Delphinis of Dodoneus and Lobel: of Dalechampius Aconitum Lycottonum ceruleum ju flore Delphinii Dodonei: it is probable to be the fourth Aconitum of Matthiolus Bauhinus calleth it Aconitum ceruleum glabrum flore consolide regalis: the fourth is called Aconitum Lycoctonum tertium ceruleum parvum of Dodonans, of Lobel Lycottonum caruleum parvum facie Napelli : it is the tenth Aconitum of Clufius, who faith and so doth Gefner also, that is called in Italy Thora Italica, and of the Chymistes there herba tora; of Bauhinus Acontum ceruleum minut, sine Napellus minor. The fift is called Acontum Lycottonum 4. Tauricum by Clusius; and by Banhinus Acontum violaceum seu Napellus secundus. The fixt is the Acontum Lycottonum alterum of Dodoneus, and is the seventh Aconitum Lycottonum of Clusius, which he faith is called also Antumnale: The seventh is the eight Aconitum Lycottonum coma nutante of Clusius, Baubinus calleth it Aconitum instexa coma maximum: the last is called by Clusius Aconitum Neubergense and by Baubinus Napellus tertius. I call all these kinds Woolses banes and Helmet flowers, not onely for a distinction from the other forts that follow (for all these are in fate and forme of growing, and in leaves, rootes, flowers and feede one, not much differing one from another) but to flew you that it is even Dioforides his distinction, who maketh this his Aconium alterum, which he saith was called Lycottonum and Lynottonum, although his former Aconium called Pardaluncher did kill Woolves as well as this, and that such different herbes should not goe in English under one common name of Woolfes bane, whereby it should bee hard to understand in the naming of them what kind is meant.

All these plants are positionous and deadly to mankinde, to be taken inwardly any manner of way, as that feast, at Amerpe sheweth, where by ignorance the leaves of superist or Napelisa, being put as a sallet herbe with others, many that did eate thereof died, after the violent passions they endured for the time: it is also as deadly to Dogs, wolves, and other creatures, who shall take thereof, either the juyce of the herbe or roote, or the herbe or roote it selfe, put into self, and given them to eate: in the juyce of the rootes especially, the hunters of swilde

beaftes, doeuse to dippe the heads of their arrowes they shoote, or darts they throw at the wilde beafts, which killeth them that are wounded therewith speedily; yet it is faid that the flesh of the beasts so, killed, is no, whit par fonous but fafe, and eateth more tender than of others of the same kinde, not killed in the same manner, for a g abide undressed for a day and a night. The ordinary physicall remedies that is to be used for any that have taken of these herbes, is first to procure vomiting, with all the speede possible, to avoid as much of the eville subliment that remaineth in the stomacke as may be; and secondly glisters, both to clense the bowells, and to draw the sell quality downewards that way : and thirdly preservatives to defend the heart and vital spirits from surfaces. on, or the bloud from putrefaction or congelation; which are effected by taking Mithridate, or rather Verse Treakle, which is more appropriate for poylons; as also to drinke the decoction of Origanum, Rew, Hore. hound. Wormewood, or Wormewood wine; as also Southernwood, Chamepitys, or ground Pine, and Gentle ana: a dramme of the true Opobal amum taken with hony is much commended, and io is Castor, Pepper and Rue, of each a little quantitie taken in wine. Some commend also to drinke that wine, wherein iron, or gold or filver, made red hot hath beene quenched. Petrus Aponensis in his Booke of poisons, commenderh theuse of Terra lemnia, a dramme or two, thereof to be taken in warme drinke; but above all hee faith that Ariffolicia longa.or the long rooted Birthwort, is the most especiall antidote or remedy against all Aconites: But behold the wonderfull goodnesse of God; who although he hath given to these plants so deadly faculties, yet bath he ended them also with other properties, very beneficiall to mans health: as that the juice or distilled water of Acoustin Ponticum of both forts, dropped into the eyes, taketh away the inflammation or rednesse in them, as also cleans them from any haw, or pinne or webbe, growing in or upon them. It is faid likewife by Pliny, that if any believe with a Scorpion, or other venemous Serpent, or have taken any other poison, that to take of this in warme was will expell the other; for finding another enemy already possessing the part that he would worke upon, he shall will expert the other ; not middle another them, are tany politically and thereby freeeth nature from rule, (but this were a desperate cure for a desperate disease) and that by the touch onely of this Aconite, Scorpions at dulled, and restored againe by white Hellebor; how true this is I leave to every one to judge or trie as he shall thinke best himselfe : but certainely if either the rootes or seedes of these Aconites, or of the other Helmer flower be beaten into pouder, or the juyce of them boyled with oyle, or Hogges fat, and the head and body anoing therewith, it will kill lice and vermine breeding therein; the lye also wherein the leaves, rootes, or (cee, his beene boyled, doth the same and clenseth the head also from source and dandrasse. Galen saith that they are used foule ulcers and fores, to confume the dead flesh, so as the fores be not in the mouth or privities, which by rese of their vicinitie, to the spirits and life are not to be dealt with in such fort : and for the Helmet flowers (theyer all thought to be of one nature, how foever it is spoken but of one that is the more common) A vicen prescribethan Antidote or remedy against the poison thereof, to be made with the Mouse that seedeth upon the roote of the Napilus, or Helmet flower, faying, that that Mouse is the Treakle thereof, and being taken in the whole thance, resistent the venome of the Napilus, and freeth them from all danger; which Mouse Matthiolus sin he hath often found, and faith it is that which Avicen calleth Napellus Moyfis, having the fame propertie senith the poison of Napellus, that the plant it selfe so called hath. Petrus Aponensis also faith, that this Muse that fee deth upon the rootes of Napellus is the Bezoar against the Napellus, if it be dryed and two drams of the ponder given in drinke; but Antonius Guainerius, a famous Phylitian of Paule, in his Treatile of poisons thinkehhus it cannot be a Mouse, that Avicen maketh mention of to feede upon the roote of Napellus, but that they are as taine great Flies that feede upon the flowers, whereof his Antidote is made that expelleth the poison. For her there reporteth the industry of a certaine student in Phylosophy, desirous to know the truth hereof, who loose diligently for this Moufe, but could neither find or fee any, or that any rootes had been eaten or bitten by sy Moufe or the like thing, but found abundance of Flies feeding upon the leaves, which therefore hee tooks, as with them in flead of the Moufe he made an Antidote, which he found to be very effectuall, not onely against ther poisons, but chiefely that of the Napellus or Helmet flower : Petrus Pena, and Matthiolus de Lobel confemeth this opinion, and experience of Guainerius his fludent by their owne trial alfo, who not finding any Monte nor hearing thereof by any the Shepheards, and others living in those mountaines of Switzerland, where the Napellus groweth in abundance, or that ever they had seene any Mouse to seede thereon, found as they say greet store of certaine great Flies, with blewish greene heads and wings, like unto Canthariaes feeding upon the flowers, when as they could not finde any other living creature, to touch or eate it; the graffe every where by ing eaten by the cattle that fed thereby, but not any part thereof once touched. And therefore much sufpetie that this posmus, was miltaken by the Arabians for posa museus the Greeke word as well as the Latine, beingh neare in letters the one unto the other; (for the roote of this Napellus killeth Mice as the name Myothus all Myophonon doth import;) of which Flies as they say, and not of any Mouse, is made an antidore most preslent against the poison of the most venemous Spider called Tarantula, as also against all other Epidemical gen rall, or contagious diseases, and is made after this manner. Take twentie of the Flies that have fed upon New lus, of Aristolochia and Bolearmonicke, of each a dramme, whereof a dramme is to be taken at a time, Graining his Antidote is to be made with Terra lemnia, Bayberies and Mithridate of each two ounces, xxiiij. of the Flies that have fed upon Napellus, of hony and oyle a sufficient quantitie, to make it up into an Electuary: you may see hereby the various opinions and Writings of men, Matthiolus and Aponensis saying they have sound and used the Mouse, that sed on the Napellus; and Guainerius, Pena and Lobel denying it, which whether site truer, and more probable, is in part shewed before, and in this may be confirmed, that Dioscorides and others the truer. write, that the Aconitum Lycottanum (whereof Napellus is a kind and as strongs) is also called Myottanua Myophonon, that is Muricida, because it killeth Mice, as well as Wolves, and therefore they could not live upon the control of if it would kill them. The Anthora or Counterpoison Monkes hood, is said by all Authors that it groweth, we or hard by the Napellus or Thora, although Gerard faith the contrary, and adviseth that it be not planted next the Napellus or Helmet flower, for feare of drawing the venemos qualitie thereof unto it. The roote is high Hugo Solerian, to purge the body very strongly, of waterish and vicious humors, both by vomit and by the stool the quantitie of a beane, be taken in broth or in wine: by reason of the exceeding bitternesse of the roote, it kills all forts of wormes in the body : it is also faith Guainerius, by mine owne experience and fight, as effectuals Dictammus unto all the purposes whereunto it serveth : the powder of the rootestaken in wine, is a molt for die and speciall remedie, against the winde collicke, which the Savoyards about Diam, where it groweth about

dantly, know very familiarly, and call it L' herbe du machon, that is, the wind collicke herbe, and suppose that it having two round rootes, the one will be full and solide one yeare, (as it is in the Orchides or Sayrions) and the other lanke, which changeth to be solide the next yeare; when the other that was firme in the former yeare, will then become lanke; that the sound roote will ease the winde chollicke, and the lanke procure it: the same rootes also nied inwardly, is not onely the chiefe and principall Antidote or remedie, against the poyson of these Wolfes banes, and Helmet flowers, but of the Leopards bane, which shall be described in the next chapter, and all other poysonous berbes what soevers and against the venome of all serpents and other venemous beasts or creatures, and is also amost soveraigne remedy against the plague or pestilence, and all other infections, or contagious diseases, which raise spots, pockes, or markes in the outward skinne; by expelling the poyson from within, and defending the heart, as a most soveraigne Cordiall.

CHAP. II.

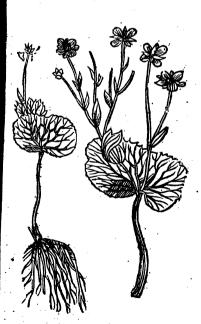

Aconitum Pardalianches five Thora. Leopards bane.

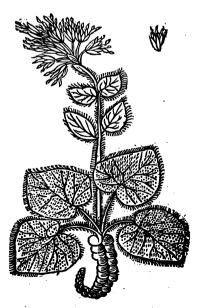

F this fort of Leopards bane, there are accounted two severall forts, differing in bearing more leaves, one than another, as also in the greatnesse of them, and of the whole plant, which yet might rather be attributed, to the fertility of strillitie of the soyle, wherein they grow: but as they are remembred by others, so I must proceede also, and set them forth here unto you.

1. Aconitum Pardalianches sive Thora minor. The lesser Leopards bane

The Leopards bane is a small low herbe, rising up with a small sender round stalke, little more than halfe a soote high, bearing about the middle thereof but one small stiffe or hard lease, for the most part, but sometimes two or three one above another, and sometimes two together, which are round somewhat like the lease of Assembly the stiffer, smooth, and of a blewish greene colour still of veines therein, somewhat unevenly dented about the edges, not comp sssing the stalke, but standing from it, upon short sootestalkes: the toppe of the stalke is divided oftentimes into two or three branches, with a small narrow lease at the joint, and one smooth pale yellow shower at the toppe thereof, somewhat like unto those of Cinquesoide or sive leased grasse, consisting in many of source, and in some of sive round pointed leaves, with a small greenish head in the middle, which when their slower is fallen, groweth to be a small head, consisting of many small seedes set together, like unto the heads of wires for of Ransinali, or Crowsette: the roote is composed of seven eight or tenne, small long round very white shining rootes, somewhat unevenly as it were branched out like knots or joynts in diverse places, plainely tobe discerned in some, but in others not, being plaine and smooth, ending in a small long fibre, and all of

them faltened at the head thereof, like unto Afbodill rootes, of the most poisonfull qualitie, that hath beeft found in any other herbe.

2. Aconisum Pardulianches five, Thoramajor. The greater Leopards bane.

The greater Leopards bane, is in all things like unto the leffer, before described, but that it is greater, and is seth higher, having larger leaves, and finely dented about the edges, and two or three standing together about the middle of the stalke, some smaller than others, and sometimes one above another, and some small long and narrow ones at the joints and branchest forth into two or three parts or more, bearing every one his small yellow flower, like the former: the seede and roote is also like the other.

ow Hower, like the former: the feete and roote is and included the Matthiology his fained Leopards bane.

3. Aconium Pardalianches Matthiolic commentations. Matthiology his fained Leopards bane.

I thinke it not amisse to set forth unto your view that figure of Matthiology, which he (as is thought caused to be drawne according to his owne fancie, taking his patterne from this Thora, and defirous to expresse it with fome nearer resemblance unto Dioscorides his description, of Aconicum Pardalianches,) hath set forth, with foure round rough leaves, and one long crooked roote, bunched out it diverse places, like unto the taile of a Scorpion, which figure bred a great contention betwirt Gefner and him; Gefner laying to his charge, that beld but fained it, and that there was no such herbe, in rerum natura, because it was made so artificially, and wanted fibres, which all other rootes have, whereby they draw nourishment out of the earth. Matthiolas in his define to that point alledgeth, that Demaria which we call Lungworte, hath no fibres, being a roote confifting only of scales, as it were set together; as also in that other roote called Demaria bulbifers, which as Manhale faith, the Germans call Sanicula alba, and he setteth forth among the Symphica; but the Author of the gree Herball printed at Lyons who was loannes Molineus and going under the name of Dalechampius, but of the writers called Ludimensi;, taketh upon him the defense of Matthiolus his sinceritie in his appendix to the period of the period the former wanted, and with all giveth the description thereof in this manner; it rifeth up faith he early inte yeare, if the fpring be milde, with his stalk, before any of the lower leaves appeare, as the Coltes foot and the be. ter burre doe; having foure small round hairy leaves upon the stalke, set by couples at distances; the flowers many growing in a tuft, or round head together at the toppe thereof, of a pale yellow colour, with many yellow ish threds in the middle : when the flowers are past, then commett up the leaves, which are foure for the me part, and are almost round, hairy and greene on the upperside, and hoary white underneath, full of veines moing through them, and sull of small spots: the roote consistent of many knots and joints like unto a Scorping taile, in the same manner as Matthiolus hath set it forth in his figure: this he faith groweth on the Alpes of Same 207, not farre from the chiefe Monastery of the Carthusans, in a rough rockie place, which they call, Les Eschin that is, the ladder, because the way of the rocke, is cut out into steppes, to get up to the toppe; and faith thereis he faw with his owne eyes, and that an Apothecary of Trevers, who had diverfe plants growing thereof in his garden, and abiding many yeares, from whom he obtained the whole plant to fet forth, to end the controvent betweene two such worthy men; and yet this figure is much suspected also to be but counterfeit, by Commain the 44 page of his minus cognitarium strpium, & by Baubinus and many others: but if I might shew mine opinia, I would rather thinke that Matthiolus let forth his figure a little artificially from the Doronicum brachiata radio which hath round leaves and such a like roote: if I be mistaken let it be accounted my error.

The Place.

The first groweth in shadowie places, on the snowie hils in Savoye, where there is scarse any crust of emb for the rootes to grow in, necreunto Mura, and in the toppe of Iura. The second groweth in the like place, among those Alpes of the Valdenses, that respect staly, called Vadersumen and Engronia, as also upon the mountaine Baldus, which is not farre so on Verona; the last his place is declared in the description.

The Time.

They all but the last doe flower in Iune, and Iuly, which are the spring Moneths of the Alpes, and their seek is ripe in August.

The Names.

It is called in Greeke by Disservices descriptor magdeniasy to, Aconisum Pardalianches, because the herbé kilent Leopards, Wolves, and all other soure source forced beasts very seedily. It is called of diverse also Thora, from the Greeke word of the state is, corruptio, venenum ant mors. Theophrassius describeth it in his ninth Booke and with Chapter, under the name of Thelyphonom, because it is a speedy death to semales; or because being put into the cert parts of semales, it speedily killeth even within a day. Gesner and others take it to be Limeum of Pling, in his 17. Booke and 10 Chapter, which he saith is an herbe so called by the Gaules wherewith they doe make audicine, to dippe their arrow heads in, when they hunt wild beasts, which they call Cervaria: Gesner saith like was called of some in his countrie, Lunaria, because the leaves were round like unto a still Moone, himselketh the Thora Venenata and Toxicum Valdensum. Clussus makethic to be his third Raunculus grumosa radic, and Lobel calleth it Phibora Valdensum. Matthiolus in contempt of Gesner calleth it Pseudo aconisum Pardaliandu, as though it were but a base kind of Aconise, without force or vertues, (which it seemeth he rather uttered in the heate of his contention, and contestation with Gesner, who alledged that this was the truer Aconisum Pardalianches of Dioscovides than in the truth of the matter) it being the nearest to Dioscovides his description in all oth parts as well as in the rootes which are shining white like Alablaster, and the strongest and speediest possion of manner of herbes. It may be called in English, either round leased Wolfes bane, or Leopards bane to distinguis it from the former.

The Vertues.

Dioscorides giveth no other properties to this kinde of Aconite, then death to all source footed beasts, beinggiven to them in sless, being put with other things are for that purpose: Theophrass, and Pliny after him say, that it is a remedy against the Scorpion, being the in warmed wine, for it killeth nature if it sinde not an enemie in nature, whom it may kill, against whom kills veth and spendeth its strength, to overcome it, that it might free nature of danger, thus saith Pliny: it was all Scorpio because the roote was like a Scorpions taile, it seemeth also it was upon the like occasion called Thropson, because it killeth Serpents; for they say, that the Scorpion is a stonied, and looseth both strength and months.

being onely touched with the Aconite; and receiveth life and strength againe, if it bee touched or rubbed with white Ellebor. It is found by most certaine experience, that it is the fiercest and speediest poyson, surpassing all other, that groweth on the ground; and that they used to say in the former times, there was not found any remedie against it, although many things had beene erved, but of later times the industry of man, hath found out his die against it, although many things had beene erved, but of later times the industry of man, hath found out his Antigonist or Counterpoyson, which is the Anthora before declared. Gespier in libro de Lunariia, reciteth that if a sword, dart, or arrow, be but touched with the juyce thereof, and therewith either man or beast wounded, that any blood be drawne, the malignity thereof so quickly pierceth inwardly, that it presently killeth, corrupting and congealing all the blood, unlesse that part round about the wound be instantly cut away, and that it may make the say will beast so wounded, after three or source leapes or springings; but (that which is more wonderfull in my opinion)he said that the sless hat safe to be lated in the shand, and yet not hurtfull to be eaten, and Plinge saith it killeth sish, whereby as hee saith it is knowne, that that poyson is an enemie to the blood. For he saith, that if any blood should fall into the pot, where this poyson is kept, it will presently loose its strength. It is said also that it is so permicious, that if it be but held in the hand a little time, it will almost take away the senses; as also, that one but smelling thereto, after behald gathered it fell downe as dead, and with much a doe was recovered.

CHAP, III.

Doronicum five Aconitum suppositiiam. The supposed Wolfes bane.

Doe adjoyne this hearbe Doronicum, next unto the Wolfes banes, because many doe hold it a kind thereof, which how true or falle you shall heare by and by in his place. Of this kinde there are found diverse forts, differing either in rootes or leaves one from another, and some for the likenesse, or manner of growing, are referred unto them, as shall be presently declared.

1. Doronicum vulgare. The most common supposed Wolfes bane.

The molt common Doronicum, (that hath beene longest known unto us, and kept in our gardens, many of the rest being found of later yeares) hath diverse leaves rising from the roote, every one standing upon a long soote stalk, which are somewhat round, greater than the Romane Sowbread leaves, soft and gentle in the handlig, somewhat hayric and of a fress greene colour; from among which riseth up diverse greene roundish stalks about a yard high or more, parted at the toppe, sometime into one or two branches, every one carrying a large slower, somewhat like the Corne Marigold, but much larger, having many narrow long yellow leaves, as a border see about a middle thrumme, somewhat yellower, which when it falleth away, turneth into small whitish downer.

1. Doronicum valgare.
The most common supposed Wolfes bane.

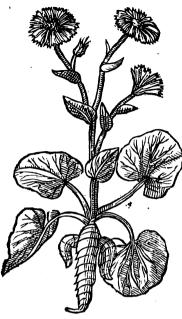

2. Doronicum minus. The leffer supposed Wolfes bane.

With

3. Doronuum brachiata radice Scorpion rooted supposed Woolfes bane.

with very fmall blackish seede, which is carryed away with the with very imail blackilli lecus, want of the recepting or lying the winderthe rootes are small, thicke and short-creeping or lying the der the upper cruft of the earth, with divers fmall fibres, flooting der the upper cruit or the earth, with divers main notes, thooing from them downe into the ground and increasing divers such like tuberous rootes round about it, which are tender and not land formewhat whitish and with some joynts therein, and greenish of the contract o the upper fide next unto the upper face of the ground: Some would make these rootes to resemble a dead Scorpion, because would make these rootes to resemble a dead scorpion, became of the joynts, which are like scales therein; the former partner the leaves, being thicke to be the body, and the other part, being small to be the taile, which is somewhat sweete in taste, and little bitter, with some austere clamminess joyned therewith.

the ditter, with 10me auttere crammine possess increasing.

2. Doronicum minus. The lefter supposed Woolfesbane.
The lester Doronicum hath divers leaves, longer and narrowe, then the former, somewhat like unto Ribwort Plantaine, but ha ry and of a yellowish greene colour; the stalkes are slender and ry and or a yenowing greene colour; the trained are increased the like yellow flowers as the former, fomewhat paler the former is small not like the former being without those joynts so plain in them.

3. Doronicum brachiata radice. Scorpion rooted supposed Woolfesbane.

This Scorpion rooted Doronicum hath large round hairy level like the first, fomewhat waved or unevenly dented about the of ges, of a fadder greene colour and fomewhat bigger; the falle have divers narrower leaves thereon, the flowers are yellow and the leaves thereof dented at the ends, the feede is like unto the other, but the roote creepeth not fo much, but is somewhales ger thrust downe into the ground, with joynts growing as wards, branched as it were on each side with young rootes; and

wards, branched as it were on each fide with young rootes; and ending in a small point, with divers long fibres set unto them.

4. Doronicum Austriacum angustifolium. Small supposed
Woolfes bane of Austria.

This small Doronicum of Austria hath fewer leaves then the cond, but soft, long, narrow and hairy like them, greene and some then it, hairy also but smooth, and striped all along; whereon are set divers narrower leaves, compassing at the bottome, up to the top, where there standeth but one large slower for the most part, like unto the other Doronicum. but of a deeper yellow colour, which turneth into downe, with small blacke seede therein, and Doronicum, but of a deeper yellow colour, which turneth into downe, with small blacke seede therein, and carryed away with the winde, in the like manner: the roote is small and joynted somewhat like unto it, buttout

carryed away with the winde, in the like manner: the roote is small and joynted somewhat like unto it, button increasing so fast, with diversiong fibres thereat.

5. Doronicum humile Stiriacum Clussia. The low Stirian supposed Woolfes bane of Clussia.

This low Doronicum hath many large and somewhat round leaves, dented about the edges like unto the third fort before expressed, standing upon high sootestalkes: the stalke is lower then it, having some leaves through an arrower then those below, and at the top (not having any branches) one slower larger them any of the standard of the supposition with many long wellow leaves. the former, but else like unto them, with many long yellow leaves, fet about a middle brownish yellow thrum: the roote is somewhat long, blackish on the outside and joynted but not plainely to bee discerned, the joyns in fing upwards, and not downewards as they doe, in most of the rest, with some other tooice, growing from it and

6. Doronicum Germanicum. The supposed Woolfes bane of Germany. The Doronicum of Germany hath divers broad hairy leaves, of a yellowish greene colour on the upper side, and whitish and smooth underneath, lying on the ground somewhat like unto broad Plantaine leaves, or rather like unto the Crossewort Gentian, having some long ribbes therein: among these leaves riseth up a stalke, and some times many, bearing long leaves, at every joynt; at the top it brancheth forth into two or three or more ann fometimes, bearing every one a faire large flower, fer as it were in a rough cup, which confifteth of many pale yellow leaves, dented at the ends, as a pale or border about the middle, which is made of many small flower, pale yellow leaves, dented at the ends, as a pale of border about the middle, which is made of many imali nown, of foure leaves a peece, of a deepe yellow colour, as it were the thrum; (Baubinus faith that there hath a for hereof beene found in Stiria) with blew flowers, which being past, the head turneth into downe, and is caimed away with the small black is freede therein: the roote is small, yet joynted like the former forts, but not so plainely to be discerned, of a sweete sent and a bitter biting taste, having many fibres underneath it, and giving

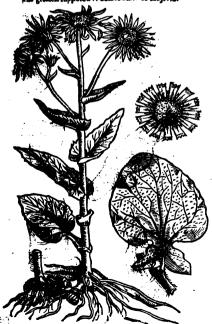

many of lets, whereby it is increased.

7. Doronicum maximum Austriacum. The greatest supposed Woosses bane of Austria.

This great Doronicum of Austria shootest forth many faire greene leaves from the roote, lying round about it, which are broad, hairy, rough and somewhat round pointed at the ends, every one standing upon a long footstalke; but those which are set upon the stalkes, which rise three or source foote high or more, are larger and outside the stalkes. stalke: but those which are set upon the stalkes, which rise three or foure foote high or more, are larger and onger then those below, fet without order, and compassing it at the bottome like Tobacco leaves, all of them alter unevenly dented about the edges: the flowers upon the toppes of the leaves of the severall branched salks, are large and yellow like unto the common Doronicum, which after they are pass, the greenish seedes that is among the downe, are conveyed both away together with the winde; the roote is thicke and joynted like the 5. Derencum bumile Stiriacum Cinfit.
The low Stirian supposed Woolfes bane, and the Derenicum rootes of the Apothecaries thops.

7. Derenicion mavicum Auftricum.
The greatest supposed Woolfes bane of Auftric.

6. Doronicum Germanicum. The supposed Woolfes bane of Germany.

8. Doronicum Helveticum incanum. The hoary Helvetian supposed Woolfes bane 8. Doronicum Helveticum sucanum. I ne noary Helvetian supposed by oches bane. World The hoary Doronicum of Helvetia, rifeth up with a round hollow greene stalke, a toote high, or more, team thereon divers leaves fomewhat longer and more pointed, then those that grow next the ground, some when are round, and others long and round, yet all dented about the edges, of a pale greene colour on the upper fide, with a white rib in the middle, and of a mealie hoarinesse underneath, as the footestake is also: the flower is read a white rib in the middle, and of a mealie hoarinesse underneath, as the footestake is also: the flower is read yellow that standeth at the top of the stalke, with many long narrow leaves, not dented at the edges, but found compassing the middle thrumme : the seede is carried away with the downe, like unto others : the roote is small joynted, and as it were scaled like the rest.

9. Poronicum Helveticum humile. The low supposed Woolfesbane of Helvetia.

This low Doronicum of Helvetia or Switzerland, hath many thicke, darke, greene, hairy leaves, and of and greene underneath, lying next the roote being somewhat long and round and dented about, the edges; from mong which rifeth up a short hairy stalke, not halfe a soote high, with very long and narrow leaves set thete parted at the toppe into two or three small branches, bearing yellow flowers, of a meane size or bignesse is unto the reft.

10. Doronicum Americanum. Supposed Woolfes bane of America.

This strange Doronicum hath divers very large leaves next the ground somewhat rough and hairie, divided a to five parts, each part being five or fix inches long, and two inches broad, pointed at the ends, and deepely densi on the edges into three parts: from among which rifeth up fundry smooth round stalkes set with the like leave on the edges into three parts: from among which include a late of the edges into three parts: from among which include a late of the edges into three parts: from among which include a late of the edges into three parts: from among which include a late of the edges into three parts: from among which include a late of the edges into three parts: from among which include a late of the edges into three parts: from among which include a late of the edges into three parts: from among which include a late of the edges into three parts: from among which include a late of the edges into three parts: from among which include a late of the edges into three parts: from among which include a late of the edges into three parts in the edges into the edges into the edges into the edges into three parts in the edges into vellow flower like unto the former, the bordering leaves being long and narrow, and the middle thrum box nish, and made as it were of many flowers set thicke together: the roote is great thicke and hard, fastned with many long strings, I have here given you two figures thereof, the one taken by us, the other by the French. 12. Radices Doronici vulgo officinarum, G. Radices Mechini rariotis Lobelis, pro Doronico gennino Arabuma Pur

exhibite. The Apothecaties Doronicum, and the true one of the Arabiana as Fona thinketh. I have here likewife particularly given you the figures of the rootes of two forts of Doronicum as they are in posed to be, the formost generally received by all or most both writers & Apothecaries for their medicine, who description is set downebefore the other Pons in his Italian Baldsus setteth forth supposing it to be more proble the true Doronicum of the Arabian, then the former, which doth not agree thereunto either in forme or quir for Avicen in the 200. Chap, of his fecond Booke, and Serapio in the 325. Chap, of his Booke of simples has described their Doronicum to be a roote of the bignesse of ones thumb, of whard and heavy substance; of a plant lowish colour on the outside and browne within, with some white veines, and is hot and dry in the third dementhus Serapio, but saith Pona, I know no other roote more properly doth represent that Doronicum, then this of M. chimus, which is often found among the Mechinus or blacke Ginger, that is brought us chiefly from Inf which Lobell calleth Mechini rara varietas, having divers circular knotted lines as it were like joynts on them.

10. Doronieum Americanum. The Supposed Woolfes bane of America.

ade, and is firme and heavy full of white velnes therein when it is broken it is also very sharpe, quicke, biting and aromaticall in tafte, and therefore faith he, having all the notes of their Doronicum, it can be no other then and aromatous material and legitimate Doronicum, from whom the reasons being so pregnant, I know not well how to disfent, yet leave it to others to judge as they shall finde cause.

The true rootes of the Doronicum in the Apothecaries shops are misser, which should have been in this table.

but are expressed in the fift figure.

TRIBE.2.

TRUBET

The Place.

The first groweth on the hills in Savoy, beyond the lake Lemanns, and in other places, both of France and Germany; the second groweth not farre from Burdeaux in France. The third on the wooddy hills about Trent. and in Austria also as Clusius faith; the fourth Clusius faith he found on divers hills in Austria. The fift likewise and in Anfrications Confirm latter the routed confirm latter the routed confirm and not overs hills in Anfrica. The first is found in many places of Germany, in the medowes and ellewhere, and as it is thought, on the hilly grounds in Northumberland. The feaventh growth in many places, both of Anfricated Hungary, as Clufton faith: the eight upon the Alpes in Switzerland: the ninth also on the fame hills about Valefia, and the last came from the French colony about the river of Canada and noursed up by Vespasian Robin the French Kings Herbarist at Paris, who gave Mr. Tradescant some rootes that hath encreased well with him and thereof hath imparted to me also.

The Time.

They all flower early for the most part, that is in May, and some of them in the Autumne againe. The Names.

The name Deronicum which is given to all these plants is derived from the Arabian Deronigi or Durungi, for it is not remembred by any of the ancient Greeke or Latine Authors, except Actuarius who calleth it Carnabadien : divers have accounted it among the Aconites, as Matthiolis (calling it Pardalianches, and referreth it to Pliny and Theophrastus their Aconstes, whose tootes are like Scorpions, as the ourward face or forme of these are, which bred the suspicion; when as the properties of these are not like their Aconites, to kill wilde bealts speedily with their Darts, or Arrowes dipped in the juice thereof; or to be a caustike herbe, able to eate away the field of a wound, and cause it to fall away:) who having received it from Cortusus of Padoa, defameth it to all the world, to be a poyson not fit to be used inwardly in mans body, and that those physicians that follow the Arabian to put it into Cordiall medicines, doe very ill, and little respect the health of man, became both as Corta/m writethunto him, and himselse upon tryall made as he saith sound to be true, that it will kill dogs the rootes being given them in flesh, which report of theirs how soever be true in dogs, may notwithstanding be not true, being given to other beafts, and may be safely given and without danger to men: for divers things that are wholfome to man, and which we often use without scruple, or doubt of danger, as Aloes and bitter Almonds, yet given to a Fox, either of them will quickly kill him, as Plutarch reporteth; and the Cameleon Thisless Fabius Columna fetteth it downe, will kill dogs and swine, &c. and yet is a most soveraigne Antidote against the poyson of Serpents, the roote being drunk in wine, and besides killeth the wormes in children without any further harme, as also even Muske, Saffron, and other things being taken in two great a quantity will kill any man: others hold them to be wholfome, as it hath beene certainly and often found true by good experience, that divers of these forts are very effectuall to helpe many diseases in men, as you shall heare by and by and therefore it is not probable, that there lyeth any venemous quality hid underneath those good ones; and befides, Gefeer faith that he had taken much and often thereof, and had given it to others without any danger of hatme; and Pena and Lobel teporteth that Ishannes de Vroede did eate many rootes thereof without any danger, or sense of paine thereby : and therefore doth advise others, not to abdicate the plant wholly from mans use, nor to discredit fish famous Arabian authors, that have appointed it to be put into Electinarium de gemmis, Electinarium ex Arabian authors, and others, as the most Cordiall medicines of all other, and whereof there was never harme taken who soever did use them, or to say that any that followed their press riptions, were guilty of the death of any man. Dodoness was also of the same minde with Matthiolus for a while, but afterwards found his owne errour and reclaimed it; but it is much doubted, whether this be the Doronicum of the Arabians or no; for Franciscus Pona in his Italian description of Mont Baldus, as I said before, refuseth it, accounting it an auncient received errour, and therefore giveth us the figure of Lobels Mechinus, for the true Dormicum, the faulties of thefe being quite contrary to their Dormicum, for besides a little sweetenesse and clammy take in the roote; it hath little or no other take, except that being fresh, some of them have an aromaticall, and some a bitterish sweet taste, like unto juice of Licoris: but the roots of this Mechinus are of an aromaticall, sharpe & biting taste: the joynts in the roots of the ordinary Deronicum, very likely might canse the later age of the world to erre, in taking it to be the right: but leave we these controversies, and attend the varietie of names and properties of these forces of Doronicum, which may better perswade us of the good to be reaped from them: The first is as I said the most common, both in the Gardens of our country and others, and is most usually called Doronicum Romanum of all writers, or with a fweete roote. The second Clufius and others call Doronicum minus and Angustifolium, Banhinus calleth it Doronicum plantaginis folio. The third Matthiolus calleth Aconitum Para dalianches Pliny, Dodoneus Pardalianches alterum, Pena and Lobel, Doronicum Brachiata radice; but Clusius setteth out the figure more truely, & calleth it his second Doronicum Auftrigeum. The fourth is Clufius his first Doronicum Austriacum sive minus, and Baubinus Doronicum longifolium hirsuie asperum. The fift is Clusius his fourth Doronicum, whichhe calleth Stiriacum, and Baubinus Doronicum latifolium flore magno. The fixt is called diverily, by divers; Matthiolus calleth it Alysma or D'amasonium, and thinketh it to be the right Alysma of Dioscorides and fo doe Camerarius and Gefner, (who calleth it also Caleha Alpina) Pena and Lobel call it Nardus Celtica als tera, as Rondeletius did take it tobe. Lugdanensis setteth it forth under the name of Ptarmica montana, as divers did call it there abouts as he faith, and yet setteth it forth againe under the title of Alisma Matthioli, Gerard likewife hath feet forth in two feverall places, under two feverall titles, the one under Calendula Alpina, the other under Chrifamhemum latifolium. Clugus calleth it Doronicum Germanicum, and faith his Pannonicum or Downiam feature, is the fame or very like, for both he and divers others doe fer it forth, with smooth, and hairy Percesalio as it is found for growing in divers and fundry places. The feventh is Clustus his Deronicum Austriafun servinus, which Bandinus calledt Deronicum maximum folis sautem amplexantions: The eighth and make a sautem applexantions.

The fingle white W dod Crowfoote

The yellow Wood Crowfoote.

middle, tipt with yellow, standing about a greene head, which in time growing ripe, is somewhat like other heads of Crowfeete, composed of many small seedes set together: the roote is usually of the bignesse of a wheate fraw stalke, not growing downe deepe, but creeping longwise under the upper crust of the ground, spreading out into diverse small knobs like branches, of a darke browne colour on the outside, and white within, and of a tharpe biting tafte, enflaming the mouth. 2. Ranunculus nemoressus mi nimns albus, The least white Wood Crowfoote.

This small wood Crowfoote, hath such like leaves as the former single white kind hath devided into three parts, and each of them into other againe, standing upon little long foore stalkes, but they are much lesser, to that the whole leafe hereof, is not much bigger than one of the Divisions, or parts of the other: the stalke is vericimall with a few leaves thereon, in two places more devided than the lower, little more than two inches high: at the toppe standeth a white flower, consisting of fixe white leaves, with a few yellowish threds in the middle : the roote is small and long like unto the other.

3. Ranunculus nemorosus flore carneo. The single blush wild Crowfoote. The fingle blufh wilde Crow foote, is both for forme, of growing, in stalkes, leaves, flowers, and rootes, like unto the former, so that untill it be in flower, there can hardly be any difference discerned, but when the flower appeareth, it sheweth it selfe much more reddish on the outside, and of a faire pale purple, or blush colour on the

inside, which maketh it a distinct species of it selfe, differing from the rest.

4. Ranguellus nemorosus flore purpures cerules. The single purple Wood Crowfoote.

This purple kinde is also like the other, and different from them chiefely in the stalke which is somewhat browner, and in the flower, which is of a pale purple blewish colour, like unto a pale violet flower; none of these have any great fent, but yet a little, and more than the yellow kinde which followeth next.

5. Ranunculus nemorosus stateus. The yellow wood Crowfoote,
The yellow Wood Crowfoote groweth in the same manner that the former doe, and with such like stalkes of leaves, but they are not so broad, nor so hard in handling, and are more deepely cut into more long and narrower parts, yet each also dented about the edges, especially towards the ends of the leaves, and of a darker greene colour; from betweene these stalkes of leaves, shooteth forth sometimes but one, and sometimes two or three stalkes, with every one a flower thereon, somewhat smaller than the former, consisting of fixe usually or of feaven, and fometimes of eight leaves, which are of a faire pale yellow colour, with many yellow threds in the middle, the seede and rootes are like the former: this hath as I said least sent at all. Vnto these belong that fort of Anemone or rather Crow foote that Dodoneus calleth Trifolia having the leaves parted into three, inipt about prioris the edges with a whitish blush flower.

6. Ranunculus nemorosus Moschatella dictus. The Muske Wood Crowfoote.

The Muske Crowfoote, hath three or foure flender pale greene stalkes of leaves, somewhat devided at the edges of them, not halfe a foote high, and not of halfe that height in fome places, very like unto those of the Hol-

Bauhinus setteth forth in his Frodomus and Pinax, under the same titles they doe here beare; the tenth Robins of Paris called Aconitum Americanum, and Cornuus Aconitum Helianthemum Canadense; but the upper leave on the stalke, with the flowers and roote, declare it to come nearer to the forts of Doronicum; the last are as the on the traine, with the nowers and total and the titles declare them. They may all be called in English, either Deronicum according to the Latine name, for so de both Italians, Spaniards, French, Germanes; and Dutchmen; or as I have entituled them supposed Wolfes bane both that the name may differ from the former Wolfes banes, and to give you to understand that they are Supposed to be dangerous; because as I said before the outward forme of the rootes, like unto Shrimpes or Sor. pions, and the leaves round like unto the leaves of Sow bread or Cowcumbers, have caused many to thinke then to be the Aconites of Theophrastus and Dioscorides; but Columna hath treated very learnedly hereof in their Chapter of his Booke of Plants, whereunto I referre you, for it were too tedious, to relate his fayings in the

The Vertues. The true Doronicum is said to be a soveraigne Cordiall, and to resist the poyson both of beasts and other deads medicines, to clenfe the breast and to helpe the cough, and to rid those humors, that cause paines in the fides; medicines, to cleme the oreat and to helpe the cough; and to the inocinimos, that can paties in the iners in our Doronicum, although it be not the true of Sergio and Avicen, yet it is no Aconice, as Matthiolus and other have supposed; for as is before said, both Gener tooke it often, and a good quantitie at a time, eventue drammes in powder, that he might find the operation of it, yet found no harme thereby; and Vroede, as Land faith tooke of it many times, without any harme; but what especiall good they found by it, is not remember for Gelner maketh not any mention thereof : yet the juyce thereof is found to be good, for those eyes that he hot and red, and full of paine, by reason of hot and sharpe rheumes, salling into them, to allay the heate, to take, way the rednesse, and to give ease of the paines and prickings in them. Cluster said that the hunters, and shere heards that live in the mountaines of Austria, doe no lesse use and commend the rootes of the third and some forts, here fet forth, (which grow with them more frequently, than the others, at the least best known unto them) then they doe the rootes of the yellow Auricula urfi, against the swimming or turning in the head, which a difease subject to those places, rising from the feare and horrour, of such steepe downeralls and dangerous places, which they doe and must continually passe, in seeking for and hunting the wild Goates, and therefore by there call them Genssurez, that is, Rupicapraria radix, as Clusius doth interpret it; and there hath beene found their mawes a certaine stone, called by Baubinus, in his Treatise thereof Bezoar Germanicum, in the middel of which stones, some of the rootes have beene found almost whole, which sheweth that they feede thereon wil lingly, without taking any harme thereby, and that the stones bred thereon are Cordiall, and so used: And Ide not thinke but any of the other forts (feeing they are all in forme, and places of growing, one so like unto another if triall were sufficiently made, would performe the same effect. For the fixt fort here expressed (which as I fild called Caliba Alpina of some, Alysma of Damosonium of others, and Doronicum Geranicum of others, of the people in the Alpes Mutterwurta, as Iofias Simlerus faith, in his Commentarie of the Alpes, that is Marricaria Morbe wort, which they have found, and do continually use to procure womens courses, and to ease the paines and diefes of the mother) is very effectuall against the poyson of the fish called Lapus marinus, as also the venemous bing of the Shrew, and the poyfon of a Toade; and is also profitable for them that have eaten Opium, in any dangerous quantitie; it is given with good successe, to them that have the bloudy flixe, or any other paines or gripings in the body or bowells, by reason of tharpe humours gathered therein: it is also helpefull to those that have convulsion or crampes, and ach or paines in the joynts and finewes, and is very powerfull to be taken with some wike Carrot feede, to expell gravell, or the stone in the reines or kidnies, if the decoction thereof in wine or water, or the powder of the herbe and rootes be taken: it is applied also outwardly, to ease the paines and inflammations apoltumes and fores: the flowers hereof doe procure neefings.

CHAP. IV.

Rannculus. Crowfoote.

Here are so many forts of Crowseete, some of the Woods, some of the Medowes, some of the Mountaines, some of the Water, some of the Rockes, and some of the Gardens; that w proceede in a methodicall manner, and to ease my selse and the Reader of too much prolimit, and intricasie, I thinke it best to distinguish or divide them into severall formes or orders, that so they may be the better apprehended and understood, for otherwise it would be toogreen

confusion, to huddle so many together : and because I have already set forth in my former Booke, many sor, whose flowers being most beautifull and rare, were fittest to adorne that Garden; I shall not neede to describe any of them againe in this worke, but referre you thereunto to be informed of them : but in shewing you the relt, I will give you the figures of some of them, and of the Anemones which are nearest unto them, and sobre every of them into their severall order, and begin first with those of the Woods.

Devisio prima. The first Division.

Ranunculi nemorofi. Wood Crowfeete.

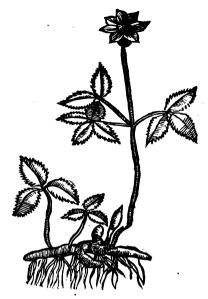

1. Ransneulus nemorofus albus simplex. The single white Wood Crowfoote.

He single white wood or wilde Crowfoote, riseth up with two or three stalkes, about an hand breadth high or better, about the middle whereof, come forth utually three stalkes of leaves, each being somewhat broad hard and cut in on the edges into three parts, of a fad greene colour, and dented also; the stalke rich up two or more inches high, bearing at the toppe one single flower, hanging downe the head for the most part made of five leaves, somewhat broad and almost round pointed, of a light blewish colour on the outside, beside it be blowne open, but white afterwards, and more white on the inlide, having a few white threds in the

Anemone trifelia Dedenni.
Dodoneus his trefoile Anemone.

6. Remuculus nemerofus Mufentelle de The Muke Wood Cronfoote.

*. Remutalus Pirginenfis elle. The white Pirginia Crowfoot.

low roote, but smaller, and of a paller shining greene colour, from among which rise up one or two small stalkes with two such like leaves thereon, but smaller, and a little above them, a small round greenish yellow head, which spreadeth not into leaves, but into source or sive little mossie heads of threads, and so abideth a while, having spreadeth not into leaves, but into source or sive little mossie heads of threads, and so abideth a while, having other slower, and passe away into many small kernelly seed; the roote is small and somewhat long, composed not other source of many small very shining white thicke scales, growing upwards, and having many white fibres at the head of them, of a little sweetish bitter, sharpe and binding taste, the leaves have a little sweete sent, somewhat like unto that kinde of Crannes bill, called Muske, yet more in the naturall places than in Gardens, when what like unto that kinde of Crannes bill, called Muske, yet more in the naturall places than in Gardens, when it is transplanted into them.

7. Rassances lus memoros is dulcia secondars Tragi. Sweete Wood Crowsoote.

The first leaves of this kinde of Crowfoote, are round somewhat like unto Violet leaves, and not devided at all, but those that rise next after them, are more devided, somewhat like unto the leaves of the last, and so those that grow after and upon the stalks are more devided than they the flowers are small, and of a faire shining gold yellow colour, standing at the toppes of the stalks, like unto the other common kindes of Crowfeete tr which come the seede many set together in a head, like a small Strawberry, as diverse other Crowfeete have; the roote is composed of many white strings and sibres, like unto others; neither roote or lease of this kind, hath any sharpe or biting taste in them, but are almost inspide.

kind, nath any, many 8. Rammeulus Virginensis albus. The white Virginia Crowfoote.

The white Virginia Crowfoot shooteth forth from a reddish thick tuberous roote with some small sibres thereso, three or some somewhat large broad whitish greene leaves upon long soote stalkes, rent or torne on the edges for the most part, among which rifeth up a stender round naked stalke, sive or sixe inches high, bearing one white shower at the toppe made of tenneor of twelve small narrow and pointed leaves, with a few yellowish threds in the middle, set about a greenish umbone, which in time groweth to be a long stender pod, wherein is The Place.

Contained form of these are found growing in Woods, Groves, and Orchards, some of them in our owne land in many places, the rest in many places of Italy, Germany, &c. The fift is found as well by the brooke sides that passed by Medowes, as in Woods, and by hedge sides.

They doe all flower very earely in the Spring, in March oftentimes, or at the furthest in Aprill.

The Names.

The first foure are diversly called of diverse Writers, for some call them Ranunculi nemorali, or nemoram and filmarum, others Anemones frivestres, or nemorofa: but in regard none of these do beare any cottony head of seede. as all the Anemones doe. I rather hold with their judgement, that referre them to the kindes of Ranunculus or Crowfoote ; yet Cluffer thinketh that they may be reckoned as kindes of wild Anemones, and faith that diverse did thinke them to be the Anemone fluestris, that Theophrastus calleth Anguaria Leimonia; the Italians call them Genero's Caloutice, wild Ginger, either because the rootes of them all, are very sharpe, hot and hiting the tongue like Gineer, or rather as I thinke, because the rootes doe grow a little spreading into severall parts, very like unto Ginger. Tragus calleth them Ranunculus fylveftris, whereof there are two forts as he faith, candidus and lutent, one that beareth white flowers and an other yellow: Iobannes Thalins maketh them his third kinde of Crowfeete: Gefore calleth the first white one Rannewins Phragmisis: I have therefore upon more mature advice entituled them Wood Crowfeete, and fet them in the first ranke or division: the second is called by Banhinn: Rammenlus nemorosus Anemones flore minor ; the third, fourth and fifth, have their names in their titles & the fixt is diversly also called, for Corda; calleth it Moschatella, and some other Moschatella pratenfis that it may differ from the Molchasella carulea of Lingdonen fir called also Ageratum purnreum; Lobel calleth it Ranunculus minimus Septentrionalium berbido mustcoso flore Tragus and Gesner make it to be a kinde of Aristolochia, for so they accounted the Radix Cave to be, and the reupon as Camerarius faith, divers did as well account it a kinde of Capues as small Crowfoote. Lugdunensis calleth it Denticulata from the forme of the roote which is made as it were of many teeth fet together: The seventh is Tragus his second Ranunculus sylvestries and Lobel his Ranunculus auricomes. The last hath not beene set forth by any before.

By reason of the hot sharpe biting take of the source first sorts, they are sound no lesse to extilect at the skinne being applied, then any of the other sorts of Crowseete; yet they may be well used to eate away and consume hard tumours, as also to take away scarres and other blemishes, and wartes upon the hands, &c. and to cate out the core of comes in the seets, the leaves or roote especially, being bruised and bound to for a certaine space. They are said also to elamse some that are much corrupted and tinking. The & and 7, fort are not knowne to be used. Vnto this Division appearaine those other sorts of Anemones systems force plene, set forth in my former Worke.

Divisio Secunda. The second division.

Ranunguli pratenses & arvenses. Field Crowfeete.

This Meddow Crowfoote (which I call fweet, not as Gerord doth because it smelleth sweets, but in regard it hath no sharpe biring for exulcerating taste, as most sof the other Crowfeete have, but is so sweet and pleasant, that many in Germany and other places, doe stew the leaves, when they are young among other better, that many in Germany and other places, doe stew the leaves, when they are young among other better, that serve to ease hash diverse great broad, darke greene leaves, spread upon the ground, a little dayie, and in on the edges into five divisions, and a little dented also about, before tally at the ends, and of a paler yellowish greene on the underside, of a sweete and not ampleasant taste, as I sayd before; among which rise and diverse havrie stalkes, with some leaves upon them, much more divided and into smaller and appropriate fairly, than the lower: at the toppes whereof stand many faire yellow slowers so like unto the next headers over some, that is very violent, sharpe and explicating the skinne; that it can hardly be

4. Ranumulus pratenfis dulcu fimples co multiples.
Single and double meddow Crowfoote.

3. Ranunculus repens flore simplici & pleno.

fumplict.

bigger than a beane, or fometimes an hafell nut, with fome long fibres at the ends especially of it, of a m Balbefut therpe biting take than any of the former.

Of this kinde is that thought to be, that beareth double yellow flowers one out of another, and called Anything the flowers in final and the flowe fet forth in my former garden, whose figure is here extant also. As also one whose flower is single and refa flure rubre an Orange. 6. Ranunculus Echinatus Cresions. Small prickly headed or Crowfoote of Candye

This small Crowfoote hath many stalkes, rising from a thready roote, round and smooth, full of brack fearfe rising a foote high, at every joynt standeth one broad sad greene crumpled leafe, upon a very long to fearle rining a roote ingin, at every royal trail, and of a pale yellow colour; and the heades of many imaliant fearles the flowers at the toppes are small, and of a pale yellow colour; and the heades of many imaliant ftalke: the flowers at the toppes are minar, and or a pare yellow colour; and the means of many man into and browne fet together, are fomewhat sharpe and prickely.

7. Ranunculus Apuleii quibus dam. The small early Crowfoote of Apuleius.

This small early Crowfoote, which some take to be the Batrachium of Apuleius, hath diverse small and be

This small early Crowroote, which to the take to be the laft, but cut into three divisions, for the most parted leaves, lying upon the ground, not so much divided as the laft, but cut into three divisions, for the most parted of them dented at the ends, and flanding upon fhort foote ftalkes, of an inch or two long, compaffing one and at the bottomes of them: from among these leaves rise up diverse weake stakes, bowing and leaning dome to the ground againe; at the joynts whereof grow such like leaves, as grow below, standing each of them his short foote stalke, and with them also commets forth at each joynt, a small short stalke, bearing a sowers. fifting of five leaves, of a faire pale yellow colour, with diverse yellow threds in the middle; after the flow are past, there follow five or fixe small cods or hornes, pointed and crooked at the ends, wherein lye brownish round seede, somewhat like those of the Winter Wolfes bane : the roote from the head then thootesh forth many white fibres, whereby it taketh fast hold on the ground, encreasing into severall but both rootes and leaves are no lesse sharpe and bitting than any of the former.

8. Ranunculus prateus retundishing Bonomensis. Meddow Crowfoote of Bonomia.

The leaves that rife from this blackish threddy rooted Crowfoote, are round soft and hayrie, dented by the edges of a fad greene colour, and about an inch broad, standing upon very long foote stalkes, but those grow upon the stalke are larger, and for the most part round also, a little divided into some parts, but not the grow upon the statke are targer, and for the most part round and, a little divided into some parts, outnot the middle: the stake is about a foote high, bending a little downe to the ground, and as it were creeping, drild into smaller branches, with large leaves at the joynts, standing upon long foote stalkes, and small pale flowers set on the toppes of them, with a few yellow threds in the middle about a greene head, which govern to be ripe, hath many tharpe or prickely browne feedes fet together.

This small Crowfoote being the least of all the rest, hath a few small leaves, growing from the roote, divided into three parts somewhat like unto an Ivie lease, each of them upon a small long hayrie foote stalke, no been than the nayle of ones singer: the stalke is about a foote high small and stender, and a little hayrie also, wi

fome leaves thereon, and fmall yellow flowers at the toppe : the feede is small in heades like the other kinds and the rootes small and fibrous.

10. Rannaculus Pannaicus maximus. The great Crowfoote of Hangary.
The great Crowfoote of Hungary, is the greatest of all these sorts of Crowfeete, having diverse very law. broad, thicke, fappy, pale, greene, thining leaves, not much lesser than Figge leaves, cut into five partor difficult, and each of them engented about the edges, being somewhat hayric withall, a little sharpe and brings. on the tongue, but not fo much, agmost of the former sharpe forts are : the stalkes are great, strong, and one what hayrie, two foote high, fpread at the toppes into diverse branches, whereon faind faire gold yellow for what nayrie, two toore ingh, ipread at the toppes into diverte branches, whereon ignite faire gold yellow noters, like unto other Crowfecte, and fuch like heads of teede following them: the rootes are many white he or ftrings, shooting downe from a head into the ground. Very like hereunto is the great Crowfoote of Comp. triplin. fet forth in my former booke but that the rootes are composed of long kernelly knots whose figure I here are

11. Ranunculus Illyricus minor. The leffer Crowffoote of Schavonic. The leffer Crowfoote of Illyria or Sclavonie, bath but three or foure narrow grayiff greene leaves, dividedim The lefter Crowtoote of 11971a or actavonie, naturous three or source nation graying greene scaves, ary non-fource or five or more parts, standing upon long foote stalkes, and of a filver white standing colors undersease the stalkes are firme and round, but small, about a foote high or more, having forme since like leaves thereon, but the middle, and spreading into three or foure branches, every one bearing a small lifting pale yellow sour,

the middle, and spreading into three or source branches, every one beauting a imair training pare yearow nows, confifting of five leaves, and fornetimes two together upon a stalke, the roote is composed of many intilinal grayish kernels, fet very close and hard together in a bunch with form short thereas.

12. Rannachim Illyricus major. The greater Gray tote of Schronile.

This greater kinde is both in lease stalke and shower, greater and larger than the former, the leaves boing two der and greener on the upperfide, and not fally of so silver a white colour, and greater, the leaves being too deepe yellow colour, and greater, but the roote hath not so many in all graines or kernels set together, that I have observed, but shootenth forth white strings, whereby it is nour the and masnamed.

Of this kinde some have beene found growing in some in the kinder or self-silver. Of this kinds forme have beene found growing in Apulsa in the Kingdomeof Naples, with a white flower,

an other with a reddish flower.

13. Randneulus Luftinicus autumnalis simplex. The single Portugali Crowfooce. This Portugal Crowfoote hath many broade leaves, lying upon the ground, almost found yet pointed, finely dented about the edges, not divided at all, but somewhat hayrie full of veines, and of a darke greene color finely dented about the edges, not divided at all, but somewhat hayrie full of veines, and of a darke greene coon on the upperside, and of a yellowish greene underneath, which continue all the winterly not falling away under fresh doe spring up: from among these leaves shoote forth two or three small slender sayrie short stakes, not soot high, bare without leaves, bearing each of them one small yellow slower, composed of five, and someway of sixe leaves, with some yellow threads in the middle, which fall away most usually with us, without being any teede, in regard it slowieshed late in Autumne, but in the naturall places; and sometimes with us, if the the roote is made of small round wintish long kernels or pieces, many set together, somewhat like the lapie; but greater and longer. This kinde Clusius observed in the Olive-yards about Lisbone, to grow with larger cumpled The final carries for a pater quitty deal.

munculus pratenfis votandifolius Bononiqufis. Meddow Crawfoqia of Rosenie

Rananculus glebofus. The globe Crowfoote or Locker Coulous.

6. Ranunculus Creticus echinas as. Small prickly headed Crowfoote of Candle

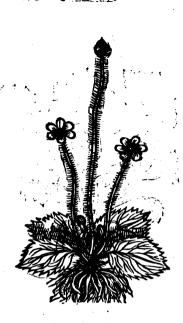

11. 12. Rangueulus Illyricuus major & misse. The greater & leffer Slavanian Crowfoote.

13. Renewesia Lafteniens entermali The Partnesii Grandouse.

pled or fwolne leaves, like as it were blifters upon them, and bearing the flower with eight or ten leaves, foretimes as if it were double, whereof he giveth a figure, but the feede will beare fuch like plants, as he fetteth forth the other to be, and therefore giveth no other mention or defeription thereof.

14. Ranusculus autumalis fore multiplici. Double flowred Autumne Crowfoose.

This is so like the last in the manner of the growing and flowring, that onely the double yellow flowers make the difference.

This Crowfoote hath a roote made of many small long and round white kernelly rootes. This Crowfoote hath a roote made of many small long and round white kernels, or graines fet close together, with diverse long fibres at them, from whence rise up somewhat round leaves, but deepedy cut in on the edge, into three parts, somewhat like unto those of the round rooted Crowfoote, sultained by long foote stalke, and somewhat hayrie: from among which rise up the stalkes, that are hayric also, and about a foote high, having leaves set thereon at two severall distances, much more cut in and jagged than those below, not divided into many branches, whose slowers at the tops of them are yellow, like unto other field Crowfeete? the small had of rough seede that followeth, is sharpe pointed, and shorter than others.

many branches, whose slowers at the tops of them are yellow, like unto other neid crowrette: the imaginary of rough seede that followeth, is sharpe pointed, and shorter than others.

16 Ransuculus Geranii tuberosi folio. lagged Field Crowisecte of Radge.

The rootes of this Crowisecte consist of long whitish strings, sending forth many darket greene smooth severy much jagged or cut into diverse parts, somewhat like unto the starts of the knowledge Cranes bill, but large, each of the cuts being larger and broader than they, which are cut in against the the whole lease being almost round, is halfe a foote long, and neere so broad also, set upon a soote tosses, an hand brigaded long; from smoog which rise up, diverse smooth greene, crested stalkes, about two soote baseling thread into branches, having sme cut leaves on them, and small pale yellow showers at the toppes, which shows threads in the middle, like unn others, after which cometh a small round knappe or head of seedes.

All these forts of Crowfeete, doe grow in fields, meddowes, and artife grounds, many of them in our owns land, especially the first five forts; the rest by their titles may be understood from when easily came.

The Time.

The first and the great Candye fore are the earliest in flower, which is about March and Aprill, and the 13 and 14. are the latest that flower of all the rest, which is not untill September. It the other in May and Iune.

The Names.

It is called in Greeke Barpinor, and there after in Latine Ranunculus, non fetting gainst account colorem folia unit to imitantur, fed point quia inter folia rane ut plurimum degunt: in English we call them Crowleete, rather than Frogwort after the Latine, from the divisions of the leaves, as I thinke, and therefore fome call them Point galli, according to Pliny, yet some writers thought them to be Coronopus per corvi of Dioscorides, and from them

it is most likely our English name of Crowfeete came they have also diverse other English names, as King Cups; gold cuppes, Baliners after the French, Pillabeds, Bolts, Troll flower, and Locker Goulons, which two last are more proper to the eight kinde in my former Booke: of the Italians Ranoncolo and Pie Corvino; of the Spaniards Terva belies, of the French Grenoilette, of the Germanes Hanen fuls, and of the Dutch Hanen voet. The first is Tragus his sufficiently studied five pratens by Fuchsius Christanthemum simplex, by Dodoneus in his French Herball and by Lugdauns Polyanthemum simplex, by Tabermoutauns Ranunculus dulcis, & by Bauhinus Ranunculus pratensis erectus whin the second is the Ranunculus luteus of Tragus, the Ranunculus pratenfis surrettis cauliculus of Lobel, & the second Banuwalus luteus of Dodoneus & Lugdunenfit. Thalius calleth it Ranunculus polyanthemus maculatus, and Ge-nad Ranuwalus Batrachoides : the third is called by Lobel Ranunculus pratenfis reptante cauliculo, by Thalius Ranunulus polyanthemos primus, by Dodoneus and Lugdumenses, Ranunculus hortenses primus, by Tabermontanus Ranunculus vinealis, and by Bauhinus Ranunculus pratenfis repens hir futus: the fourth is called by Lobel in his Icones Remerches arvorum, as it is in the title, by Dodoneus and Lobel in his observations Ranunculus sylvestris tertius; by Cordes in his history of Plants, Ramunculus Segetalis, by Gesper in hortu Germanie Ranunculus arvensis, and by Banhims Ranunculus arvensis echinatus: The fift is called by Tragus Ranunculus exiguus & sceleratissimus; nd by Gesner in hort Germania Ranunsulus Flammula distus, by Lobel Ranunculus bulbosus, and by Dodonaus turofus, by Brunfelfus Crus Galli and Coronopus parvus; it is generally taken to be, and so called Batrachium Apulcy, Banhinus calleth it Ranunculus pratenfis radice verticilli modo rotunda. The fixt is called by Pona in his Palian description of Mount Baldus, Ranunculus echinatus Creticus, Which he saith he had from Signior Contarini of Venice, Bandium callethic Ranunculus stellarus echinatus Creticus: the seaventh is called by Clussus Ranunculus Apuley quibaldam, Pena and Lobel fet it forth in their Adversaria, under the name of Ranunculus palustris, romadure folio semine echinato, but as Banhimus faith in his Phytopinax and Prodromus, they confound it with the other Remuculus palustris rotundifolius Levis and therefore he calleth it Ranunculus palustris echinatus not that it growth in moorish ground but in wer fields. The eighth is called by Baubinus Ranunculus rotundifol in repens echinaw. The ninth is called by Columna Ranunculius minimus Apulus, as it is in the title, and by Bauhings Ranunculus arvenfis parvus folio wifids. The tenth is called by Clusius Ranunculius Platophyllos, and is his fift Montanus, which Banking calleth Latifiting folio bir suita. The eleventh is generally called of most writers, as also with all Herbarifie Ranmonlus Agricus miner, and is the fourth Ranunculus grumo faradice of Cluftus, and by Baubinus Lannenting langing as engagified as more and is the tourn amone must be called by all Illyricus major, being of the lane kind, which Banding therefore callette, Rannening Imaginofic angultifolia; grumofa radice major, and remembered by Clufus in the fame place with the other. The thirteenth is called by Clufus Rannenius autumnation to the fame place with the other, whereothe maken two forts, and hath two figures them the dimension of the fame of the summer of the major of the summer of the spon the divertities of the leaves and flowers, it is therefore called Luftenicis by Lobel, Dodone is, Dalechamp in and all others, except Bankings, who calledn it Rammenly farifolish bullarine Appodell radice. The fourteenth a temeribed by lacebin Corners onely in his Booke of Canada planes. The fifteenth is called by Ranbings Remarkly promofe radics folio Ranuaculi bulbo B. The last is called also by him Ranuaculius Geranij tuber of folio B. it is in the title.

TRIBE. 2.

The Vertues.

The first of these kindes, being of no sharpe or biting ratte, is held to be harmelesse; for the Germanes as Trages sharpe to eate it familiarly among other herbes: but the others are sharpe and doe exulcerate the different sharpes and the sharpest sharpe especially the fift kinde more than any of the rest, and therefore not to be used inwardly in any case: the form especially the fit kinde more trian any or the rest, and therefore not to be after hands, to drive away and third forts here expressed, are oftentimes used to be laid to the writts of the hands, to drive away ague, to leaves being bruised, with a few cornes of bay salt, and a little glasse of windowes, beaten small and mixed by leaves being bruited, with a rew cornes or pay pair, and a name grane or white or a sum and unreads gether. Camerarine faith that they in Germany used to apply the roote of the fift kinde to plague fores, to draw them to maturity and breake them, yet it is no other likely but the other share rootes will doe the like, for the them to maturity and breake them, yet it is no other likely our the other inarpe rootes was use them like, for by will breake tumours and draw impostumes being wisely applied; and Tragus saith, that even those that are as sharpe, doe discusse and dissolve hard tumors in any part of the body, being applied; a peece of the round to teed Crowfoote put betweene those teeth that doe ake, or into an hollow rooth, taketh away the panels. teed Crowfoote put betweene mote teem that doe ake, or into an nonow footh, taketh away the pane, be many times, it either breaketh those that are bollow, or causeth them to fall out: some write, that applieds the finger, by causing more paine therein, than is felt, by the touthach, it taketh away the paine; the decoding the leaves of the field Crowfeere, healeth scabs and the itch, but they must not be suffered to abide long upon the places; it is likewise used to stay the falling of the haire, the head being washed therewish, being made warm. but not to rest thereon above two or three houres, and then washed off with fresh warme water: it is also so that if the roote be bruised, and applied unto a foule ulcer, it will clense and take away all the filthy and comp matter therein, leaving the fore faire to be healed up with other convenient things, but it must not lie long in the fore left it worke too forciblie: all these sharpe Crowfeere, have the same operation to take away wares, a the scabbed ruggednesse of nailes, markes, spots, and blemishes in the skin, and all the other properties attribute to these sorts of Crowseete, mentioned in the former division: besides being mixed with swines day. they breake Scropbulas, or the small kernells under the eares, and of the necke called the Kings Evill, and the they oreake Seroponios, or the inna exernent under the cares, and of the network and applyed to the Hemorrhoides or piles that swell and bleede not, helpeth to discusse or take them away that is a hand must be applyed to those that are open and bleede. The distilled water of the herbe, whilst it is in slowe, worketh fafely to all the purposes aforefaid, and as some report is given with good successe inwardly, we fome Holland pouther, or the species called Lithouribon, to provoke urine when it is stopped, and to breake the stop of most of them made into pouther, and put into the nose procureth needing.

Divisio tertia. The third Division.

1. Rannneuli Montani. Mountaine Crowfoote.

F some of these Crowfeete I have entreated in my former Booke, by the name of Rannaculai montain Frome of these Crowsteete I have entreated in my former Booke, by the name of Kannucus montain humilior, of two forts, and is the first small figure set here also. Rannucus montains also mine for simplicit, which is the second figure here, and the double sort among the other garden sorts hereafter. Rannucus Thalistri and Rusaccosolio both in one figure, being the third in place and then Rannucus Thalistri folium Asphodeli radice the sourch and Rannuculus graminens flore lutes simplicited duplicit the site, which are nother againe described: but there are a great many other forts which I will here bring to your consideration and speak

1. Ranuntulus montanus maximus albus. The greater white Mountaine Crowfoote.

The great white Mountaine Crowfoote different from the lesser single white mountaine Crowfeete that i the great white Mountaine Crowroote different from the letter lingle white mountaine Crowrette man fer forth in my former booke (whole figure I give you here in the fecond place) chiefly in these thing, that the leaves of this Crowfoote, being tomewhat hairy and very large, are divided to the stalke into five put, and each of them somewhat deepelier dented about the edges, resembling the leaves of the Globe Crowfoot, but larger and standing upon sootestalkes, that are hairy and a soote long almost the maine stalke is somewhat great and hairy, bare almost of leaves unto the top, where it brancheth out into flowers, under which stands the joynt three large leaves, much more divided then those below: the flowers are many, each standing on a large footestalk very large and white, consisting of five leaves so large that the whole slower seemeth to be a got as a single purple ringed Dassodill, and very sweete withall, having many yellow threds in the middle stading

as a fingle purple ringed Daffodill, and very iweete withall, having many yellow threds in the middle many about a greene head, whereon being ripe the feede groweth many fer together; the roote is formewhat greened long, but as it were bitten off in the halfe, with many long blackish strings hanging thereat.

2. Rannaculus montanus Pennai. The great purple mountaine Crowfoote.

This great Crowfoote hath source of five or more very large and hairy leaves, rising from the roote, set up long hairy foote stakes, each whereof is devided into five or more parts, deepely cut in unto the middle, dead likewise about the edges and of a darke greene colour on the unper side, and gravish, or as it were hosymment. likewise about the edges, and of a darke greene colour on the upper side, and grayish, or as it were hoary more neath, among which rifeth up a ftrong round hollow stalke, hairy also, about a yard high, bearing a least one at the top much divided, and from thence spreadeth into three or foure or more small branches, each substant a small leafe or two, about which standeth the flower, consisting of five round leaves of a purplish colour onto a manifed two, about the edges of the infide, but pure white on the rest of the infide; having many relations in the middle, about a greene head, which beareth many flattish and blackish browne sharpe points.

threds in the middle, about a greene nead, which peareth many flattill and placklin prowne marpe pears feede: the roote is composed of many long fibres or strings, and hairy at it were at the head thereof.

3. Ranunculus Plantaginis folio. Plantaine leafed Crowfoote.

This Pyrenean Crowfoote hath three or foure leaves rising from the roote, set on pretty long stotellalist, is ing somewhat long and broad like unto Plantaine leaves, with ribs therein, but more pointed at the endaged of the green state of the property long stotellalist, is a set of the property long footellalist, is a set of the property long footellalist long fo ing iomewhat long and broad like unto Plantaine leaves, with ribs therein, but more pointed at the ends, now ded or dented about the edges, but imooth and plaine with some veines running through the length of them, at pointed at the ends of a whitish of grayish greene colour, circled at it were with a white downe the stable round, firme, and greene, about a foote and a halfe high, bearing two or three longer leaves, broad at the bar tome and compassing the stake, which devideth it selfe at the top, into two or three small branches, but every of them a small long lease at the foote thereof, and a reasonable large slower at the head without any said consisting of five white round cointed leaves, with many vellowish should be middle and a ground grant. confiding of five white round pointed leaves, with many yellowish threds in the middle, and a round many which afterwards growing ripe bath many seedes set together, like unto divers other forts of Commit

Remuculus Montanus humiltor albus fimplex & duplex. Single and double cow white mountaine Crowfoose,

Randuculus Montanus albas minor fimplex. The leffer fingle white mountaine Crowfoot,

the roote is composed of many white strings or fibres, fastned to a head which is somewhat hairy, and abiders many years, but the leaves perish quite in the end of Summer, and are renewed in the spring 4. Ranunculus Pyreneus albus duplex. Double white Crowfoote of the Pyreneun hills.

This Crowfoote differeth little from the last but in the flowers which are not so many together, and config of two rowes of white leaves.

Ranunculus montanus Betonice foliis. Mountaine Crowfoote with Betony like leaves. This small Crowfoote hath divers leaves rising from the roote, somewhat broad and long, full of small veines which make it seeme rugged every one upon a little short footestalke, roundly dented about the edges and round at the point or end, very like unto the leaves of Betony, but that they are smaller, of a brownish greene colour on the upper side, and of a silver white shining colour underneath: the stender hayrie stalke that nicht up in the middle of those leaves, doth searse exceede the length of ones hand, bare or naked without any leaves unto the top, where it beareth one flower onely, like unto the last described single Crowfoote but small let, confifting of five small white leaves, pointed at the ends with some yellow threds in the middle, having five small greene leaves under it, as a buske wherein it is set : the seede is conteined in a small rough head like unto other Crowfeete : the roote is a small tust of white Fibres, somewhat like unto the roote of Betony : the whole plant both leaves and rootes are bitter, with an exceeding auftere or aftringent binding tafte, whereby it is judged not to be hurtfull or offensive, but rather acceptable to the stomacke, and may be profitable for moyst,

6 Rannnenlus graminens bulbofus. The bulbed graffeleafed Crowfoote, This bulbed graffeleafed Crowfoote hath divers very long and narrow, smooth, grayish, greene leaves, some what hairy at the bottome, and with fome long veines therein; from among which rifeth up a flender stalke, about a foote high, with two small long leaves thereon, not branched at all, but bearing out of a small huske of five greene parts, one small faire thining yellow flower, like unto other Crowfeete, as is the seede also, being many fet together on a long head, and every one pointed with a crooked and the roote is formewhat round at the bottoms, with a long necke upward, covered with a blackish hairy coate or covering, with divers thicke and round Fibres growing underneath, thicker at the ends then at the heads with some small hairy sibres at the end of them, within that outer hairy coate is found a round bulbons roote, like unto that of Gladiolus or Corne

end of them a within that outer hairy coate is found a round bulbons roote, like unto that of Gianolisis or Corne Flagge, the pile fet upon the other which was the elder, and seemed as it were shrunke.

7. Raminensis graminens perfoliatus. Thorough leafed grasse Crow foote.

This small thorough leafed grasse Crow foote sendeth forth from a small sibrous roote, divers narrow grayish riseth up the state of the state of the state of the middle of whom bottome and compassing the state of five broad leaves, somewhat foulded inward, and not layd fully open: the head of feede is small, but like unto

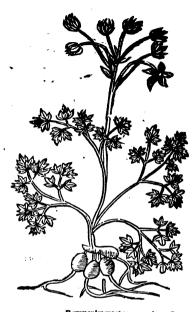

Rananculus nemorofus Thalstiri & Rutaceo folio. Medow Rue and Garden Rue leafed Crowfoote.

Raum culus Thelifiri folio minor afphodeli radicious. Colombine leafed Crowfoot with Afphodill rootes.

Ranunculus gramineus flore tuteo fimplici & duplici. Yellow graffe Crowfoot fingle and double.

Ranunculus montanus maximus albut. The great white mountaine Crowfoote,

thegrafic Crowfoote described in my former Booke. Of this kinde there is another whose leaves are somewhat Folis latithe graue of the flowers more spread open, and with sharper ends. 8. Rannualus pumilus alter angustisolius. Another small narrow leased Crowsoote.

There is another of this laft kinde, which groweth a little bigger and higher, and beareth but one yellow flower upon the toppe of the stalke; larger than in any other of these three last grasse which Apphodis radice flore lines. Yellow Crowfoote with Apphodis rootes.

I have in my former Booke set forth one of this kind, very like hereunto both for former of flowers and rootes, whose figure you have before: this other different from it in the leaves (the former being somewhat broader than this, very like unto the small Thalistrum) which are very small, narrow, and much divided, very like unto the greater Bulbocastanum, or earth Chesnut; some lying upon the ground, and others standing the seath standing upon a reddish hairy soote stalke, which with the leaves is treen which before unto me leaves and franching upon a reddish hairy foote stalke, which with the leaves is very nigh halfe a foote more puright, each tain ting upon a create that y took take, which with the leaves is very nigh halfe a foote long, in the middle of whom appeareth a greene head before the shalke is risen, and beareth it at the toppe thereof, as triseth; which when it is ripe ready to blow, sheweth to be but one faire shining yellow flowers, (whereas the other hath many white ones) consisting of five round pointed leaves; with many yellow threds. whereas the difference is a greene head, which in time groweth formewhat longer than in other forts of Cowfette, having many crooked feedes fet together thereon, but much smaller than in many of the other: the Crowners, laying the many, but hairy and reddish, seldome branched, but bearing two or three divided leaves likes ingular, its thereof is the course of in a very long fibre, very like unto the other.

10. Russmenlus alter saxatilis Asphodeli radice. The pale Crowfoote of Naples, with Asphodill roote. This Crowfoote of Naples, hath many thicke cloggie rootes, joyned together at the end, greater above and fmaller downewards, of about a thummes length, with many small fibres among them, from whence the first leaves that rise up are broad, somewhat deepely cut in on the edges on both sides, but those that follow next ate much more divided, and into many parts, each part cut in also and dented besides on the edges, and standing much more divided, and into many parts, each part cut in allo and denice of online course, and transing upon long foote stalkes, which are broader at the bottome than above, and compasse one another at the foote, for a little wayupward, being somewhat hairy also, greene on the upperside and whiter underneath: the stalke is round and hairy, about a foote and a halfe high, having diverse leaves thereon, much more divided than those below; and at the joynts with the leaves; toward the toppescome forth long branches, with small jagged leaves on them, under a small tuft of three or foure large pale flowers, of five broad or round pointed leaves, of the breadth of ones naile, with many yellow threds in the middle: the feede is small, round, flat and pointed, many fer together on a long head.

11. Ranunculus montanus hirsutus latifolius. Great hairy Mountaine Crowfootes, The first leaves of this Crowfoote are round, like those of Doves foote, very hairy, of a blackish greene color, and fost, divided or cut into three parts, each of them also parted into three smaller divisions, standing upon

2. Remutulus ment anus Pennet. The great purple mountainte Crowfoote.

3. Ranunculus plantaginis folio. Plantaine leafed Crowfoote.

Ranunculus montant & tonica feliis, Mountain

Crowfoote with Betony.

like leaves.

long hairy footestalkes, yet those that follow are broader, more divided and hairy, among which riseth up a finds long hairy footestalkes, yet those that rollow are crosses fet thereon, and parted toward the toppe into mit hollow stalke, a cubite and a halfe high, with diverse leaves set thereon, and parted toward the toppe into mit hollow stalke, a cubite and a halfe high, with diverse another, like unto others of this kinde, and seede also in the like. branches, having small pale yellow flowers on them, like unto others of this kinde, and seede also in the like me ner the roote is long made of many fibres.

the roote is long made of thank in the state of the state The roote of this Crowfoote hath reddish strings or fibres, sending forth a small soft woolly stalke, about ag. The roote of this Crowroote nature audit in the property of the roote of this Crowroote nature and see the root of the roote of the roo woolly long footestalkes, an hand breadth long, devided into three principall parts, and each of them into other and dented about the edges, very like unto those of the Medow creeping Crowfoote; the flowers hereofthe stand at the toppes of the branches are yellow, but larger than the last.

Double white Crowfoote of the

Pyrenian hills.

Ranunculus faxatilis magno flore. Rocke Crowfoote with large flowers This Crowfoote hath many small leaves rising from a long fibrous roote, fet upon long foote stalkes, franchis broad as the naile of ones hand, parted into three 4 Ranunculus Pyreneus albus duplex. fmall jagges, and they againe into two or three other, fomewhat foft and woolly; the stalke that rifeth up among thefe, is fearle an hand breadth high, fomewhat woolly also bearing but one large flower at the toppe, of a shining gold yellow colour, made of five leaves, with many deeper

CHAP. 4.

yellow thre ds in the middle. 14. Ranunculm faxatilis folis subrotundis.

Rocke Crowfoote with roundish leaves. This small Rocke Crowfoote, hath a few somewhat round leaves spread upon the ground, thicke and hairy, scarse a nailes breadth, yet devided into small peeces, which also are cut in on the edges, standing upon short footestalkes, scarce an inch long: the slender woolly stalke that brancheth it selse from the bottome, riseth not above halfe a foote high with fome leaves at the foote of the branches, and many yellow flowers of five finall leaves at the toppes: the roote is small and fibrous.

15. Rannneules minimus faxatilis hirfutus.

The smallest hairy Rocke Crowfoote. This smallest Crowfoote spreadeth diverse verie finall, and fomewhat round hairy leaves, cur into three round parts, and dented about the edges, standing upon small long hairy foote stalkes, in the middle of which rifeth up, a small flender hairy branched stalke, not above two or three inches high, with small yellow flowers, at the toppes, like unto the rest, and so is the seede that followeth, the roots likewise is small and

16. Ranunculus vilosissimus Monspeliacus. Small red hairy Crowfoote of Mompelior.

This red hairy Crowfoote of Mompelier, hath a small roote made of many reddish fibres, from whence spring up diverse thicke small and

5.305

8. Ranunculus pumilus angufifelia. Another finall norrow leafed Crowfood

7. Ranunculus gramineus perfoliatus. Ranunculus alter non perfoliatus latifolius. Thorough leafed graffe Crowfoote.

hary leaves, at the first being devided into diverse peeces, some whereof are round, and other sharpe pointed; but those that rise po with the hairy statke, are devided into long and pointed peeces, and as it were prickly at the fear mercen length. Some being longer and shores than other metals and as it were prickly at but more many and in week length, fome being longer and shorter than others; which stake being of an hand the ends, but of an uneven length, fome being longer and shorter than others; which stake being of an hand the ends, our of the toppe, hath a small devided leafe, at the foote of every of those small branches, breachings, and flowers of a meane bignesse, like unto others of this fort, the whole plant is covered with reddif for haires, that it feemeth as if it were reddiff it felfe.

The Place.

All the form of Crowfeete grow upon the Mountaines, fome in Germany, fome on Mount Iura by Savoy. fome by Mangelier, and others in the Kingdome of Naples, or on the Pyrenean hills, none of them being knowne to grow wild in our countrie.

The Time

They doe all of them flower about May and Inne, and their feede is ripe quickly after.

The Names.

The full kinde which is of two forts, Clufius maketh to be his fecond kinde of Mountaine Crowfoote, of two forts buthis it the liter of his. Lobel calleth it Aconitum Batrachoides, and is the fift Ranunculus montants of Boulinus in his Pinax which hec calleth Narcifei flore: the second is Clusius his third Mountaine Crowfoote, Bandenset in the second is Compared in the second is Compared in the second is Compared in the second in Compared in the second in Compared in the second in purplif flower be called Candidam and accasion without a stalke, I know not: the third Clustus nameth Ranuncity Process of flore, whose leaves as he faith are like unto those of Plantaine, and therefore with most Herbarilla now is dayes of armnessus plantaginis folio, and so doth Barbinus, who likewise seemeth to thinke, that it may be the Ramanessus Phanicians Myconi, for the resemblance of the long seaves, like unto those of the Date tree but herein, ity my opinion he is much mistaken, for that the roote of that Ramanessus is Bulbons, and therefore more likely to be another; as I thail thew you, by and by: the fourth and fift have no other names thanare in their titles, being plants never let forth by any before, but growing on one of the Alpes, which the inhabitants call Mont ferin, & fent the one by Monnel; & the other by Peliterius unto Dr. Lobel: the fixt Fabius Columna finding on the hill Æquicolo, 'in the Kingdome of Naples, calleth it Ranunculus leptomacrophyllon bulbosus, or Ranunculus bulbosu gramineus montanus, which Banbinus thereupon calleth Ranunculus gramineo folio bulbosus, and as I think dochmore nearely refemble, the Ranunculus Pheniceus Myconi, fet forth in the great Herball called Lugdunenfis, which hee faith groweth plentifully at the foote of the hills of Santa Maria Monte ferate, and the places there about, and as he faith there, hath bulbous rootes and long narrow leaves, and so hath this, but the former hath neither. The seventh and eight with the other of the same kinde are likewise plants never written of by any other before, and therefore their titles must stand as they doe. The ninth Fabius Columna found likewife in the hills (ampelarenses and Equicoli, and calleth it Ranunculus montanus Leptophyllos Alphodeli radice which is very like unto that with Asphodill rootes, which I have fet forth in my former Book, having leaves like the small Thali-Urum, and a white flower but this hath yellow, which as I there faid, Lugdunenfis setteth among the umbelliferous plants, and alleth it Octionsho Micons, because he finding it on the rockie or stony hills in Spaine, referred it rinto Ocnombe, in regard of the rootes; but the flowers and seede demonstrate it plannely to be no such plant; but a plaine Crowfoote, as both by the comparison and mine owne inspection (having had it growing in mine owne Garden many yeares, and seene it with others) may truely be testified: The tenth Fabius Columna found likewise on the contrary colder fide of those hills * Equicoli, and called it, as it is in the title; the last fixe forts have their mmes in their titles, as Bauhinus calleth them in his Pinax and Prodromus.

The Vertues.

Most of these fores of Crowfeere being hot and sharpe in taste, and explorating the skinne, no lesse than many of the former, cannot be but of the same quality with them, and although there hath not so many and manifelt trials, becominde of the to being most of them but of late invention, yet no doubt but they may be applied, for the same purposes; according to their degree, in being more or lesse sharpe than others; onely the fourth fort that hath leaves like Betony, for the forme sake of the flowers, being joyned to this family, as is said in the defciption, hath no such hot sharpe or exulcerating propertie, but as is there said being somewhat bitter, and exceeding aftringent in tafte, is held affuredly to be friendly to the fromacke, as other things that are of the fame qualitie of bitternesse and astriction; which helpe to stay and drie up the desfurions of humors, be they cold or hot that fall from the head upon the stomacke and lungs, and to preferve them from purrefaction caused thereby.

Ranunculi hortensis. Garden Crowfeete.

Hole Crowfeete that are chiefefly nourfed up in Gardens, friend follow next, but that I have already thewed them in my former Booke, selecting all those that beare flowers of any beautie, out of all the relt of the Tribes or Pamilies, to store that Garden with all as was most fit and proper a whosoever therefore are desirous to fee their discriptions or know farther of them, I must referre them to that Booke wherein they may fee andreide the varieties there expressed, The Anemones also or Wind slowers and Pulsatillas as being kindes of Crowfecte their flame rathe and explicating qualitie declaring the fame, should be are a place here with the rest, but that they are all likewise described aforehand, yet I thinke it not a mille to give you some figures of them, to beautific this worke and to please your eyes.

Asemones maxime Chalcedonica flos. The flower of the great Windflower of Confantinople.

Rannneuli palustres & Aquatiles. Marsh and Water Crowfoote. Such forts of Crowfeete likewife should follow, and be joyned to the rest, as grow in Morish grounds or Watery places, if I had not fet and propounded to my felfe an other manner of method to follow in this Worker I mult referre therefore all those that are desirous, to be satisfied with the knowledge of them unto their proper place, where they shall be intreated of all together, with all other forts of herbes, naturally growing in such places, which is the Classis of Morish and Watery plants.

CHAP V.

Mandrogoras Mandrake.

Lthough I have declared in my former Booke the divertities of Mandrake, both male and female? yet I thinke it not a misse to remember them here againe, being a plant both of that worth and rarie-tic, and dangerous and profitable qualities therein, especially soporiferous whereof some ensuing plants doe partake. 1. Mandragoras mas vulgatior. The more ordinary male Mandrake.

This male Mandrake thrusteeth forth from the roote (which groweth somewhat great and downe right, in some but with one, in others with two, three or foure twines or branches, devided a little below the head or toppe, and diverse small fibers besides, blackish on the out side, & whitish within, without other shape of mans or womans parts, what foever cunning knaves may forme other rootes by Art to be like what they please) many large leaves lying on the ground greater than any Beete leaves, whereinto Dieforides compareth them : from the middle of whom rise up fundry pale greene flowers, made of five round leaves apeece, each standing on a small slender store state within a greene sive leased huske wherein afterwards is the fruit ster, being of the bignesser roote stake within a greene five leased huske wherein anerwards is the fruit kee, being of the big-nesser a reasonable Pippin, and as yellow as gold when it is thorough ripe with divers round whitish flar seedes within it and of an heady or strong stuffing sent, this is the true description of the plant, and therefore those idle formes of the Mandrakes and Womandrakes, as they are foolishly so called, which have beene exposed to publike view both in ours and other lands and countries, are utterly deceitfull being the work of cunning knaves, onely to get mony by their forgery; doe not missource that the months of this relation no more than you would of any other blant fer downe in this back. plant fet downe in this booke, for it is the plaine truth whereon every one may relie.

1 Gardin - 2- Mandragoras mus alter. Another male Mandrake.

I faw in my Lord Watter his Garden at Conterbury, whereof Mr. Lobn Tradescant had then the keeping sir

other fort of male Mandrake whose leaves were of a more grayish greene colour and somewhat foulded to other fort of male Mandrake whose seaves were or which grew there hard by this alfo, but what fruit it bottom not be affured having never borne any as they faid.

3. Mandragoras famineus. The female Mandrake. The female Mandrake hath likewife many leaves lying on the ground, but imaller, narrower, more crumple and of a darker greene colour, refembling those of Lettice as Discorides compareth them: the flowers also and of a darker greene colour, retempting those of the former, but of a blewish purple colour; the figure among the leaves, each on his stender sootestake as in the former, but of a blewish purple colour; the figure that followeth is much smaller than those of the male, but Mandregoras mas & faminens. The male and female Mandrake. roundlike them, and not peare fashion as some have

thought, (for Clufius who faw diverse of them, growing naturally in fundry places in Spaine denieth it) of a paler yellow colour when they are ripe, and of a more pleafing, or rather of a leffe heady fent, than the apples of the male, wherein are contained fuch like feede but smaller and blacker, the roote also is like the former, blackish without and white within, neere unto the same forme. parted into more or fewer branches, as nature lifterh. The Place.

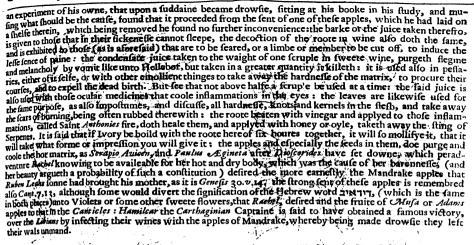

They grow in woods and shadowie places, and the female by rivers sides, in diverse countries beyound the Alpes, but not on this fide naturally, as in Gracia, the Iles of Candy, and others in the Mediterranean sea, Italy also and Spaine: withus they are noursed up as rarieties in Gardens, the male in fundry places: but the female onely with the curious, as being both farre more rare to get, and more tender to keepe. The Time.

The male flowreth in March and the fruit is ripe in July the female as Clusius, faith, he found in some places in Spaine in flower in February, and in the fame moneth in other places of Spaine it had ripe fruit, but with us where it is beit preferved, it flowreth not untill August or September, and the fruit feldome or never ripeneth.

The Names It is called in Greek ward (a) jeges and Mandragoras also in Latine, quod ad mandras pecorum aliasque speluncas proveniat: fome also as Dioscorides fairh in his time called it di nuano, and Circaa, because Circe the great enchantresse used it as is thought in love matters ; Pythagoras called it av Prontuop-9.5 a forma humana, because the roote hath some likenesse of a mans body with two legges, but without atmes; they are called also Mala canina & terrestria. Dioscorides saith the female was called TPIBanas tridacias of the Letice like leaves, and niger, as the male was called Candidus, the fruit of both is round, but of the female as Diofeoride faith, like

sots forbis, and not of 1: ovis, as Ruelliss his Translation hath it, which caused some to figure it peare sashion, especially ally feeing Oribafius who followed Dissertles most nearely compareth the fruit as well to acradibus with peares; but you here before Clusius his deniall thereof, as an ocularus testis of all those that he taw, so that if any fall out otherwise, it might be rather accounted Infus nature, than the ordinary propertie in nature. Dissented faith hath a stalke as Elleborn, Cicum and Albueum, but is much controverted by diverse, being not certainly knowne what herbe it is, and peradventure also not to Dioscorides himselfe, for he relateth it but by hearts, he doth many other things which were not of his owne knowledge. Mathiolus defendeth Hermolan Bath. The against Brasavolus and Fuchsius, who judged that Hermolaus thought the Melongena or Malainsaum be Dioscorides his Morion, which he describeth, ut ferunt or tradunt, to grow nigh unto caves in sindry woods, with lesser white leaves than those of the white Mandrake, a spanne long lying about the roote, which is tender and white, longer then ones hand, and of the thicknesse of ones thumbe: tradent againe saith he, that if a drame of the roote be given any man in bread or broath, it will take away the use of reason and sense, causing him to sleepe for three or foure houres, after the same manner of disposition as when he tooke it : Physicians use the when there is cause to burne or cut off any member, (that is, to call him into a deepe or dead sleepe, that is paines may not be so sensible:) by the se words of Dioscorides, it doth plainely appeare to me, that his Morie is in another species of the former which hath no stalkes, for the leaves he saith (and peradventure the fruite also) lieu the ground about the head of the roote : but Pliny hath faulted foulely in describing the Mandrakes, making those of Theophrastus and Dioscorides to be one, and transferring that which is proper to the one unto the ther. The fundry fables hereof reported in Marthiolus and others are not fit here to be related; who so are firous to know them, may reade them in thir Authors or Relators. The Arabians call it Iabora and Tabroats the Italians Mandragora; the Spaniards Mandracola; the French Mandragore and Mandagloire; the Gramm; the Dutch Mandragora; and we in English Mandrake:

The Vertues. The Mandrake as Galen faith is of an exceeding cold qualitie even in the third degree, yet hath in it some hear, in the barke of the roote is some drinesse, and in the apple some moisture, whereby it is of a soportierous propertie caufing sleepinesse or drowsinesse, as Levinna Lemniae in his Herball to the Bible maketh mention

CHAP. VI.

Solanum. Nightshade.

Here are diverse forts of Nightshades, properly so to be called, and there be some other that are referred thereunto, for the likenesse of the leaves, flowers, or fruite, or for the properties in the operation. Of those that are referred unto the Nightshade, I have already spoken of diverse in my former booke, whereunto I referre them, that would be enformed of them, not meaning to repeate their descriptions, but denominations in this place, which are Mirabilia Pervana, the Mervaile of Peruor of the world. Pomum amoris fruitu majore, Apples of love the greater fort.

Stramenium sive Pomum spinosum majus store simpli albo, & purpureo, & Datura Turcarum store albo simplici & fore duplici purpureo, Thorne apples the greater, with a single white, or single purple flower, and the lesser with a single white flower, or a double purple flower. Solanum arborescens or finite osum, called also Pseudocapsicum Dedonzi, or Amomum Psinij, Solanum Americanum, & Cerasa Indiana, Tree Nightshade, the Mumme tree, or Winter Cherry tree: & Solanum vesticarium or Alkekengi, Winter Cherries, Potatoes of Virginia called of many, apples of youth, and of Baubinus in his Matthiolus Solanum tubers sum esculentum, and thought by Clusius, that it did in many things refemble the Pycnocomon of Dioscorides, moved chiefely thereunto from the likenesse of the figure thereof, which he faw in a written copy of Diofcorides, that had figures; as also that it might be Arabidia of Theophrafius; but fetteth it downe in his Hiltory of Plantes, by the name of Papas Peruvianorum, and called by the Indians, or Spaniards Papas, as Gomara and others fay : and although the common wild Nightshade, is not dangerous, as divers others are, nor planted in Gardens with us as it was in former times, to be as a potherbe or falletherbe usually eaten, (but now adayes utterly refused,) and therefore called Garden Nightshade, yet let me set it with the rest of the familye and not disjoine it from them.

The Common Nightshade, hath an upright round greene hollow stalke, about a foote, or halfe a yard high, bulling forthinto many branches, whereon grow many darke greene leaves, fomewhat broad and pointed at the ends, fost and full of juice, larger than the leaves of Bassill, else somewhat like, and a little unevenly dented about the edges, at the toppes of the stalkes and branches, come forth three or source or more white slowers, made of five small pointed leaves a peece, standing on a stalke together, one by or above another, with yellow pointels in the middle, composed of foure or five yellow threds set together, which afterwards turne into so many pendulors greene berries, of the bignesse of small pease, full of greene juice, and small whitish round flat feede, lying within it; the roote is white and a little wooddy, when it hath given flower and fruite, with many small fibres at it: the whole plane is of a waterish insipidetalte, but the juice within the berryes, is somewhat viscous, like unto a thin mucilage, and is of a cooling and binding quality.

2. Solanum vulgare baccis rubris. Red berryed common Nightshade. I call this common Nightshade, because it is in all things like the former common Nightshade, except that the leaves hereof are fomewhat harder and rougher, and the berries when they are ripe, are either of a yellow, or of a yellowish ted colour, the whole plant growing also little bigger then the other; this fort we have had out of Spaine, but endured not a winter withus, being more tender as comming out of a hotter Country, where it abideth many yeares, and it may be, that it is but a degeneration by reason of the climate, as it hapeneth in sweete Fenell feede and divers other things which change by transplantation.

3: Solanum Somniferum. Sleepy Nightshade. Sleepy Nighthaderifeth up, with divers thicke round foft woolly stalkes, divided into other branches, whereon grow many fost woolly, but greene broad round leaves, very like unto Quince leaves, two alwayes set at a joynt one against another, of formewhat a hot talte as Clufine faith: the flowers come forth at the joynts with

1. Solanum vulgare. Common Nightshade.

CHAP.6.

Solanum vulgarė.
 Common Nightihade

5. Sclannin Straniferum atterum. Sleepy Nightthade of another tort.

3. Solanum Sommifernam Sleepy Nightshade.

6. Solanum Lathate. Dwale or deadly Nightshade.

the leaves, all along the stalkes and branches, three or source together round about them, which are long and hollow, ending in source somewhat long and pointed leaves, of a pate white colour, which being past, there rise up in their places small yellowish red bearies, yet bigger then those of the former, set in woolly huskes; the roote is thicke long and hard, and of a brownish colour on the outside.

Solonium fomitiferum antiquorum verum. The true fleepy Nightshade of the ancient writers.

This Nightshader rifeth up with three or foure or more thicke round straight whitish shalkes about a yard high or named into some other branches, hard to

8. Soldman magnam Virginiamm vubrum.

more, paried into fome other branches, hard to breake, for with fomewhat broad leaves very like unto Quiace leaves with fmall footestalkes under them not alwayes two at a joynt, but many stanthem not have to introduce the middle of the ftalkes upwards, come forth diverse middle of the ftalkes upwards, come forth diverse together, confifting of four e leaves aperce after which follow, fmall striped and poinred greenish maskes; but red when they are ripe, very like unto the bladders of the Winter Cherries, but much leffe, with a red berry within it, in like manner; the roote is fornewhat great and wooddy, covered with a whitish barke, not very thicke, of a foule fent and infipide tafte. Because that kindt of Solanum, which Matthiolis first, and Chifin after him, fet forth for the true Somniferum of the ancients, dosh, not beare bladder like husker or fruite, as Theophrastus faith, lib. 9. c. 12 it hath, it cannot be the right, but this onely which hath fuch.

5. Solanum Sommiferum alterum. Sleepie Nightshade of another sort.

The other sleepy Night shade, hath an upright crested or comered stalke, with many leaves thereon, being longer and narrower than the last, and more inclining downeward to the ground, full of veines tunning long wise and traverse therein: at the joynts of the stalke, from the middle parr upward, come forth severall pendulous slowers, hunging by very long stalkes, being long and hollowlike unto a Bell-slower, of a purplish colour, each of them set in a large greene huske, dented or curinto swe parts at the edges, but not very deepe; wherein after the flower is past, standeth a round berry, of a deepe blackish purple colour, enclosed

therein to the middle, and having like a Crowne, at the head of the berry; which is full of a winelike juice, and many small white seeds within it: the roote is great and spreadeth many great branches with small sibres also, under the ground.

Ocadly Nightshade groweth sometimes to the height of a man, but usually it riseth not up above three or source some sigh, having tound green stalkes, set with divers large leaves, much greater than any of those before, smooth and of a darke greene colour, set upon very short sootestalkes; among which at the joynts with the leaves come forth severall long hollow flowers, dented at the brims, of a faint deadish purple colour, standing in a greene huske; which after the flower is fallen containeth a great round berry, greene at the first but of a shining blacke colour, like shining or posished jet; when it is ripe, sull of a purplish juice, and many whitish seeds lying thereins the roote is great, growing downe deepe into the ground, and spreading great branches therein, and besides creepeth under ground, rising up in severall places distant, quickely spreading over a ground: the plant hath no good sent, nor talte, but unsavory and bitter and very pernicious.

Of this kinde there is another fort, whose leaves are lesser, and of a darker greene colour, standing upon longer solutions are not so great and large as the other.

Clusius in his fourthbooke of Exosickes, declareth that one Dr. Cole, or Coolmans, going with Dutch Merchant Ships to Bantam, and other places, in the East Indies (but dying by the way in comming home) had gathered some herbes, and put them up into a booke of papers, which being viewed by Clusius, hee found among many others, this dryed plant without leaves, which yet he referreth to the kinds of Nightshade; the stender stalkes, being about five inches long, and hoary white, bearing many shrivelled betryes, hanging downe out of five pointed hustes or cuppes, of a brownish red colour, of the bignesse of pepper cornes, standing in a tust or unbell, wherein were white seasons.

umbell, wherein were white feedes. like to those of Nightshade, but not ripe.

8. Solanton magnum rubrum. Red Nightshade or Red weed of Virginia.

This great Virginian plant, which from the likenes of the leaves we have called a Solanton, and referred thereunto, rifeth up with a great thick round reddish stalke, of the thickness of ones thumbe at the least, & 4. or 5, stoote high or more, set without order with many very large fresh greene leaves full of veines, some greater and some smaller and sometimes turning reddish: from the joynts where the leaves shand from the middle of the stalke upwards, come forth severall small stalkes bearing the slowers which are very small consisting of source leaves a peece of a pale red or blush colour, divers standing together as it were in a small long cluster, which after bring forth small

The great Virginia Red Nightsbade.

blackish round seede, foureusually set in one buske: yet it seldome commeth to ripenesse in our country; the roote is white and groweth great with us, but perisheth if it be not defended from the frosts in winter, which the ally rot it, but in the natural places it groweth as big as a mans legge, (for such hath beene sent me, with many circles to be seene in the middle when it was cut like unto a Bryonye roote) and above a foote long. 8. Solanum Mexicanum parvo flore, sive Mirabilia Pernana minor. The small Mervaile of Peru

This small Mervaile of the world, or of Pern, groweth in the same manner, that the greater kinde, there you in my former booke doth, but nothing fo great or high, having fuch like leaves fet on the stalkes, but made you in my former booke doth, our nothing to great of angu, maying make and made of one leafe, our made lefter and rounder: the flowers likewife being of a red colour for the most part, and made of one leafe, opening in five parts at the brimes, like the other, are fo small, that the whole flower of this is scarce so bigge as the one part, or division of the greater flower, the seed that followeth, and the roote likewise are answerable in propar tion to the rest of the plant.

The Place.

The first croweth wild with us, under old walles, and in rubbish, the common paths and sides of hedges and fieldes as well as in other countryes, either hot or cold, as also both in their and our gardens, without any planting. The second groweth onely wild in the hotter countries of Spaine, Italy, &c. The third Classica sinh he found not farre from Malaga in Spaine, and Matthiolus faith in Italy also. The fourth Alpinus faith, growenin Candye. The fifth as Matthiolus faith, groweth on the hill Salvatino in the County of Govitio in Italy, hard by Trent, and as some thinke in Syria, and the East Countries thereabouts. The fixth groweth wilde not onely in many, and divers woods of Germany, but in divers places of our owne Land, as in the Castle yard of France many, and divers woods of Germany, but in divers places of that Country vallo at Hord in Element in Suffelke, under Iclus Colledge wall in Cambridge, and in many places of that Country vallo at Hord in Element in Suffelke, under Iclus Colledge wall in Cambridge, and in many places of that Country vallo at Hord in Element in Suffelke, under Iclus Colledge wall in Cambridge, and in many places of that Country vallo at Hord in Element in Suffel Country vallo at Hord in S at Croydon among the Elmes, at the end of the Towne: in Moore Parke in the Parke of Sir Percivall Horn Lelling from in Kent, on the Conny burries, in Burling Parke likewife, as also in the way that leadeth from S. Me. 77 Cray to Footes Cray over against the gate of a great field called Wennell. The seventh is declared in the de feription. The eighth groweth in Virginia, New England &c. from whence the feed and Plants, were fifth brought to us. The last came as the greater fort did from the West-Indies.

They doe all dye downe to the ground in winter, although fome doe shoote a fresh in the spring, as the 3.4 5.7.8.9. doe, yet the third being more tender as comming out of a warmer Country, doth hardly endure, but peritheth unterly, by the extremities of our winters, especially if it be not housed or well desended, and evente two first that dye every yeare, and rise of their owne sowing, doe not spring out of the ground, untill it be late in the yeare, as not untill the latter end of Aprill at the soonest.

The Names It is called in Greeke of some τράχνΟ & τρυκιΦ, but moreusually ΣτρύχνΦ quod viteum, capreolum, vitment acinum, vel tale quiddam signet, ait Pena, in Solanorum classe, quibus cunclis proprium acinos plures vel paucimes betere, nist quin sid proprie e. Theophrastos suspicari malit aut Borto proprium spo you mutatum. In Latine Solanum & Solanum. Una lupina & Una vulpis. Pliny faith it was called also Strumm and Cucubains, but they are thought to be no ther bastard names, and not to be proper to this plant, the Arabians call it Hameb albomaleb, Hameb alchaich, and Hame atthales, the Spaniard, Terea Mora, and Morella, the Italians Solatro. The French CMorelle. The Grann, Nachifchads, and the Dutch Nascaye, and Natchscade. In English Nightscade, Morrell, Petty Morrell, and in some places Hounds berries. Dioseorides reckoneth up source sorts, Kumile hortens, changaged to restainmy senont. fomniferum, and uarraos furiosum or manicum. Theophrastus in his 7 booke and 14 chapter, maketh but three lots, solanum edule, fructum veluti mitem, velacinosum ferens. Sunt alia duo quorum alterum somnium, alterum issaim adfert. The first is generally called by all writers Solanum simply, or vulgare, or horsense, because it is most usual and generally every where to be had, and was planted in gardens as other herbes for foode, but now is no whet used, but Physically: the second is called of Cordus in his History of Plants Solanum puniceum, and of Gesuria hortin Germania Solanum rubrum & luteum, and is remembred by others also. The third is generally taken tobe the true Solanum somniferum of Dioscorides, for so Matthiolus, Gesner, Guilandimus, Lacuna, Clusius, Dodonen, Lobel, Casalpinus, Castor Durantes, Camerarius, and Lugdunensis doe set it downe. Prosper Alpinus only conteleth against it, and sheweth that the fourth here set downe, which in his booke de plantie exoticie, he faith hathred bladders, and small red berryes in them, is the right fort, as Dioscorides, Theophrastus and Pliny doe describe their Solanum somniferum tobe. The fifth Matthiobu calleth Solanum somniferum alterum, and so doe Camerain; Gesner, and Lugdunen sis, Dodoness calleth it Solani lethalis alind genus, The sixth is generally by the Italian ch led Bella Donna, either per Antiphrasin, because it is blacke, or as the Moores doe account them fairest, that have the finest blackeskinne, or as some have reported, because the Italian Dames, use the juice or distilled water thereof for a fucus, peradventure by the excessive cold quality, to take away their high colour, and make then looke paler. Matthiolus calleth it Solanum majus, and so doe Cesalpinus, and Camerarius: Tragus Solanum ber tone pater. Transmission taitetti it outanam major, and to doe Cajasporm, and Camerarior. Trager outanam secole nigrum: Fuchfus, Lobel, and Lugdanenfir, Solanum formiferum, Dodonem, and Cluftus Solanum lethale, and to doth Thaliur; Gefner Solanum straticum; Anguillara, Guillandinus, Dodoneus, Fuchfus, Cordus and other, doe take it to be Mandragoras morion of Theophrastus, but not of Dioscorides, for they are so much differing on from another, as though they had lived in two severall worlds, to give names to herbes, the one not knowing of the other. The Germanes call it Schlaffbeere and Dolmartz; it is called in English, Dwale, or deadly Nighthan The feaventh Clusius maketh mention of, in the fourth booke of his Exerickes, by the name of Solani Indicigran, and Bauhinun thereupon calleth it as I doe in the title, Solanum Indicum birfutum corymbiferum. The eighth we have referred as I said before, to the kindes of Solanum, for the likenesse of the leaves, although much large, and call it rubrum, both for the colour of the stalke, and from the colour that it giveth, for the Indian there with doe both colour their skinnes, and the barkes of trees wherewith they make their baskets, and fuchlite things, as we are informed: the Indians themselves call it ginia, call it Red weede, but we according to the Latine name, red Night food of Virginia. The last Bashini setterth fort in his Prodomus and Pinax, under the title here expressed, not being mentioned by any other

The ordinary or common Nightshade is wholly used to cooleall hot inflammations, either inwardly or onwardly, being no way dangerous to any that shall use it, as most of the rest are; yet it must be used moderateoutwardly, or my and binding in the fecond degree, the diffilled water onely of the whole herbe is fittelf and fa-

ly, for being comminwardly: the juyce also clarified and mingled with a little vinegar, is good to wash the telt to be cased that is inflamed; but outwardly the juyce of the herbe or berries, with oyle of Roses, and a mouth and throate that is inflamed together in a leader March the herbe or berries, with oyle of Roses, and a mouth and unroute that is inflatined. Out out wantedly the juyce of the here or berries, with oyle of Koles, and a little rinegar and ceruffe, laboured together in a leaden Morter, is very good to anoint all hot inflammations, little rinegar and all other grieved places, that are molefled with heate, as the head ache and frenzies, saint Automics for a head of the head the saints and for a head of the head ache and frenzies. Saint Automore me, and an other graves praces, that are more treat with neare, as the head ache and frenzies; anoming the temples and forehead therewith, as also the heate and inflammation in the eyes: it doth also much anoming us remiples, ringwormes, and in all running, fretting & corroding ulcers, and in weeping or moiff Fiftugood for the finingles, ringwormes, and in all running, fretting & corroding ulcers, and in weeping or moiff Fiftulacs, if the faire be made up with fome hens dung, and applied thereunto: a peffary dipped in the juyce, and put up lass, it me junce flayeth the immoderate fluxe of womens courses; a cloth wet therein and applied to the testicles into the matrixes flayeth the immoderate fluxe of womens courses; a cloth wet therein and applied to the testicles into the matrix welling therein giveth much ease: as allo to the goute, that commeth of hot and sharpe huor compension of the eares, eafeth those paines that arise of heat or instantantial or instantant marpe flumoreover, that it is good for hot fwellings under the throate: the sleepie Nightshade of both forts, are of one and the fame qualitie, being cold in the third degree, and drie in the fecond, comming neere unto the propertie of Opism to procure sleepe, but somewhat weaker, if a dramme of the barke of the roote be taken in wine, but nor nexceede that proportion for feare of danger: the feede drunke doth powerfully expell urine, and is also good for the droplie; but the often taking thereof in too great a quantite, procureth frenzie; the remedy whereof is, to take good flore of warme housed water: the roote boyled in wine, and a little thereof held in the mouth, easeth the paines of the tooth ache: Pliny faith it is good to fasten loose teeth: the juyce of the roote moun, earth the property is good for the eyes that are weake of fight. It is more effectuall in all hot fwellings and inflammations than the former, in regard it is colder in qualitie, the juyce of the herbe or rootes, or the diffilled water of the whole plant being applied; the deadly Nightshade is held more dangerous than any of the other, for it is thought to be cold in the fourth degree : the juyce of the leaves, and a little vinegar mixed together, procurch rest and steepe, (when upon great distemperature, either in long sicknesse, or in the tedious hot fits of agues, rest and sleepe is much hindered) if the temples and forehead be a little bathed therewith as also taketh away the violent paine of the head, proceeding of a hot cause i the leaves bruised or their juyce may be applied to fuch hor inflammations, as Saint Anthonies fire, the thingles, and all other fiery or running cankers, to coole and flay the foreading : the danger is very great; and more in the use of this inwardly, than in any of the former, and therefore there had neede of the more heed and care, that children and others doe not eate of the berries bereof, least you see the lamentable effects it worketh upon the takers thereof as it hath done, both in our owne land, upon fundry children killed by eating the broth wherein the leaves were boiled, or the berries, and beyond the fea in the same manner; yet some doe hold that two ounces of the distilled water hereof is effectuall, tobe taken inwardly without any danger, against the heart burning, and other inflammations of the bowells, and against all other hor inflammations of the skinne or eyes, giving ease to the paines. It hath beene often proved, that one fruple of the dried roote hereof infused in a little wine fixe or seven houres; and then strained hard through a cloth, that if this wine be put into a draught of other wine, who foever shall drinke that wine, shall not teable to eate any meate for that meale, nor untill they drinke some vinegar, which will presently dispell that qualitie, and cause them fall to their vlands, with as good a stomacke, as they had before : this is a good jen for abold unwelcome guest. The Virginia Night shade is a familiar purger with them in Virginia, Nem England, &c. where they take a spoonefull or two of the juyce of the roote which worketh strongly; but we having tried to give the dried roote in powder have not found that effect,

CHAP. VII.

1. Solanum lignofum five Dulcamara. Wood Nightshade or Bitter sweete.

Lithough this plant hath no dangerous quality therein, nor yet is properly any Nightshade, more than the outward conformitie in some fort, yet because many learned Authours have reckoned it as a sort thereof, and called it by that name, let me also place it with them, and shew it you in this place, thus: it groweth up with many slender winding brittle wooddy stalkes, five or size foote high, without any claspers, but foulding it selfe about hedges, or any other thing that standeth next unto it, covered with a whitish rough barke, and having a pith in the middle, shooting out many branches on all sides, which are greene while they are young; whereon grow many leaves without order, fomewhat like unto the leaves of Nightshade, but that they are somewhat broad, long, and pointed at the ends, with two small leaves, or rather peeces of leaves, at the bottome of most of them, somewhat like the Sage with eares, and many of them likewise, but with one peece on the oneside, sometimes also those peeces are close unto the leaves, making them seeme as it were jagged, or cut in on the edges into so many parts, and sometimes separate there from, making the leaves seeme winged or made of many leaves. and are of a pale greene colour: at the toppes and sides of the branches come forth many flowers, standing in fashion of a long umbell, upon thort foote stalkes, one above another, which confift of five narrow, and long violet purple coloured leaves, not spread like a. starre, or very seldome, but turning themselves backwards to the stalkes againe whereon they stand, with a long gold yellow pointell in the middle sticking forth, which afterwards turne into round and somewhat long berries greene at the first, and very red, fost and full of juyce when they are ripe, of an unpleasant bitter taste, although fweete at the first; wherein are contained many flat white feedes the roote spreadeth it selfe into many strings under ground, and not growing into any great body: the barke also of the branches, being chewed, tasteth bitter at the sirst but sweeter afterwards.

Of this kinde there is another that different not from the former, more than in the flowers, whose outer.

leaves are white, and the pointell yellow. The Place.

This groweth usually by ditches sides, and hedges, where they may climbe up upon them, the first almost every where : the second is very rare and seldome to be met with, yet it groweth by Saint Margates Church in Rumner Marsh, and necre unto Bermonsie house on Southwarke fide, when Gerard wrote thereof, but now is not there to be found. The Time.

The branches abide dispoiled of leaves all the Winter. yet perish not, but shooteth forth new leaves in the Spring, and flowreth about July, the berries are ripe in . The names. August.

This hath not beene remembred, by any of the ancient Greeke Authours, although some of the moderne Wririters, have imposed Greeke names upon it, calling it squy odev Acov . Strychnodendron, which is Solanum arborefcens : and 3 Aukumager Glycypicron, that is, Dulcamara or Amaradulcis; diverse doe thinke it to be Melothron of Theophrastus. Matthiolus tooke it to be Vitis Sylvefiris of Dioscorides, lib.4. cap. 183. Others in referring it to the Nightshades, call it Solanum lignosum or fruicosum or rubrum. It is called of the Germans Ielenger ie lieber and Hyn/chkrant, because the shepheards use it for their cattell, when they are troubled with that disease they call Hynsch, of the Dutchmen Alfrank, of the French Morelle du bois; and we in English Bitter sweete, wood Nightshade, and Fellonworte of some. Tragus would referre it to the Hedera Cilicia, or Smilax of Theophrastus in his third Booke and last Chapter; or unto the Smilax levis of Diofcorides, fet forth in his fourth Book and 140. Chapter; Dodoneus thinketh that that kinde that bearerh white flowers, may be Cyclaminus altera of Dioscorides, Guillandinus tooke it to be Salicastrum of Pliny, lib. 22. cap. I .but all erroniously : the learned of Mompelior as Pena andCamerarius fay called it Circaa; whereuntoit as little agreeth, asthe Circea set forth inthe next Chapter, as you shall there understand. Baubinsu callehi & lanum (candens, seu Dulcamara,

Both leaves and fruit are hot and drie, aftringent and clenting. Tragus theweth the manner of making a medicine for the yellow faundise, (and for the dropsie saith Dodoness) although it be inveterate, by driving it forth gently, both by urine and the stoole, in this wife: Take faith he, a pound of the wood of wood Nightshade, cut it small, and put it into a new earthen pot, whose cover hath an hole in the toppe, with the pints of white wine, close the joynts of the pot with paste, and set it on the fire to boyle gently, untill a thin part be consumed : which afterwards being strained forth, take a draft thereof morning and evening : The joya of the leaves and berries is thought to be good for them that have beene bruifed by blowes or falls, to differ and avoid the congealed bloud, and heale the part affected afterwards : it is held also effectuall to open the o fructions of the liver and spleene, but so often as I have given it by appointment I have knowne it to purge un churlishly. Some also use the drinke before prescribed against purride seavers or agues. The countrie shephend of Germany as Tragus reporteth, doth use to hang it about their cattells neckes, when they are troubled with the disease they call Die Hynsch, which is a swimming in the head, causing them to turne round : diverse counts people doe use the berries bruised and laid to the finger that hath a Felon thereon to cure it.

CHAP. VIII.

1, Circea Lutetiana major. The greater Inchanters Nightshade.

IE likenesse also of this plant in some part thereof, hath caused it to be referred unto the Nige It rifeth up with diverse small round pointed states place may be knowne, the description whereof is the leaning downe to the ground, and taking roote at the jointes, about a foote or more high, especially for a most of the description whereof is the leaning downe to the ground, and taking roote at the jointes, about a foote or more high, especially the control of the downing place with the pointes and the pointes are the pointes. if it grow in a moilt shadowie place, with two leaves fet at every joyne, each of them set upon a pro-

tie long foote stalke, which are broad and round almost at the bottome, and very long pointed at the end, some the long foote stalke, which are broad and round almost at the bottome, and very long pointed at the end, some the long foote stalker. what dented about the edges: some compare them unto the leaves of Nightshade; others unto those of Pellism of the wall, being of a shining greene colour on the upperside, and tender, soft, or gentle in the handling, although it be a little hairy, and of a darke grayish colour underneath: from the middle of the stalke almost appears, the source grow Spike fast ion many second has one should be a little hairy. the flowers grow Spike fashion, many set together one above another, which shew to be of a darke browning colour, while they abide buddes unblowne open, but being blowne are small white five leafed starte slower, dasht over especially at the brimmes or edges, with a light shew of blush, with many brownish yellow that in the middle, where after they are past, came small rough round heads, like anto small burres, sticking more controlled to the like manual where a start and the like manual where a start a sta garments in the like manner, wherein are included finall fillining blacker round feede, formewhat like month

Dulcamara fen Solanum lignofum. Wood Night thade.

The Vertues.

The Theater of Plants.

feed, of Pellitorye of the wall, but leffer: the roote is small, very white, and full of joynts, from whence it feed, or remainded or respect hevery way under ground, quickly ipreading a great compatie: the talte hereof is inootetii weetish and waterish withall. 2. Circea lutetiana minor. Small Inchanters Nightshade.

This small Nightshade is in all things like the former, but that it groweth much smaller in every part, although it grow in the same places with it.

They grow in moift and shadowye places, and somerimes at the rootes of old rotten trees in woods, and foretimes by the hedgefides or borders of fields. The Time.

They fpring up in Aprill, are in flower in Iune, give their feede in August, and perish downe to the ground afterwards, the rootes abiding fafe in the ground. The Names.

These were not knowne to any of the ancient writers. that we can finde, but are usually in these dayes, called by all Herbarists Circea, because in the outward forme. it is like the Circaa of Diofcorides : Lobel and Pena, call the greater Circea Lutetiana, not knowing the leffer. we adde major for a distinction between them, the former is called also Circea Monspelunsium. Tragus calleth it Lapa store, because the small heads of seed, are rough like small burres, for he judgeth the Amaranthus minor purpureus to be the Circan of Dio/corides and Pliny. Iohannes Thalius in Harcynia Sylva (which is joyned with Comerarius his hortus Medicus) calleth them Helxing Selvestry, sve suviatilis major & miner, and faith that they are like in leaves, unto the Helxine, that is called Parietaria. Gesuer in hortis Germania, calleth it Ocimafrum verrucarium (not being before knowne by any name) because the leaves as he faith, are like Baffill, and the rough heades, like unto rugged warts; Tabermontamu calleth it berba Di. Stephani: Bauhinus calleth the greater Solanifolia Circaa dicta major, as hee doth the leffer Solanifolia Circaa Alpina, which Fabius Columna calleth Circuminima. Many also have taken the Mandrake of Theophrastin to be Circua of the ancients, because he faith, it was fo called by fome in his dayes: and fome the Mandragoras of Theophrastus, to be this Circaa, and have attributed the vertues thereof unto it : but affuredly none of these herbes, nor that in the former Chapter is answerable unto the description of Diescorides his Circes, for although he faith the leaves of Circea are like

1. Circea lutetiana major. The greater Inchanters Nightshade,

Nightshale, yet the flowers are many and blacke, and the seede like unto Millet, growing in small hornes: the roote also he saith is almost a foote long, three or source together, being white, sweete in smell, and of an hearing or warming property: so that as I said, none of these answer unto this description in all things, for the feede of none of them is contained in hornes or crooked cods, although Tragm faith the Amaranthus is; yet the rosses are not sweete, nor heating, nor of any use, when as the chiefest property of Dioscorides his Circea, consisted in the roote applyed for many purposes. It is called in English of Gerard, Inchanters Nightshade, derived from Circes the great Enchantreffe, inentioned by the ancient writers, but why he should call it also Bindweede Night-Bade, (anothis corrector letteth it so passe) I see no cause; for that name doth better agree, unto the wood Night-Bade, let forth in the former Chapter, because it doth climbe like a Bindweed.

The Vertues. There hath not beeneany of the moderne writers, either Tragus, Gefner, Thalius, Lobel and Pena, or Tabermontanus, that have set downe any property, wherewith any inward or outward diseases may be helped thereby, but have overpatted them, as though none of all the Country people where they grow, made any use thereof: but affuredly by the temperate qualityes, of cold and moisture therein, they may not unfitly, nor peradventure without good effect be applyed in hot griefes, as the Nightshade is, although it be moist and not altringent as it is : A ded not here tet downe any of the vertues of Dioscorides his Circea, because this is not it, neither dee we know what it is,

CHAP!

CHAP, IX.

Solana Pomifera. Applebearing Nightshades.

Nto the kindes of Nightshade I must, as divers other good authors doe, joyne some other plane. which for their qualities, either more or leffe dangerous, or for their outward forme and proportion, doe somewhat agree with the former set done.

1. Solanum pomiferum herbariorum Lobelij. Lobels red berried Nightshade.

It groweth like common Nightshade but greater, the leaves are like small Tobacco leave, the flowers are white, like the ordinary fort, the berryes are small and round, of an orient reddish colour, with white feedes within them of an infipide talte, almost without any heate or sharpenesse, and persibeth every sear as Nightshade doth, this different from Alala Ethiopica, although Bashinsus make them to be one, for the hath no prickes, or thornes, on stalkes, or leaves, nor is the fruite hard or crested.

Solanum fruticofum Americanum dictum Amomum Pliny. The Winter Cherry Tree.

This is described in my former Booke.

2. Mala Infana Syriaca, Madde Apples of Syria.

This raging or madde Apple, rifeth up with a great hard round purplish or brownish greene stalke, two free high, divided from the bottome into divers branches, whereon are fet many hairy broad rough leaves (one what unevenly cut in on the edges, and somewhat like the Thorne apple leaves; at the joynts with the leave. come forth severall large flowers, confisting of six large pointed leaves, in some plants white, in others of subbut deadish purple colour, with yellow threds in the middle; which being past there succeedeth large, six what long and round fruite, in the warme countries, as bigge as a Cowcumber, but in others, feldome bigge then a large great egge fet in the fame cup or huske, that contained the flower before, whose colour or the outside, is usually according to the flower it bore, either of a whitish greene, more yellowish, or of a grayla outside, is usually according to the slower it bore, either of a whittin greene, more yellowish, or of a grayin ash colour, or of a pale or wanne purplish colour, with a very thinne skinne or barke, and full of a whitin pulpe, and juice within, having many small flat whittin seedes within it, somewhat greater then those of the Apples of love, the roote is composed of many strings, some great, others small, not thrusting downe depoint the ground, nor abiding but perishing with the first frosts.

3. Mala Ethiopia.

The Madde apples of Ethiopia, are somewhat like the former, but that it groweth not so high, nor spreads so much, but having one upright stake, about halfe a yeard high, see here and there, with divers small pride, and had a supple of the string of the supple so that it is groweth not so high, nor spreads so much, but having one upright stake, about halfe a yeard high, see here and there, with divers small pride, and the supple sup

not very hard or long, and at leverall joynts with jagged leaves, both leffer, and leffe cut in on the edge, the the former, especially the lowermost, having some prickes also in the middle rib, on the backeside, but the leaves that grow higher, toward the toppes of the stalkes and branches, are much lesser, divided on the eless the flowers thand differfed on the branches at the joynts, confifting of fixe white white short leaves, with are

low pointell in the middle, of divers threds joyned together, after which commeth the fruite which is round and a little pointed at the end, smaller and harder then the greater kinde of Love apples, and straked, and surrowed withall in divers places, of an excellent red colour, and turning more deepe when it is ripe, having fometimes small bun-ches on them, like unto other small apples, growing unto them; and containing a juicye pulpe within it, somewhat more sharpe then the former, but nothing so moist as the love apples, with such like flat yellowish white seede withinit: the roote is a tuft of threds, perishing likewise every yeare, and seldome in these colder countryes commeth to maturity, to shew his beautifull colour or give good

This kinde of madde Apples, groweth with an upright round stalke, to the bignesse of ones singer, a stoote and a halfe high, from whence spring forth at severall joynts, sometimes on the one side, and sometimes on the other, divers long and somewhat broad greene leaves, unevenly cut in on the edges; and ending in a long point, three for the most part comming together, each of them upon a thort footestalke: at the tops of the stalke grow the fruite, which are round reddish berryes or apples of the bignesse of a Plum, full of seede within them.

5. Poma amoris majora media & minora.
Apples of Love, of a greater, lesser, and middle size.

Thele forts of Love Apples, doe in all things fo neerely resemble one another, both in the long trayling branches, the winged and divided leaves, the yellow flowers, and the red berries or fruite, as I have shewed in my former booke, that I can adde no more thereunto.

The Place. The first was brought out of Spaint, the second groweth plentifully wild in Egypt, as divers doe report, as also in I. Solanum pomiferum berbariorum Lobelij. Lobels red berried Nightshade.

2 Mala infana Syriaca.

5. Pomam amorismajus, The greater love Apples.

Hh 3

Syria, and these Easterne countryes: the third is thought to come out of Athiopia, and the backe parts of Bo. Syria, and their Easterne countryes: the time in fladowie places, upon the Apennine Mountaines: the last like. wise groweth in those Easterly Countryes of Egypt, Syria, Arabia, &c.

The three first doe flower late in the yeare, that is, not untill August, so that their fruite, hardly comments be any thing ripe with us, but the forts of the last, doe usually ripen well, if the Sommer be not too cold The Names.

The first is called by Lobel, Solanum pomiferum herbariorum, but is not Mala Ethiopica of Dodoneus and The first is called by Love, Solanum pomifer an act of the first as Baubinum fetteth it downe. The second is called in Latine Mala Infana of most writers, that is Male Apples in English, (but many doe much marveile, why they should be so called, seeing none have beene known. Apples in English, (but many doe much marveine, why they alway the state and medianens, and of the Florensine, at to receive any harme by the eating of them:) in Italian Melanzana and Melangens, and of the Florensine, at the state of the s Matthiolus faith Petranciani, of the Spaniards Verengenas, of the French Pommes d'amour, but why they flood Matthiolus faith Petranciam, or the Spaniarus Gerengemen, of the Spaniarus Gerengemen, of the Spaniarus Gerengemen, or the Spaniarus Germanes Melanizan and Dellopffell: divers doe take this to be Strychnon of Dioscorides, and vrbanum of This phrastu, as also the third kinde of Pliny, whereupon Cesalpinua as I thinke, calleth it Solanum hortense, and Ppu phrassum, as also the third kinde of Pling, whereupon essempline as I thinke, caneth it so anomeworsense, and Ppu insana, of Bauhimu Solamum pomiserum frusti sollongo. Hermolau is thought by Fuschius, and Brasavelus, to the this to be the Mandragorus Morion of Dioscorides, but Matthiolus defendeth him, and reprove them, for lay. ing that imputation upon him, which he did not avouch. The third is called by Dodonaus, and others, Male Ethopica: Lugdunensis calleth it Capsicum rotundum Dalechampy, but very erroniously, for this hath no such Ethopica: Lugamenji canetn it capjicum reinnam interampi, due veli cirolionity, for uns nain no such fiery heating quality therein as the Capsica Ginney Peppers have; of Bauthinus, Solanum pomiserum frusturents do striato duro: The fourth is called by Lugdunensis, Hyosciamus perceptinus Dalechampi, and of Bauthinus Solanum perceptinum frusturorundo, I have called it Mala Insana Europea, because that growing naturally in the parts, it is so like unto the last, which is a kinde of Mala Insana: the last sicalled, Pommu amoris, and Pomus or Malum aureum, which Anguillara tooke to be Lycopersicum, or Lycopersion as some have it of Gales and of CNLlum aureum, Willen anguluara tooke to be Lycoper jumin, of Dieper jum as folile have it of other ad others, and to be Glaucium of Diefeorides, which it cannot be, for that hath a yellow juice and bitter, which this hath not : Guilandinus faith it is called Tumatle by the Americans, and some others also would referre it to Solanum furiosum, whereunto it hath no quality correspondent, Baubinus calleth it Solanum Pomiferum fruit retundo Ariato molli.

The Vertues. Madde apples are eaten being first boyled in fat broth, with vinegar or falt, oyle and pepper, as a continual juncker with the Genveles and others, as Scaliger faith, and neither breed freniyes nor any other harme, and therefore he faith, minus fano judicio infana dicuntur. Yet Avicen lib. 2. cap. 455. condemneth them, faying the those that are old are very noisome and hurtfull, although the fresh ones be better: for by their bitterness and acrimony it is gathered, that they are hot and dry in the second degree, and that therefore they engender Me lancholly, the Leprofie, Cancers, the Piles. Impostumes, the Headache, and a stincking breath, breed oblings ons in the Liver and Spleene, and change the complection into a foule blacke and yellow colour, unlesse they be boyled in Vinegar; so that it is to be admired, that Averrhoes should commend them, being drest in some fashien. Fuschisu saith that there is a superaboundant coldnesse, and moisture, in the Madde apples, astheres in Cowcumbers and Mushroomes: yet the beauty of the fruite worketh in some, and the insatiable desireofde light to the palate in others, and the inciting to Venery in the most, (which these are thought to procure) doe fo farre transport a great many, that in Italy and other hot countries, where they come to their full maturity, and proper rellish, they doe eate them with more desire and pleasure then we doe Cowcumbers, or the like, and therefore prepare and dresse them in divers manners; as some doe cate them raw, as Cowcumbers, some doe roalt them under the Embers, and others doe first boyle them, pare them and slice them: and having strowd flower over them, doe frye them with oyle or butter, and with a little pepper and falt, serve them to the table, Some also doe keepe them in pickle, to serve for to spend in the Winter and Spring : but it is certainly found true, that they doe hardly digest in the stomacke, whereby they breed much windinesse, and thereby peradventure bodily lust; that they engender bad blood and Melancholicke humours, and give little nourishment at allumo the body, and that not good: the Apples of Ethiopia, are of the fame quality, although of a firmer substance, no yeelding any good nourishment, but rather offensive to the body, for these two are congeneres in forme, and there fore most likely in quality. The golden apples or apples of love, are cold and most, more then any of the former, and therefore lesse offensive, these are eaten with great delight and pleasure in the hotter Countries, but not in ours, because their moilture is flashy and insipide, for want of the sufficient heate of the Sunne in their ripening.

CHAP. X.

Solana pomifera spinosa. Thornye applebearing Nightshades.

Here are one or two more to be spoken of, to finish this family of the Nightshades, one whole fruite is neerest in likenesse unto these Madde apples, the other to the Nightshades, after which the Thorne apples should next follow, as being by all authors referred unto the Nightshades, by because I have already set forth all their descriptions, I shall not neede to repeate them agains.

1. Solanum spinosum fructu rotundo, sive Pomum Hiericonticum Imperato.
Thorny Nightshade of Hiericho with round apples.

The leaves hereof are very like unto those of the former madde apples of Europe, but whiter and softer, having many fmall thornes on the middle ribbe of every leafe on the under fide : on the stalke likewise and branches at sparsedly set divers thornes, and purplish flowers at the toppes of them being smaller then the former, after which come smaller apples also, greene before they be ripe, changing yellow and brownish afterwards, being tout and somewhat sweete in smell, but as unsavoury, or without taste as the former.

TRIBE 3. Datura five Pomum spinosum majus flore albo & purpureo.

Datura feve Stramonium minus flore albo simplici & flore purpureo simplici & duplici. These are described in my former Booke, and the figures of the lesser forts here exhibited.

2. Selaunm poniferum Indicum folio rotundo.

Islan Applebearing Nightshade with round leaves.
This plant being onely mentioned by Monardus, in his This plant being oner, in this bifloy of those imple medicines, that come from the West bifloy of those imple medicines, that come from the West hiltory or those impre incurrences, that come from the West Indies, is referred by Banhinus unto his Classis of Thorne Apples in his Pinax, but should more properly in my judge-Apprenium placed with the fruits, in the last Chapter going ment, be plated Madde Apples, but that it hath farre more before, called Madde Apples, but that it hath farre more excellent properties. The plant groweth in manner of a Chrisbe or hedge bush as he faith, of an excellent greenerefe, having leaves that are fmall, thinne and round, bearing long fruit, round at the lower end, and flat toward the falke, like unto the Malum infanum or Madde Apple, of agrayish or ashcolour on the out side, and of a pleaor a grayitate full talte, without any acrimony therein, having many very small seedes within it. The Place.

The first groweth in Syria and Palestina, and other the countries neare there unto; the other groweth in the Mountaines of Pers onely, a Province in the West Indies, and the feede fent unto Monardus into Spaine, who fowed the feede, to make triall of the effects, were declared to be in it. The Time.

It is not mentioned at what time either of them flowrethor bearethripe fruite, but it is probable they varie not much from the featon, of the other Thorne and Madde Apples, unto which they are fo like in forme.

The Names. The first Baubinus calleth Solanum spinosum fruetu ro-undo, which Ferrantes Imperatus of Naples, calleth Pomum Hiericonticum: the other Monardus faith came to him under the name of Caches, as the Indians it is likely doe

The Vertues?

There hith not any Phisicall use beene remembred of the fift; whereunto it serveth : but Monardus saith of the other, that was sent him out of the Indies, that it is of great estimation there, both with the Spaniards and Indians themselves, in that it provoketh urine, expelleth gravelland the slone in the kidnies and bladder, for which it is most commended; it breaketh the stone in the bla dder, if it be not too hard and inveterate, or may by any medecines be dissolved, whereof there were many proofes (as Monardus faith) declared to his great wonderment: for as he faith, he did not thinke that the stone

in the bladder could be diffolved, and expelled by any medicines, and that the cure thereof confifted onely, in the cutting of it out by a cunning hand : but it was faid of this, that the feede taken in any fit and convenient water, for that purpose, will by little and little dissolve the stone into small gravell, which after it is expelled forth, will againe be gathered and grow into a hard stone.

CHAP. XI.

Capficum. Ginny Pepper.

He Ginny Pepper in mine opinion is fittelt to follow next after the family of the Nightshades, be-Ing in outward forme likelt thereunto, as also being no lesse dangerous, although in a quite contrary nature. for this is as farre exceeding in heate, as the other in cold: hereof there are found out, or at least brought to knowledge many sorts in these dayes, which were not knowne in forout, or at least brought to knowledge many forts in these dayes, which were not knowledge many forts in these dayes, which were not knowledge many forts in the leaft, as they have beene of later time, especially by Gregorius de Reggio, a Capuchine Fryer, who hath observed a dozen severall varieties at the least in the scuite or cods, although very little differing in any thing esse. All which I thinke it not amisse to show you in this Chapter, with some others also not observed by him, but by Clustum and others.

1. Capsicum majus vulgatius oblongis siliquis. The most ordinary Ginny Pepper with long huskes. I propound this Ginny Pepper as a patterne, by which yee may frame the descriptions of all the rest, the chiefell difference confilling in the forme of the fruite whether you will call them huskes or cods, as shall bee shewed every one in their order. The plant it selfe riseth up with an upright firme round stalke, with a certaine pith within them, about two foote high in our Country, and not above three foote in the hotter, fpreading into many branches; on all fides, even from the very bottome, which divide themselves again into other smaller branches; at each joynt whereof come forth two long leaves upon short footestalkes, somewhat bigger then those of Nightshade, else very like, with divers veines in them, not dented about the edges at all, and of a very fad greene colour: the flowers stand severally at the joynts with the leaves, very like unto the flowers of Nightshade, confisting of five most usually, yet sometimes of six white small pointed leaves, standing

Stramonicum minus five peregrinum fimplex to duplex. Single and double small Thorny Apples.

open like a starre, with a few yellow threds in the middle; after which come the fruite (either great or fmall open like a starre, with a rew yellow threes in the limiting; and which will be either long or short, either round or square, as the kinde is, either standing upright or hanging downe, as their standing upright or hanging downe, as their either long or thort, either round or iquale, as the killing is, closed the med bereafter,) in this formewhat great and flowers shew themselves, either of this or that forme, as shall be shewed hereafter,) in this somewhat great and the shall be showed the and which the shall be sh flowers show themselves, enter or time or time for the falke, and smaller toward the end, which is not shap long, about three inches in length, thicke and round at the stalke, and smaller toward the end, which is not shap long, about three inches in length, thicke and round at the traike, and imatter toward the end, which is not have but round pointed, greene at the first, but being full ripe, of a very deepe, crimson, shining red colour on the outside, which is like a thicke skinne, and white on the inside, smelling reasonable well, and sweete, having that yellowish white seedes therein, cleaving to certain ethinne skinnes within it, which are broaderable upper end, and smaller at the lower, leaving the end or point empty within not reaching so farre, the white upper end, and finaller at the lower, leaving the end or point empty within not reaching to rarre, the who haske but effectally the feede, being of fo hot and fiery a tafte, that it enflameth and burneth the mound throate, for a long time after it is chewed, almost ready to choake one, that carelelly taketh much at a time thereof: the roote is composed of a great rust, or bush of threads, spreading plentifully in the ground and pells. etheven in the hot Countryes, after it hath ripened all his fruite, and with us, upon the first sharpe frois

2. Capsicum minus Brasilianum. Small round Ginny Pepper This Ginny Pepper groweth in the same manner that the former doth, not differing therefrom in any thing he in the leaves, which being of the fame forme, are not fo great and large, and in the fruite which is small and round (Randing fome forthright, and fome upright, but none pendulous or hanging downe, each of thems, on a long footestalke) about the bignesse of a Barbery, but round and nothing fored, but of a darke or blacksh on a long rootetraine) about the organical of a pattery, but tould and hotting fuch like feede within them, by fomewhat smaller, no lesse hot and fiery then the former, and abideth the winter colds, no otherwise then the former, and indeede feldome beareth ripe fruite in our Country. Those which we have had from the Brands where they are naturall, are of a yellowish red.

3. Capficum rotundum majus surrectum. The greater round upright Ginny Pepper.
The chiefest difference in this fort of Ginny Pepper, consistent most in the forme of the fruite, which say deth upright, as the flowers doe, being great and round like an apple, even the greatest of all the forts that bear round truite, of an exellent red colour when it is ripe, like unto a pollished Corrall.

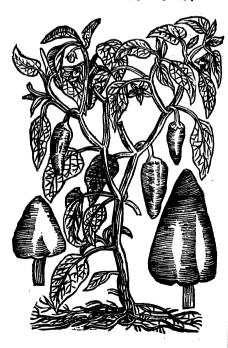

4. Carscum erectum pyramidale maju. The great upright spire sashioned Ginny Pepper.

This is much alike or very little differing from the sist, the difference of the fruite is that this standethupigh, great below, and smaller, and smaller to the point, which is sharper then in the sust, essentially seems the same that the same than the sust of the same than the same than the sust of the same than the same tha being inverted, that is, either that turned upward, or this turned downewards, of as brave an orient Coll like colour as the last.

Capficum Longum.

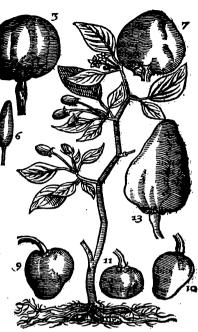

I: Capficum majus vulgatius obiongu filiquia, & alia as genera nempe quartum & quintum. The most ordinary Gimney Pepper with great long hunkes, and the fourth and fifth,

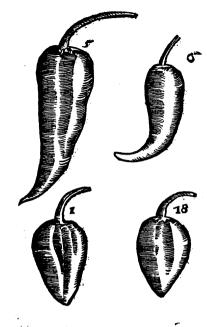

2. Capfeum minus Brafilianum & 7. alla genera. Small round Ginny Pepper, and 7. other lotts.

Coppeispecies quatuor nempc. 15.16.17. & 18.

Capicum erectum pyramidale minus. The leffer upright spyrefashioned Ginny Pepper. Asthe fruite of this fort is leffer, by the halfe than the last, and not so sharpe or small at the end, but somewhat round to the greene leaves also are smaller and narrower, and the stalke smaller and not growing so high : the slowers of this, as of all the rest, that beare their fruit upright, doe stand upright also, which is a certaine rule to know what fruit will be pendulous and what will be upright. The figures of both these last sorts are set on the

6. Capficum exiguum erettum pyramidale. The least Spyretashioned Ginny Pepper.

The forme of this small Spyretashioned Ginny Pepper, commeth so neare unto the second fort, that many may some be deceived, in thinking them both one, that doe not heede them more precisely; for although they both agree in growing upright, and being small, yet those (of the second fort I meane) are short and round like unto a wild Olive, and these are smaller and longer, of an inch long at the least, and of a blackish red before they be thorough ripe, but then are as red as the rest: this groweth taller, fuller of branches, and more stored both with slowers and struite, which make the goodlier prospect: the leaves also are no smaller, than in any other fore

going before, and of the same darke greene colour with the rest.

7. Capsicum Cordatum erettum majus. The greater upright heart fashioned Ginny Pepper. This fort of Ginny Pepper groweth to be but of a meane height, that is, not so high as most of the former, having large leaves, but not so small at the ends: the fruit is not pendulous or hanging downewards, with his footestalke, but standing upright, being somewhat great flattish, and as it were bunched out at the upper end next unto the stalke, and smaller below, short and round pointed, somewhat resembling the forme of a mans

8. Capficum Cordasum erectum minus. The leffer upright heart fashioned Ginny Pepper. This different not from the laft, but in the smallnesse of the fruit, standing also upright, and being smaller by a third part, or neare an halfe, and shorter also: the figure of this is omitted, because it is the same with the next, but that this is upright and the other pendulous.

9. Capficum Cordatum propendens. Pendulous heartfashioned Gimy Pepper. The fathion of this fort of Pepper, is formewhat like the greater upright heart fathioned Pepper, being neare of the same binesses this lort of Pepper, is somewhat like the greater upright heartrainioned repper, being hear of the same binesses, but a little more uneven and not so round, but is as red being ripe, and is pendulous hanging alternos downewards not standing upright as the other. There is another of this fore of pendulous Peppers differing in Minus. nothing from the greater but in being smaller.

10. Capficum filiqua Olivaria propendens. Pendulous Olivefashioned Giang Pepper. This Pepper hath small long and round cods, smaller below than above, being very like unto an Olive berry, tred being rised be as red being ripe as any of the reft, and with the stalke hanging downeward.

11, Capficum filiqua Olivaria eretta. Vpright Olivefashioned Ginny Pepper. This different from the last but in being greater than it, and standing upright and not in anything one. The figure of this is not fet in any of the tables; but this figure with eleven is next under the number swelve-12. Capsicum

12. Capsicum siliqua rosunda Cerasorum. Cherry fashioned Ginny Pepper.

There are two forts of this Pepper, one which is fully round, like unto an English or Flanders Cherry, the There are two forts of this Pepper, one winch is long a little bigger then the other, and both of them harging

13. Capficum siliqua lata & rugosa. Broad and Crumpled Ginny Pepper.

The cods of this Pepper are fomewhat large, greater above and finaller below, fom what flat alfoand not rook but crumpled as it were or shrunke halfe together, and smelleth pretty sweete.

14. Capsicum erettum majus longum. Long and upright Ginny Pepper.

This Pepper is long and round, yet not like that, that carryeth the forme of an Olive berry, but much long and of an equall bignesse all the length thereof, and standeth upright.

15. Capsicum oblongum majus recurvis sliquis. The greater crooked or horned Ginny Pepper. The greater horned Ginny Pepper, hath great large cods, about five inches long, fometimes little or noting regreater normed of my repper, managementage crooked at the lower end, which is long and small, sometimes a little crooked or bended upwards, and small,

. 16. Capsicum oblongum minus recurvis siliquis. The lesser horned Ginny Pepper. This different from the last, in not being halfe so thicke or long, and keeping his end bowed or crooked to frantly, not varying as it doth: both this and the last hang downe their cods toward the ground: the whole plantly, not varying as it doth:

17. Capsicum bifurcata siliqua. Double pointed Ginny Pepper.

This Pepper is very like the long upright Pepper, and much about the same forme and bignesse, being of and quall fize almost, all the length thereof, but differeth from it in this, the lower end is parted as it were, more thort round points, and is also a little smaller there then upwards, neither in colour nor any thing else differen from the rest.

18. Capsicum siliqua slava breviore. The shorter gold yellow Ginny Pepper. It might be thought by divers, that onely see the cods of this Pepper, that it different from all the rest, in the manner of growing, as well as in the colour of the fruite, but it is not fo; for it hath like leaves, faller flowers in every part, and onely different in that it beareth cods, very like unto the first fort here set down which is the most common, but that they are shorter, and ending in a smaller or sharper point, and of a fine gold yellow colour, not red as all the other before are.

19. Capficum siliqua flavalongiore. The longer gold yellow Ginny Pepper. This gold yellow Pepper differeth in nothing from the laft, but in the cods, which are not fo thicke as they be a little smaller, from the middle thereof being longer, or lessening very finely unto the pointed end, of size a gold yellow colour as the other,

20. Capsicum caule piloso. Ginny Pepper with hairy stalkes.

This Ginny Pepper groweth with round greene stalkes; set full of white haires thereon, contrary to all the former forts: at the joynts with the branches come forth two such leaves, as the first fort here set forth land but larger then they; the flowers are white, confifting of five leaves like the rest, but larger also then and them; after which come the gods, greene at the first, as all the other are, but as red as the rest, when they are ripe, which are somewhat great and long, ending in a very long point, in the rest, as in the seede and room not differing from the former forts.

All these forts of Pepper, came first from the West Indies, called America, and the severall parts thereof Bushi being reckoned as a parcell thereof, and our Sommer Ilands also, although we in English from others fallership on, give it the name of Ginny Pepper, as though it originally came from thence : they are nurfed up in gr dens, in all the Provinces of Europe, and groweth in many places of Italy, Spaine, Sec. Set in pots about the windowes of their houses, either for the pleasure of the beautifull greene leaves and fruite or cods, when the are ripe, or for the use it serveth, or both. Clusius saith it is not onely planted in Spaine, and Portugall in diver places, but in Moravia also as he faith, for the profits sake they make of the fruite, which serveth theminthole parts, in the stead of the East-Indian Peppers The Time.

They use not to sow them untill the end of March, or beginning of Aprill, no not in the warme Countries they flower usually not before the beginning of August, at the soonest; and their brave red cods ripen not the rowly, untill the beginning of Winter, and so will abide both with flowers and fruite, most of the Winter with them; but if they take any frosts with us, they presently perish, and therefore must be housed if any will per ferve them.

The Names.

It is generally held to be Siliquastrum of Pliny, a siliquis quas producit, and Piperitis of him also, quis frates Piperis sapore & acrimonia sit, and Ka Lixova Kanta mordeo, Capsicum of Alluarius, Pena thinketh it to be Zinim Caninum of Avicen: it is in these dayes diversely called, for some call it Piper Indicum, Piper Americanum, Piper Brafilicum, or Brafilianum, some Calecuthium, some Hispanicum, and some Piper de Guinea. Fragosu lim that the Indians call it Axi, and besides the sorts here mentioned, he speaketh of one in the last Chapter of Spitts of a blackish blew colour, familiar in Spaine. Of the Italians Pepe Cornato, and Pepe d'India. Of the Spaine Pepe Indiano. Of the French Roinre d' Inde, and Poinre d' Espagne. Of the Germanes Pfeffer Indianisch, and solite Wile of the Dutchmen, we in English generally call it Ginny Pepper, and some Indian Pepper. The first as being best knowne, and first obtained in these Christian parts of the world, is mentioned by most of the later witness Fuschius calleth the first two, Capsicum rubrum & nigrum, and Siliquastrum majus & minu, Matthiolus calleth them Piper Ind. cum, and mentioneth three forts, this first kinde, the fixth fort, and the seventh, which these gure in Banhinus, his addition unto him doth demonstrate, Lugdunensis calleth them, Capsicum majus & missis, Cofalpinus tooke it to be Circea of Dioscorides. Lobel calleth them Capsicum, vel Piper Indicum longioribm fil quin the hirteenth is likewise remembred by Fuschine, by the name of Capsicum latum, and Siliquastrum que 14m, and to doth Dodoneus alfo, and Lugdunenfis from him, call it Capficum latum, some also doe call that

fort Capficum Cordatum : the last is mentioned by Camerarius in his Hortus Medicus, by the name of Piper Indicum tort cappe in the most of the rest are remembred by the foresaid Gregorio de Reggio, and some by Bauhimus. The Vertues.

The Ginny Pepper of all forts (for herein they are all like) are hot and dry in the fourth degree, and beyond it The Grinn report is and are so fiery hor and sharpe biting intast, that they burne and ensiance the mouth and through occurrences of extreamely that it is hardly to be endured; for it any shall cate thereof unadvisedly, it will bee and more to the choake them, and if it be outwardly applied to the skin in any place of the body, it will amort ministration and raise blisters in the same manner, as if they had beene burnt with fire or scalding water: weather ferce vapours that arise from the huskes or cods, while one doth but open them, to take out the feede, to use or fowe, (especially if they doe mince or beate them into pouder) will so pierce the senses by flying up into the head lowe, (cipetian) that it will procure aboundance of neelings, and draw downe fuch aboundance of thin rheume. that it is to be admired, forcing teares very plentifully and passing likewise into the throate, it will provoke a that its tobe adming, and even cause a vomiting in that vehemencie, that all the bowells as well as the stomack, will harpetouguing, he much perplexed therewith, and if any shall with their hands touch their face or eyes, it will raise so great an inflammation, both in the face and eyes, that they will thinke themselves utterly spoyled, which will not bee remedyed in a long time, by all the bathing of them with wine or cold water that may be used, but yet will pale away without further harme : if some hereof be cast into the fire, it raiseth greevous strong and nov some vapour, procuring sneezings very siercely and coughing, and even vomiting or casting very strongly, to all that bein the roome any thing neare thereunto : yet marke and observe the goodnesse of our good God, that that resulte the state of the s by often taking would prove very dangerous to life, the way here set downe is found to be the safet, both to be taken familiarly and often without offence in meate as well as medicine, as also to worke those good effects in Physick whereunto it is conducible: It is Gregorio de Reggio his receipt, for take faith he, of the ripe cods of any fort of Ginny Pepper (for as I fayd before, they are all in propertie alike) and dry them well, first of themselves, and then in an oven, after the bread is taken out, put into a pot or pipkin, with some flower that they may be thoroghly dyed, clense them from the flower, and their stalkes if they have any, cut them or clip them very small, both luskes and feedes within them, and to every ounce of them, put a pound of fine wheate flower (the same veedryed them withall in the oven, may be part if yee will) make them up together into cakes or small loaves with so much leaven, as yee thinke may be convenient for the quantitie you make; bake these as you doe bread of that file, and being baked cut it againe into smaller parts, and bake it againe, that it may be as dry and hard as bifket, which beaten into fine pouder and fifted, may be kept for any the uses hereafter specified, or may serve in stead of ordinary Pepper, to leason meate or broth, or for sauce, of any other purpose the East Indian Pepper doth serves for it not onely giveth as good, but rather a better tafte or rellish to the meate or sauce (yea and your wine and other drinke) but it is found to be fingular good, to breake and discusse the winde, both in the stomacke and the collicke in the body: it is singular good to be used with such meates as are flatulent or windy, and such as breed much moviliure and crudities (whereof fish is reckoned one speciall:) one scruple of the said pouder, taken in a line broth of Veale, or of a Chicken, doth wonderfully comfort a cold stomacke, causing slegme, and such grosse orvilcous humours as lve low in the bottome thereof to be avoided, helpeth difgettion, for it provoketh an appetite to meate, provoketh urine, and taken with Saxifrage water expelleth the stone in the kidneyes, and the flegme that breedeth them, and taketh away the dimnes or millinesse of the fight used in meates; taken with Pilale Alphangine doth helpe the dropfie: the pouder taken for three dayes together in the decoction of Penyroyall, expelleth the dead birth, but if a peece of the cod or huske, either greene or dry be put into the mother after delivery, it will make them barren for ever after ; but the ponder taken for foure or five dayes falting, with as much fennell feede, will ease all paines of the mother the same also made up with a little ponder of Gentians and oyle of bayes into a peffarie, with fome cotten wooll, doth bring downe their courses if they have beene flayed the fame mixed with a Lohoc or Electuary for the cough, helpeth an old inveterate cough; being mixed withhony and applied to the throate, troubled with the squinsie, helpeth it in a short space, and made up with a little pitch or Turpentine, and layd upon any hard knots or kernells in any part of the body, it will resolve them, and not fuffer any more to grow there: mixed with some niter and used, it taketh away the morphew. and all other freckles, spots or markes, and disconlourings of the skin; applyed with Hens grease dissolveth all cold impollumes and carbuncles, and mixed with sharpe Vinegar, dissolveth the hardnesse of the spleene; if some thereof bee mixed with unguentum de alablastro, and the raines of the backe anointed therewith, it will take away the shaking fits of Agues : a plaister made thereof, and the leaves of Tobacco, will heale the sting or biting of any venemous heaft: the decoction of the huskes themselves made with water, and the mouth gargled therewith easeth the toothach, and preserveth them from rottennesse: the ashes of them being rubbed on the teeth, will clense them and make them grow white that were blacke: the decoction of them with wine helpeth the Rupture that commeth of water, if it be applyed warme morning and evening if they out it to steepe for three dayes together in aqua vite, and the place affected with the palfie bathed therewith, will give a great deale of case; and steeped for a day in wine, and two spoonefull thereof drunke every day fasting, will helpe a flinking breath, although it hath continued long; and frust up into the nostrills, will correct and helpe the stinck of them, which is produced of flegme corrupted therein.

CHAP. XII.

Dorrenium. The supposed venemous plant Dorrenium.

Here are diverse plants set forth for the true Dorgenium of Dioscorides by diverse Writers, not any or Where are diverse plants set forth for the true Dorganian of where of agreeth with all the notes that he giveth of it; so that yet to this day, the true Dorganian in where of agreeth with all the notes that he giveth of it; so that yet to this day, the true Dorganian in whereof agreeth with all the notes that he give hor for forth unto you fome of those plants the knowne to any that we can heare of: I will therefore here fet forth unto you fome of those plants the the most judicious moderne Writers, doe suppose may be referred thereunto, as agreeing therewith many things, and shew whereunto else they may most properly be referred.

1. Dorycnium suppositionem Monspeliense & Hispanicum.

The white shrubbe Trefoile of Mompelier and Spaine.

The shrubbe Trefoile, which Rondeletiss and other the learned of Mompelier, (as Pens faith) called De The thrubbe Trerotte, which administration is the bottome, and whiter towards the toppes, forms, shooteth forth many wooddy branches, browne at the bottome, and whiter towards the toppes, forms what flexible, to the height of three or foure foote(as I have observed in mine owne Garden) whereon at feveral what flexible, to the neight of three or flower located as a first or more together at a joynt round about the flake at the toppes of the branches stand many small whitish flowers in tuftes, like unto the flowers of other Trefolle at the toppes of the oranges using many man winding movers in the trope of the fraction of the first them; the trope but fmaller, which turne into fmall long cods with fmall round blackiff gray feedes within them; the root but finaller, which turne into thinking toos with himself ground, of a pale reddish or flesh colour on the inside, covered with a darke brownish barke; which abideth diverse yeares, although the branches dye downe to the ground, if there be care taken to defend it from the extremities of the frosts in Winter, for want where mine perished: it hath little or no taste at all.

2. Dorycnio congener Clusii. Another Tre foile like unto the former.

This other as Cluftus faith is very like the former, but more white or hoary, having shorter and broader leave fet in the same manner, three or five together, upon the small bending branches, which are whiter and senden than they: the flowers are greenish and larger than the former, standing many together on a stender bare twigge,

Anguilara and Camerarius say the flowers are purple, or of a whitish purple colour, this hath a saltish taste with

3. Dorzenium Dioscoridis forte Pona. Pona his supposed true Dorzenium of Dioscorides. This strange plant faith Pona, that was encreased from the seede sent out of Candy, to Signer Contains, and grew in his garden, rose to the height of a foote and a halfe, spreading forth into many branches, whereon did grow many small long and narrow rugged leaves full of veines, lesser then the leaves of the Olive tree, set with out order upon them: the flowers were fashioned like unto the blossomes of Pulse or Pease sometimes of a white

colour, and sometimes of a more yellowish colour: the feed he faith he did not fee, (but furely it must give feede in cods or huskes: for there are very few plants that beare pease or pulse like flowers, but they beare their feede in cods or the like) the rootes are many small strings and fibres shooting from a head, which whether it die every yeare or abide, wee have not yet learned: but Dioscorides saith that his Doryenium hath a roote of the length of a cubit and of the thickenesse of a finger when it is growneold, which this as you heare hath not, and therefore if for nothing else, it agreeth not with the right Dorycnium of Dioscorides, and yet Pona faith, he hath not seene any plant that doth so neerely resemble the true Dorycnium as this doth,

4. Dorycnium Creticum Alpini. The supposed true Dorycnium of Candy.

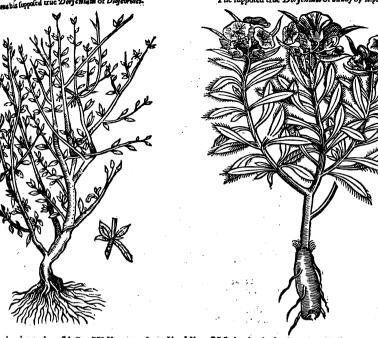

This plant doth so differ from others, that every one is ready to apply it to a severall plant, as his judgement and affection to some particular part thereof doth draw him, because it doth partake with divers plants, as you shall heare: it rifeth with divers straight upright wooddy stalkes, yet very flexible, divided into many branches from the bottome, all white or hoary; whereon grow many long thicke, and somewhat narrow white filver like leaves, fet without order, at the toppes of the stalkes and branches, come forth many flowers together in a tuft or umbell, with some small leaves with them, every one whereof is broad, open at the brims, and round, confifting of one whole leafe, like unto a Bell-flower, or bindweed, which open by degrees, one after another, and not all together, whereby it doth continue the longer in flowring: after the flowers are fallen, come small rough huskes, wherein is contained blacke seed, like unto those of the Bindweedes, somewhat thicke and great: the roote is somewhat great and thicke not growing downe deepe into the ground, with many fibres thereat, which abideth many yeares in the warme countryes, yet the branches lose their

1. 2. Dorycnium suppositivium Monspellense & Hispanicum.
The white shrubbe trefoile of Mompeller and spaine.
Et Dorycnio congener Ciusis. Another like it.

[cayes

RIBE. 2. Dorgenium Diefeoridis forte Pona. 4. Doryculum Creticum Alpini,
The supposed true Dorycnium of Candy by Alpinus, Pont his supposed true Dorg enium of Diofeorides.

levesin winter, themselves yeelding new, and budding fresh in the spring out hardly endureth a winter with w, unlessed peciall care be had to preferve it, by keeping it in a large pot or, such like, and housing it untill the spring.

The Place. The two first grow in divers provinces of Spaine, as Clusius setteth it downe, and the foremost about Mompelier also. The third and the last growboth in rocky or stony places neare the Sea, in Candy, from whence the feede or plants were first brought into Italy, and from thence to severall friends elsewhere. The Time

They doe all flower very late in these parts, whereby their seede seldome commeth to persection, and in their naturall not untill the Autumne.

The Names. It is called in Greeke Sephanior Dorrenium, and of Cratevas as Dioscorides faith, dinarded & rate Halicacabus, and Caka, some write it is called Sozunior Dorycnium quasi toxicum, quo spicula cuspidatave tela infici solita suerunt, ut celeriorem molirentur perniciem faith Pena, but we cannot heare, that any of these plants, have any soporifrom, much leffe venemous or mortall quality in them, as Dioscorides attributeth to his, and therefore the more suspitious that none of them are the right, although in the outward face, they may all of them, in some things resemble it. There are other plants also referred thereunto, as the Phyllirea, which Gesner in hortin Germania, taketh to bea shrube like unto the Vitin Idea, as also Pisum cordatum, or Vesicaria nigra, sive peregrinna cordin es-figit, by Cordan upon Dirscorides. The first is called Dorycnium verum, by the learned of Mompelier, as Pena and Lobel say, and Anguillars, and Clusius say the same also, yet Clusius calleth it Deryenienm Hispanicum, which was also sent him as he saith, by Ulisses Aldroandus, by the name of Trifolium album, but by Cordus in the place before recited, it is accounted falle. Bauhimu in his Pinax reckoneth it among the spiked Trefoiles, calling it Trifolism album angustifolism storibus, velut in capitulum congestis. Clusius saith that the Spaniards about Salamanca, where he found it call it Myediega, Gerard calleth it venemous Trefoile of Mompelier; and of Spaine, materials and of Spaine and Originals and Or king them to be two severall plants, expressed by two sigures, and Mr Iohnson his corrector letter them so passe likewise, but I had rather give it the denomination of Dorycnium, from the Latine, as most other nations doe, and call in the control of the control of formula. and call it Dorychium Supposition, Supposed Dorychium, because it is but supposed to be right, or else from the forme, and all it Dorychium Supposition, Supposed Dorychium, because it is but supposed to be right, or else from the forme, and call it firmbbe Trefoile onely, because it is not dangerous. The second is so called by Clusius, as it is in the title, but Bankinus calleth it Lotor pentaphyllor incanno. The third is called by Pona in his Italian booke, from Honorius Bellus, out of Candy, by the name of Lago Chymica, which grew with him, but if the flowers be learninger, as Bush of Candy, by the name of Lago Chymica, who grew with him, but if the flowers be learninger, as Bush of Candy, by the name of Lago Chymica, who grew with him, but if the flowers be learninger, as Bush of Candy, by the name of Lago Chymica, which are grew with him, but if the flowers be learninger, as Bush of Candy, by the name of Lago Chymica, which are the grew with him, but if the flowers be learninger. legum ness, as Pona describeth them to be, it cannot possibly come nere to any Iacea, and yet againe in his Pinax, fd. 465. he maketh it also to be Cneore also assimin, which how likely it is, let others judge. The last Clusters to be the first in the last Clusters when the control is the control of the last Clusters. teth forth in the Appendix, to his History of Plants, by the name of Doryenium Plateau, because Iacobus Plateau, had it growing with him, from the feede received from Candy, and fent both the figure and description thereof

CHAP. 12.

TRIBIN unto Clusius, Imperatus also it is likely had it from thence, by the same ame of Dorgenium, for so Banking unto (In fim, Imperatus also it is many and a transfer and Alpinus in his booke de plantis exoticis, faith that they of Candy doe call it Dorreism is laith, he called it, and Alpinnin in its boons are provided to be a Convolved, and calleth it Convolved to Pond doth not account it to be the right, but rather thinketh it to be a Convolved, and calleth it Convolved to Pona doth not account it to be the right, out rather Dalechampy, and Banhinus in his Pinax calleth it, Commander, Lugdunenfis calleth it Commander, and Comm bum folio olea argenteo melli. The Vertues:

There hath not beene any experience made of any of these plantes, so farre as I can understand, that they is There hath not beene any experience made or any or more of them; for feeing none of them are for feeling none of them. as Dioscorides his Dorycnium, or venemous, and was accounted as strong a Toxicum, to dippe their arrowed as Diofeorides his Doryenum, or venemous, and was active the vertues of Dorychinum, to any of these plans, to kill wild beafts, as any other; I cannot appropriate the vertues of Dorychinum, to any of these plans, to in, to kill wild beauts, as any other; a cannot appropriate the cooling property, and only dangerous if too man were taken thereof, in provoking too much sleepe,

CHAP, XIII.

Hyoscyamus. Henbane.

. He ancient writers hath made mention, but of three kindes of Henbane, the one blacke, the ob white, and the third yellow; which denominations are not taken from the colour of the harten flower, but of the feede : but there hath beene some other forts found out of later times; all which I thinke meete to fet downe in this Chapter together.

1. Hyoscyamus vulgaris. Common Henbane. Our common Henbane, hath very large, thicke, foft, woolly leaves, lying upon the ground, much on ing torne on the edges, of a darke or evill grayish greene colour, among which rise up divers thicke and soft shile two or three force high, spread into divers smaller branches, with some lesser leaves on them, and many holes flowers, scarse appearing above the huskes, and usually torne on the one side, ending in five round point green ing one above another, of a deadiffy yellow colour, somewhat paler towards the edges, with many purity veines therein, and of a darke yellowish purple in the bottome of the flower, with a small pointell of the flower. colour in the middle, each of them standing in a hard close huske, which after the flower is past, growther like (the huske of the Pomgranet flower, but that is not so well knowne unto us) the flower or huske of Alea bacca, and somewhat sharpe at the toppe points, wherein is contained much small seed, very like unto Pope feede, but of a duskye grayish colour, the roote is great white and thicke, branching forth divers ways under ground, so like unto a Parsnep roote, but that it is not so white, that it hath deceived divers, as you shall be by and by; the whole plant more then the roote, hath an heavie evill soporiferous smell somewhat offer five.

1. Hyofcyamus niger vel vulgaria. Common or white Henbane

CHAP. 12.

2. Hyoscyamu abus. White Henbane.

The white Henbane hath divers large leaves, but not fo great as the former, yet more foft and woolly and The work jugged or corne on the edges, rounder also, and of a paler greene colour; the stakes grow higher. act to many set branches on them, the flowers are in forme like the other, but smaller and of a pale colour, enand which he wise the feed likewife groweth in fuch like hard huskes, but leffe prickely, and is which dining we want also is not much unlike, but leffer and perisheth every yeare that it giveth seede, the smell of this nothing to heady and offensive as the other.

3. Hyofeyamus Greticus. Henbane of Candy.

This Henbane of Candy, hatch lefter and thinner leaves then the laft, more white and woolly, and more cut in on the edges, dented also, and standing upon longer wefelkes, the stalkes are more slender and short, hawine fuch like flowers, ending in full round leaves, frandie higher above the baskes, of a faire yellow and fomesime of a pale yellow colour, and purple at the bottome: after which come feede like the common kinde, but fomewhat yellower in rounder heades or huskes: the roote is

fonewhat thicke and short, like a Navew roote, dying every yeare with us.

4. Hydryamus Agyptisus. Henbane of Egypt.

The Exprise Henbane rifeth up with a strong woolly alle about two foote high, wheron are fet leffer leaves. hen those of the common kinde, and almost as much torne on the edges, especially those towards the bottome, but those that grow up higher toward the toppe, are little or othing cut on the edges at all, all of them being very white and hoary: the flowers stand every one of them the joynts with the leaves, and at the tops likewife. fuch like huskes as the common doth, and of the fame ale yellow colour, with purple veines therein, at the of blowing of them, but afterwards as they grow larger, the colour changeth to be of a darke reddish colour, yith veines of a deeper colour, and a whitish bottome, with a purple pointell, encompast with yellowish threds the middle, after which commeth fuch like prickely ads, as the common kinde hath, and fuch like feed alfo : the roote is small and perisheth every yeare. The Place.

The first is commonly growing by the way sides, and under hedge fides, and walles: the fecond groweth by the Stafider, in Narbone in France, neare where the River Rhodone numeth into the Sea. The third groweth in Canor, and in Spaine also, from whence the seed being sent, hath growne with me and divers others also. The last is namrall both in Egypt and Syria, and in our Gardens. The Time.

4 Hyofcianus Ægyptius. Henbane of Egypt.

They doe all flower in July, yet the strange kindes somewhat later, and from their seed growing ripe, and fulfared to fied, it springeth up againe every yeare, but the two last doe scarse perfect their seede with us, The Names.

ltis called in Greeke jooredu. quaft faba percina, quod Eliano authore, pastu hujus herbe convellantur sues aprive, presentimentis pericule, nise copia aqua statim se foris & intus prolucrint : adeuntes aquas, non ut proluant fetanum, verum etiam ut cancres venentur, eos enim nacti protinus fanitati restituuntur; in Latine also Hyoscyamu, and corruptly Insquiamus, and Apollinaris, ab Apolline medecina inventore, vel quia opplet cerebrum vitioso & fatido halitu, coque montem percellis, quast Apollinio aftro. Pliny faith that the Arabians call it Altercum, or Aliercausenum, but Scribonius saith the Latines call it Altercum, ab altercando, quia cum verborum altercatione rivaque se terquent Hyosciamo dementati; Camerarim saith, it is also called Priapeia, quia stali semine utuntur ad priapisum sedandum. It is called by the Arabian Phisticins Bengi (which name different but little from Banque of Garcius ab Orra, and Christophorus Acosta, so called of the Persians and Indians also of divers places, and peradventure may be the fame, for they fay the plant is infipide, or without tafte, and the feede both smaller then Hempe whoremso it is compared, and not so white: (and which hath a great affinity as Clusius saith, with the Massac of the Turker; yet Baubinus saith, that their Massac, is made of the great Strammium or Pomnim spinosum) which procureth a kinde of sheepy drunkennesse, or alienation of the minde, as this stone other effects tending to the state of the procureth a kinde of sheepy drunkennesse, or alienation of the minde, as this state of the procureth a kinde of sheepy drunkennesse, or alienation of the minde. fest tending to venery, as may be seen in their workes, whereunto I referre those that would be surther informed:) of the Policus Insquiamo, of the Spaniards Velenho, of the French Insquiamo, and Hanne bane, of the Germanos Billionizano, of the Duschmen Billion craids. The first is called Hudsenamu albut of all, and is but of one niger, onely Fustime callecth is flavous. The second is likewise called Hyosopamus about of all, and is but of one kinde, although Bankinus seemeth to make two. The third is called by Clusius, Hyosopamus Creticus, and although he make two sores as Bankinus doth, that followeth him, yet assuredly I thinke that they are book but one plant, as the descriptions do a latest way from the configuration of the seconds. as the descriptions doedeclare. The last likewise is by Baubinus divided into two or three forts, because Camerarius in borto, fetteth forth two figures, the one he nameth Syriacus, the other peculiaris; when in his deforiptions he faith they differ onely in the broadnesse of the leaves, the one from the other, which may happen takes bush 6-11 difference. Requires agreeth rather by the fertility of the foile, wherein they grow, then of any other specificall difference. Bankimm nameth

CHAP. XIV. Papaver. Poppie.

TRIBE. it rubello flore, and maketh it tobe another fort from the Egyptiacus of Classia, when as both Clusius and Can agree in this, that Paludanus brought the feede from Egypt, and Rannoffinm faith he found it growing agree in this char Paludanus brought the feede from Egypt, and Rannoffinm faith he found it growing afterno: fo that the feven forts of Hyoferamus fet forth by Banbinus, are but these foure here recited, for the Alepso: fo that the seven sorts of Candy are but one; and his two sorts, the one rubello flores of white, are but one; his two sorts of Gandy are but one; and his two sorts, the one rubello flores of white, are but one; orter of white, are but one; ins two ions of Gamay are but one; and this two with a life one in other finosissimic Acadiculus giptiacus are but one; even that which Camerarius calleth Syriacus, and present and Clustus Agyptiacus rubello flore; but Diofeorides his third fort, wich is the yellow, is not declared, which and Clusius Agyptiacus rubello store; but Diojeoriaes instinications, which is the yellow, as not declared, which these it should be, the sufficient called niger, blacke, and the second white, are peculiarly set downe, and upon by all, but the yellow, as I said is not so plainely determined, some taking the English Tobacco to be the Indian kinde, being quite differing in effect, this being hot and superfactive, the other cold and soprificant but if I might be allowed my verdit, I should say that the Candy Henbane is most probable to be the yellow. and the Egyptian kinde the blacke, or a species thereof differing onely by the climate.

The Vertues. The blacke or common Henbane, and the yellow, are both accounted to be more dangerous than the win and therefore to be as much avoyded in inward medicines as may be, and that but in cafe of necessities when white cannot be had, for the white is cold in the third degree, and the other in the fourth, procuring drog. white cannot be had, for the white is cold in the third degree, and like it the white is fit onely to be field in neffe and a fenflefinefie of the spirits, stupefied by the benumming qualitie; the white is fit onely to be field in ward Philicke, which is most availeable to many good purposes, if it be wifely and conveniently applied; it ward Philicke, which is most availeable to many good purposes, it is to water, appear of the body; and the leaves of them all doe coole all hot inflammations, either in the eyes or any other part of the body; and a good to affwage all manner of swellings, whether of the cods, or womens breafts, or else where, if they is boyled in wine, and either applied themselves or the somentation warme; the same also applied to the same assume the paines thereof, and of the Sciatica, and all other paines in the joynts, and other parts, which is from an hot cause; it helpeth likewise the headach, and want of sleepe in hot fevers, applying it with viner h the forchead and temples : the juyce of the herbe or feede, or the oyle drawne from the feede doth the like, at fo doth the decoction of the huskes, to wash the feete or the head, but see that you doe not use it too often for feare of danger: Dieforides faith that the feede is profitable against the defluxions of hot and sharpe sakinema upon the lungs cauling a cough, as also against the strangling and other paines of the mother, and to stay the one great fluxes of their courses, and all other fluxes of bloud: the oyle of the seede is helpefull for the dealers and noise and wormes in the eares, being dropped therein : the juice of the herbe or roote doth also the same in helpeth the tooth-ach, if the roote be boyled in vinegar, and a little of the decoction be held on that fike the paine is: fome have also affirmed, that the fume of the seede being burned, taken into the mouth, will be onely ease the paines, but cause the wormes to fall out from the teeth, but diverse cunning knaves to done those they would get money from, having caused such to hold their mouthes over warme water, have cunningly conveyed small peeces of Lute strings into the water, to cause them to believe they voyded so live wormes, as there are peeces in the water: for the property of those Lute strings is, that feeling the benefit the water, they will seeme to stirre, and move as though they were alive: but Pens sheweth that hee knews young woman that used the foresaid fomentation for her teeth, that after shee had ease of them, was forther dayes fo troubled in her fenses, that she seemed as if shee had beene drunke, being very merry and pleasant that time, which passed away without further danger : but I know a friend of mine, that having diged a fone Particepheroores that grew in his Garden, by chance fome rootes of Henbane which grew among the fone Particepheroores from the state of the sta tatte, or relitin or any thing was taken away, judgenly also his urine also was troubled that ne could not differ things as they were, but as if they were 3, or 4, fold, his urine also was quite stopped, so that notwithsandig he had great defire to make water, yet he could not possibly: in this perplexitie he continued most of the night neither could he rest, or sleepe being in bed, but his urine by the stopping thereof grew so hot within him, and at able to passe it from him, caused him to bethinke himselse of a pouder, himselse had caused to be made, available against the stone, which he caused to be given him, which suddenly caused him to make water and thereby be presently felt incredible ease in his whole body, for all the things that he had taken before did doe himnogod, but by this meanes he quickly recovered his fight, and the other fymptomes vanished, and before morning be was as well as before the taking of that roote: the servants also that did cate of the good Parsneps that were boyled with these malignant rootes were somewhat distempered, some more some lesse, each somewhat according to their feeding, and their owne dispositions working together: this I have related that you may know also the danger of this herbe, and of every part thereof; the seede is usually mixed with Contact that you may know also the danger of this herbe, and of every part thereof; the seede is usually mixed with Contact that you India to take fish, causing them that take it to turne up their bellies, and lie above the water as they were dead for a while; but they doe not long abide in this manner, but returne to their senses against fivinme away: Hens also or other birds, that take of this seede will die, and the fume of the herbe being but ned, and brought into their routhing place, will cause them to fall downe as if they were dead: the decoction also of the herbe or seede or both, will kill lice and vermine whether in man or beast, which you shall plainely precive in a dogge troubled with lice, being washed therewith, the lice will be soone found dead upon him, and some fall from him: the sume of the dried herbe, salkes, and seede burned, and the hands held over the sum of the dried burned with sums of the dried burned. thereof, that are troubled with swellings and chilblanes in the Winter, or their heeles that have kibes, will quickly heale them. The distilled water of the herbe is effectuall for all the purposes aforesaid. The remodym helpe those that have taken Henbane, is to drinke Goates milke, much mede or honied water, Pine kernells with fweete wine ; or if these be not at hand or will doe no good. Fennell seede, Nettle seede, the seede of Cresses. Mustard or Raddish, as also Onions or Garlicke taken in wine, doe all helpe to free them from danger, and restore them to their due temper againe. The white Henbane is as I seid, the sittest and most effectuall in all inwed medicines for the griefes afore specified: the other forts are of the qualitie of the ordinary, that is, more dangerous than the white.

Here are diverte forts of Poppies, some tame and of the garden, others wild and of the fieldes; of the Garden kinde some have single and some have double flowers: of the wilde there are diverse kindes. fome of the corne fields most properly and plentifully, and therefore called Corne Rose, or Corne fome of the corne news more properly and plentifully, and therefore called Corne Rose, or Corne Poppie, others whose heads of seede are small & long, bending or bowing like an horne, and therefore called londed Poppy, of which kinde one fort groweth most usually by the sea side-others by the pathes, hedges and bankes in fields: then that kinde called Spatling Poppie, differing from them all, as Papaver Heracleum doth, although called Poppy: and lastly, there is a bastard kind of wild Poppie, called in Latine Argemone, which almost the property were the malacle is like unactive the section of the corner of the property were the malacle is like unactive the section. although called roppy and although Poppies, yet he maketh it like unto the wild corne Poppies, both though Disferrides reckoneth it not among the Poppies, yet he maketh it like unto the wild corne Poppies, both in heads and flowers, and like the Anemones in leaves, and as he faith with a round roote, wherein it different from in heads and nowers, minded it have already spoken, and therefore neede not to discribe them againe: the Garden in double flowers I have already spoken, and therefore neede not to discribe them againe: the Garden index, with double flowers I have set forth in my former Booke of the Garden of flowers, as also a kinde denkindes, with underestable that heareth double flowers; and in the Classis of purging plants, here before in this other wild corne a very state of Horned Poppie; as also that kind of Spatling Poppie, that is so accounted with us the relations of the forts of Horned Poppie; as also that kind of Spatling Poppie, that is so accounted with us the relation to the forts and kindes nor fet forth, are now to be entreated off: but I thinke it most fit to give with user restauding the figures before expressed, and to speake of the forts of Argemone, in the next Chapter, and not in this.

Papaver simplex sativum album, Single Garden white Poppie. The Garden Poppie hath at the first, foure or five whitish greene leaves, lying upon the ground, which rise with the flalke, compassing it at the bottome of them and are very large both broad and long, much rent or tome in on the edges, and dented also besides : the stalke (for every roote for the most part hath but one, of tone in on use rouges, and seemed a state that to every roote for the most part fractions, of the height of foure or five foote (hath fometimes no branches at the toppe, and usually but two or three at the most, bearing every one but one head, wrapped or folded in a thinne filme or skinne, which boweth downe, before the trady to blow, and then riting and being broken, the flower which was foulded within it, spreamont in the property of the state of the sta deth it felfe open, and confifteth of foure very large white round leaves, with many whitish round threds in the middle, ferabout a small round greene head, having a crowne or starre-like cover at the head thereof, which mount, he accomment to be as large as the greatest apple; (Bellonius saith the heades are in Natolia (where they make Opium) so great, that they will containe halfe a pint) wherein are contained a great number of white finall round feede, in feverall partitions or divisions, next unto the shell the middle thereof remaining hollow

1. Papave fimplen album faitvum. Garden white Poppie

Papaver multiplied flore. Double Garden Poppies.

and emptie: this head abideth close, and openeth not at the toppe under the crowne, as all the blacke kindes for the most part doe; all the whole plant, both leaves stalkes and heads, while they are fresh, young and greene, yeeld a milke when they are broken, of an unpleasant bitter tafte, almost ready to provoke casting, and of a strong heady smell, which being condensate, is called either Opium or Meconium, as you shall heare by and by: the roote is white and wooddy, perishing as soone as it hath given ripe seede: Of this white kinde, there is another in all things like unto it, but that the flowers, but especially the head of feede is not so great by the halfe, and for the most part hath more branches upon the Halkes; the seede is as white as the other, and as large or great. The varieties of the double garden Poppies are fet forth in my former Booke.

2. Papaver (ativum simplex nigrum. Single garden blacke Poppie.

There is little difference to be discerned betweene this and the last mentioned, until it beareth his flower, which in this is somewhat lesse, and of a blacke purplish colour, without any purple spots in the bottome of the leafe as in the next; the head of feede is usially not so bigge as the fecond fort of white ones, and openeth it felfe a little round about the toppe under the crowne, so that the seede which is very blacke, will fall out if one turne the head thereof downewards.

3. Papaver sativum simplex flore rubro rubente, &c.

Single garden red Poppie of diverse colours. There be some other forts of this garden Poppie, which differ not onely somewhat in the leaves from the former, being lesser, and in some crumpled and cut in on the edges, but in the jagged edges also of some of the flowers, and specially in the colour of the flower and seede, for the flower of some will be very red, of others paler, some of a Rose colour, others of a murry colour, either deeper or paler, yet all of them have a deeper spot somewhat large in the bottome of every lease: and as the slower varieth so doth the seede also, for the Rose and pale coloured flower bringeth gray or ashcoloured seed, the Reddish and deepemurrey, not so pale seede, but more enclining to the blacke: the seedes of all these kindes, the white as well as the blacke or gray, if they be suffered to shed will spring up againe the next yeare, and beare every kinde

4. Papaver Rineas.
Wild Poppie or corne Rofe.

his owne colour of flower and feed, and doe not degenerate or vary, for ought that ever I could observe. 4. Papaver erraticum, Rheas five filvestre. Wilde red Poppy or Corne Rose.

The leaves of the wild Poppy, are long and narrow, very much cut in on the edges into many divisions, of a light greene colour, but not whitish, and sometimes hairye withall: the stalke is blackish and hairy also, but light greene to like his has the Garden kindes, having fome fuch like leaves thereon as grow below, parted into three ritet not up to the four branches fometimes, whereon grow small hairy heads bowing downe, before the skinne breake, whereor foure translation of the foure prantice of the skinne breake, wherein the flower is enclosed, which when it is full blowne open, is of a faire yellowish red or crimson colour, and in the flower is entended, without any spot in the bottome of the leaves, having many blacke soft threds in the middle, compssing a small greene head, which when it is ripe, is not bigger then ones little singers end, wherein is contained much blacke seeds, smaller by halfethen that of the Garden: the roote perisheth every yeare, and the tained minutes the every yeare of its owne fowing. Of this kinde there is one that is leffer in all the parts thereof, feed in mothing else. Banhinus maketh mention of one of this kinde, that bore a great yellow flower, Minus. and peradventure might be the Argemone flore luteo in the next Chapter, but the plant was onely brought dry un- Fiore and peralternal as he faith in divers wet places, on the Pyrenean hils. The double wild Poppy is described also plane. inmy former Booke.

5. Papaver spinosum. Thorny Poppy.

Vnto the forts of Poppye I thinke meete to adjoyne this Thornye Poppy, not finding a fitter place; which bith at the first, three or more whitish greene leaves lying upon the ground, straked with white veines, which growing greater, are long, smooth, and not hairy somewhat long and broad, rent or torne diversly on the edges. fouring great, having many corners or dentes as it were about them, whereat stand many small that the total that wilde Carduus or Thistie, called our Ladies Thistie, and on the underside are more are like to that which with fome small prickes, along the middle ribbe and veines, compassing the stalke at the bottome of them, which fisted to be two or three sorted high, spreading forth into diverse branches, with the like, but lesser leaves on them, and bearing at every of the toppes, one small head, enclosed in a rough skinne or filme, like as the Poppies have, from whence I thinke rose the name of a Poppy, given unto it, which being open sheweth fortha small yellow flower, consisting of five leaves usually, yet sometimes it will have but source, and sometimes fixe, with a small long greene prickely head in the middle, tipped at the top with a red spot, which quickly weareth away, and with many yellow threds standing about it; after the flower is past, for it continueth but a while, the head groweth ripe, having five or fixe ribbes from the toppe to the bottome, and so likewise betweenetheribbes, armed with very small, but cruell sharpe and short prickes, or thornes, wherein is enclosed roundrough blacke feed, twice as bigge as any Poppye feed: the roote is small and spreading, dying every yeare; every part of the plant yeeldeth a yellow juice.

The Garden kindes doe not naturally grow wild in any place, I thinke, although Diofeorides, Galen, and others say, that the blacke kinde that sheddeth his seede, groweth wilde, for I rather suppose that some seed happening thereby chance, shed it selfe, and so was thought to grow naturally wilde, and being suffered to shed. will grow plentifully, though smaller, but in all Countries, at the least in all Christian Countries, they are all fowen, and not found wild, fo farre as I can learne, onely the first wilde kinde is plentiful enough, and many times too much, in the corne fields of all Countries, and also upon ditch banckes, and hedge sides: the lesser also is found in cornefieldes, but more rarely, as also in some other places. The thornye Poppy groweth in the West-Indies, from whence the feede was first brought to us.

The Garden kindes are usually fowen in the spring, which then flower about the end of May, and somewhat earlier, if they spring of their owne sowing: the wilde kindes slower usuall from May untill July, and the seed of themall is soone ripe after the flowring. The Thorny kinde flowreth seldome before Midsomer, and the. seede is ripe in August, but is to be sowen in Autumne, or else it hardly springeth.

The Names, It is called in Greeke unixor a un xoreir non ministrando, quod vescentes suis munits sungi non possunt; or as some thinkea un univ, quod ejus usus nimium infrigidet, & hominibus tandem motum auferat, the Garden white kinde is called must of moura (and of Dioscorides Sunaxitis thylacitis and the blacke seede is called moitis pithitis) bortense or sativum: the wild kinde is called ford; Rheas, that is fluidum, quia flores protinus decidunt; in Latine l'apaver Rheas, erraticum rubrum, or silvestre; Dioscorides Galen, and others, make onely the first great white kinde, to be the Garden kinde, and the blacke to be the wilde fort, the Garden kinde is called by the Arabians Caxcax, by the Italians Papavero domestico, by the Spaniards Dormideras and Cascall, by the French Pavot, by the Germans Mag amen and Olfamen, of the Dutchmen Huell and Mancup; of us in English Poppy, or Garden Poppye for the most part, yet in some Countries with us, lone silver pinne, subanditur faire without and foule within, and in many other places Cheeseboules : the wild Poppy is called in Italian, Papavero silvatico, in Spanish Amapolar rosella, and Papoulus; in French Coquelices, Pavot Sawage and Confanons, in the high Dutch tongue Clapper rosen, and korn rosen, in the low Dutch tongue Rooden huel, wilden huel, and Colbioemen, in English; Wild Poppy, Come Role, redweede, and Canckers, Tragus calleth it Argemone, The Thorny Poppy is called generally by all now adayes, Papaver phinosum, but of Gerard Cardum Ceryfanthemus Permanus; by the Spaniards in the Indies; from whom the Italiani had it Figo del Inferno, that is Ficus Infernalis, the Figge of hell, because the military is the prickely head is long and contains the first of the prickely head is long and contains the state of the prickely head is long and contains the state of the prickely head is long and contains the state of the prickely head is long and contains the state of the prickely head is long and contains the state of the prickely head is long and contains the state of the prickely head is long and contains the state of the prickely head is long and contains the state of the prickely head is long and contains the state of the prickely head is long and contains the state of the prickely head is long and contains the state of the prickely head is long and contains the state of the prickely head is long and contains the state of the prickely head is long and contains the state of the prickely head is long and contains the state of the prickely head is long and the state of the prickely head is long and the state of the prickely head is long and the state of the prickely head is long and the state of the prickely head is long and the state of the prickely head is long and the state of the prickely head is long and the state of the prickely head is long and the state of the state of the prickely head is long and the state of the prickely head is long and the state of the state o head is long and round, formewhat like a figge, and that who foever should have one of them sticke in his throate, it would furely fend him to heaven or hell. The milkye juice gathered from the heades onely of the great white Poppye, growing in the East Countryes of Asia major, towards India, and in divers other countries of these India, Countries of Asia major, towards India, and in divers other countries of those main, growing in the East Countryes or Asia major, towards small, and in divers ourse assume two wets those main, for it is there a great merchandise of much use and expence, as also in Paphlagonia, Cappadocia, Garlaia, Cilicia and Natolia, which is the lesser Asia, as I said before, is that true and best Opium, that is or should be used in A socoticke medicines, and is an ingredient of much tespect, in those great compositions of Thriba and Mithridarium. and Mithridatium, Oc. whereof a small quantity, hath beene gathered in some Christian Country est and my felle and others in our owne land, have gathered a little from the greene heads, as they stand, and are but halfe

growne ripe, flit or cut with a knife in two or three places, that the milke isluing forth, may be gathered in fome convenient thing, and hardned afterwards in the Sunne, but not at the fire, which will not be so black as that Opium, that commeth usually tous, which is rather Meconium as Dioscorides setteth it downe, which as that Opium, that commetri utuary tous, which is made of the juice of both leaves and heades prefied forth, of the white as well as of the blacke Poppy, for is made of the juice of both leaves and heaves prefixed to the yellow from the true best Opium is somewhat of a whitish yellow or brownish colour, and giveth no such yellow tinder, as that which is sophisticate andmade with Glancium, which is the yellow juice of an herbe, with leaves like up. to horned Poppy, but divers have thought Glancium, to be the juice of Chelidonius majus, others of Pomum cannot majus, and lastly Baubinus and some others, thinke it to be of this thorny Poppy, because it giveth a yellow joice) but as Bellonius writeth, that to have any quantity of true Opium, it rather confifteth in the multitude of guing. rers (for it must be both speedily gathered, and in the heat of the day) then in the great quantity of ground lown therewith, it being a tedious worke; for a very small quantity can be but gathered by any one in a day, in the every head yeeldeth but little, and must be attended tobe taken from them, before it be dryed too much them tlæm.

The Vertues.

All the forts of Poppyes are cold in the fourth degree, but especially Opium or the condensate juice, as Gala and divers other authours doe affime, yet Matthiolus sticketh thereat, thinking it rather to be hot, by the sharp. nesse and bitternesse thereof, and is Anodinum medicamentum, that is such a medicine, that by procuring sleen. eafeth many paines for the present, which indeede it doth but palliate or cause to be quiet for a time; the consi nuall use whereof, bringeth very often more harme, and a more dangerous disease then it hath allayed, that is infensiblenesse or stupefaction of a part or member, which commet to be the dead passe, for although Differides, Galen, and others write, that the white seed is familiarly taken in bread, and made into cakes and one with pleasure, and Matthiolus and divers others have observed that in our dayes, the white Poppy seed, fowen in Italy and other places, and much used, yea and the blacke seede also, although as they all agree, it stronger in operation, and onely medicineable, or onely to be used in Physicke to helpe diseases; for Mathiaba Writeth that the inhabitants about Trent, doe fow the blacke feede in their fields and grounds, among Beam and other pulse, which they familiarly eate, being made into cakes, that are made of many foldes, the seedele ing cast in between the folds, and so kneaded together, and yet hee faith, they are no whit more step or drowfie, then those that eate none of them; as also that in Stiria and the upper Austria, the inhabitants decemthe oyle pressed out of the blacke seede in their meates familiarly, in the stead of Sallet oyle, and finde no into. veniency of drowlinesse at all thereby; which made him as he faith, venture to give the creame of the state made up with Barly water oftentimes, and in great quantity, in the hot fits of agues, and burning feavers, but to alwade thirft, and to procure reft, and hereby as he faith, he shooke of that feare of Poppy, that his wie Matters had by their grave admonitions, seasoned him withall in former times: the Garden Poppy heads with feeden made into a Syrupe, is both frequently used in our dayes, and to very good effect to procure rest and leng in the ficke and weake, and to flay catarrhes, and defluxions of hot and thinne rheume, from the head into the flomacke, and upon the lungs, cauling a continual cough, the forerunner of a confumption; but hathnot believe that force in those that are stronger, for the strength or debility of nature worketh divers effects, as you see, a well in this, as in all or most other things; the same also helpeth the hoarsenesse of the throate, and whenore hath lost their voyce, which the oyle of the seede doth likewise: the blacke seed boyled in wine and drunke, is faid also to stay the fluxe of the belly, and the immoderate course of womens sickenesse: the empty shelts sike Poppy heades, are usually boyled in water, and given to procure rest and sleepe; so doe the leaves in the same manner, as also if the head and temples be bathed with the decoction warme, or with the oyle of Poppyes, the greene leaves or heads bruised, and applyed with a little vinegar, or made into a pultis with Barly meale and Axungia, cooleth and tempereth all inflammations, as also that disease called Saint Anthonyes fire. The Opin, but I may rather fay the Meconium, (which is the juice of the Poppy thickned) that is commonly used in the hothecaries shops, and is much weaker by the judgement of all, both moderne and ancients, then the true Opina, is much colder, and stronger in effect, than any other part of the plant, but if we may know the temperature in qualities of things, by their taste and effect, we may rather judge Opium to be hot then cold, or at the leas, w have very hot parts in it, witnesse the bitternesse thereof, the heate and sharpenesse that is felt in the mouth, on the talting, and keeping it in the mouth a while, that it is ready to blifter both tongue and pallate; is also the grievous or heady heavy finell, as well in it, as in the whole plant: but it may be faith Matthiolus, the bieternesse, heate, and sharpenesse in Opium, or Meconium, is rather accessory then innate, and is therein by the mixture and adulterating of it with Glancium, and to give a yellow juice, for our Opium if it be dissolved don thew a brownish yellownesse; yet by his seave I may say, that even the fresh milke with us, is bitter and strong in smell like the Meconium or Opium, but because our ancients, who have found out the qualities of things and left them for our knowledge, have so found and judged of Opium, I must as Matthiolus saith, leave it soroten to descant theron, as reason and experience shall direct them: It is generally used as I said before in Treakland Mithridatum, and in all other medicines that are made to procure rest and sleepe, and to ease paines in the had, as well as in other parts, as I faid before, or rather to palliate them, it is used also, both to coole inflammation, agues, or frensies, and to stay defluctions, which cause a cough or consumption, as also other fluxes of the bely, or womens courses, and generally for all the properties that the seede or any other part of the plant is used: #B also put into hollow teeth to ease the paine : it is used both in ocular and auricular medicines with some, and to stay fluxes and to ease paines, but Galen, and divers others in the former as well as in our times, have forbidden such medicines, as too dangerous for the eyes, and even any other wayes used inwardly, it is not to betken, but with good correction and great caution, yet divers have found that applyed to the gout, it hathgive much ease of paine : The wild or red Poppy that groweth in the corne, while it is young, is a Sallet here in Italy, in many places, and in the territory of Trent especially, as Matthiolus faith, as also to prevent the falling ficknesse, which Theophrastus also faith in his 9. booke and 13. Chapter, was common in his time : the Sympe made of the flowers is with good effect, given to those that have a Plurisie, and the dryed flowers also, either boyled in water or made into powder and drunke, either in the diftilled water of them, or in some other drinks worketh the like effect; the same also is availeable, in all other cephalicall or pectorall griefes: the diffilled

water of the flowers of the wildered Poppyes, is held to be of much good use against furfers, to drinke it evenwater of the now it is also more cooling in quality, then any other Poppy, and therefore cannot but be as efing and mustages, frenties, and other inflammations, either inward or ontward, the Syrupe or water to be fedual in not agues, seeme leaves used outwardly, either in an ointment as it is in Populeon, a cooling ointment, used thatin, or the greene leaves used outwardly, either in an ointment as it is in Populeon, a cooling ointment, uled instead, or any other wayes applyed, Gales in 7. facultains fimplicium medicamentorum, faith the feede is dangerous to be used inwardly. General was much mistaken, to thinke that this wilde Poppy should be that, which should be med in the composition called Discodium, and citeth Galen for his authour, as if he had taught him that obibe used in the composition what kinde of Poppy. Gate's doth meant by wild Poppy, for he according as Disferiation, not understanding what kinde of Poppy. Gate's doth meant by wild Poppy, for he according as Disferiation hath done, accounteth onely the great white Poppy; whose heads are somewhat long, to be the garden or gannered kinde, and the other blacke kind to be wild, and doth not meane this red Poppy, because it garden or garden with me and not source as who source source source that of source has also not source as who source source source source. isoney wild with us, and not fower, as who foever shall observe the places throughly shall finde. The thorny Poppy being but of late invention, hath not beene applyed to any dilease by any, that I can heare of.

CHAP. XV.

Argemone. Baltard wilde Poppy.

Here is of the kindes of wilde Poppy divers other forts, some described by others, and some not fet forth by any before that I know, which being found in our owne land, shall be spoken of with the reft.

I. Argemone capitulo rotundiere. Round headed bastard Wild Poppy. This kind of wilde Poppy, hath divers hairy greene leaves lying on the ground, somewhat longer and more divided into parts, then those of the former wild Poppy, somewhat like unto

the leaves of the thinne leafed Anemone or wind flower, as Lobel faith, but is seldome so found with us, from among which rife up diverse rough hairy stalkes, more then two foote high sometimes, bearing such like leaves here and there on them, leffer then those below, all yeelding a yellow juice or milke being broken, and on the top of each branch one flower leffer then the other wilde Poppy, yet confifting of foure round pointed leaves of a more delayed red colour formetimes having each of them a blackish spot in the bottome, and sometimes with out, with divers blackish threds standing about a small greene head, which when it is ripe, is somewhat short, rough and round, with some crests thereon, and a little round head, but not a Crowne or starre, like the Pop-

1. Argemone capitale retundiere.
Round headed baltard wilde Poppy.

4. Argemone lutea Cambro Britanica. Yellow wild bastard Poppy of Wales.

pies at the top, wherein is contained fuch like small blackish feed, as the former wild kind hath, but bigge, the roote is small and long, with many fibres thereat, and perisheth in the like manner after seede time.

the roote is imail and long, with many more superiors. Long headed Baltard wild Poppy.

2. Argemone capitule longiere. Long headed Baltard wild Poppy.

This is in all things like the laft, both for leaves, flowers, and feede, the chiefest difference in this from the logical popular ballary shape above. This is in all things like the last and the feede, which is longer then the other, smaller below then above, yet having little round head at the top, but no crowne, and is rough and hard like it.

3. Argemone Alpina lutes, Yellow mountaine bastard wilde Poppy.

The yellow outlandish mountaine bastard wilde Poppy, hath many smooth greene leaves, set on somewhat The yellow outlandin mountains ballate which leaves are very much and finely curon the edges, very like hairy long footestalkes, an handbredth long, which leaves are very much and finely curon the edges, very like hairy long footetrances, an unanouscent range, which rife up divers hare or naked frakes, very the unto those of the Coriander leafed Crowfoote, from among which rife up divers hare or naked frakes, yething the control of the Coriander leafed Crowfoote, from among which rife up divers hare or naked frakes, yething the control of the coriander leafed Crowfoote, from among which rife up divers hare or naked frakes, yething the control of the corresponding to the control of the coriander leafed Crowfoote, from among which rife up divers hare or naked frakes, yething the control of the coriander leafed Crowfoote, from among which rife up divers hare or naked frakes, yething the corresponding to th unto those of the Coriander leared Crowroose, from among which the updates were or maked trakes, with ry withall, of halfe a foore high, at the toppes whereof frand one flower a peece, of a meane fize, confiling of four yellow leaves, with many whitish threds in the middle tipt with yellow, standing about a small round at rough head, like the former kinde, wherein is contained small blackish feede; the roote is small and long, and threddy at the end.

4. Argemone Cambro-Britanica lutea. Yellow wild Bastard Poppy of wales. This yellow Poppy, hath many winged large spreade leaves, lying upon the ground, that is, many leaves set to gether on each side of a middle rib, each divided lease being some what despely cut in, in some places of the edge, more then others, of a deepe, but faire greene colour: among these leaves rise up, divers branched stalkes two some high, having fome fuch leaves thereon, but fmaller, at feverall diffances, and at the tops of the stalkes and branch high, having some tuen leaves the testing of four round leaves, with many yellow threds in the middle, which when the flower is fallen, and the head ripe, is then leave then the former long headed wilde Poppy, but in the like manner smaller at the bottome and bigger at the tope, with a small head thereon, containing much small blacke seed, lying within severall cels, in the same sassion be the other Poppies doe: the roote is long, and brownish on the outlide, spreading into some branches, and direct small fibres thereat, which perisheth not every years, as the other forts before specified doe.

The Place. The two first are often found as well in Corne fields, in Summer fet flive, Kone, and other Countries of this land. as in the corners and borders of fieldes, and by the way fides. The third was found upon Sacherg a hill in debit as also on some hils in Italy. The last groweth in many places of Wales, in the valleyes and fields, at the forest the hils, and by the water fides, about a mile from a finall village called Abbar, and in the midway from David to Guider, the house of a worthy Gentleman Sir Iohn Guin, as also nere a woodden bridge, that giveth pulse ouer the River Dee, to a small village called Balam, which is in North-Wales, and in going up the hill the leades to Banghor, as also nere Anglesey in the way to the said Sir Iohn Guin his house. The Time.

All of them doe flower about the end of Iune, and in Iuly, and the feed is ripe in August, in some places eather. and in others later.

The Names. It is called in Greeke A'ppenorn, quia argeman, id est, oculorum nubeculas tollit, in Latine also Argemon, after the Greeke word, Pliny in his 25. booke, and 9. Chapter calleth it Argemonia, and faith that they in his time made three forts hereof, whereof the best was that, whose roote did smell like Francums ence, but in some places he maketh mention of foure forts, as in his 21. book, &23. chap he faith, that Anemone is called Argemene, in his 14. book, & 19. chap, he faith that Lappa Canaria, whose roote imelleth of Francumsence, was called Argenna, and his 26 book, & 6 chap he faith Inquinaria was called Argemone ; in former times our ordinary Agrimmy waspken for Argemone, but now a daies all our moderne writers do agree, that our Argemone is the fame that Dieferdes wrote of, notwithstanding that he giveth to it, a round roote which ours hath not; some copies have no ther fort of Argemone, which most doe not hold right : the first of these is called by Lobel, Argemone capital ther into the general, which is Argemone capitalo breviore, and thinketh it to be the same, that Lobel and Pena in their Adversaria, call Anemone minor Coriandri folio, fore Pulsailla capitalis his his noc at Papawarolla donain: The second is called by Lobel Argemone capitalo longiore, as Bankinum doth also, but he match the also to be the Anemone Narbonensis major corniculata of Lobel and Pena, in their Adversaria, when by the judgment of the best, that Anemone of theirs, is Papaver corniculatum violaceum of Clussus, Dodonesus and othersand doth much differ from this Argemone, both in bignesse and colour of the flower, and in the head of seeds, that being much longer and smaller then this : Cordus in his History of Plants, and 46. Chapter, setteth this form by the name of Argemone, which Gesier who set him forth knew not, because Cordes seith, is giveth a yellow juice like Colondine: The third is set forth by Pona in his Italian Baldon, and by Bankinus, in his Prodrems and Pinax, under two titles as two forts, when as affiredly they are both but one : The last was found as I head you before in many places of Wales, by Lobel in his life time, and therefore entituled juftly according to the

The Vertues. Dissertes and Galen give unto this kinds of Poppie, a clenting qualitie and tharps, that it is able to clearest spots that happen in the eyes, and such misses, dimes and cloudes, that grow in them to hinder the fight, as also to aff wage any inflammations; but others fay, that inhelpeth the bloudy fluxe, the decocion thereof being mate in water and drunke, as also if it be boyled in wine and drunke, is a prefent remedy against the stinging orbiting of any venemous book, and that two drammag the peof taken in wine, wasteth the spleene that is swollen; being beaten while it is fresh, and applied to cuttes and wounds healeth them speedily applied also to any member vexed with crampes or convultions, coany fores, cankers, or filtulas, to any blacke and blew fpots in the face, or on the eyes, by frokes or falles, doub belpe and heale them all: being bruifed and applied with vineger to the throat, healeth the quinfie, and applied to the place grieved with the gout taketh away the paine thereof quickly being rubbed upon Wartes, it doth in a short time consume them, and take them away. There is no properte remembred belonging to any of the two lait forts.

CHAP, XVI.

Hypecoum. The Hypecoum of Dioscorides herbe.

Lthough Camerarius, Dodoneus, Lobel, and others doe reckon this small plant as a species, or fort of wild Cumin, and have referred it to with them, yet I dare not fo call it, because I doe not finde either the face, or outward resemblance there of, nor yet the temperature and qualities. to be any way answerable thereunto, but rather unto the Poppies, I have therefore thought it fittest to joyne it next unto them, and doe rather incline to the judgement of Clusius, to account this plant to be the true Hypeocum of Dioscorides: unto which I will also adjoyne another small plans, rekoned also by Lobel to be of the kindes of wild Cumin, which I must call another Hypeocum, in that it is

plant, items the other: And let me crave leave with all to infert here, as in an extravagant place, that kinde of wild Cumin, which is so accounted of most Writers, as not having a fir place to set it alone, in regard it may not wine canada, which must be intreated of among the umbellifers, and because this is in other Authors joyned with the former.

I, Hypecoum legitimum Clufij. The true Hypecoum of Dioscorides according to Clusius.

This small plant hath diverse long leaves lying on the ground, very much divided, and cut into many parts, of a rale or whitish greene colour, so like unto Fumiterry in the colour of the leaves, as also somewhat neere in the pale or winding free the cook, that it will soone deceive one that doth but slightly regard it, but is smaller and hinner and more gentle in handling, yet is larger in Spaine than with us a Clusius recordeth; in the middle of them rifeth up a stalke or two, with some leaves thereon, and divided towards the toppe into diverse branthe: atthetoppes whereof fland small yellow flowers, consisting of sixe leaves, two whereof are larger than theref, and stand one opposite unto another, the rest being very small and scarse discerned, but when the flower is blower opensafter which doe arife long crooked flat huskes or cods full of joints, fomewhat like unto the huskes of the Seminider of Mathiches, but greater and longer: in the severall joints whereof lye severall square vellowish seede, very hardly to be taken forth, and separated from the huskes or skinnes: the roote is small, and a littlestringy, dying every yeare at the first approach of Winter, and is very hardly made to spring, but by an Autumne lowing t the tafte of the plant is unpleafant. 2. Hypecoum alterum. Another Hypecoum.

This other fort (for fo I make it) is very like unto the former, but that the leaves hereof are not fo broad and long, being more finely divided, fornewhat like unto the Sefeli or Hartwort of Marfeilles or wild Chervill; the stalkes are smooth, full of leaves and branches, whereat come forth yellow flowers made of five pointed leaves. and after them long pods, which hang downe and stand not upright: nor are crooked like the former, but joynted and with greater and yellow seedes within them, like unto those of Galega or Goates Rue.

3. Cuminum sylvestre. Wild Cumin. Wild Camin shooteth forth diverse long rough, or somewhat hard winged leaves, each whereof is finely dented about the edges; from among which rifeth up a stender weake bending stalke, divided at the toppe into many parts, each whereof hath a round whitish fost gentle, and woolly head or ball upon a small foote stalke.

like unto those of the Plane tree heads or balls, wherein is contained small feedes: the roote is small and white and quickly perisheth, with the least blastes or dewes of cold nights, and seldomecommeth to maturitie in our countrey, as I have often feene the experience my felfe.

The Place.

The two first groweth as well in Province, in the way to Arles, Mompelier, and other places in France, as in diverse Provinces of Spaine as Clusius faith : the other as Lobel faith, groweth in the same places in France, that the former doth: the last he faith likewise groweth plentifully in Narbone about Aquas Sextim, and other places of France.

The Time. All these flower with us, not untill the midst of Sommer, and give their feede late, but the last worst as I said, and seldome good although late.

The Names. Diescorides calleth anherbe in Greeke vancos and vancos Hypecome and Hypopheums, for which the Latines have no other name Hypeconm, after the Greeke; yet there is great doubt amongst many, what plant should be the right, some thinking the Thasittrum minus to be it, others thinking the Argemone minor of Trains (which is the leffer Papaver Rham) to be it : Matshiolas (according to his manner, that whatfoever was obtruded unto him, and was not manifestly contradictory, was presently presented for right; no markes there of wanting) maketh the Altes sufacaria or Ueneta, which Lobel calleth Peregrina Solifequa to be it, which I have fet forth in my former Booke: And lastly Classus, and from him Dedonens propound this first plant, for the true Hypecours of Dioscorides ; Classas affirming that of all the plants that he knew, there was not any that came nearer thereunto than this, unto whom I must also conseut, for that neither the face nor the qualitie, as I I. Hypecoum legitimum Clusi, The true Hypecoum of Ciufins.

2. Hypecours a'terum. Another Hypccoum.

faid before doth gainefay it. It is also by Matthiolm, and Caster Durantes who taketh it from him, as also Camerarius, Lugdunensis, Tabermontanus and Lobel called Cuminum Sylvestre alterum or siliquosum, and Generalistics Cornicularum; Clusius, as I faid before, and after him Dodonens and Camerarius, call it Hypecoum & legitimum, und fo doth Bankinns also, who quoteth Matthiolus in two places to call Caminum Jyvestre alterum both Delpina and this, but he quoteth Gespier in hors is Germanie to call it so likewise; when in that place Gespier his Hyperum, is that of Matthiolis, which is the Alexa vesicaria, and not this. Clusius faith that the Spaniards in the kingdom of Granado and Murciano doe call it Cadorya. The second is called Cuminum sliquosum alterum, Dufe. ridis of Lobel and Pena, whom Lugdunen is doth imitate; of Tabermontanus Cuminum fylvestre 3. and fligmin minu. Bauhinus calleth it Hypecoi altera species, and so doe I, the face thereof so nearely agreeing unto the lift. The last is called Cuminum street, and Dioscoridis primum of Matthiolus, and so of most Writers, but Globia of Camerarius and Capitulis globofis of Baubinus. Bellonius in his observations saith, that in the lle of Lemmos, they call it Lago Chimeni, that is leporum cubile, which the inhabitants of Lemnor called at this day Stalimene, doe we's their meate in flead of Origanum which they want, for as he there faith, it hath both the fmell and talle of Origanum num; and for the likenesse, he there compareth the leaves with those of Yarrow, and the round heads to those of the Romane Nettle.

The Vertues.

The tafte of the two first is as I faid before unpleasant as that of the Poppies, and therefore of a temperature inclining to the propertie of Poppie, whereunto Dioscorides and Galen make Hypecoum to be like, there bathout beene any further experience made of either of the former plants, and therefore I can relate no more untoyout them: the last if it be the right wild Cumin of *Dioscorides*, as by *Bellonius* his relation here before set downer may very well be, the seede is essectuall against the windinesse, either of the stomacke, or of the belly and bowells, which bringeth tormenting paines and swellings with it, being taken in wine, and expelleth the possion. of any venemous beaftes : it is good for moist somackes, that are troubled with raw crude humors : taken with vinegar, it stayeth the hickocke; and if it be applied with hony and raysins to the face, or any other place that is blacke or blew by stroakes and beatings, it will quickely take them away, and applied in the same manner tothe cods when they are swollen, allayeth the swelling and taketh away the paine.

CHAP. XVII.

Arum. Wake Robin or Cuckow-pinte.

Nto this common Arum or Wake-Robin (which groweth wilde in many ditches and driebanke throughout all this kingdome, I must adde divers other forts, which in most things are like therens to, as also another much differing from all the rest, accounted the true Golocasio or Faba Egyptiat. 1. Arum vulgare non maculatum. Common Wake Robin without spots.

This Wake Robin shooteth forth three or foure or five leaves at the most from one roote, ever one whereof is somewhat large, and long, broad at the botome next unto the stalke, and forked like unto a some

leafe, but ending in a point, without dent or cut on the edges, of a fad or full greene colour, each standing upon a thickeround stalke, of an handbreadth long or more; among which after they have beene up two or three moneths and begin to wither, rifeth up a bare naked round whitishigreene stalke, somewhat spotted and straked with purple, like the stalke of Dragons, somewhat higher than the leaves; at the toppe whereof, standeth a long with purple, the table of the bottome, but open from the middle upwards, ending in a point; in the middle mount and the finall long petile or clapper, finaller at the bottome than at the toppes, of a darke burwhere was the hole or huske is on the infide, though greene without, which after it hath to abiden for some time, the hole or huske decateth, with the pestell or clapper, and the soote or bottome thereof groweth time, the total time bunch of berries, greene at the first, and each of them when they are ripe, of a yellowish red colour, of the bignesse of an Hasell-nut kernell, which abide thereon almost untill Winter: lowish tra coloni, of the eight in the color is color in the color in the color is round and formewhat long, not growing downe right, but for the most part lying along, the leares shooting forthat the bigger end, which when it beareth his berries is somewhat wrinckled and loofe, another being growen under it, which is folid and firme, with many fibres or small threads hanging thereat, which in the beginning of the yeare, when the leaves beginne to spring yeeldeth a milky sappe being broken or which the beginning of the years when the leaves beginne to iping years a many tape coung from or out the whole plant is of a very tharpe and biting tafte, pricking the tongue upon the tafting, no less than Nedes doe the hands, and so abideth for a great while without alteration; the roote with the sharpenesse hath avery strange clamminesse in it, stiffening linnen, or any other thing whereon it is laid, no lesse than slarch: and avery transe takes, when the making of our ordinary flarch (which is made of the branne of wheate) was nor-knowen, or frequent in use, the finest dames used the rootes hereof, to starch their linnen, which would so fling, exasperate and choppe the skinne of their servants hands that used it, that they could scarle get them (mooth and whole with all the nointing they could doe, before they should use it agains.

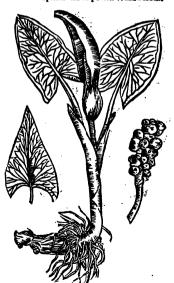

2. Arum vulgare maculatum. Spotted wake Robin.
This Atum is in all things like the former, but that the leaves hereof are fornewhat harder in handling, smaller pointed and have forme blackish spots thereon, like the spotted Arsemart, which for the most part abide in the Sommer longer greene then the former, and both leaves and rootes, are more sharpe and sierce then it. 3. Arum magnum rotundiore folio. Round leafed wake Robin.

This kinde hath somewhat larger leaves, then either of the former, and more round pointed, both at the end and at the bottome next to the stalke, having some white veines appearing in the leaves, and abiding greene longer in the Sommer, even almost untill Autumne, the hose or huske, with the pestell or clapper, are both of a pale which yellow colour, in which things this different from the other and in nothing elfe: Profer Alpinus fet-Alterum tethfort an other fort found at the bottome of fome of the Alpine hills, whose leaves and flowers differ little from rounda rathe fecond fort, but the roote is round, like unto the rootes of the round rooted Culcas:

4. Aram Byzansinum. Wake-Robin of Constantinople.

This Aram of Constantinople, hath a reasonable great thicke roote, of an hand breaddth long, or there abouts, having many small round heades, breaking forth on all sides thereof, from whence come forth many fresh great elaves, very like unto the two sinft sorts of Aram, some whereof will be sported with similar blacke sports. others not having any at all; from among which rifeth up a stalke, having such a like hose or hood, as the Arum hath, and a petitle therein which are of a purplish colour in those that have spotted leaves, and white in those

1. 2. Arm vulgare maculatum & non maculatum.
Spotted and unspotted Wake Robin.

4. Arum Byzantinum. Wake Robin of Conftantinople.

TRIBEL

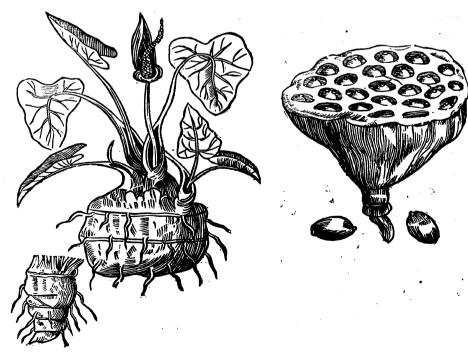

5. Arifarum latifolium. Broad leafed Fryers coule.

6. Arifarum longifolium. Long or narrow leated Fryers coule.

7. Aram Ægypisam votunda & longa radice unigo Colocalista dilla. The Egyptian Culcas or wake Robin with a rounder and longer roote.

Fabe Ægyptie fruitus. The fruite of the Egyptian Beane.

that have no spots, the leaves likewise of those that have spots, spring up for the most part before Winter, and the other not untill the Spring, there hath not any fruite beene observed in this, by any that I can under-

5. Arifarum latifolium. Broad leafed Fryers Coule.

The Broad leafed Arifarum groweth in all things like unto the Arum, having divers faire greene leaves; whose middle ribonche upperfide, as also some other of the veines are white sometimes, and somewhat thicker and rounder pointed then the Aram. the middle stalke beating the flower (which is a crooked or bending hose at the rounder points from the find from the middle, rinfing out of it.) is spotted with red spots, not rifing fully shights the leaves, which are nothing so sharpe in raste, as those of the Wake Robin, and doe alwayes fining up in the end of Annumne, abiding greene all the Winter: after the huske or flower is palt, and the pring withered and gone, which will be in the Summer, then the berryes doe appeare on the toppes of hefalke, greene at the first, and of a yellowish red when they are ripe, which abide untill the frosts cause them to wither, and the greene leaves begin to appeare: the roote is white and somewhat round, encreasing much by of fets.

6. Ar farum longifolium. Long or narrow leafed Fryers Coule. The leaves of this Arifarum, are very narrow and long, not rifing to high as the former, but tather lying on the ground, and doth more seldome beare any hose, which is whitish small and long, with a very long and small reddith pettell in the middle, like unto a long worme, scarse rising above the ground, the berryes that follow are white and not red, the roote is white and round, smaller then the former, encreasing by of fets, but not in fo plentifull a manner.

7. Arum Ægyptium vulgo dictum Colocasia rotundiore & oblongiore radice: The Egyptian Culcas or Wake Robin with a rounder and longer roote.

This Emplim plant, hath beene the subject of much controversie, among many worthy and learned writers. both of an adoftormer times, fome applying it to the Faba Ægyptia of Dioscorides, whose huske contening the students and whose contening the students are students. it simply Aram and Agypeium, because it was a species or kinde of Aram, that is thought to bee naturall to Egys, as also to other places, as you shall heare by and by, the description whereof is in this manner: If hooten forth divers very large and whitish greene leaves, of the fashion of Arum, or Wake Robin leaves, pointed at the ends, but formewhat rounder, each of them two foote long, and a foote and a halfe broad, not fo thicke and sappy as they, but thinner and harder, like unto a thinne hard skinne full of veines, running every way, and refuling moilture, though they be laid in water, standing every one, on a very thicke stalke, nere five foote long in the said places, which is not set at the very division of the lease into two parts, as the wake Robin is, but more toward the middle, formewhat like unto the water Lillies, the division of each leafe at the bottome, being somewhat rounder then those of Wake Robin: betweene these leaves after many yeares continuance in a place unlined, there rifeth up sometime but one stalke of flowers, and sometimes two or three, according to the age andencease of the plant, the standing and keeping (for all these helpe to the fructifying thereof, for else it would not beare any shew of hose, or pestell, or flower, as many that not having seene any, have considerally see downethat it never beareth any) thereof in a large pot, or other fuch thing, and in a warme place and climate: each of theie stalkes are much shorter, then those of the leaves, and beareth an open long huske at the top, in the middle whereof, rifeth up for the most part three severall narrow huskes or hoses (and never one alone, as the Armor Arifarum do) with every one their pestell or clapper in the middle of them, which is small, whitish and bile a foot long, from the middle downwards bigger, and fer round about with small whitish flowers, smelling very sweete, the lowermost first flowring, and so by degrees upwards, which last not above three dayes, and from the middle upward bare or naked, ending in a small long point, after the flowers are all past, that lower part abideth, and beareth many berryes, like as the Arum and Arifdrum doe, but much paler and smaller, the reoceisgreat and bulbous, or rather tuberous, in some more round then in others, which are smaller and long with the roundnesse; as great as the roote of a great Squill or Sea Onion, (which I judge more properly, speaking thereof in my former booke to be a Sea Hyacinth) and one which Alpinum setteth forth in his Historia Lagra tiaca, with great long creeping rootes like the Reede, reddish on the outside, and whitish within, having many bulbous or tuberous heads, thooting from all fides thereof, whereby it is encreased, and with many great fibres shooting therefrom into the ground.

8. Faba Egyptia Dioscoridio & Theophrasti cujus radix Colocasia dicebatur.

Dioscorides and Theophrastus their Egyptian Beane, whose roote was called Colocasia. Becanse the Egyptian Arum, hath beene so much miltaken by many writers that have called it the true Colocasia of Disserides and Theophrastus; let me here shew you in this place, the description of the true Colocasia, that is the roote of the Egyptian Beane, as Dioscorides and Theophrass may be seen that the figure of Mathinian his Egyptian Beane, as he set it forth in his comentaries upon Dioscorides, moulded from his owner. imagination, and not from the fight of any plant growing in rerum natura, to make it answer the description, but hath failed chiefely in the fruite, which is not expressed like to the combe that waspes doe make, but faire differing as many have observed, and objected against him, although as he saith, Odoardus did shew it him at Trens, with many other rare plants, which he brought out of Syria and Egypt; the figure of the true fruite, Claran hath fer forth, in the 32. folio of his booke of exoticles or firange things, which was brought by Duich Marriners from fortaine parts unto Amsterdam, but was not then knowne where it grew (but since is knowne to be the Kingdome of Isva in the East-Indies) who was perferaded it might be the true fruite of their Egyptian Beane, unto whose judgement therein, both Baubinus and Columna doe encline, and so doe I as you shall heard by and by more at large, but for brevities fake, I will draw both the descriptions thereof by Theophirasim and Diofforides into one. The Beane of Egypt, which fome call the Beane of Pontus faith Dieferides, (bit Theophrafim mentioneth neither Egypt nor Pontus, but onely calleth it a Beane) groweth in Lakes and Randing waters (plentifully in Egypt faith Discorides, which Theophrassus speaketh not of,) in Asia, that is in Syrid and Cilicia, but there saith Theophrassus, it doth hardly perfect his fruite, but about Torona, in a Lake, in the Country of Calcidiants of the Calcidiants cam, it commets to perfection, and bearets very large leaves (like those of the butter-butte faith Dissertides) the

stalke faith Diefeorides, is a cubice long, Theophrastus faith the longest is foure cubics high, of the bignesse of finger, like unto a fost reede, but without joynts, it beareth a flower, twife as large as that of the Poppy(wi double flowers, for to I enterpret in plenum caput, the words of Theophrasius) of the colour of the Role, and which is past commeth a round head called Ciborion, or Cibottion, that is a small caske, (yet Athenem faith that kinde of drinking cup was so called also, whose forme peradventure was like this fruite here expressed not will to the comb which waspes do make, wherin is contained thirty cels at the most and in every cel or division the of, groweth a Beane, whose toppe riseth higher then the cell wherein it is enclosed, whose kernell is him which fay they the inhabitants thereabouts put into clay, and thrult downe to the bottome of the water, long poales, that it may abide therein and thereby make their encrease: the roote is very thicke and great is unto that of the Reede, but (Theophrastus addeth, which Dioscorides hath not) full of exuell prickes or them and therefore faith he, the Crocodile refuseth to come nere it, least he should runne against the prickes there with his eyes, where with he cannot see well, and is called Colocasia as Dioscorides maketh mention, but he Theophraftus, which is used to be caten either raw or otherwayes dressed, that is sodden or roassed, the Benn faith Dioscorides are eaten while they are fresh and greene, but grow hard and blacke when they are old, being formewhat bigger then an ordinary Beane, which faith Diofeorides (Theophrassus making no mention of any ordinary or lities, or vertues of them) have an astringent or binding faculty, and thereby profitable to the stomacke, and believes. peth those that have the fluxe of the stomacke and belly, and the bloody flux, the meale or flower of them fluxe. ed upon meate &c. or taken in broth : the huskes whereof faith he doth more good, being boyled in fweete win the middle part of the beane which is greene and bitter, being bruised and boyled in Rosewater, and dropped into the eares, eafeth the paines of them. Thus farre Theophraften and Dioscorides. Now the description of the fin his strange fruite is thus, as he setteth it downe. This fruite did resemble a very large Poppy head, or of at the toppe: and consisted of a rough or wrinckled skinny substance; of a brownish colour somewhat like whose circumstenence at the top was nine inches, and growing lesser and lesser by degrees, unto the stalkes, who as it feemed, did sustaine the flower, after which came this fruite, for there appeared certaine markes of the flower. er, where it did abide: the upper part hereof was fmooth and plaine, having 24 holes or cells therein, placed in a certaine order, like unto the combe of waspes; in every one whereof was one nut, like unto a small store, almost an inch long, and an inch thicke in compasse, whose toppe was browne, ending in a point, like as a akome doth, the lower part having an hole or hollow place, where it should seeme the footestalke upbed it. while it was in its place, whose kernell was rancide or mouldy, thus farre Clussus. Let me here also brigg an eye witnesses or this plants growing in the lie of Iava, Dr. Insum Henrium, both Divine an Physicion, for the Ducth sactory in the Kingdome or Ile of Iava, sent into Holland a small booke or collection certains herbes, &c. growing in that country, with the vertues and uses, whereunto the naturals did apply the (which booke, as I understand by my good friends, Dr. Daniel Haringhooke, and Dr. William Parkins both Engli (Which booke, as a understand by my good rectains, L. L. Lance, Reving and L. . William P are no both Logic, is kept in the Vniversity Library at Leyden in a close cupbord having a glasse window before it, thorough whit any one may reade so much thereof as lyeth open) at the end whereof is one by him set downe, under the man of Nymphea glandifera thus described: the huske or cup (suith he) is rugged or full of wrinkles yet soft has and spungye, like a Mushroome, and of a greate colour divided into twelve or fourteene cels (Shiften his specified exhibited hath 24) or places, in every one whereof is contained one fruite like unto an akorne of ablashing purple colour on the outside and very white within, the taste whereof is astringent and somewhat bitterwish all, like akornes but rough and spongie: it groweth in Moorish places, and by rivers banckes: the kears at wondrous great and like unto those of the Water Lilly, and so is the flower also of a very strong smell like me the oyle of Anescedes: thus farre Dr. Heurnius; whose description in my judgement is so punctuall to the of Dioscorides and Theophrastus aforesaid, the description of the roote onely wanting, that I shall not needs in ther to comment upon it, every ones judgement though meane, I suppose being able by comparing to agree it there is to be that Cinsum having seene this booke and the figure hereof annexed to the description might soone pronounce it (as I doe here) to be the true Faba Egyptia of the ancients: there is no mention maken that booke of Heurnius by what name the Iavaneses or Malayos doe call it. The other eye witnesse hereofish. William Fincham an English Merchant, as he is recorded in Mr. Purchas his fourth booke of Pilgrimes, the 4.d. Sett. 5. p. 429. that faith he often did eate of the fruite of a certaine herbe growing in a great Brooke or Lak, two or three courses or miles long on the North-West side of Fetipore, which is about twelve courses from Age in the dominior s of the great Mogoll called Surrat or Guzurrat in the East-Indies, Which the people call Cando chachery, describing it to be like a goblet, flat at the head conteining divers Nuts or akornes within it. I have here fet downe these things, as well to show you mine owne observations after Clustus and others, that assure ly this is the true Faba Egyptia of the ancients, as to provoke some of our nation to be as industrious, ute Hollanders by whole care in their travels, this was first made knowne to us to fearch out such rare fruites men in the parts of their abode, and either communicate them to fuch as are experienced, or having penned them publish their labours in Print, if it may be, which I hold the better, according to Mr. Finchens example, which observations have given so great an illustration in this matter, as well as in other things, by me also remembed elfewhere in this worke.

The Place.

The two first are frequent enough as our owne County. The third is found in some place of Germany. It fourth Clusius saith came among other pootes from Configurations. The saith he found in Spain and Portugall. The sait in Italy, in diverse places. The search is not naturall to Egypt as I suppose, because it not found to flower there, being places. The search is not naturall to Egypt as I suppose, because it groweshin Candy naturally as Relamine saich, and Portugall as Glusius reporteth and in Italy also in many place, and in the Country of Salarme in the Ringdome of Nagher as Galusius reporteth it, as also in the Illand of Ica, where they are it as samiliarly as in Egypt, and so doubt in sunday other places as Theophrashus remembreth, whetherefore would not call it Agypticas Dissorbias and no doubt in sunday other places as Theophrashus remembreth, whetherefore would not call it Agypticas Dissorbias doth, being not proper to Egypt, where for many ages pall bath not beene known to grow now at all, but a sturedly it is were a naturall of Egypt, it cannot be quite entired.

The foure first shoote forth leaves, in the Spring, and continue but untill the middle of Sommer, or somewhat latter, their hoses or huskes appearing before they fall away, and their fruit shewing in August. The fifth what latter, their hoses or huskes appearing before they fall away, and their fruit shewing in August. The fifth and fart as I said, doe shoote forth their greene leaves in Autumne, presently after the first froits have pulled adout the stalkes with fruits, and abide greene all the Winter withering in Sommer, before which their huskes downer to the sweet of the sweet stalkes with fruits, and abide greene all the Winter withering in Sommer, before which their huskes appeare to the sweet sweet appears to the sweet sweet sweet sweet sweet in the warme countries, seldome beapeners to Robert or November, and the fruit doth there seldome come to perfection: the last (as may be gathered by the relation thereof) showeth and beareth fruit in the Sommer time as other herbes doe.

It is alled in Greeke ded, and in Latine Arum, and some Pes vituli, because the leafe doth somewhat re-It is cauce in Octavita and Dracontea minor, and Serpentaria minor: others againe from the figure of the semuce a super in the middle of the hose, call it Sacerdotis penes, and can't priague. Simon Inventis calleth it pelle or clapper in the middle of the hose call it Sacerdotis penes, and can't priague. Simon Inventis calleth it petite or cusped in the Syrians as Dioscorides faith call it Lupha : it is called of the Arabians I arm and Sara, and after them diverse Apothecaries beyond the seas in their shops: In Italian Aro, Giaro, Gigaro and Balaazon as and ancer thich; In Spanish Taro, in French Pied de vean, & vid or vit de prestre & vit de chien, in high Durch Pfaffenpint: Durante anni in Spatial Wake Robin, Cuckowes pintle Priests pintle, Rampe, Buckrams, and of some Starch-wort. Cefalpinus calleth it with spotted leaves, Gicherum or Gigarum after the Italian name, when as all othereagree in the name of Arum, with the distinction of maculin albin and nigris, as the kind or fort is, yet the third is called by Lobel Arum majus Veroneuse, and by Baubinus Arum venu albis, and by Dalechampius upon Pliny B Calle wimmen genus Plinij. Cordus in historia planearu calleth it Dracunculus benicophyllos, and as he faith is the same that Mathiolise calleth Dracunculus major Clussus calleth the fourth Byzantium, & it is most probable, it is the same with Masshiolus his Arum alind minus with many fmall rootes, which he faith he received from Calzolarius of Will Will and thought it grew upon Mount Baldus, because he had fent him many plants that grew there: but bequie this is not mentioned in all the description of Mount Baldus, it is more likely that Calzolarius, had it from Confinitionple, or fome other place in Turkie, and fent it him as a raririe. The fift & fixt are called Arifarum or Aria as Plin faith and diftinguished by the titles of latifolium and angustifolium. The Spaniards call it Frailillos, that is little Priers, because the hose doth represent the forme of a Friers Cowletthe latifolium Dalechampius upon Pling calleth Cala altern geine Pliny, yet Tragus thinketh that this Arifaru, frould be more properly the Arum of Diefcoride, which is usually eaten, for our Arum is so hot and sharpe, that it is not to be endured, whereun to some others doe reply and say, that the Arum of the hotter countries is more mild, and yet the same in specie: The seventh is called by the Spaniards Manta de nuestra senora from the largenesse of the leaves, and diversely by divers late Latine Writers, some as I said contesting earnestly, that it is the Faba Egyptia, and Colocasia of Dioscorides, or Colocolom of Nicandar, others flatly denying it and calling it Arum Agyptium, which terme Pliny useth, but it is not knowne from whom he had it : those that hold and maintaine the former opinion, are Bellonius, Alpinus, Camerarius, Lugdunensis, and lastly Clusius, who doe all conclude, that this plant which the Egyptians call Culcus canbeno other plant then the Faba Egyptia of Dioscorides and Theophrastus, although it beare neither flower nor fuit, and thereupon doe much suspect the truth of their descriptions, because there was never heard or found (as they fay) any other that did answer in all things unto their descriptions, and that this did most nearely approach thereunto, both for that the name of Culcus, so nearely drawing to the Greeke name Colocafia, and was so antiently continued among those Nations of Egypt, Syria, Atabia and Affricke, and that the daily use of the roote to be defled or eaten raw, for their food and meate as they faid their Faba was; but the fruit or nuts was their foode and not the rootes, time having inverted both name and use: it is also called Talusse by the inhabitants of Iava (but Lalase in the Malaia tongue) which soundeth somewhat neere Culeas as it is recorded in the Dusch Navigation thither in Anno 1595. Defore spoken of, where it is said also to be are neither flower nor fruit; but those that hold the contrary opinion that it is but Arum Agyptium, and not the true Colorafia, although commonly fo called, are Anguillara, Guillandinin, Maranta, Caufaboum, Marthiolas, Gefrer in horsis Germanie, Dodonzus, Lobel, and Columna, who have all of them in their times tellified it, most of them having seene the flower or fruit, or both, that it beareth; which plainely declareth it to be a kind of deam, and that it is not the Faba & Egyptia, whose roote was called Colocafia: but Fabius Columna lastly and most fully to the purpose, doth shew the truth, setting forththe description of this Arum Agyptium, amply in every part; to beare leaves, flowers, hose or huske; with a pelle or clapper therein, and berries afterwards, agreeing in all those parts to the vulgar Aram and Arifaram, although somewhat in a different manner, as every species of a Genes doth; and with all doth defend the verific of Disserides and Theophrastus descriptions thereof; against allogaines avondering that so many learned menshould not discerne the truth, but be led away so groffely into errour, against so plaine declarations, that they make of the plant and every part thereof, that is of roote, thalke, leafe, sowers and fruits the roote to be like the roote of the Reede, but greater and not bulbbus like the driven, tobe armed with pidekles or thornes, when as the roote of this Arum, or supposed Goloculin is not fo, then that it beareth a statke a cubic or more high, which this doth not, and that it carrieth a flower thereon, bigger than that of the Popple, and of a Role colour, which this hath no refemblance thereunto; and lally that it beareth a head like a Walper combe, with many cells or divisions therein, in every one where groweth a florie or not, bigger than an ordinary Beane, which among this Arms hath no likenes; I might adde also the name of the head called Chorion, or Cibetion, which as I faid finished foull selection. fignifieth a small casket, from the similitude of the places, wherein the fruit standeth, as also from the forsite of the head with the fruit, like unto a drinking cuppe, afed among the ancient Greelaw; as alto the fruite of Beane is felle, to notably knowne to all the Nations, both Greekee and others, that is was as a standard for a certaine weight, whose true proportion was certainely knowne, and wontermily maintained: the place also of the grow-ing, being in the waters, is differing from that of Assam, the vertiles and qualities as different from it, an winter have therefore thewed you, that every one may platnely fee the truth, and hereafter be better per (waded) if they have creed in their opinion and Judgement. Mand to they this originall of this errour, as it is most into bathe in first I may say that the revolution of time, which bringeth on With it may say that the revolution of time, which bringeth on With it many slippes and errours, havin before the cause thereof, which therefore wise men and judicious, must still be carefull to finde out atto reforme : Belloniste in the 28. Chapter of his second Booke of Observations, thinketh that Herodotus was the first, that was the

cause of that errour, but I verily suppose it to be more antient, for Dioscorides faith in his Chapter of Aramanon the diverse names thereof, that those of Coprus did call Arum by the name of Colocasion, and therefore it is not probable that diverse Nations, eating the rootes of this Arum, as well as the rest, which were not hot and share probable that diverte Nations, eating the rootes of this street, as well as well as the color fire, because the root in taste, in those countries, as they are in these colder, did from the Cyprians call it Colorafia, because the root of down when a made the Egyptian Beane, being also called Colocasia, was boyled and eaten as those of Aram were: and thus this. the Egyptian Beane, being allo caucio Concentin, was boyied and caucin as those on the concentration from the Egyptian Beane, and the use of them encreasing by being peradventure, both more plentifull, to be haddy a crease, and more acceptable to the taste, than the fruite of the Egyptian Beane, it became of lesseeme and planted whereby it became of the same of the crease. time to be so much neglected, that it was no more looked after and planted, whereby it became to be unity unknowne at the last, and the name Culcas, was still maintained and imposed on those rootes of Arum, as it is had beene the rootes of the Egyptian Beane. Thus much I thought good out of my simple judgement to declar, which if it doe not agree with truth and reason, I submit it to those that can bring better.

The Vertues. Tragm reporteth that a dramme weight, or more if neede be, of the roote of that Wake Robin, that bath specific and the state of the sta ted leaves, whether it be fresh and greene, or dried it mattereth not; being bruised or beaten and taken, it most present remedy never failing against both poyson and plague: some he saith, take as much the most present remedy never failing against both poyson and plague: some he saith, take as much the most present remedy never failing against both poyson and plague: some he saith, take as much the most present place as the player of the herbe taken, to the quantitie of a spoonefull or most, worketh the same effect: but if there be a little vinegar added thereunto, as well as to the roote before spoke of, it will somewhat allay that sharpe biting taste upon the tongue, which it causeth; the greene leaves likewie of, it will tomewhat allay that marpe ofting tatte upon the tongue, which it canten, the green leaves meeting bruifed and laid upon any boyle or plague fore, doth wonderfully helpe to draw forth the poylon: the pounder of the dried roote of Wake Robin, to the weight of a dramme, taken with twife as much Sugar, in the forme of a Lohoc or licking Electuary, or the greene roote, doth wonderfully helpe those that are purile or hope winded, as also those that have the cough, having their stomacke, cheft, and longs, stuffed with much stegme. for it breaketh and digesteth it in them, and canseth it to be easily avoided and spit forth: the milke whereme roote hath beene boyled, is effectuall also for the same purpose: the said pouder taken in wine or drinke, orthe juyce of the berries, or the pouder of them, or the wine wherein they have beene boyled provokethiming. and bringeth downe womens courses when they are stayed, and purgeth them effectually after child bering, to bring away the afterbirth; it is said that it expelleth drunkennesse also; taken with sheepes mile. it healeth the inward ulcers of the bowells; the diffilled water hereof likewife is effectuall, to all the purpose aforesaid; and moreover a spoonefull taken at a time, healeth the itch; and an ounce or more taken at time for some dayes together, doth helpe the rupture; the leaves either greene or drie or the june of them, doth clense all manner of rotten and filthy ulcers, of what part of the body soever they be, and the flinking fores in the nose called Polypus and healeth them also: the water wherein the roote hath beeneboyled, dropped into the eyes, clenfeth them from any filme or skinne beginning to grow over them, or clouder miltes that may hinder the fight, and helpeth also the watering and rednesse of them, and when by chancelly become blacke and blew: the roote mixed with Beane flower, and applied to the throat or jawes that are in flamed, helpeth them: the juice of the berries boyled in oyle of Roses, or the berries themselves made mo pounder, and mixed with the oyle and dropped into the eares, easeth the paines in them: the berries or the rootes beaten with hot oxe dung, and applied to the gout, eafeth the paines thereof: the leaves and roots also boyled in wine with a little oyle, and applied to the piles, or the falling downe of the fundament eafeth them, and so doth the fitting over the hot some schereof: the fresh rootes bruised and distilled with a little milke, reldeth a most soveraigne water to clense the skinne from scurfe, freekles, spots, or blemishes whatsoever them. yet some use the rootes themse wes braised and mixed with vinegar, but that is too sharpe, and not to be used to when there is great neede, and with good caution, and not to abide long upon any place: there is a feedband by art from the fresh rootes, called Gersasernaria, which is as white as Starch or Gersse, and being diffored in milke, or in the distilled water, of the rootes and milke aforesaid, doth wonderfully blanch the skinne, hiding many deformities: the fresh rootes cut small and mixed with a faller of white Endive or Lettice, &c, is and cellent dill to entertaine a fmell-feast, or unbidden unwelcome guest to a mans table, to make sport with him, and drive him from his too much boldnesse; or the pouder of the dried roote, strawed upon any daintie bird meate, that may be given him to eate; for eithen way, within a while after the taking of it, it will fo burne and pricke his mouth and throate, that he shall not be able either to eate a bit more, or scarse to speake for pain, and will so abide untill there be some new milke or fresh butter given, which by little and little, will take awy the heate and pricking, and restore him againe. Some use to lay the greene leaves of Wake Robin among the Cheefes, both to keepe them from breeding wormes, and to ridde them also being in them. The Arisama Friers Coule, as Dioscorides and Galen affirme, is farre hotter, and sharpe or biting in talte, than Arnm or Wale Robin, which is not to found in any part of Europe, whether fraty or Spaine, France, Germany or England, that I know, both hot and cold countries, but in all of them much milder and weaker than the Arum (which could Tragmas I faid before, to suspect that our Arum, was the Arifarum of the antients) and therefore they appoint it, to be laid to eating, fretting, and running force, to flay their spreading, and abate their malignitie, as also tobe put into fiftulas and hollow uncers, to helpe to clense and heale them up 1 a peece of the roote, put into the feat parts of any femall creature, killeth them, causing them to die quickly; which thing is contradicted by some and faid to be utterly untrue, Lamen Lufteanne, writeth, that in the Low Countries it was used against the plague, whereof Cinfim faith, it was not knowne unto his countrie men, untill he had travelled into Spain and Paringall, and from thence gave them the knowledge thereof, by fending it unto them; but it may be he miltooke Arifarum, for Arum, which as you may fee before, is found effectuall for that purpose. The same Egypt as it is milder in rafte, although somewhat sharpe and bitter and slimie in cating, so it is leffe effectivaling. medicine, because it is more usual in measte. All the Balk countries which the Italians call the Levans, as Asia, Syria, Arabia, Egypt, orc. and lave also, and other places in the Indies as you heard before doe most frequently eate the rootes hereof boiled in the broth of fleth, and many other wayes dreffed, not onely 202 daily foods, but as they thinke, to encrease natural pretime or seede, and to cause a validitie also, and more powerfull abilities The intelligible of the

CHAP. XVIII.

Christophoriana. Herbe Christopher.

Elides the usuall fort of herbe Christophe, which hath beene knowne of a long time to us, we have late?

by Elides the usual fort or heroe Corrisopour, which hadrocene knowned a long time to us, we have the profession of the Herbt Christopher shooteth forth diverse greene stakes of leaves, halfe a foote long, which are made into three parts, yet some times into five, the lower parts standing for the most part one against another, made into titree parts, jet to the other at the end of the stalke, each of these parts consist of three leaves separate a growth distant, and the other at the end of the stalke, each of these parts consist of three leaves separate a ornormuch anitant, and the centre at the ornor than, which are fomewhat broad, and ending in a point, fome of them cut fundet, with small foote stalkes unto them, which are somewhat broad, and ending in a point, some of them cut funder, with minin toolers and all of them dented about the edges, of a fad greene colour; among these leaves in on the edges more deepely, and all of them dented about the edges, of a fad greene colour; among these leaves month cuges more described and the service of the s the up diverse content at the landing upright, having three or foure such like leaves thereon, as grew below, but with shorter stalkes : at the tanding upriging, and the stand a ruft or bush of white flowers, every one confisting of five small leaves, with many toppes of the stalkes stand a ruft or bush of white flowers, every one confisting of five small leaves, with many toppes or the the middle; and after they are fallen come small round berries, greene at the first, and blacke which threds in the middle; and after they are fallen come small round berries, greene at the first, and blacke whitin threes in the froote is blacke without, and a little yellowish within, and somewhat thicke with diversible kish strings, or great fibres annexed thereunto, which perisheth not, although the stalkes and leaves veite Dackin Ittings, o gicae ince aniene up againe. docdiedowne every yeare, fresh springing up againe.

2. Christophoriana Americana baccis niveis & rubris. Herbe Christopher of America.

2. Christophoriana Americana Daccin nives & ruors. Fierde Christophor of America.

This stranger shootesth forth in the Spring many reddish stalkes about a foote high with diverse leaves thereon, divided into many parts somewhat resembling the former, but larger, rougher, and of a sadder greene colour, divided into many parts somewhat resembling the former, but larger, rougher, and of a sadder greene colour, and the same stalker with the same stalker and the same stalker and the same stalker with the same stalker and the same st be more nearedy vewed, there will appeare for every flower fixe small white leaves with their threds in the be more necestry vewers, that a special which comming to maturitie is either white with a purple tippe and middle, compalling a round greene button, which comming to maturitie is either white with a purple tippe and music, companing a round greene button, which containing to matter the white a purple uppe and foote stake, or reddish wholly: the roote is blacke, thicke, short and crooked, not growing downewards nor foote stake, or reddish wholly:

creeping: but with many fibres thereat.

The first groweth generally in the woods of mountaines, that are somewhat open and not too much shadowed, The Place. and other like places, as well in our owne as other countries. The other both in our Plantations, and the French in America. The Time.

They flower after Midsomer, and the berries are ripe in August.

christophoriana vulgaris. Ordinary herbe Chriftopher.

The Names.

TRIBE 3. Vines pervines unigaris. Common Pervanciste.

Cen ath Daphnoides latifolia fen Vinca pervinea major. The greater Periwinchle.

It hath no Greeke, or fearfe any good Latin name, although commonly with most it be called Christ phrise and many do doubt of the fearfe and many do doubt of the fearfe. It hath no Greeke, or scarse any good Latin maine, authoright common, with many do doubt of the Saints many or herba fantli Christophori, but for what cause and respect I cannot learne, and many do doubt of the Saints many. or herba fantli Christophori, but for what cause and respect I cannot searne, and many do doubt of the Saint man' thinking it but composed as relative, bearing Christ according to the morall of the story, and not effentiall and in deede: Some call it as Lugdunensis saint Napellus less anthemos, and some Aconisms bacciferum. Lugdunensis saint, it is called with them Napellus racemosus, as some and so comerarius saint, some agains all faith, it is called with them Napellus racemosus, so with Marantha as Camerarius saint, some agains all solling niger, Pena and Lobel make a doubt whether it be nor Astes of Pliny, in his 27. Booke and 7. Chapte, be cause his Astes beareth blacke berries like Ivie: but diverse good and judicious Herbaritis, doe rather take Astes hard. Some shie hard no rough stalke as Astes hard, but a smooth: and Paulus Esinets interpresent cause his Attea beareth Diacke Derried like Ivie Lout diverse good month; and Paulin Egineta interpreted to be Ebulus, for this hath no rough fialke as Attea hath, but a smooth; and Paulin Egineta interpreted the to be Ebulus, for this hath no rough stake as Actes nath, but a smooth; and a series interpreted to roote of Altes, to be the roote of Sambucus; Baubinus calleth it Aconisum racemofum, and seemeth to leave Lobel his opinion, whether it be not Pliny his Altes or no. Some also doe call Scropbularia by this name of being Lobel his opinion, whether it do not runy his return of no. Some and do call of the christopher. Camerariss saith it is called in high Dutch Wolfs worts, when as Tragus and others say, the Ani. tum Lycollonum, that is Luparia or Lupicida is so called also with them. Camerariss saith also it is called with them Christoffels kraut, But Tragm faith that a kind of Vetch or Pulse, which he thinketh is the Aracm of Digo them Christoffets krant, but I ragm latti that a kind of vetch of rules, which he distributes the creates of Distributes, is called with them Sant Christoffels krant: The other is called by Iacobus Coruntum in his Canadensian plan riaes, 18 cauca with them Saint major five racemofum Canadenfe: but why Panax being no wound herbe, I fee no canadenfe in the saint major five racemofum Canadenfe in the saint with Panax being no wound herbe, I fee no canadenfe in the saint major five racemofum Canadenfe in the saint major five racemofunction five racem unlesse it were for want of a bettername : but I thinke I have entituled it more truely, I am sure more merely

The Vertues. The Inhabitans of all the mountaines and places, wherefoever the first groweth as fome Writers fay, doe go nerally hold it to be a most dangerous and deadly poison, both to men and beast, and that they use to kill Women here with very speedily; it must therefore be cautelously used, or rather utterly refused; but I much doubt whether those Mountainers meane not rather that Aconium Lycottomum called Lupicida; and although many good Ap. thours hold it dangerous, yet cannot I in my judgement so thinke, not finding herein by the taste any pernition qualitie; but I cannot learne what helpe this hath procured to any: Cornsis saith of his Pannees Carpinon, the

CHAP. XIX.

Clematites, Climers or Clamberers,

it is eaten familiarly both with the naturalls, and French inhabitants with them as a fallet herbe.

resembling this herbe, than any Panax that I know.

Here are diverse sort Climers or Clamberers, most of which are sharpe hot and causticke, ore. ulcerating the skinne, if they lie any little time thereon, and thereby dangerous, although not deally; diverse of them have beene declared in my former Booke, whereunto I referre them that would be enformed of them, yet I thinke it not amisse to let you see some of their figures, the descriptions of the rest shall follow.

1 . Clematic Sylvestris latifolia sive Viorna. The great wild Climer or Gerards Travellers Joy. This wild Climer or Travellers joy, as some call it, hath in some places (especially if it have stood long in a place) a thicke and strong ragged wooddie stemme or trunke, with diverse chops or rittes in the barke, which is of grayish colour, from whence shoote forth many long pliant grayish greene branches, more strong and wooddie, than any of the other Climers. (fo that their branches doe in many places ferve as withes, to winde about garden and field gates, or to bindeany bundle together.) these branches spread upon the hedges or trees, whateever it standeth next unto, dividing it selfe into many other twigges, whereon are fet at the severall joyns, two long stalkes of winged leaves, consisting of five leaves, two and two together, and one at the end, and dented on the fides, with small notches, of a pale greene colour, and talling sharpe and hot, biting upon the tented on the index, with input noticines, of a paregreene colour, and tenting may pe and not, ording upon the tongue, but not so much as the birning Climer or Virgins bower; these branches winde themselves about my thing, standeth neare unto them for a great way, but have no classing tendrells, like the Vine, to take holded winde it selfe thereby, as Gerard saith it hath, so farre as ever I could observe: at the joynts where the large fland, come forth likewise towards the toppes of the branches, diverse bunches or rusts of white slowers, set to gether upon small long soote stalkes, with diverse yellow threds in the middle, smelling very sweete; and site they are past, there arise in their places severall heads of many long hoary silver like plumes, as if they were feathers fet together, with a brownish flat seede at the bottome of every of them, which abide a great while, wa to the Winter, before they fall off, or are blowen away with the winde: The roote ir great thicke, and fomewhat wordy, dispersing it selfe into diverse long branches under ground: the leaves fall away in the Wister,

and recover againe in the Spring.

2. Classics fylvestra altera Bacica. The great Spanish wild Climer.

This other wilde Climer bath such like running or climing branches, but spreading farther with many joyns all the length thereof, wherear stand sound about it diverse hard and somewhat broad leave, each by it selfe upon all the length thereof, whereat stand sound about it diverse hard and somewhat broad leave, each by it selfe upon a small footestalke, and dented reined about the edges, of as sharpe and hot taste as the former, where also come forth two claspers on each side, whereby it esecheth sast hold of any thing standeth in the way neare unto it from the joynts likewise where the leaves stand, come forth (the slowers were not observed) long tasto sheads, in the same manner that the former hath, with the like plumed seathers, of a hoary white colour, with smaller seed below them, then the other.

3. Clemanic Crucials Alpina. The crosse Climer of the Alpes.

This Crossewort Climen hath many slender and more square branches, than any of the other Climers, somewhat hard and wooddy, rising to be source or sive soote high, standing for the most part upright, or but leaning a little downewards, from whence shoote forth many small twigges. not oast source inches long, whereon are

a little downewards, from whence shoote forth many small twigges, not past foure inches long, whereon are fet at equall diffances, two small stakes of leaves, all the length of the twigges, three joyned alwayes together at the ends of them, each whereof is hard rough and full of vaines, of a fad greene colour, of the bignesse of a large Mirtle leafe, or bigger, dented thicke round about the edges; the flowers come forth fingle, every one upon

Clematic urens flore albe. The burning Clamer or Virgins Bower,

Clematis peregrina flore subso vel purpureo fin piex. Single Ladies bower red or purple.

The leffer Hungarian Climer.

Clematis Passuica Clufij major. The greater Hungarian Climer.

flenderlong foote stalke, confishing of foure woolly and assender long foote stalke, consisting of foure woolly and pointed leaves, laid open like unto a crosse, of a blush white colour, having in the middle thereof, many small whiter leaves soulded together: the roote spreadeth very much under ground, which hath but very small acrimonic specin, or none at all, but the leaves are somewhat sharpe the in rafte. and hot in tafte.

4. Clematis maritima repens.

and hot in talle.

4. Clematis maritima repens.

The creeping Sea Climer.

This creeping Sea Climeris, spreadeth abroad many creeping pliant, joynted and crefted branches, about two footelong, covered with a very darke greene barke, from whence shoote forth many winged leaves, a little dented whence shoote forth many winged leaves, a little dented whence shoote forth many winged leaves, a little dented whence shootened the view of the upright Virgins Bower, consisting of five leaves, but most commonly of three upon a stalke, being narrower, harder and longer pointed: at the ends whereof commeth forth, a small classing tendrell, but shole that grow up higher upon the stalkes, and nearer unto the toppes, where the slowers doe stand, are much smaller andnarrower: the slowers come forth many together; as in the other, set upon long foote stalkes, which are white with many hairy threds in the middle of them: and after they are pass, arise many round flat reddish seede, smaller than the other, three or source upon a stalke together, plumed with a white seather, at the head of every of them: the whole plant is sharpe and hot like unto the other.

The Place.

The first groweth in many places of our owne land, in the hedges of fields, & by the high wayes side, in Bucking-hamshire, Bedfordshire, and Essex, but especially in Kent, where from beyond Woolwich to Gravesend, and from Gravesend along to Canterbury, you may see it in many

2. Climatis filveftris altera Bætica.
The great spansh wild Climer.

1. Clematis sylvestris latifolia &ve Viorna. The great wild Climer or Travellers sive.

3. Clemaiis Crucista Alpina. The leffer Climer of the Alpes.

places. The second Clusius onely found in Spaine, betweene Medina Sidonia and Calpe, and in divent places. The fecond Clusius onely round in spanie, betweene and as Baubinus faith, but is fer down thereof. The third was found upon mount Baldus, by Iungermanus as Baubinus faith, but is fer down. thereof. The third was found upon mount Datum, by Languer which he fent unto Cluffins, that following Pona, an Apothecarie of Verona, in his description thereof which he fent unto Cluffins, that following the languer and was appeared afterwards by Pona Links Iohannes Pona, an Apothecarie or Verona, in the description the terms of the lifted and fet it forth at the end of his history of plants, and was augmented afterwards by Pona himself, and the forth in Italian to the control of the latest and the forth in Italian to the control of the latest and the latest lished and set it forth at the end or his mittory of plants, and was augustions and set forth in Italian by his feetforth first in Latine, and after that againe enlarged with many additions and set forth in Italian by his land. yet Bauhinm faith it was found alfo very plentifully, both fairer and greater by Doctor Burferm, upon the yet Baubinus faith it was found allo very pientituity, both faith and and in those the Adriancke sea shore, and in those the sea of the Adriancke sea shore, and in those the sea of the Adriancke sea shore, and in those the sea of the Adriancke sea shore, and in those the sea of the Adriancke sea shore, and in those the sea of the Adriancke sea shore, and in those the sea of the Adriancke sea shore, and in those the sea of the Adriancke sea shore.

They doe all flower about Inly, and the feather like toppes of the crefted ones, appeare in fome place a the winter.

They are called Clematides of their climing and spreading branches. The first Baubinus calleth Clemating They are called lemanaes or their climing and apreading or annual vertical West ratificial, and to doe 1 and . Lover and Gerara call to Color, and the Bellonins faith, it is Vibarnam Galan was but derived from the French Vierne, or the French from the Latine : Bellonins faith, it is Vibarnam Galan (and Ruellim I thinke tooke it from him ore converso.) as if the French Viorne were derived from Vione

Verum hoc tantum alias inter caput extulit urbes, Quantum lenta solent inter Viburna Cupressus.

Wherein he compareth the statelines of Rome to the Cypresse tree, and the meanesse of other Cities to the thrubb. Vibarnum: but fo it is not likely to bee, feing this Viorna will rife to the top of the tallest Cyprasis felfe, if it be planted nigh it whereon it may clime; that Virgilhis comparison therefore may hold good wend find Viburnum to be a low thrub much differing from this, as you shall heare in his place: Fujchius thought to be Ind Viburnum to be a low intub inuch differing from this, as you man to be Atragene Theophrasti, whereof he maketh no. tion in lib. 5 c. 10. Whereunto Clusius doth consent as being the most likely of any other plant, and Pemand L bel doe not dissent therefrom, neither doe I for the reasons there shewed : it is also the Vitta Sylvestrin of Im whereof he speaketh in his 16. Booke and fourth Chapter, and the Clematic tertia of Matthiolius, the Vi fluestris caustica, of Gesner in hortis Gemarniathe Vitis spluestris Dioscoridis of Anguillara, and the Chair altera prima of Cordus upon Dioscorides : the Italians call it Vitalba, the Germans Linen and Lynen, the Dutch Lyne and in English of most country people where it groweth Honestie; and the Gentlewomen call it Love, but rard coyned that name of the Travelours joy. The second Clusius calleth Clemais altera Batica, and Batica that he might vary therefrom, Clematic peregrina foliss princife: The third is fet forth by Pone under the the of Clematis Cruciata Alpina, but Baubinus to alter the title, calleth it Clematis Alpina Gerani folia: the latte. binus calleth Clematis maritima repens, as it is in my kitle and describing it in his Pinax, referreth it to digala

The Vertues.

None of these here described are used in Physicke, by any that I know, for although they are all hot ad that pe in taft, fome more or leffe then others, yet are they not applyed to the purpofes that the other forest, which Diofeorides and Galen fpeak of both thefe and the other Climers whose figure I give you here, and the description in my former booke may very well serve to make Arbours, in Gardens, Orchards, or other place for pleasure, for thereunto they are most fit, if any will so respect as to plant them. The other Climenson to take away the fourfe, lepry, or other deformities of the skinne: but may not fafely be used inwardly, although Dioscorides, Galen, Pliny, and others say it was used to purge the waters in the Dropsie: Martholus sain the waters. ter of the upright Virgins Bower is effectuall in any cold greefes, and that fome gave the leaves prepared to her the quartane Ague : an oyle made thereof is used to heale those that have aches, crampes, and other pains in come by cold, as also to helpe the stone and to provoke urine: the Periwincle is a great binder staying bleding both at the note and mouth if some of the leaves be chewed, the French doe use it to stay the mentitual course Dissocrides, Galen, and Egineta commend it against the laske and fluxes of the belly to bee drunke with wire it is a tradition received with many, that a wreath made hereof and worne about the legs defendeth themin the crampe. The Maracoe or Virginia Climer, although I have placed it among them for the manner of growing yet is it of a farre differing quality, the liquor within the finite is very pleasant to the taste, as if Muske of Abber were mixed with it, or as others say, having a little aciditie with it, so that it cloyeth nor the stomats though one take much thereof, nor giveth any bad symptome, but is held rather to move the belly downership and make it folible. Aldinus in his Farnesian Garden hath set downe many vertues thereof rather in an hypotheli think then in verity, which I thinke were rather others fantasses then of his owne approbation : for in his own judgement and tryall he faith the leaves are of a sleepie property, smelling like unto Nightshade, having with all peradventure fome deleteriall or deadly quality in them also, because (as he observed) that slies resting on the

CHAP. XX.

Apocynum five Peripleca. Dogs bane.

Here are three forts of this Apocynum or Dogs bane differing chiefely in the climing, and in the form of their leaves, and are dangerous to man and beaft, but there are fome other plants referred upon them, as well for their face and forme of growing and giving of milke, as for their violent and dange rous qualities, I have spoken of that kind that came out of Virginia in my former booke, whereum I must refer them for the description that are desirous to see it.

1. Apociumm latifoliumi non repens. Broad leafed or upright Dogs bane. This broad leafed or upright Dogsbane, a wooddy stemme of the bignesse of once singer, covered with a gray

th barke, from whence arise divers wooddy; but flexible greenish branches, case to winde, but very yough & hard in breake funding for the most part upright, and seldome trayling or laying hold of any thing that groweth neare to breake landing so darke greene leaves, but sharpe and not round at the points, set at every joynt all along, it, having two broad darke greene leaves, but sharpe and not round at the points, set at every joynt all along, but but very neare one unto another, still of veynes, somewhat softer then Ivie leaves, somewhat thicke also, whose fallies and branches being broken yeeld a pale yellow coloured the like as Dioscorides and other writers in a much deeper yellow, that is, in the warmer Countries with flowers of the format the joynts with the large, and at the tops three or some or more sometimes standing together; which consists of a which so construction of a which colour, yet larger then those of Asserting wealth we word; after which (in the hortest larger than the construction of a which of Asserting the sound of the standard of naria was a worker to the falle, but fevered at the ferting to the falke, and are full of a filken white downe, wherein lye dispersed many flat blackish browne seedes; the roote groweth downe into the ground foreading into fundry branches, with divers small fibres thereat, this looseth not his branches but ground spreading into sugary prancines, with divers small fibres thereof, this booleth not his branches, but leave every yeare, new shooting forth every spring.

2. Apocynum angustifolium sive repens. Cliquing Dogs lattice.

The climing Dogs bane sendeth forth from the roote divers wooded branches, wer tough and steelible, of a divergayish greene colour, and sometimes brownish especially near the ground, where it beareth no leaves after it is growne of any bignesse or height, which winde the military from the Sun ward (as in all that I have seene I hoose leaves after the growness for the sun ward (as in all that I have seene I hoose leaves after the sun ward (as in all that I have seene I

have observed) to a very great height, eventy foote or more fametimes, if it finde whereon it may climbe higher, or elfe falling downe againe with his top, whereon frand at feverall gold diffiners, faving at the tops where they fland thicker integers, two leaves longer and narrower then the former and pained at the ends, formewhat thicke, and of a deepe greenecolour almost thining : the flowers stand in the fame manner that the others doe, confilling of five thicke leaves, each of them pointed and somewhat bending backwards, feeming to have two leaves a peece, one lying upon another, like unto those of Epimedium or Barrenwort, the undermost being green band larger then the upper leaves, which lye upon them, and are not to large to cover them wholly, but leive the greene brims, or edges of the lower leaves to bee eene round about them, which upper leaves are of a darke surple or reddish colour, and cleave so fast to the lower, that it is very hard to separate them: in the middle of each flower finderhagreene pointella dricompassed with five darke yelow thives, each of them turning inwards raften the flowers are fallen oppeare (in the warme countries, but not mount limit long code, ewo alwayes joyned together, brunner history then the other, bowing fomewhat more SHE while in the same of the s other, and squeetimes senderb forth suckers, whereby it is mreafed this likewise loofeth his leaves but not his stalkes in the winter and gaineth frells in the fpring,

3. Apognum augusto Salicis folio: Willow leafed Dogs bane.

hisother narrow leafed Dogs bane groweth up in the has some that the latt to having two leaves fet at every joynt of the climing twigs, but they are not fo thate, but formwhat thinner, and much narrower then they, almost resembling the forme of a willow leafe, the flowers are like the other, and blow as late, looking his leaves in the winter, in the same manner.

4. 5. Apocynum rectum latifolium & angustifolium Americanum, sive majus & minus.

The great and lesser upright American Dogs bane.

Although Thave in my former booke given you both the description and figure of the greater fort of these Dogs banes by the name of Periploca Virginiana, Virginian filke, yet I think it not amisse to mention it here againe give you the full figure thereof, referring you to fee the description, &c. there, and with it to joyne a lesser fort which reepeth not with the rootes in the ground like it, but from many long fibres shooteth forth a round browne stalke about halfe a yard high, having at each joynt a paire of long narrow leaves, and such a large tult of flowers at the top, but of a deeper purple colour, which have a certaine clammineffe on them that will deraine flies or other light things that happen to fall thereon, after which come long and straight cods (not dooked like the greater fort hereof) with flar browne feede therein lying in a white kind of downe, like unto Afteria Swallowewort: this yeeldeth a milky sap like the other, and thought to be both dangerous, although no true myall hath beene made thereof.

6. Ponda apacynum Virginianum, aly: Galfeminum Americanum maximum flore pheniceo. Virginian Iasmineo. Letter I pray you make bold to infert in this place to the rest this Indian, Ientitule him with bastardy to the reasons hereafter specified, whose description I give you in this manner. It shooteth forth fundry weake which wooddy flemmes not able to fulfaing themselves without helpe of flakes or fastening to some wall but reading exceeding high or farre, branching forth on all sides into many small ones, at whose joynts come forth long winged leaves (caven or nine fee on a middle falke, each whereof is formewhat broad and long poin-

2. Apocynum angaftifolium frue repent. Climing Dogs bane.

Apocymum rollum latifolium & anguftifolium Americanum Se minus. The greater and leffer

TRIBEL

red and dented somewhat deepely about the edges, and of a fad greene colour full of voines, very neutral bling the leaves of the great Germane Burnet Saxifrage. This never bore flower with mee, nor any other hath it in our country that I could heare of t but in the naturall place, as also beyond fee at Rome, and other and countries, it beareth a great raft of flowers together hanging downewards, each whereof is large and showly long, somewhat like to the Foxglove, but rather Bell fathion, shall at the bottome big in the belly, and will open at the mouth, cut in on the brims into five or fix lips as it were or divisions, of a fad Orenge objellowibil open at the mouth, cut in on the prims into over or in the as it were or divinous, or a lad Oreinge or youwand colour, with some yellow threat, or a which stile in the middle after the flowers are still arise hardly woody is a still still double edged crooked and pointed cods, containing within them a double flow of flat, this granpar, browne skinny and winged seedes, with a thinne wooddy film separating them in the middle all the length the cod: the roote growth not very deepe but spreadeth, yet runneth not under growth, the seedes all this code is the roote growth not very deepe but spreadeth, yet runneth not under growth. away from the branches every winter, and are renewed every fpring. By this that hath beene layd you may be ceive the reason why I place it among these dangerous climers, although it have no obnoxious or thursfull on therein for any thing I can learne, and doe not call it a lasmine as many others do nor a Honysuckle as our learne. Colonie at Virginia first did, nor a Bell flower as since they have done, nor yet place it with the other Climbia the last Chapter, because of the pode with seede, neither yet doe I entitle it Gelseninam beder accum Tuling that good French goofe doth, whose horned name is prefixed to his worke of great judgement no doubt, with it beare an Ivy title that hath so little resemblance thereto.

The first groweth in Syria and those Easterne countries, the other groweth in Traly, in Apulia and Calabia The Place. the kingdome of Naples: the third likely groweth in Italy, the feede being fent from thence is also in Fig. the three last forts came all from our English plantations in America.

The Time They flower very late in the yeare, if they flower at all, that is, not untill the end of August, and to the mile

The Names. It is called in Greeke A nouver and aurouser. Apocynum and Cymneron, quia canjo interficit ? Dioferide titl was also called of divers in his time Cynocrambe, Braffica canina, but it han extravagant name not fic and divers Peripleca of divers; which is as well a word, common to all forts of Actives, that clime up and wind thems about trees, and other things as peculiar to these called Peripleca, whose Alexipharmacum of tounierpoffer the Vincetoxicum or Asclepias, as the Anthora is unto the Thora, and Herba Paris unto Pardallanchei. The Columna seemeth to doubt, that the Herbarists and Apothecaries in Italy did take the Apotynian of Discount of the Columna seemeth to doubt, that the Herbarists and Apothecaries in Italy did take the Apotynian of Discount of the Columna seemeth to doubt, that the Herbarists and Apothecaries in Italy did take the Apotynian of Discount of the Columna seemeth to doubt, that the Herbarists and Apothecaries in Italy did take the Apotynian of Discount of the Columna seemeth to doubt, that the Herbarists and Apothecaries in Italy did take the Apotynian of Discount of the Columna seemeth to doubt, that the Herbarists and Apothecaries in Italy did take the Apothecaries and the Columna seemeth to doubt, that the Herbarists and Apothecaries in Italy did take the Apothecaries and the Columna seemeth to doubt, that the Herbarists and Apothecaries in Italy did take the Apothecaries and Italy did tak in their Medicines, which is deadly, in flead of Afelepias, and that they did not know the true Afeipias of Dispides, upto whole description that which is called Afelepias with them and us doth not agree; for although it a number of rootes, yearthey doe not finell well, (as Diofeorides faith the rootes of his African hould not yet hath it feeds like mote Securitary Harris Tool nor yet hath it feeds like unto Securidaca Hatchet Teeth, but hathleaves, flowers, cods, with filken downs,

feede in them, like unto the Apacynum of Diofcorides, and differing in nothing but in the milkye juice it veelfeeden them, in that, is white like milke (but Dioscorides faith, that his Apocynum giveth a vellow inic or milke) and in this, is of a pale yellow colour like unto the poyfon of the viper, that flicketh in the guma flistering, which he faith he hath often shewed to his friends, to shew them the likelihood of danger to be in of the internation of uninger to be in their Africania, which yeeldeth fuch a likely poyfon, or at the least to cause them to be more cautelous in the use then Afterplay if their Afelepias (which is the same with ours called also Vincetoxicum as I thinke) doe give of it: Ditamile, yet doth it not in our Country, neither the white nor black; he faith also, that the latter writers avellowin innesses forts of Apocynum under the name of Asclepias of Dioscorides, for that they doe not know. not have seene the true Asclepias of Dioscorides, unlesse his Apocynum and Asclepias be all one, set forth in divers places, and by divers names: thus farre Fabius Columna, led away onely by the fight of that yellowish milke in place, and of the place of the but rather an Apocynum: but I thinke he did not thorowly confider that the true kindes of Apocynum, have all of them wooddy, yet pliant branches, as Diofeorides giveth to his Apocynum, fit to binde any thing, which abide and dyenot downer to the ground, as all the forts of Afelepias doe, which is the true note to diffinguish the Apocysen from Aftlepias. The names of them all, as they are in their titles here set downe, doe little or nothing vary, from those that all other writers give them, fome calling them Apocynum, and fome Periploca, and therefore I needenot I thinke, make any further repetition of their divers appellations, onely the fourth Baubinus calleth as Idee, and taketh it to be also the Secamone Agyptiorum of Alpinm, and the second fort of the second kinde of Approxim of Clusture: the last, because of the wooddy pods with the manner of the climing, mooveth me rather to jove it to these although I know not of any evill quality therein, and therefore give it a bastard name. The Vertnes.

There is no property herein fit for the use of mans body, appropriated by any, either ancient or moderne writen, for the place in Pliny, lib. 24. c. 11. is mistaken or scarse to be beleeved; where he saith the seede of Aters, for the place in Finny, 100, 24, 0. 11. Is initiated of learner to be detected, where he faith the feede of Managamathatical does much,) and yet afterwards faith it killeth dogges, and all foure footed bealts, being given them in their meate, for Galen faith it is a poyfon to man, and being of a frong fent its hot, and that not in a meane degree, although it is not drying in the same, and is not to be used but outwardly, to discusse humours. Clusius faith, that the most illustrous Prince, William Landtsgrave of Hessen, in appointing his Physitions to make uvall of the Terra Sile flaca, which was taken at Strega, whether it had those properties to expell poysons, as they that brought it to fell reported of it, caused divers poysons to be given to dogs, as Arfnicke, Napellin, or Helmet flower, and Oleander or the Rose bay, and this Dogs bane also, which soever of those dogges, had that eathgiven to him in drinke, did after some fits or passions recover, but those that had none thereof given them dyed all, but none so specially as those that had this Dogs bane given unso them, yet Pena and Lobel in their Advisions, speaking of that kind of Dogs bane, say thus; If it be death to a dogge that hath earen it, it is probable that it is Apocynum (for in their title, they make a doubt thereof) of Dioscorides; but say they, wee have it forestains, and of long time found true by experience and tryall, that this is a counterpoyson against other forestopyson given to dogges, thus you see the reports of these two are flat contrary, the one unto another, so that which of them to believe, I leave to every one as they thinke good : peradventure, this their Periplocal Green fully lationibus bederaceis, (for fo they call it) is the same vulgar or common Asclepius, that Fabius Columna sainh, was used in Italy, as is before said, and not that Apocynum rectum of Clusius.

CHAP. XXI.

Asclepias sive Vincetoxicum. Asclepias or Swallow-wort.

Aving now shewed you all the Venemous Plants, as also those that procure sleepe, and those that are harfull and dangerous; let me now shew you also those that are accounted Counterpoysons, to those deadly or dangerous herbes, as also to other forts of Venome or poyson, and yet not all; for some are dispersed in this worke, in the severall Classes thereof, and some are spoken of in my former booke, as you may there find. The fifft of them that I shall set forth unto you is the Swallow-wort, because it is folikeunto the Dogs-bane in the last Chapter, and is his Antidote, whereof there are three forts as follow-

1. Asclepias flore albo. Swallow-wort with white flowers. This Swallow-wortrifeth up with divers slender weake stalkes; to be two or three foote long not easie to breake, scarse able to stand upright, and therefore for the most part, scane or sye downe upon the ground, if it find not any thing to fulfaine it, and fometimes will twine themselves about it, whereon are fet two leaves at the joynts, being somewhat broad and long pointed at the end, of a darke greene colour, and smooth at the edgess. at the joying with the leaves towards the toppes of the stalkes, and at the toppes themselves, come forth divergences to the stalkes and at the toppes themselves, come forth divergences to the stalkes and at the toppes themselves, come forth divergences the stalkes are the toppes themselves. fmall white flowers, conflitting of five pointed leaves apecce. of an heavy fweet fent; after which come small long pods, thicke above and growing leffe and leffe to the point, wherein lye small flat browne seede, wrapped in a great deale of white filken downe, which when the pod is ripe, openeth of it felfe, and sheddeth both feed and cotten upon the ground, if it be not carefully gathered: this yeeldeth no milke either white or yellow in our Country as the Dogs bane doth, in any that I have observed, but a thinne watery juice; the rootes are a great bush, of many white ftrings fastened together at the head, smelling somewhat strong while they are fresh and greene, but more pleasant when they are dryed: both leaves and stalkes, dye downe every years to the ground, and rise a new in the Spring of the years, when the stalkes at their first springing are blackish browne.

2. Asclepius store nigro. Swallow-wort with blacke showers.

The blacke Swallow-wort groweth in the same manner that the former doth, having his long slender rough branches, file to a greater height then the other, and twining themselves about whatsoever standeth next unto

them.

TRIBE.L

TRIBE. 2.

CH A P. 21.

1. A Clepias flore albo. Swallow-wort with white flowers.

1. Aftiepias flore nigro. Swallow-wort with blacke flowers.

them, having fuch like darke greene leaves fet by couples, but somewhat smaller then they: the flower like wise stand in the same fashion, but somewhat smaller also and of so darke a purplish colour, that it seemed to be a blacke, and are scarse discerned unlesse one looke very earnestly upon them: after which come more the tifully then in the former, such like cods, with a white filver downe, and seedes in them as in the former: the rootes hereof are not so bushye as in the other, neither smell so strong, nor doth it give any milkie bera ween juice when it is broken, so farre as ever I could observe. 3. Asclepias Cretica, Swallow-wort of Candy.

This Candy Swallow-wort, rifethup in the same fashion that the former doe, with many slender sender greene branches, with leaves set at the joynts, on either side, as the white kinde hath, and are very like um them, but somewhat of a paler greene colour; the flowers stand in the same manner, three or source together upon a stalke, but are somewhat of a paler white colour, not so white as they, to whom succeede somewhat of a paler white colour, not so white as they, to whom succeede somewhat of a paler white colour, not so white as they, to whom succeede somewhat of a paler white colour, not so white as they, to whom succeedes somewhat of a paler white colour, not so white as they, to whom succeedes somewhat of a paler greene colour; the source of t but one, but most usually two pods together, which are thicker and shorter then those of the white kinde, fine ked all along, and double forked at the ends, wherein lye feedes and filke as in the former: the rootes have me fo many strings as the last, and have as well as the rest of the Plant, a strong smell resembling Boxe leaves. The Place.

The two first grow in rough untilled places, and in mountaines in divers places, both in France about Nation Marseilles and Mompelier, and in Italy also, and in other places. The last grew in Candy from whence the feet

The Time. They all flower in the moneths of lune and July, and sometimes not untill August, if the yeare be backered and their cods with feede is ripe about a moneth after: the empty huskes abiding on the dry branches, whends feed and filke is flied out, and fallen on the ground, or blowne away with the wind. The Names.

It is called in Greeke donnumde Asclepias, ab Ascalapio, qui donnumae Greeie dicitur antiquo medicine dilmi some bastard names it hath also, as wonor quasi hederula, and wovever bederefolium: and thereupon or from the forme of the leaves like unto Ivy: Ruelliss calleth it Hederalis, in Latine it is called usually Afclepias and Una toxicum, which is as a generall word to denominate any Counterpoilon, for Vincetoxicum quafi Alexiphanian dillum, & quod illi infignis adversus venena vis infie, it was anciently called Hirundinaria, (although both the kints of Chelidonisms major and minum, be allo called Hirundinaria of of tone, quia acute of apera equi fitique, cumum dida lanugine volanti hirundini fere fimilis est, ally vero a femine lanugine pinuato, it dici ainsu: that is, it is led Swallow-wort of some, because the pointed code when they are open; and the silke appeareth out of them, doe somewhat resemble a Swallow slying; others say from the likenesse of the seed, sethered as it were with the downe about it; it is called in Italian Vene: tassico & Aslepiade, in high Dutch Schwallen wants, in high Dutch Schwallen wants, pad

Dutch Swalme wortel, and in English Swallow-wort, and of some silken Cicely: It is generally by the most Duties Swainwe working and most judicious Herbarists now a dayes, acknowledged to be the true Asclepias of Dioscorides, alwriters, and most adoubteth of it; and Matthiolus denieth it and contesteth against Fuchsius that said it was Vinthough Angulum, For first concerning the leaves, to be like Ivye, as Dioscorides sath and long as it is in some copyes. but ribalise as he faith hath it not so; and Marcellus doth thereunto agree, led peradventure as he saith, by the sight or that was the large to the leaves being like unto Bay leaves, but sharper pointed; secondly that the flowers had no of tome amended, the control of the frong or true term, she Hatchet Fetch; all which Dodonam retorteth faying, all his exceptions and reasons are or place worth, but I may fay all Diofeorides his comparisons are not so stricktly to be stucke unto: for in the denothing would, of the cods of Apocymum, he fairh, they are like Beane cods, when as all know they are more like the cods criptions and in the description of the leaves of Periclymenum he faith they are like those of Ivy, unto whom they are in all mens judgement very little like, and so in a number of other things: Concerning the rootes. they will they faith, that an ancient Manuscript hath not the word monas multas, but him ras tenues, but which of them while taken doth not much alter the matter: but that they are not sweete, no man that hath his sence of smelboth staten do that the state of Inciper of the feele their fent, as they grow naturally in the Mountaines; and for the evill smell of the flowers, the word Goldon virus redolens, is not in all things of one equality: and for the seede although other lowers, the Wolfe worldsca, yet is flat, and in colour and bignefic like it. Fabius (clumma as it is set klownein the Chapter before, tooke the Italian Asclepias, to be rather Apocynum of Dioscorides: and Lobel also calleth the blacke Swallow-wort Periploca minor, belike because it riseth higher, and clambereth like a Periploca, or more then the white: or peradventure because of the blacke flowers, but I shewed you before the chiefest note. toknow Afelesias from Periplica or Apocynum. There is little variation in the denominations of these plants by any writers, more then is here expressed, some calling them by the one, and some by the other name, and therefore not worthy further trouble. The Vertues.

The rootes have a most soveraine quality against all poylons, but in particular as is said before, against the Aportness or Dogsbane; It is effectually given to any that are bitten by any venemous beaft, or flunge by any Serpent or other Creature; as also against the biting of a mad dogge, a dramme and a halfe thereof taken in Cardun Benedichun water, for divers dayes together: It is taken also in wine every day against the Plague or Petilence: adramme thereof taken in Sorrell or Buglosse water is very effectuall against all the passions of the hear, if a few Citron feedes be taken therewith, taken in the fame manner and measure, it easeth all the griping paines in the belly: the decoction of the rootes, made with white wine, taken for divers dayes together, a good draught at a time, and sweating presently thereupon cureth the dropsie the same also helpeth the jaunile, provoketh urine, and easeth the cough and all defects of the cheft and lunges: the powder of the rootes taken with Peony feede, is good against the falling sickenesse, or with Bassis seede or the rinde of Pomecitrons segood against Melancholly: and taken with the rootes of Distamnus albus or Fraxinella, bastard Dittany, will kill and expell the wormes of the maw or belly : the rootes are very effectually used with other things, made for bather for women to fit in, or over, to ease all paines of the mother, and to bring downe their courses: the decoction likewise of the rootes hereof, and of Cumfrye made with wine, is much commended to helpe those that are builten or have a rupture, also for them that have beene bruised by a fall, or otherwise: the powder of the roots or leaves, is no lesseeffectualt to clense all putride rotten and filthy ulcers and sores wheresoever, then the rooter of driftelectia or Birthwort, and may fafely be used in all falves. Unguents and lossons, made for such purpose, in the stead thereof, the one for the other: the leaves and flowers boyled and made into a pultis, and applyed to the hard tumours or fwellings of womens breafts, cureth them speedily, as also such evill fores as happen in the matrix, although they be inveterate or hard to be cured: the downe that is found in the cods of

these herbes, as well as in the Dogs bane, doe make a farre softer stuffing for cushions or pillowes or the like,

CHAP. XXII.

then Thislledowne, which is much used in some places for the like purposes.

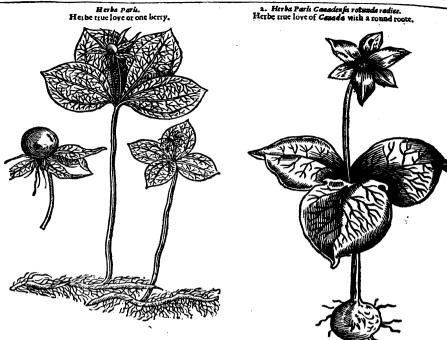

Herba Paris. Herbe True love or one berry.

Esides the usual and knowne Herba Paris, I have two other herbes like thereunto, to bring to your confideration, which I thinke is fit to take up the roome here.

The ordinary Herba Paris, or Herbe true love natura image excepting tools, of the ground, formeunpleasant loathforme taste, running here and there, under the upper crust of the ground, someunits the course but not so white, and not much lesser then the roote of the white. what like a Couch graffe roote, but not so white, and not much leffer then the roote of the white, wild Anemone, and almost of as darke a colour, but much like thereunto in creeping: shooting forth stalkes with leaves, some whereof carry no berries, and others doe, every stalke being smooth without joynts, and blackiff greene, rifing to the height of halfe a foote at the most, it it bears berries (for most commonly those that bears none, doe not rife fully so high) bearing at the toppe four leaves, set directly one against another in manner of a crosse, or a lace, or ribben, tyed as it is called, in a true Loves knot, which are each of them a part somewhat like were a Nicheland as in others. fomewhat like unto a Nightshade leafe, but somewhat broader (yea in some places twice as broad as in others, for it will much vary,) fometimes having but three leaves, fometimes five, and fometimes fixe, and fometimes fmaller and sometimes larger, either by a quarter or halfe, or as I said before, twise as great: I have seene it. also degenerate, that the source leaves being twise as large as the ordinary, have beene dented in, both at the edges and points, which have beene parted or forked, (and have borne greater berries then the ordinary) all which are of a fresh greene colour, not dented about the edges: in the middle of those fource leaves, there right up a small standard the degree colours are the standard that the colour standard the standard that the standar up a small stender stalke about an inch high, bearing at the toppe thereof one flower spread open like a starre, confilting of foure farall and narrow long pointed leaves, of a yellowish greene colour, and foure other lying between

L 13

CHAP. 23.

them leffer then they; in the middle whereof standeth a round darke purplish button or head, compassed the with eight small yellow mealy chives or threds, which three colours make it the more conspicuous, and love to behold: this button or head in the middle, when the other leaves are withered, becomment a blackish purple berry full of juice, of no hot nor evill, nor yet of any sweetish taste, of the bignesse of a reasonable graps, being within it many white seedes a the whole plant is almost inspide, without any manifest taste, and by the effects, in repressing humours and inflammations is accounted as cold as the Nightshade.

2. Herbs Faris triphyllos Brasiliano. Herbe true love of Brasil.

The roote of this herbe is small and creepeth like the other, sending forth a slender stalke of foure or sive inches high, having three broader and longer leaves see thereon, then are in the former, the stalke rise thabout three inches above them, bearing at the top three much narrower leaves, as it were the huske to the slower, standing in the middle, consisting of three white leaves having some veines in them, and are about three inches long, and one of the standards of three white leaves having some veines in them, and are about three inches long, and one of the standards with a round roote.

This herbe groweth with three large leaves like the last, and at the toppe of the upper stalke one flower, offisting of fixe leaves, three whereof are greene and small, which are as it were the huske to the other three land which are larger and longer, of a darke purple colour, and in some white, in the middle whereof groweds small round blackish berry, full of small seedes like Nightshade seede: the roote hereof creepeth not as the some r, but groweth into a small round tuber.

The Place.

The first groweth in our woods and copies, as also sometimes in the corners and borders of fields, and was grounds, invery many places of this land, for besides those places which Gerard hath set downe, which are not all wasted and consumed, every one running thereunto, that is next him, and gathering it: it is south mostly wood, three mile from Maidestone in Kent, in a wood also called Harmers, neare to Pinnendan hath, one mile from the said Maidestone, in a wood by Chiselburss in Kent, called Long wood, and in the next wood thereunto called Isees wood, especially about the skirts of a hoppe garden bordering thereon, in a wood also over against Boxly Abbay a mile from Maidestone in great abundance, not farre from the hedge side of that Medow, through which runnes a rivelet, related by Mr. George Bowles a young Gentleman, of excellent knowledge in these things. The second was sound as Baubinus saith in the woods of Brassl, but I had the knowledge three given me from Mainser Loumeau of Rochell Preacher, who had it out of Canada. The last was brought on of

They fpring up in the middle of Aprill, or May, and are in flower foone after, the berries are ripe in the ended May, and in fome places in lune.

Canada, and mentioned by Coruntus in his booke of Canada plants.

The Names.

This herbe Paris hath not beene knowne, to either antient Greeke or Latine Writers, that wee can finde by their writings. It hath found therefore divers names, by divers of the moderne Authours, every one according their Willings and judgement led him: for although Matthiolus, Cafalpinus, Anguillara, Camerarius, Dodonassa, and Ludanen fur following them, doe call it Herba Paris, as it is now generally termed of all Herbarists; ver and by in the former times, Fuschism tooke it to be Aconitum Pardalianches, and to be deadly or at least dangerous, whom Mathielas contradicteth, and Cordus in his History of plants, seemeth to be of Fulschus opinion, calling it Aconitum five Pardalianches monococcon, but because it was found by good experience not to be hurtfull, but helpefull, Tabermanus calleth it Aconitum Salutiferum. Some called it Uva versa. Tragus not knowing any Latine name. that others called it by, giveth it the name of After, from his owne countrie people, who called it Sternkraut. but he addeth thereunto, sed non Atticus, because it might be knowne, he did not account it the After Atticus of Disserides, and others: he also calleth it Uva lupina, after the Germane word Wolffsbeer, whereby they in other places usually call it; as also einbeer: the Italians call it Herba Paris; the Spaniards Centelha; the French Raisin de Prison the Dutch Wolfebessen, and Spinne coppen. Gesner in hortin Germanie, and Lobel and Pana in their Adverfaria, callit Selanum tetraphyllon, from the forme of the leaves and berries, or both, and Banhinus as leaning unto their judgement, calleth it Solanum quadrifolium Bacciferum. The second Bauhimu calleth Solanum triphyllum Inalianum; and I Herba Paris triphylles Braftsiana, because I doe not account the Herba Paris to be any kinde of Solanum. The last Cornutus calleth Solanum triphyllum Canadense.

Although some formerly did account this herbe to be dangerons, if not deadly, as by the name of Aconitum, it may be gathered, because the forme thereof bred in them such assistion, yet have not set downe any evill Symtomes that it wrought, and therefore Pena and Lobel fay, they made much triall thereof upon dogs, & other creatures to finde out whether it would worke any dangerous effects unto them, but did not fee any harme come to them that had eaten it, and therefore upon report of the contrary effect it would worke, they made triall likewife thereof upon two dogs, to whom was given of Arfenicke and Sublimatum, of each halfe a dramme in meate, unto one of them, about an houre after their taking of it, when their furious & forming fits were over, that they become morequiet, wifthey were ready to die, there was given one of them, two drammes of the pouder called Pulvis Saxonicus, (the receipt whereof hereafter followeth) in red wine, who presently thereupon grew well, the other dying without helperthe receipt of the pouder is thus. Ref. Radicum Angelica fative of fluestris, Vincetoxici, The five Valeriane majoris, Polypodij quercini, Althae & Urtica ana unciam dimidiam, Corticis Meseres Germanici, aucimu dun, granorum herba Paridis numero 24. Foliorum ejusdem cum toto numero 36. ex radicibus & cortice in accommendia, ficcatio at cateria of mixtis flat omnium pulvis: the leaves or berries alone are also effectually to expell poisons of all forts, but especially that of the Aconites, as also the plague and other insectious diseases: it hathbeene observed faith Matthiolus, as well from my owne experience, as from Baptista Sardus, the author that enlarged the Pandells, that some have beene holpen hereby, that have lyen long in a lingring sicknesse, and obersthat by Witchcraft (as it was thought) were become halfe foolish, as wanting their wits and sences, by the taking a dramme of the seedes, or the berries hereof in pouder, every day for twenty dayes together, were perfettly reftored to their former good estate, and health: the leaves dried and given in pouder, have the like operation, yet in a weaker manner; it is thought also that the berries procure sleepe, being taken at night in drink: the rootes in ponder ease the paines of the collicke incontinently, being taken in wine : the leaves are very effestudi, as well for greene wounds, as to clense and heale up old filthy ulcers and fores, and is very powerfull to difcusseall tumours and swellings, and to allay all inflammations very speedily, as also those tum ours that happen in the cods, privy parts, or in the groine: the juyce or distilled water of the leaves, taketh away all heate and inflammation in the eyes: the fame leaves also or their juyce applied to fellons, or those nailes of the hands or toes, that have empostumes or fores gathered together at the rootes of them, healeth them in a short space.

CHAP. XXIII.

Bistorta. Bistort or Snakeweede.

Here be diverse forts of Bistorts, some being of late, others of elder account.

1. Bistorta major vulgar is. Common Bistorte or Snakeweeke.

This common Biffort hath a thicke short knobbed roote, blackish without, and somewhat reddish within, a little crooked or turned together, of an harsh or astringent raste, with divers blackish fibres growing thereat, from whence spring up every yeare divers leaves standing upon long foote slakes, being somewhat long and broad, very like unto a Docke lease, and a little pointed at the ends, but that it is of ablewish greene colour on the up perside, and of an Ash colour gray, and a little purplish underneath, having divers veines therein; from among which rise up diverse small and sender stalkes, two soote high, almost naked and without leaves, or with very sew, and narrower, bearing a spikie bush of pale sless to observe which being past, there abideth small seede somewhat like unto Sorrell seede but greater.

This Biftort differeth not much from the former, being a little lesse, both in lease and roote, which are more three square seed than the former; the Spikie flowers, &c. are equall also, almost unto them, and so is the spikie flowers.

The great Bistort hath many very long and pointed leaves, of the same colour with the first, both above and underneath, some of a cubite or a soote and a halfe long, and but narrow in comparison of the length, being about three inches broad, these state almost twise as high as the first, almost bare without leaves thereon, which are much smaller, bearing a spike of blush showers, source inches long at the toppes: the roote is fource times bigger than the common fort, blacke without, with many blacke sibres at them, but not so red within as the first, but satisfacts.

A. Bistoria

RIBE-3

4. Bistortaminor nostras. Small Bistort of our owne Countrie.

This small Bristorte sendeth forth three or foure small narrow leaves, scarse an inchbroad, and almost some inches long, greene above, and gray underneath; the stalkes are slender, and but with one or two leaves fe thereon, at the toppes whereof frand small long round spikie heads of white flowers, with diverse small group leaves among them; after which come a reddish seede almost round, which being drie, become blackish, and are bigger than those of the first: the roote is small in proportion, but somewhat crooked or turned like the conmon kinde, being of a blackish colour without, and somewhat whitish within, of the same auster binding use that the rest hath.

5. Bistorta minor Alpina. Small Bistort of the Alpes.
This small Bistort hath broader leaves, and not so long as the last, the tust of flowers likewise at the toppe is closer set together, in other things not differing.

6. Bistorta Alpina pumila varia, Variable leafed small Bistort.

This Bistort hath not onely two or three broad and short almost round leaves pointed at the ends, but two or three very narrow and long leaves also with them comming from the roote, the stalke is scarle and had breadth high, with many such whitish flowers thereon as are in the other small ones. The Place.

The two first grow at the soote of hills, and in the shadowie most woods neare unto them, in many place of Germany; and in our countrie likewise in the like places, but chiefely is nourished up in gardens. The thing groweth on the high hills in Silesia, and other places: the fourth groweth especially in the North, as in Le cashire, Yorkeshire, and Cumberland in diverse places. The two last are found likewise on the Alpes in diverse places, but the last among the Switzers.

The Time.

They all flower about the end of May, and the feede is ripe about the beginning of Iuly. The Names.

It is called generally Biftorta, quod radice in se ferpentis modo contorta, & convoluta conftet, of Tragus, Landane, and others Colubrina, from the Germane title of Schlangenwurtzel and Natterwurtzel; of Fuschin Serpennie qued venenosorum serpentium ittibus succurrit: of Gesner in hortin Germania Limonium. Fracastorius callethir la lapathum, as well as Bistorta. Lobel and Clasius thinke it may be Britannica of Dioscorides and Pliny. Bain calleth the first, Bistorta major radice minus interta. Some call it Behen rubrum, others take it to be Mahlins of Pliny. Some also doe take it to be the second Dracunculus of Pliny lib.4. cap. 16. the second is called by True Colubrina minor. Bauhimus calleth it Bistoria major radice magis intorta. The third Bauhimus, that hathful a it forth as I thinke, calleth it Bistorta Alpina maxima: the fourth I take to be differing from the next, and then fore call it Nostras : the fifth is called by Camerarius, Clufus, Lobel, Baubinus, and all others that have with

1. 4. Bistorta major vulgarit & minor.
Great and small Bistorte or Snakeweede.

5. 6. Bifferta miner Alpina & Alpina punila veria. Small Bifforte of the Alpes anduariabbe leafed Briffort.

percol Biferraminer, or Alpina miner; onely Gefner in hortis Germanie, reckoneth it to be a finall fort of Limonireof Emeria cannot be Britanica this sheweth: in the description thereof that the leaves are rough or But in that By the feaves are rough or any when there are finall and thort, when there are not finall alary, when mere are timeous, and that the constraint and the state that although the result of Britanica be formewhat hough the result of Britanica be formewhat hough hour; and hough hours, and hough hours have been published by the faculties doe he man hours he have been published by the faculties doe keunto Docke leaves, you the true Behen rubrum & album, that it cannot be generaturem, the faculties doe folly declare, for the trootes of the true Behen rubrum & album, are both weete in finell, and are of an hot qualify declare, for chefforall to procure venerate, or hodily luft which these cannot all and are of an hot qualify declared to the control of the cont if ly deciare, for the effectivall to procure venery, or bodily lust which these cannot a the last is not remembred by he, that they are this time. The Italians, Spaniards and French doe follow the Latine, as we doe also, the Low butch the Germanes in their appellations, which is Natterwortele.

The Vertues.

Bothte kaves and rootes of Biftort, have a powerfull facultie to refift all poyfon, a dramme of the roote Bonus Rayes and drinke, expelleth the venome of the plague or Pestilence, the small Pocks, Measells, Purples. power infectious difease, driving it forth by sweating : the same roote in pouder, or the decoction thereof was office and the control of the body manor waman; as also when one is troubled with vomiting: the ponder also of the roote, or the decoction man or woman; as any or the decoction berof being drunke, is very availeable against ruptures or burkings, or all bruises or falls what foever dissolving the congeled bloud, and easing the paires that happen thereupon: the same also helpeth the Jaundise: the ward dissolvent before the congeled bloud, and easing the paires that happen thereupon: the same also helpeth the Jaundise: the ward dissolvent before and rootes, is a singular remedy to washrany place, birten or stung by any venenons creature, as Spiders, Toades, Adders, or the like, as also for any the purposes before spoken of: and is very nod to wash any running fores or ulcers: the decoction of the roote in wine being drunke, hindereth abortion, oot to wan any women are apt to miscarrie in child bearing, the leaves also killeth the wormes in children, and is:
greathelps to them that cannot keepe their water, if they put thereto some juyce of Plantaise; and applied greatures when the great representation of the reines and represent the pouter of the roote, aven in the water thereof, wherein some iron or steele being red hot bath beene quenched, is an admirable helpe aken into water body be first prepared and purged from the offentive hamours: the leaves or seedes, or lottons, and the lotter inward or outward lotter, and the purged from the offentive hamours: the leaves or seedes, or lottons, for either inward or outward younds, or other fores; and the pouder strowed upon any cut or wound in a veine, &c. that is apt to bleede nuch, staieth the immoderate suize thereof: the decoction of the rootes in water, whereunto some Pomgranet ills, and flowers are added, ferveth for an incection into the matrice, as well to flay the acceffe of humours to healers thereof, as also to bring it to the place being fallen downe, and to helpe to stay the abundance of their fourfestheroore of Biftort and Pellitory of Spaine, and burnt Allome of each alike quantitie, beaten finall & made nto a rulle with some hony, a little peece hereof put into an hollow tooth, or holden betweene the teeth, if here be no hollownesse in them, staieth the defluxions of rheume upon them, when it is the cause of paine in hem, and helpeth to clenic the head, and avoide much offensive matter : the distilled water is very effectuall to wash those fores or cankers that happen in the nofe or any other part, if the powder of the roote be applied hereto afterwards: it is good also to fasten the gummes, and to take away the heate and inflammation, that hape ensi well in the jawes, almonds of the throat of mouth, if the decoction of the rootes leaves, or feedes, be used. or the juyce of them : the rootes are more effectuall to all the purposes aforesaid, than either leaves or seede.

CHAP. XXIV.

Tormentilla. Tormentill or Setfoile.

Lthough formerly there hath but one kind of Tormentill or Setfoile beene knowne to our English Writers, yet now there is found out and made knowne to us two other forts, which shall be all declared in this Chapter.

1. Tormentilla vulgarii. Common Tormentill.

The common Tormentill (is so like unto Cinquefoile, that many doe mistake it, for it may well be reckoned as one of them) hath many reddiffs slender, weake branches, rising from the roote, lying. mon the ground, or rather leaning, than standing upright, with many short leaves that stand closer to the lakes, than the other Cinkefoiles doe, with the foote stalke encompassing the branches at severall places, but those that grow next to the ground are set upon long soote stalkes, each whereof are like unto the leaves of Cinkefold, or five leafed graffe, but somewhat longer and leffer, and demed about the edges, many of them divided but into five leaves, but most of them into feaven, whereof it tooke the name Setfoile, and standing round with the divisions like a starre, and therefore called Stellaria) yet some may have sixe and some right, as the fertilkie of the foile and nature lift to worke: at the toppes of the branches stand divers small yellow flowers, confiling of five leaves, like unto those of Cimhefoile, but smaller : the roote is smaller than Biltort, somewhat thicke but blacker without, and not fo red within, yet sometimes a little crooked, having many blackish fibres

This Tormentill Alpina major. The greater Tormentill.

This Tormentill different not from the former, but in the largenesse of the leaves and tootes, which are much greater and redder, and of a better fent, in all things else agreeing with the former.

3. Termentille argentese. Silver leafed Tormentill. This white Tormentill, hath many fort, low and thicke spread reddish stakes, with leaves like unto a Cinkefoile, but much finaller than the first, and confishing of five leaves in many of them, and fixe and feaver in mod of them, & fometimes more being formewhat longer, & each of them fet upon very long footoftalkes, greene on the upperfide, and of a filver thinging white colour underneath, finoeth and not finite at all about the edges the flower are finaller than in the first by the halfe, and of a white colour underneath, finoeth and not finite at all about the edges the flower are finaller than in the first by the halfe, and of a white colour, fet about the Raiker at the toppes, at feverall different than in the first by the halfe, and of a white colour the different different flower than the first by the halfe, and of a white colour the results of the land of the lan at fewerall diffances, and flanding in finall busines, wherein afterwards is contained finall yellowish feede: the

394

1. Termentilla vulgaris. Tormentill or Setfoile. 3. Tormentilla orgentea. Silver leafed Tormentill.

roote is thicke and somewhat long, joynted or knotted, blackish on the outside and somewhat reddish with many sibres thereat.

• The Place.

The common fort groweth as well in woods and shadowie places, as in the open champion countrie, should borders of fields in many places of this land. The second groweth among the Helvetians or Switfers, as also to country of Tiroll: the last groweth upon the Alpes in divers rockie or stony places, as also upon the Pyrman Mountaines, and among the Savojards likewise.

The Time.

They doe all flower in the Sommer, from the beginning to the end, but the last is latest.

The Names

It hath beene not fer forth, by any of the antient Greeke or Latine Writers, yet it hath obtained a Greeke and from the forme (and posses Hept aphyllum, or Septifolium, Setfoile, or Seven leaves, but not properly, for they at not seaven leaves, but the number is seven of the divisions of every lease; for to speake properly, it is but the sumber is seven developed to speak properly, it is but the seven divisions, and not seven leaves; for this is a generall rule in all leaves, whether of herbes or of trees, that what lease, falleth away wholly together with his stalke and not in partes, and at seven times, is but one leafe, whether winged as we call it, as the leaves of the Ash tree, the Elder, the Wallmine, Horse Chesnut Virginia Sumacke, &c. the great Centory, Agrimony, Danewort, Parsnep, Valerian, the Treble, Cinkefoiles, and this Setsoile, in herbes: for in all these and the like the whole stalke, with the leaves fallethan together, and not any part of those leaves at one time, and part at another, as in all other trees and better the have not winged divided leaves. Although this narration be somewhat prolixe and extravagant, yet I hopen fome good purpose, in regard the use thereof, may be profitable to young Herbarilts, that know not or regard not so much before: the first is called Tormentilla vulgaris, and of some Stellaria, from the forme of the leaves, and yet there are divers other herbes called Stellaria, as shall be shewed in their places, and some Confolidaraha, from the efficacie and colour of the root. The Second Camerarius in horto, calleth Tormentilla Alpina and Basin Tormentilla Alpina vulgaris major. The last is very variably entituled by divers, as Pentaphyllum argentems of he guillara, Pentaphyllum Alpinum petrosum, & minimum by Lobel Pentaphyllum petraum & Alpinum of Tabermett nus Cefalpinus taketh it to be Alchimilla alterum genus; and Clusius semewhat leaneth to that opinion, yet called it Heptaphyllon. Tragus taketh it to be the true Pentaphyllum of Dioscorides and Theophrassus, because it is found as often almost to have but five leaves as seaven; and Gesner in horrin Germania Argentarea petrea; of Campin rius Stellaria argentea, and Argentea Heptaphyllos montana; and of Lugdunensis Tormentilla-candida Dalechampi it is very likely to be the Pentapyllum lupini folium of Thalius in Harcynia sylva. Banbinus calleth it, Tormentilla Alpina flore serices. Some also doe thinke it is Chrysogonum of Dioscorides, but thereof he hath but a very bot description, saying Crysogonon busheth thickely with Oaken leaves, whose flower is very like unto Verbalen Coronarium, the roote whereof is like a Turneppe, very red within and blacke without ; but this herbe hathan leaves like an Oake, neither is the flower of any fuch beauty, or respect, that it might be put into garlands a the Verbascum Coronarium (which is thought to be the Lychinis Coronaria Rosecampion with the red flower,

fe and usual flower for garlands, for no other *Verbaseum* is knowne to be put to that use) neither is the roote like a Turneppe, whereby you may see what great difference there is, betweene this and that: But the true *Chryfogung of Dioscorides, *Ranwolfinus* sound among the corne fields, not farre from *Aleppo* in Syria, as *Lugdunensis* statch is forth, in his *Appendix to the generall History of Plants; and *Fona also sheweth in his *Italian* description of Mount Baldun, as you shall have it more fully in his proper place the *Germans* call it *Blumurtzell* and *Bannetzell*, that is, *radix *Sanguinaria*, and *radix rubra*; and fome after the Latine Tormentill*, as most of the other Nations doc.

The *Uertner*.

Tormenill is of the same temperature and qualitie, that Bistort is, which hath caused divers to account it a kinds thereof, being rold in the second, and drie in the third degree, and therefore most excellent to stay all kinder of fluxes of bloud or humors, in man or woman, whether at the nose, mouth, belly, or any wound in the veice, of any where effecthe juyce of she herbe or roote taken in drinke, not only resistent all poyson or venome of any orature, but of the plague and pestilence it felfe, and pestilential feavers, and infectious diseases, as the od my details, purples, Sec. by expelling the venome and infection from the heart by sweating if the greene pour, measure, par you to be had readily, the powder of the drie roote is as effectuall, to the purposes aforenote in the decortion likewise of the herbes and rootes made in wine. and interpretation and for dothalfor the distilled water of the herber and rootes, rightly made and prepared, which is so there in wine for a night, and then distilled in Balneo marie; this water in this and proposed, which is not record the sum of a night, and then quittied in Balneo marke; this water in this manner proposed taken with forme Venice Treakle, and thereupon being prefently laid to fiweate, will certainely by God, helpe expell any venome or poylon, or the plague, or any fever or horror, or the shaking fit that happenen in the sum of especial respect in all antidotes or counterpoylons, never to be forgotten out of them, it is so effectual in the operation against the plague; yea it is said that good shepheards doe carefully prings this has and give at their Sheepe for the rot, and many other diseases in them: for there is not found any root, more effectuall to helpe any fluxe of the belly, stomacke, spleene, or bloud than this, prepared after what manner one will to be taken in wardly or applied outwardly : the juyce taken doth wonderfully open the oblindians the lines and lungs, and thereby certainely helpeth the yellow jaundife in a fhort space. Some therebekkuseso make cakes hereof, as well to fray all fluxes, as to referaine all chollericke belchings, and much Numers bears, made up with the white of an egge, and as much meale of Oates, as all of them come unto, which being based, it was saken every morning one, untill you finde helpe : or the powder of the roote onely, made up with the white of sin aggs, and baked upon an hot tile and fo taken. Andreas Uale fine de radice Chine, pag. 84. policitation plaint the real share the discoction of the roote is no leffe effectuall to cure the French poxe, then Guingmor Chine , because it fo migheily refisteth putrefaction: Lobel faith that Rondelet.m used it in the stead or after in the same manner, that he used Hermodattiles for joint aches : the powder also, or the decoction to be drunke, or to fit therein as in a bath, is an affured remedy against abortion in women, that is, when they use to miscarie often in this detailing, if it proceeds from the over fluxibilitie or weakenesse of the inward retentive faculties, as also a plaister made therewith and vinegar, applied to thereines of the backe doth much helpe; it dochmuch helpe likewise those that cannot hold their water, the powder taken in the juice of Plantane, and is doth much helpe likewise those that cannot hold their water, the powder taken in the juice of Plantane, and is commended also against the wormes in children: it is very powerfull in ruptures and burstings, as also for brufer and falls, to be used as well outwardly as inwardly: the roote hereof made up with pellitorie of Spaine and Allone, and put into an hollow tooth doth not onely assward the paine, but stateth the fluxe of humors thereunto, which was the cause thereof: the juice hereof also being drunke, is found effectuall to open the obstructions of the livit and gall. To rementall likewise is no lesse effectuall and powerfull a remedy, for outward wounds, see that the state of the livit and such to the state of the livit and such that the state of the livit and the livit and such that the state of the livit and such that the fore and burn, than for inward, and therefore it ought to be a speciall ingredient in all wound drinkes, lotions and injections, for soule and corrupt rotten fores, and ulcers of the mouth, or secret parts, or any other part of the body; and to put either the juice, or powder of the roote into fuch bindments, plaifters, and fuch things that are to be applied to wounds and fores, as cause shall require: it doth also dissolve all knots, kernells, and hardressegathered about the eares, the throate and jawes, and the Kings evill, if the leaves and rootes be bruised and applied thereusto; the same also easeth the paines of the Scintica, or Hippegout, by reltraining the sharpe humoni that flow thereunto; the juice of the leaves and rootes used with a little vinegar, is also a speciall remany that how thereunto: the juice of the leaves and rootes used with a little vinegar, is also a special remody against the vinning fores in the head, or other parts, scabbes also, and the itch, or any such cruptions in the skings proceeding of that and sharpe humours: the same also is effectuall for the hemorrhoides or piles in the same in the proceeding of the herbe and rootes; it is foundationed by the property of the herbe and rootes; it is foundationed by the property of the herbe and rootes; it is samely, inchings on the like, if a little prepared Twits or white Amber, be used with the distilled water hereoft many women also with the distilled water hereoft many women also with the same also as a same colors. many women also tile this water as a fecret to belpe themselves and others, when they are troubled with the abundance of the splace or reds, as they call them, both to be drunke, and injected by a Syring.

CHAP. XXV.

Pemaphyllum five Quinquefolium. Cinkefoile or five leafed Graffe.

He next unto the Tormentill must come the Cinkefoile to be intreated of, not onely for the likenesses of the outward sice, or forme of the plant, but of the properties also, as you shall heare hereafter. Hereof there are many more forty found out, and now made knowne, than formerly there was, and that there or Frisinke it fit to expresse them in some method and order, that is in three rankes; the first sold shall be of that forts, that beare white or whitish slowers; the second shall be of those that beare of those that shand more upsight bearing vellow slowers.

TRIBE 2.

Primus Ordo. The first Ranke:

t. Pentaphyllum majus luteo flore vel albo. Great white or vellow Cinkefoile

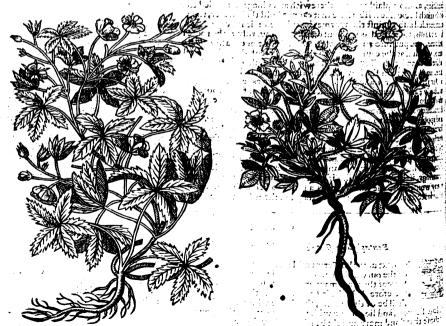

His first and greatest upright Cinkefoile, hath many leaves rising from the roote, each upon his owne took His first and greatest apright Cinketone; nath many seaves rinng from the roote, each upon us owns how stake, divided in five parts, as if they were five severall leaves, dented about the edges, and some round pointed, very like the great common yellow Cinketone; but larger and a little hairy; from among which rise up straight or upright stakes, and not much leaning downs to the ground, as the next that follower down in three branches, and they against into other search. a little hairy alfo, and divided at the toppes into two or three branches, and they againe into other from upon every one whereof standeth one flower, of a white colour and larger than in others, but confishing upon every one whereof standeth one flower, or a writte colour and tanger that an object, but the standard with thing the leaves, as all others doe; in the middle whereof standeth a small downy head, encountabled with thing the leaves, as all others doe; in the middle whereof standard long, and reddish with all.

This other white Cinkefoile, which is more common with all Herbardts, thave many faired growing from roote, divided into five parts, each of them somewhat longers a little dented, and pointed allow greene on the upper side and hoary white underneath, betweene these leaves grow weaker branches. greene on the upperside and hoary white underneath, betweene there reaves grow weare oranties adown to the ground, scarse a foote long, with many such like leaves upon them, but leffer than shock them, the flowers of these, are almost as large, as those before, and of a white colour; consisting of five more pointed leaves, than the greater before, yet with a nicke in the middle, with many shall gellew thickes middle, set about a woolly head, having many small seedes set together; like unto a Crowstoote beade before the roote is somewhat thicke and long, blackish on the outside, but reddish within, with many sheet with the standard of this fort there is an other whose greene leaves are not dented about the edges, little distribution of the creatisse-thing else.

3. Pentaphyllum feliquofum Arabicum albidum. Codded Ginkefoile of Arabida 200 annum; This Cinkefoile of Arabia riteth up with a tender transparent browne stalke about a spanie or halfs from high, and afterwards groweth to be a footh high or more, having some leaves at the ground; and of the stalke, each of them set at the end of pretty long societalkes, standing upright, bowing a little days and in the middle, and raised at the ends, which leaves are soft; and of a sad greene colour, the state was the single as they, and the fifth in the middle, bigger by halfe then either of the saft; but after they have good while, the two lower leaves onely grow somewhat largers the stalke divideth it selfe from the saft up to the middle thereof, into divers reddish branches; set are very joynt with the like staves as the many that the saft is the saft of the saft is the saft of the saft in the middle thereof, into divers reddish branches; set are very joynt with the like saves as the many that the saft is the saft of the saft is the saft of the saft is the saft of the saf

1. Pyntaphyllum majus luteo flore vel albo. Great white or yellow Cinkefoile.

whereofgrow along spiky bush of flowers, one set above another, flowring one after another, thereby enduring very long with flowers on them, which before they are blowne resemble small cups, set in small greene boskes, with pointels in the middle, but being blowen open, conflit of foure little long and narrow hard leaves, of so pure but a fullen white colour with me, but blash with others, not standing as other Cinkefoiles doe, but upigit all of them together almost, on the one side of a button, which is in the middle of the huske, and the pointed below then on the other fide, standing forth an inch long, small at the bottome, and bigger at the fur-therend, of a very darke or browne colour, having foure small purplish threds, with yellow chives hanging at the ends about it: at the joynts all along the stalkes, where they beginne to flower, come forth much smaller grene leaves, divided onely into three parts: the seede did not come to perfection in my Garden, but withe-

prenerves, divided onely into three parts: the feededid not come to perfection in my Garden, but withered by fome earely cold blaffes, pulling downe all the heades, that were full of flowers and cods, to have feeded, us. Alpian lib., de exoticis, faith it beareth long and flender round and pointed pods, containing small round blacke feed, the roote neither spreadeth deepe nor wide, but perisheth with the first frosts.

4. Pentaphyllum album minus. Small white Cinkefoile.

This small Cinkefoile, hath many bushy upright stalkes, growing thicke together, with many hoary white lawes, in forme like the common white Cinkefole, and at the toppes of them many white slowers, like unto other, composed of five round pointed leaves, with a nicke in the middle: the roote is blackish and thready, more than the former, and the whole plant, best stalkes leaves, and deliver and best lower and best in a stalker. more then the former, and the whole plant, both stalkes leaves, and flowers, are both lower and lesser, in other things little differing.

This least Cinkefoile, hath his low stalkes somewhat hairy, but not hoary, being little more then one handends: the toppes of the stalkes are divided, into many branches, whereon stand many white slowers like the last, but smaller, the roote is small and blackish.

This other small Cinkefoile spreadeth on the ground, with very many whitish branches, covered next unto the roote, with many short brownish threds or haires, more like then leaves, above which come forth the leaves, made offive parts, as small as the last but round pointed, and not dented at the end, of a sad greene colour on the upperide & of a most fine shining silver colour underneath: at the tops of thebranches stand a confused number of greeaith heads or huskes, set round about long branches, much differing from the other forts, out of which appeare very finall whitish flowers, scarse to be discerned, which turne into a very small yellowish seed, somewhat brown, the roote

a great deale of ground.

7. Pentaphyllum fragiferum Clusij. Strawberry Cinkefoile. This Cinkefoile hath divers long hairy stalkes of leaves, rising from the roote, not set close together as on Cinkefoiles are, but parted or divided more like unto a winged leafe, fometimes into five, and sometimes in feaven leaves, rough and hairy alfo, dented about the edges, greene above and gray underneath, two fet one gainst another, with a little space betweene, but those three at the ends, standing somewhat closer together; falke that rifeth up among these leaves, is about a soote high or more, reddish and hairy, and divideth new at the toppe into lefter branches, with divers leaves thereon, divided into three parts, on the toppes whereof the large white flowers, very like unto Strawberry flowers, but fomewhat leffe, with many yellow threds in the middle: which being fallen there succeede small round heads, very like unto Strawberryes, but smaller without any juice therein, having small reddish seeds within them: the roote is somewhat thicke, long, hard and

1. Pentaphyllum valgatisimum.
The most common Cinkefoile.

4. Pentaphy llum minus repens lanugino fum. Small hoary creeping Cinketoile,

6. Pentaphyllum fupinum Potentille facie. Low Cinkefoile with wild Tanfieleaves.

The Place. The first Bauhinus faith, was found on the walls of Wallstat, a City of the Switzers. The second as Chin faith, groweth in many of the woods, upon the mountaines in Austria, extending to the Alpes, as also in the ravia, Hungary, in Italy also, and divers other places: the other fort of that kinde, Tragm saith, he found at farre from Lutha, a City of the Empire; the third was brought out of Egypt, or out of Arabia, as the tilete. clareth. The fourth grew in stony places, about Curia of the Switzers. The fifth grew faith Clusius, in the flony and rocky places of the Alpes in Austria and Stiria. The fixth is a Plant raised from the seede that the among other forts of feedes, fent me from beyond fea: the last groweth in divers places of Hungaria, and the

The Time. They doe all flower in the Sommer moneths of I une and Iuly, and the third in August. The Names.

wooddy, reddish within and blackish without, with divers small long fibres thereat,

It is called in Greek Herrázussor, and in Latine Pentaphyllum and Quinquefolium, a numero foliorum. Galattalle ting Theophrassus calleth it Quinque petum. Tragus sheweth his mind and opinion concerning the Pensaphla of Dioscorides, and Theophrastus, that our Tormentill is their best and most noble Pentaphyllum, and is there to led as he faith, by the text of Theophrastus, in his tenth booke and fourth Chapter, (which yet contrasichlis judgement in my mind) for he there faith, that all the leaves are five parted, and his roote reddish whenth fresh, and blackish and square when it is dryed; but Tormentill hath more leaves of seaven divisions, then my and hath alwayes yellow flowers, when as Dioscorides saith his hath whitish. The first Baubinns calleth Que que folium album majus caulescens. The second is his Quinque folium album majus alterum, and by all other he thors, Pentaphyllum or Quinquefolium album, the other of that kind Tragus calleth his owne, that is, Pentaphyllus Tragi & nobile. Vnto the third I have given the name as Alpinus doth, from the forme of his leaves and fruit, which from the place of his naturall abiding, but Pona in his Italian Baldun calleth it, Lupinus Arabicun five Pentaphilas peregrinum. The fourth Baubinus calleth Quinquefolium album minus. The fifth is Clufius his fecond, which head leth Quinquefolium minus flore albo, and as he faith is the same that Lobel calleth Pentaphyllum minimum & part um, but that as Clusius faith, his kinde hath as large flowers as the Strawberry, which Lobels hath not be Clusius is therein much deceived, for Lobels Ventaphyllum petreum or petrolum, is declared before to be the Sullaria argentea of Camerarius, and with Baubinus, Quinquefolium album minus alterum. The fixth came tomeb the name of Pentaphyllum argenteum, and because it is none of the great ones, I have added thereto minu. The last Clusius calleth, Pentaphylium fragiferum, and is the Fragaria quarta Tragi. The Italians call it Cinquesia, the Spaniards Cinco Tramas, the French Quintefueille, the Germanes Funff finger kraut, the Dutch men Vif vino ezujt, we in English Cinkefoile and Cinkefield, and five finger graffe, or five leafed graffe,

Secundus Ordo. The second Ranke.

1. Pentaphyllum vulgatissimum. The most common Cinkefoile.

He common small Cinkefoile spreadeth and creepeth farre upon the ground, with long slender stringessite Strawberries which take roote againe, and shooteth forth many leaves, made of five parts, and some time of feven, dented about the edges, and somewhat hard, the stalkes are slender, leaning downewards, and bare many small yellow flowers thereon, with some yellow threds in the middle, standing about a smooth greenbad which when it is ripe, is a little rough, and containeth small brownish seede: the roote is of a blackish brown colour, feldome so bigge as ones little finger, but growing long with some threds or fibres thereat, and byth small strings it quickly spreadeth over the ground.

2. Pentaphyllum incanum repens Alpinum. Creeping Mountaine Cinkefoile. The creeping Mountaine Cinkefoile, shooteth forth many leaves from the roote like unto the former, dented about the edges, but softer in handling; and somewhat of a grayish greene or hairy shining colour: he stakes are slender and trayle almost upon the ground, with some lesser and lesser divided leaves on them, the below, bearing many gold yellow large flowers, with yellow threds in the middle, and fuch like feede: the toote is smaller and more fibrous then the former, but spreadeth in the like manner.

3. Pentaphyllum rapens minus. Small creeping Cinkefoile.
This small Cinkefoile, creepeth and spreadeth upon the ground like the last, and is in stalkes and slowers and have a link like also, saving that the leaves are somewhat larger and nothing hoary or shining, but greene, and have a link for hairy downs or should be a south of the save and south of the save and south of the save and save a link for hairy downs or should be save a save and save a link for hairy downs or should be save and save a link for hairy downs or should be save and save a link for hairy downs or should be save and save a link for hairy downs or should be save and save a link for hairy downs or should be save and save a link for hairy downs or should be save a link f foft hairy downe on them, and the flowers are not of fogold a yellow colour, in other things not much difference.

4. Pentaphyllum minus repens lanuginofum. Small woolly creeping Cinkefoile. This woolly Cinkefoile is very like the last for growing, both of stalkes, leaves and flowers, but the stalkes at the stalkes. alittle flender not greene but reddifh. the leaves are more woolly, and the edges deepelier dented in, the flowers also are of a deeper gold yellow colour then the last, 5. Pentaphy llum minimum repens.

The smallest creeping Cinkefoile.

This smallest Cinkefoile, is less creeping then any of the former, having many small leaves of five parts, as others have, but a little whitish hoary underneath, this farfe beareth any stalke, with small pale yellow flowers, having a purplish head in the middle, which growing ripe shard, and like a finall Strawberry head as all the rest have, the roote is small, but somewhat sharper in taste then the others, but yet aftringent withall.

6. Pentaphyllum supinum Potentille facie. Low Cinkefoile with wild Tanfy leaves.

This small Cinkefoile creepeth not, nor yet standeth upright, but leaneth downe with his weake stalkes to the gound ward, having very long stalkes of leaves on them, divided into many parts next the ground, set on each side ercoftwo at a space one against another, and an odde one at the end, all of them dented about the edges, very like unto wild Tanfy leaves, but not hoary or filver like as they, out greene: the flowers come at the joynts with the leaves wards the toppes of the stalkes, which are there, lesset and leffe divided then those below, every one by it selfe, which are small and of a pale yellow colour, with a head the middle, which after it is ripe, is like unto the other inkefoile heads of feede, that is, like unto a small hard dry Strawberry: theroote is small long and blackish, like the ordinary Cinkefoile.

7. Alterum eidem simile Enneaphyllon. Another small one like thereunto. There is another low one of this kind, that Baubinus hath et forth in his Prodromus, whose small stender stalkes, three or foure inches long are many, lying round about the roote pon the ground, divided into many branches, whereon are

Mm 2

long

TRIBE-2-

CHAP. 25.

long stalkes of leaves like unto the last, but divided into nine parts, each of them much narrower than they very hairy and dented about the edges: the flowers are small and more yellow, standing in the same manner, and yeel ing the like heade of feede: the roote is somewhat thicker and blacke ending in long fibres. The Place.

The first groweth by woods sides, hedge sides, the pathwayes in fields, and in the borders and corners of them The first groweth by woods sides, hedge sides, the pathwayes in news, and in the borders and corners of them, almost through all the land: the second groweth on the highest copies of the Alpes, that are nighest unto some string; the other Pentaphyllum of Clussus groweth in the grassic fields of the Alpes neare Austria: the thing groweth the most common of all others, by the wayes sides, in dry grounds in Hungary, the lower Austria. groweth the most common or all others, by the wayes have, and groweth the third, but more rare to be met with, the ravia and Bohemia: the fourth groweth in the same places with the third, but more rare to be met with, the ravia and Bohemia: the tourth growers in the lame places with the saline fields that are by the woods side; the fift Tragus saith, in many sandie grounds of Germany, and in the grassic fields that are by the woods side; the fixt Clustus faith he found in the borders of fields, that are by the woods fides about Vienna, and is cherished in gardens with many; the last groweth on the Alpes among the Switfers. The Time

They doe all flower in Sommer for the most part, yet the least, is often in flower the carliest, which is force. times in Aprill, and the second in May,

The Names. The first is generally called by all, either Pentaphyllum or Quinquefolium vulgare; of Baubinus, Quinquefolium The first is generally called by all, entire remaphylum of Cluffus, called by him, Pentaphyllum Alpinum sorten, and is the third Pentaphyllum of Cluffus, called by him, Pentaphyllum Alpinum sorten, and by Bauhiniu, Quinquefolium minus repens Alpinum aureum: the third is Clusius his first fort, of the found kinde of Pentaphyllum, which Baubinus calleth Quinquefolium minus repens lanuginosum luteum : the fourth is the other fort, of Clusius his fourth kinde, and called by Bauhinus, Quinquefolium minus repens aureum. The fir is the first kinde of Tragus, called by him Quinquefolium minimum, and by Lobel in his Adversaria, Pentaphia minus luteum: the fixt is called by Lobel in his observations and Icones, Pentaphyllum supinum Tormentille fair, but by C'nsim more properly, Potentille facie; by Dodonem according to his figure, but not the description Quinques column tertium repens, which is M. Gerards Fragaria vesca sive serilis: Bauhinus calleth it Quinques. liofragifero affinis; and calleth the last (which if it be not the same and growing lesse in his naturall or wilde blee. yet is very like it) Quinquefolio affinis Enneaphyllon.

Ordo tertius. The third Ranke.

1. Pentaphyllum majus erectum. The greater upright Cinkefoile.

The greater upright Cinkefoile, hath somewhat longer and larger greene leaves, than any of the former some cut into five parts, and often also into seven, and but with three leaves towards the toppes, and dentels bout the edges: the stalkes are strong and upright, not much above halfe a yard high, branched divers ways,

with large pale yellow flowers at the toppes of them, which turne into feede like as the other torts doe, the roote is blackish and stringie. Of this kinde, there is some that doth sometimes beare white flowers, and others purplish, whereof their flowers make the difference.

2. Pentaphyllum rectum minus.

The leffer upright Cinkefoile.

The leffer upright Cinkefoile, hath smaller and rounder leaves than the other, of a fad greene colour on the upperfide, and gray or hoary underneath: the stalkes are tenderer and lower, and the flowers at the toppes of them, are fomewhat imalier and of a more gold yellow colour, and herein confilteth the chiefest differences the one from the other.

. Pentaphyllum montanum erectum.

The Mountaine upright Cinkefoile.
The Mountaine upright Cinkefoile, hath divers upright but slender hoary stalkes, scarse halfe a yard high, divided at the toppes into fundry branches, whereon grow divers leaves, cut into five deeper parts, and deeper dented about the edges, fomewhat hairy also, and a little hoary underneath but not shining, whose foote stalkes are some shorter and some longer than others: but those leaves that grow below, at the foote of the stalkes stand upon very long soote stalkes, and are for the most part divided into seven parts or leaves: at the toppes of the stalkes grow gold yellow flowers, like the former but smaller, the feede that followeth, is not unlike the reft, neither is the roote which is blackish.

The first groweth in many places in Germany, France, and in Savena of Narbone where it beareth white flowers fay Pena and Lobel, and in Italy purplish : the second groweth in Germany in divers places, for Fuschius and lohannes Thalius make mention of it : the third Bauhinus faith was found on the hill Crentzacenia, in the ascending to the toppe. The Time

The feflower for the most part all the Sommer long.

1. Pentaphy am majus crestam. The greater upright Cinkefoile.

The Names.

The first is called Pentaphyllum majus by Brunfelfus and Label in his Observations; and rettum majus by Cames The first is called a company in his Icones, and unto Gerards figure, the title is Pentaphyllum vulgare: in the Adwi : yet unto Lovers inglice cause of the variation of their flowers in the colour as I faid before) Pentaphyllum of aria the title is increase; with many Herbarists in these dayes it is called Pentaphyllum Heptaphylli facie, behule it huthfulfully feven divisions or leaves upon a stalke; Bauhinus termeth it Quinque folium retinm luteum micithathloutually leven ulvillois of leaves upon a trained Landman termeth it Quinquefolium retirm luteum.

The feond is called by Matthiolus in some editions Pentaphyllum album, and by Tragus Pentaphyllum exigusin,

The feond is called by Matthiolus in some editions of the condition of the co Iobami I maior III and Pentaphyllum or Quinque folium luteum minus; by Gerard Quinquefolium Tormen-u, Fuschin and Lugdunensis; Pentaphyllum or Quinque folium luteum minus; by Gerard Quinquefolium Tormen-Lus, Fusciones and Lus Guinquefolium petreum majus, and by Bauhinnes Qinquefolium folio argenteo. The third ille fair, by Tabermontanus Quinquefolium petreum majus, and by Bauhinnes Qinquefolium folio argenteo. The third The Vertues

Having declared unto you all the feverall forts of this kinde of herbe, called Cinkefoile, in their Orders and Having uction of the chiefe properties of them altogether, and yet flew which is the most Rinkes, 1 min. more incident, and naturall unto them all, then the cooling, in that fome of them are a little sharpe or bitter in not incident, and natural unto the large of the cooling, as that followed them are a little sharpe of bittering and, which arguest some more heate, yet I may gheste the sharpenesse or bitternesse therein, is no more any specified sharpenesse in the cooling of sharpenesses or common wilde creeping Cinkesoile, the greater prignote and the white Cinkesoile, are the chiefest for use, and strongest in effect of all the rest. These three forear much alike for their operation, and are held to be as effectual for all the purposes; whereunto the Topformate unutualistic the preferring against venemous and infectious creatures, and diseases in each respect, as in keeping from purrefaction, for binding and restraining fluxes, either of bloud or humors, or any the other effech, whereunto Tormentill is applied; fo that in stead thereof, and where it is wanting Cinkefoile may be nedtous good purpose, I might referre you therefore to the properties of the Tormentill, to be enformed luted to agood purpote, a larger teacher you thereby, for the feverall helpes, that this doth give; but I will hew you some particular remedies, it worketh upon openial griefes and difeases; as first, it is an especiall herbe, used in all inflammations and seavers, whether infectious and pestilentiall or topicall among other herbes, to coole and temper the bloud and humours in the body, as also for all lotions, gargles, injections and the like, for fore mouthes, ulters, cánckers, fistulaes, and other corrupt and foule or running fores: yet some are so foolish to thinke. that the decoction of one branch of leaves thereof, taken with a little Pepper, doth helpe a quotidian or daily ague, that three branches helpeth a terrian, and foure a quartane ague; but this fet number of leaves and branches, le rather an idle conceir, as it is alloto were it in their shooes, for the same purpose, then any certainety sit for a wise man or Phistian to leane and trult unto: the juice hereof drunke about foure ounces at a time for certaine dayes together, cureth the quintie and the yellow jaundife, and to be taken for thirtie dayes together cureth the falling ficknesse, and for all fluxes in man or woman, whither the whites on the reds, as also the bloudy flixe, the rootes boyled in mille, and drunke is held most effectuall of any other remedy: the rootes boiled in vinegar, and the decoction thereofield in the mouth, eafeth the paines of the toothach: the juice or the desoction is good to helpe the fourfeness of the throate taken with a little hony; as also is good for the cough of the lunges: The distilled watrofboth rootes and leaves, is effect uall to all the purposes aforesaid, and if the hands be washed often therein, and suffered at every time to drie in of it selfe without wiping it will in a short time helpe the palse, or the Chaking in them : the roote boyled in vinegar helpeth all knots, kernells, bard fwellings and lumpes growing in the field in any part applied there unto ; as also all inflammations and S. Anthonies fire, all empoltumes and painefull fore, with heate and putteraction, the hingles also and all other fores of running and soule scabbs, fores, and itches: the same also boiled in wine, and applied to any joynts sull of paine and ache, the gout also in any of the joyne of the hands or feete, and that also of the hippes called Sciatica: and if the decoction thereof be also drunke, it helpeth forward the cure much the fooner, and eafeth also much paines in the bowells : the rootes are likewik effectuall to helpe ruptures or burstings to be used with other things availeable therefore, either inwardly or ontwardly or both, as also for bruises, or hurts by blowes, falls, or the like, and to stay the bleeding of wounds, in any part inward or outward.

CHAP. XXVI.

Gentiana, Gentian or Fellwort.

Lthough I have fet forth in my former Booke divers forts of Gentians or Fellwort, yet there remaine divers others to be intreated of, which shall be here remembred; and because I was there somewhat briefe in declaring the vertues as was fit for that worke, being but an abstract of choise

onewhat briefe in dectaring the vertices as was in too that works, being out an activact or choise plants, that beare beautifull flowers to flore a gapden of pleafure, and not a generall worke wherein all things are to be comprised, and all athat may be faid of every one also, I will here therefore amplific my selfe the more in their werties, that have beene spoken of, which are the most effectuall, and of these also, for they are to be referred muto them; yet I thinke good to give you here some of the figures extant before. But that I may use such a method; all course, as I have formerly held; in setting forth other plants which have divers forts of one kinde, I will divide this family of Gentians into a greater and less the first and close the figures. and leffer fort, and of the leffer fort which admitteth a subdivision, and not the greater; I will divide them agains into perennes, everliving or abiding, that is, that perish not in the Winter; and into annual annual, that is, fach as spring up and perish the same yeare that they slower, abiding onely the Sommer and not the Winter: I might also divide the lesser fort againe into Vernall. Estimate and Autumptet slowing plants, whereof every one in their order.

theflowers, as they are in their titles.

1. Gentiana major flore purpureo. Great purple Gentian.

"He great purple Gentian, is very like the great yellow Gentian in most things, having a great thickeling He great purple wontan, is very inte ting great branches; with great fibres at them but a little mortal nish yellow roote, parted into two or three great branches; with great fibres at them but a little mortal to the fibres at the fibres at them. and woody of as bitter a tafte as the other, which fendeth forthat the feverall heads thereof, many fair but a tafte as the other, which fendeth forthat the feverall heads thereof, many fair but a tafte as the other. and woody of as bitter a taite as the other, which the other, that it is somewhat hard to dikinguish be three ribbed darke greene shining leaves, so like unto the other, that it is somewhat hard to dikinguish be three ribbed darke greene thining leaves, 10 like the order of thicke and strong stalkes, three or source footh thicke and strong stalkes, three or source footh thicke and strong stalkes, three or source footh the one against another: towards the toppes where the many of their heads it of all all of the with divers joynts on them, and two leaves at them, one against another: towards the toppes whereof with divers joynts on them, and two leaves at them, one against another. Over the two leaves appear on forth the flowers compaffing the flalkes, at two or three of the uppermost joints, with two leaves appear on the flowers that have the two they have her this abide, and the same that the two they have her abide and the same that the same that the two they have her abide and the same that th forth the flowers compating the markes, at two or three or the upper more joines, while two leaves apecee and them, like as in the other, which are not laid open, starre fashion, like the other, but abide close and hollow, the brimmes onely divided into fixe or more round parts, of a purple colour, but paler at the bottome of them, when they are spotted with purple spots on the inside, having so many yellowish threds in the middle, as the some hath corners, standing about a long greene by forked head, which growing ripe is the seede vessell, and contains there in such like flat brownish seedes as the other, but somewhat lesse.

2. Gentiana major flore albo. Great Gentian with white flowers.

This white flowred Gentian is very like the former, and the great yellow kinde, not much leffer and lower any part than the former, whose flowers are not purple but pure white, and hollow like the other, without foots in them, this making the whole difference betweene them.

3. Gentiana major flore pallido punstato. Great pale yellow spotted Gentian.
This spotted great Gentian, is in all things also like the first, but in the slowers, which are of a dustified vellow colour, spotted both within and without with very many blacke spots.

Gentiana major flore caruleo. Great Gentian with blew flowers.

And this also differeth neither in greatnesse of stalkes, leaves and flowers, nor in the manner of growing, be in the colour of the flower, which is of a blew colour.

5. Gentiana Asclepiadis folia. Swallowort Gentian. This is discribed in my former Booke.

The Place.

All these forts grow in many places on the Mountaines of Germany, and in other places, but are not tobe fool to usually as the great yellow.

The Time. These doe all flower in Iune or there abouts

The Names.

It is called in Greek restiden in Latine, and so likewise Gentiana, a Gentio Illyriorum rege primu inventor, a Die

1. Gent'aus majer cujufque coloris. The greater Gentian of any of the colours,

Gentiana Cruciata. Croffeworte Gentian.

familes & Pliny fer it down: Serapio faith it was called Bafilica: of some it was called as some copies of Diescorides foridet & Plany literaturia radix, of some Aloes Gallica Narce sChironion, and as Plany faith, some Romanes called it Chena bath it Common Ciminalia. The Italians and Spaniards follow the Latine name Gentiana, the French also Gent ane, the Germanet Gentian, Enzian, and Bitterwurtz; but the Gentiana Conciata, they call Modelgheer; we call ir the bendances ther Gentian or Fellworte, mixed as I take of Latine and English together, or Bitterwort, and of in Englishment : all Authors doe generally call them all Gentians, and diftinguished according to the colour of

Contiane minores vernales perennes. The leffer Gentians of the fpring, abiding.

1. Genianella major feve Gentianella Alpina latifolia magno flore. The greatest small Gentian of the Spring?

Hisgreatest of the small Gentians is very like unto the Gentian of the Spring, that I have already set forth. yet it is not the fame, having larger greene leaves, of two inches long and one broad, formewhat round pointed, with three ribbes or veines running through them, as the others have, the stalkerising from the middle of these leaves, groweth about foure inches high, with a small leafe or two thereon, bearing at the end thereof alarge baske, instained by two small and long leaves, from the middle whereof shooteth forth a very large and great hollow blew flower, ending in five small points: the roote is small yellowish and fibrous, 2. Gentianella angustifolia verna. Small narrow leased Gentian of the Spring.

This small Gentian of the Spring, shooteth from the roote, which is long slender much spring and under the ground and yellowish, many heads of divers small long and narrow leaves set together, somewhat longer then then extra talt followers, from some of these heads, (for all flower not in one and the same yeare, those flowering theyeare following, which flowred not the yeare before, and those that did flower, not flowring againe the nenyare after,) rifeth up a small stender stalke, somewhat higher then the former, bearing thereon, two such like inall leaves at a joynt, and at the toppe one flower for the most part, (seldome more or the stalke branched) machimaller then the last, narrow long and hollow like a hole or huske of one entire leafe at the lower part, but ending above into five corners or small pointed leaves, laid open like a starre, having small peeces of leaves like an were eares, set at the bottome of the divisions of them, both of them of a perfect blew colour, but not so dere as the former, having a white line in the middle of each of them, and the ground or bottome of the flower whitifulfo, with a few threds standing about a small head, not to be seene until the flower be almost or fully pat, unless one open it; which after it is ripe is small and long, containing very small brownish seede.

3. Gentianella minor Verns. The smaller Vernall Gentian,
This limite Gentian groweth in all things like the last, saving that the leaves are not so long and narrow, but are

finall, adof the breadth of the naile of ones little finger, force what pointed at the end: the stalke is much a-bour the sime height, and beareth such a like small blew slower, somewhat pointed at the end: the stalke is much a-bour the sime height, and beareth such a like small blew slower, somewhat pointed at the end: the stalke is much a-bour the sime height, and beareth such a like small blew slower, somewhat pointed at the end: the stalke is much a-bour the sime height, and beareth such a like small blew slower, somewhat pointed at the end: the stalke is much a-bour the sime height, and beareth such a like small blew slower, somewhat pointed at the end: the stalke is much a-stalke is much a-st

4. Gentianella omnium minima. The least Gentian of all. This leaft Gentian (fo called because of the bitternesse in it, else it might very well be accounted rather a kind of mosse) spreadeth, and as it were matteth upon the ground, with many small and long leaves, among which

1. Gentianel's Alphna verna major.
The greatest of the small Gentians of the Spring.

Gentienella verna miner. The finaller Vernall Gentian.

TRIBE.

rife small little footestalkes, little more then an inch high, bearing each of them one flower, larger then the proportion of the plant may feeme to beare, of a pale blew colour scarse appearing out of the buske: the rooms imall and white. The Place.

The first groweth upon the Alpes, that are neere unto Switzerland as Baubinsus faith, The second groweth on the dry cold hils of Savoy. The third Clusius faith he found as well upon the Pyrenean hils neare Spaine, as all upon divers hils of Austria and Hungary, Gerard saith it is found upon Salisbury plaine, in Suffex, and nere & Albons. but I doubt he was miltaken, for that which groweth in those places, as farre as I can heare or learns. as also in many other of our owne land, is not this Vernall kinde, but some other, that flower some in the Son mer, some in Autumne, as you shall understand by and by. The last as Baubinus saith groweth upon the bile among the Switzers.

The Time.

The two first forts doe usually flower in Aprill, the third in May, and the last latest, and it is but casuall, if the flower at any other time, for their leaves abiding greene all the Winter, they do encrease at the roote and may be casily parted.

These are called by most writers, Gentianella quase Gentiana minor, and verne because they doe chiefely flower in the Spring time. Lugdunensis saith, they may be called Thylacitis major of minor. The first Banking in his Pinas and Prodramu calleth Genianella Alpina latifolia magno flore, as it none had made mention of it before himselfe, but affuredly it is the same that Lugdunensis setteth forth, although that of Lobel and Clusius bet leffer of that great fort, which is that I have already fet forth in my former booke, which he calleth Gentiary Alpina angustifolia magno store. The second is the Gentianella angustifolia of Lugdunensis, which different from the Alpina minor of Clusius, although Baubinus doth not distinguish them, but calleth it Gentianella Alpina major, when all others call it minor. Gefner in hortis Germania calleth it Calathiana verna, and Lugdunensis Hellebium Dalechampiy on Dioscorides. The third Clusius calleth Gentianella minor verna, and is thought by divers the Cantabrica of Pliny. Casaipisus taketh it to be Vincetoxici fieries pufilla. The French by a special name, call both the greater and the lesser of this fort Reperer. The last Baubinus calleth Gentiana omnium minima, as it is in the title, and peradventure is the Gentianella Bavaries of Camerarias in lus Icones, but that this he faith hath lower and that rounder leaves.

Gentianella astirve. Small Gentians of the Sommer.

1. Gentiana Pennei carulea punctata. Docter Pennies blew spotted Gentian-

I though I am in some doubt, whether this be a Gentian and dare not affirme it to be any of the great kind A of Gentian (and Clusius also to whom Dr. Penny gave both the figure and description, was doubtfull of 1. Gentiana Pennei carules puntlata. Dr. Penny his blew spotted Gentian.

not to be of the smaller kinde, let mee therefore place ireither as the last of the greatest Sommer forts, and least of them, or first of the Sommer kinde, but greater then any of the smaller, whose description is as followeth. It hath a joynted stalke about a foore and a halfe high, somewhat reddish toward the bottome next to the roote, with two leaves like the great Gentian, fet at each joynt, but much imaller, and with more veines or ribbes therein then it, each standing upon a reddish footestalke, greater below then those above, where they do in a manner compasse the stalke, from the middle of the stalke upward come forth the flowers at the joynts with the leaves, on both fides of the stalke, three for the most part standing together, except the uppermost of all, where they stand five together, each of them with a short footestalke under them, confifting of five small pointed leaves, spread like a starre, of a pale blew colour finely spotted, with many fmall blacke prickes on the infide, having a fmall umbone in the middle, and five small threds, tipt with yellow standing about it: the seeds that follweth, is enclosed in fuch heads or huskes, as the Gentians have: the roote is fmall and yellow, with many fibres annexed unto it. Hereunto I may referre another very like unto it, found in the North parts of this land, namely in Lancashire, by Mr. Hesket, a Gentleman in his life time very skilfull in the knowledge of Plants, whose figure I here exhibit, that Centiana fome other may be stirred up to finde it out againe, that we

dubia An may have further knowledge thereof. Heartlike Sommer Gentian.

This Sommer Gentian, hath a small long fibrous, but wooddy yellowish roote, (and thereby may be judged to be but annuall and not abiding) from whence arise small leaves, somewhat round pointed, with a greenish yellow tibbe in the middle of them, two alwaies fet one against

mother: the stalke is foure, about halfe a foote high, with the like leaves at the joyntes and divided from the modile upwards, into divers small short branches, on the toppes whereof stand very large slowers, in commiddle upwares of the Plant, which is of a whitish blew colour before it be open, and writhed togepartion to the many of the flowers of the small Bindeweeds, but being opened consistent of a long hollow round ther, users in five hard leaves, formewhat broad and pointed like a starre, of as brave a deepe blew colour. as hunte course in most a description of a solution and any of the former: betweene those greater leaves, there are other smaller leaves ser, each of them round at the ends and dented in, making them seems like unto a heart, as it is painted, from whence the name in the title ends and demind the first the first being not observed in any of the other; the seede vessell after the flower is past, groweth to have a small long necke, and bigger above, which being ripe openeth it after the head, contrary to the rest, containing within it much blacke seede, but twise as bigge and as long as the other.

3. Gentianella estiva purpuro-carulea. Small purple Sommer Gentian. This purple Sommer Gentian shooteth forth a reasonable strong stalke, a soote and a halfe high, with divers iomp, and two leaves at every one of them, somewhat broad at the bottome, where it joyneth to the stalke. joyne, and long pointed: the stalke at the toppe nothering any toolettake, whereon are fet five or fix or more small purplish blew flowers, ending in five small pointed leaves, after they are fallen and past, come up small long cornered pods, or seede vessels; conpunter that the punter is flender long and fibrous, and periffeeth after bearing, raifing it felfe againg from it owne fowing, and it it spring before Winter, it will endure it well and flower the next yeare, elle if it rife in the Spring, it will abide all the first yeare and flower and seede the next.

4. Gentianella eftiva flore lanuginofo. Sommer Gentian with a cottony flower.

This Sommer Gentian springeth up with many long and narrow leaves, lying in compasse upon the ground, with three vines in every one of them, as is utitalt in all or most of the Gentians, from among which rifethup a squirestalke, about a foote high or more, bearing at every joynt two such like leaves as grow below, but lesser and loser pointed: at the joynts with the leaves, toward the toppes of the stalkes, shoote forth two or three horbranches, bearing every of them three or foure flowers, larger then the former and bigger bellyed, ending in five points or leaves, of a paler purple colour, having a small purplish cottony downynesse, at the comme of each of the leaves, where they are divided on the infide: after the flowers are fallen, there appeare fmallong huskes, like hornes, full of small round seede, the roote is small and long, of a pale colour somew hat wooddy, perishing as all the Sommer kindes doe.

5. Gentianella aftiva flore breviore. Sommer Gentian with short flowers. This kinde of Gentian is somewhat like unto the last, but that the leaves are broader by the halfe, two alwaies flanding at a joynt, of a deeper greene colour, the stalke is square and branched at the toppe in the same manner, bearing divers flowers on every of them, which are both shorter and greater then they, and of a pale blewish colour, the feedes and rootes are much alike: all these kinds as well as the former are very bitter, which cause them

to be referred to Gentian.

6. Gentianella affiva minima Neapolitana. The small Sommer Gentian of Naples.

This small Gentian hath small square stalkes, little more then halfe a foote high, but suller of branches and flowers then the last, the leaves thereon are somewhat long and narrow, the stalkes are branched from the bottome, with many small flowers on them, standing in small huskes, which are long like a cuppe, the brimmes ending in four parts, formewhat diffant one from another, making the ends to feeme the longer, of a purplifh codivided, and white also on the inside, at the lower part of them, and of a paler purple about the edges; after which come up small long heads, forked at the toppe, wherein is contained small round shining yellowish feed, yet bigger then any of the former, the roote is longer and more full of threds or fibres then the last, foreading much under ground.

The Place.

The first as Clusius faith, Dr. Penny of London, thewed him the figure, and gave him the description, and told him that he gathered it upon Bockmut a hill of the Smitzers, and the other of that kinde, as is faid in some places of Lancashire, but we know not where. Columna faith he found the second upon the hils Aquicoli in Naples. The third and fourth groweth in the meddowes, at the foote of hills in many places of Germany, as Clufius faith. The fifth groweth on the toppes of hills onely, in many places of Austria. And the last on the hils in Naples as Columna faith.

These doe all flower in the Sommer Moneths of July, and August, and not before, the seede growing ripe soone after, which shedding themselves continue their kinds, but will hardly endure transplantation, or rise of the seed lowen in a Garden, as both Camerarius and others have observed, and my selfe can say the same.

The Names.

Thefe are called Gentianella aftive, and are media inter Gentianas & Centaurias minores, as partaking of both in forme and property, Clusius calleth them Fugaces, because they abide not a Winter, unlesse it be upon their first yeares fowing, that they doe not runne up to flower, for so they may be said to abide two yeares, yet they are called annuall in that they perish after flowring. Baubinus calleth them pratenfer, because they grow in meddowes, yet some of them are onely found on the toppes of hils. The first Dr. Penny called Gentiana punctata; but Clufus referreth it to the Classis of his Fugaces. Baubinus calleth it in his Phytopinax Alifma folio glabro but in his finax, Gentiana palustria latifolia store pantiato, Columna calleth the second Gentianella cerulea cor-data, for the causes expressed in the description, which Baubinus entitleth Gentianella utriculis ventricosis. The third is Clufius his first kind of Gentiana fagax, which Baubinus calleth Gentiana autumnalis ramofa; which title in my judgement is not correspondent to the Plant, as indeed in these small Gentians, as well as in many others, he is much and often militaken, making two forts of one, and fometimes milapplying the authors ritles, to those that are not right, for neither is this plant onely full of branches, to beare the title ramola, for others of this fort are so also, neither doth it flower so late to be made an Autumnalia, more then the other in this order,

TRIBE 2

TRIBE. 3.

which for the most part are past before the Autumnall kindes be in flower. The fourth is Clusius his second Go which for the most part are past obtained the manufacture of the fift is Clusies his third Gentians fugax, which Baubinus calleth Gentians pratents flore lanuginoso: the fift is Clusies his third Gentians fuga. which Baubinsu calleth Gentiana praienfis flore breviore & majore: the last Columna calleth Gentianella purpus

Gentianelle autumnales. Small Autumne Gentians

I. Gentianella Autumnalis Pneumonanthe dilta. The greater Autumne Gemian.

He greater of these small Gentians, that doth flower in Autumne, riseth sometimes with more, and some Trie greater of their falkes, sometimes also they rise higher, to be two foote high at the least, and sometimes itimes with fewer traines, tomerimes and they the figure, of a brownish greene colour, having many lag not above a foote high, according to the fertilitie of the foile, of a brownish greene colour, having many lag. and narrow darke greene leaves, fet by couples on them, up to the toppes, which feldome branch forth, but beit every one, a reasonable large hollow flower, bigger than any of the rest that follow, of a very deepeber. is purple colour in most, yet in some a little paler, ending in five points or corners: the rootes are many small and long, thrusting downe deeper for the most part into the ground, then those before named, and ability after feede time, not perifhing as the reft.

2. Gentianella autumnalis simbriato flore. Autumne Gentian of Naples. This Gentian of Naples, from a long yellowish small roote, creeping like Couchgraffe, doth shoote forthate long and narrow leaves, fomewhat like unto the leaves of Line or Flaxe, but shorter, but those that grown long and narrow leaves, the middle thereof are fill larger, and from the middle to the toppe, decreafing aging, but in all places two fet at every joint, and striped from every one of the joynts on both sides all the length of the stalke, which being greene and about a foote high, beareth at the toppe thereof a purplish greene cuppe of hale, consisting of four large pointed leaves enclosing the flower, which before it blow open is long and writhed a pale blew colour, but being open, is of a deeper blew colour, ending in four eleaves formewhat long, and ar were purfled about the edges, with a little hairinesse at them also, having a small lease at the bottome of each them, and a few yellow threds in the middle, standing about an umbone or head, which when the flower is & len groweth to be the feede vessell, forked into two parts at the head, where it is somewhat greater than into low, wherein when it is ripe is contained, very small blacke seede.

3. Gentianella autumnalis Centaurea minorisfolio. Autumne Gentian with small Centory leaves. This Autumne Gentian groweth up with fundry stalkes, not a foote high, parted into divers small branks. whereon frand two small leaves together, as is usuall in all the Gentians, very like unto those of the life Centaury, which are not so long as either of the former, a little broader and of a whiter greene colour : at the toppes of the stalkes and branches grow divers orient blew flowers, not so large as either of the two former, by

> 1. Pneumonanthe. The greater Autumne Gentian,

CHAP.26.

3. Gentianella autumnalis Centaurea mineris folifico Autumne Gentian with [mall Centory leaves.

fain small long huskes, halfe way rising above the toppes of tem, after which come small seede in long horned vessels. the roote is small and full of threds.

4. Alia flori Centaureaminoris similis folio majore. Another with small Centory like flowers.

Ihave scene in Mr. Thomas Pemble his garden at Maribone a for that was more foreading than the former forts, fmall but with larger leaves and flowers than Centory, and of the fame colour of the Centory flowers, yet more plentifully stored and longer lasting; the plant perishing as the other. Gentianella Centaurez minoris folio minor.

A smaller Gentian with Centory leaves. This small Gentian is very like unto the last, in the fashion and order of the leaves, but that they are somewhat smaller. and the stalke much lower, being not above three inches high, yet stored with many small branches, whereon are set long yet man done what large blew flowers, very like unto the leffer yenal Gentian, after which the feede and veffels being ripe hew to belike the last : the roote is likewise small, but with many more fibres thereat then others.

6. Genianella minima elegantissima Bavarica Camerarij. Other excellent forts of Autumne fmall

Gentians with Centorie like leaves. The greater of them spreadeth fundry branches upon the round, let full of small Centory like leaves, but a little pointed. and at the toppes of each, an orient blew flower made of five

leaves. The other is even the smallest of all, with small round leaves (which the cutter hath perverted) and Starre-like blew flowers like the laft. The Place.

The first groweth in many places of Germany, and other places beyond the seas, as also in divers places of our owne land. as neare Longfield by Gravefend, neare Greenehithe and Cobham in Kent, in the fields about Sir Percivall Harts house at Lellingfrom in Kent, and in a chalkie pit, not farre from Dartford in Kon hardby a Paper Mill, in the West Country also in divers

places: it groweth as well in wet as in dry grounds. The fecond groweth on the hills in Naples, as Columna faith. Thethird groweth in Kent in divers places, as about Southfleete and Long-field upon the Downes, as also upon Burm hills in Bedfordsbire, upon a peece of waste Chalkie ground, as yee goe out of Dunstable way, towards Gottambury, and not farre from the ruines of the old Cittle Verulam, which is not farre from Saint Albones : the fourth is not knowne from whence it came : the fift upon divers of the Alpes : and the last according to the title

The Time.

These flower for the most part not untill August, and that is later than the former, and therefore deservedly have the name of Autumne Gentians.

The Names. The first is set downe by Matthiolus, Lobel, Cordun, Clusius and others; some under the name of Gentiana minima, as Matthiolus : some Pnenmonanthe, as Cordus and Lobel; some Calathiana viola, as Gesner in hortis Germanie; some Campanula Autumnalia as Dodonaus, and of Lugdunensis Campanula pratensis: the second Columna onely mentioneth by the name of Gentianella carulea simbriata angustifolia autumnalu. Baubium calleth it Gentimella cerulea oris pilosis: the third is the tenth Gentian of Clusius, and called by Eystotensis horti author Gentian nella autumnalis folis; centaure e minoris flore caruleo. Lobel calleth it Gentiana minima, Bauhinus Gentiana angustifolia autumnalis floribus ad latera pilosis: the fourth is not mentioned by any before: the fift is the eleventh small Gentian of Clusius : the last is called by Camerarius, Gentianella elegantissima Bavarica; Bauhinus referreth it to the Gentiana verna Alpina, : I to the Calathiana verna Dalechampy of Lugdunensis; but that Camerarius saith it flowreth in Autumne.

The Vertues. The greater Gentians are more used in Phylicke with us then the smaller, although they be neare of one propertie, and almost as effectuall both inwardly and outwardly, and in the places, where the smaller are in plentie to be had, and the greater not fo readily to be gotten, they doe very well serve in their stead. They are by their bitternesse so availeable against putresaction, venomne and poyson, the plague also or pestilence, being a most certains and fire remedy, that the Germans account it their Treakle, holding nothing to be a more commodious counterpoilon, and for this purpose did formerly make a Treakle therewith and other things, at Iena which was transported into our country, and we thereupon called it *Iene* Treakle, made of Gentian, *Aristolochia*, Bayberies and other things, which were all good, wholesome, and effectuall for griefes and paines in the stomacke, and another things, which were all good, wholesome, and effectuall for griefes and paines in the stomacke, and another things. an effectiall medicine against the infection of the plague, to expell the malignitic of that, and all other infectious discases, and to preserve the heart, to strengthen it also against faintings and swounings; which Treakle was birther than the strengthen it also against faintings and swounings; which Treakle was birther than the strengthen it also against faintings and swounings; which Treakle was birther than the strengthen it also against faintings and swounings; which Treakle was birther than the strengthen it also against faintings and swounings; which Treakle was birther than the strengthen it also against faintings and swounings; which Treakle was birther than the strengthen in t ter, and therefore the more likely to worke these, and other good effects; but that leane Treakle, which hath fine crept into the place of it among the vulgar, because it is sweet and pleasant; is for that cause greedily sought after, and for the cheapenesse, of most forts of poore people desired, but there is nothing in it, that can doe them good, nor hath beene found to helpe them of any difease, being nothing but the drosse and worst part of Sugar,

6. Gentianella minima Bavarica Camerarij. Other forts, of Ausumne fmall Gentians with Centory like leaves.

whereby they pine away by a confumption.

408

hundred weights thereof, beene publikely purified in the open furcies, before their doores that fold it, as a just witnesses to all (if they would understand their owne good, and be persuaded by reason, true judgement and persence) that it is not a thing tollerable in a Common-weight that it is not a thing tollerable in a Common-weight of the common as in the matural of the common and the common as in the commo

perience) that it is not a thing contraine in a community to informe all of our countrie to fubmit their will and, and yet I hope not without good and just cause, to informe all of our countrie to submit their will an hand, and yet I hope not without good and just came, to another an of our countries or the wills at affections unto those of learning and judgement in Phisicke, and not be obtinate in their selfe willed opinion and ignorance; for affuredly if that kind of Icane Treakle were wholform or effectual to any good purpose, it

were as easie for the Phisitians to give way to the use thereof, as for any other tollerated medicine: but the in-

ing is most true, Nitimur invetitum semper, cupimusque negatum, the more a thing is forbidden the more iting

fired; for the wrong opinion of many is to thinke, that it is for the private profit of some that the thing is forthe

fired; for the wrong opinion of many is to thinke, that it is not the private profit of fome that the thing is total den, and therefore stollen bread is sweetest But to the matter now in hand. The powder of the dried roots who

present ease and remedy: being steeped in wine and drunke, it selections that are overwearied with the vell, and are by cold and ill lodging abroad, growen starke or lame in their joints: these also that have any giping paines in their sides, as prickings, stitches or the like: it helpeth those that are brussed by blowes or take by dissolving the congealed bloud, and easing the paines: the same also is held very effectuall againful again, as take of the roote not in wine, but some other drinke, or the water distilled of the herbe: the fresh roote, or the water distilled of the herbe is the fresh roote, or the water distilled of the herbe is the fresh roote, or the water distilled of the herbe is the fresh roote, or the water distilled of the herbe is the fresh roote, or the water distilled of the herbe is the fresh roote, or the water distilled of the herbe is the fresh roote, or the water distilled of the herbe is the fresh roote, or the water distilled of the herbe is the fresh roote, or the water distilled of the herbe is the fresh roote, or the water distilled of the herbe is the fresh roote, or the water distilled of the herbe is the fresh roote, or the water distilled of the herbe is the fresh roote, or the water distilled of the herbe is the fresh roote, or the water distilled of the herbe is the fresh roote.

dried made into a peffary, and put into the matrice, expelleth the dead child, and the afterbirth, for it through worketh upon those parts, and therefore not to be given to women that are with child, and being taken inwards

ly, procureth their courses being stopped, and the urine when it is staied: the decoction of the roote is merellous effectuall to helpe those that are pained with the stone: the same also taken in wine doth merellous

much good to those that are troubled with crampes and convulsions in any parts: it doth much good alon those that are bursten, and have any ruptures. Dioscorides saith that there is so great power and efficacionte

rootes hereof, that it helpeth not men onely, but beafts also that are troubled with coughes, and the outgoing of their intrails, and that it expelleth the wormes of the belly: it breaketh much winde in the body, and cutchi

to avoid; and generally it is availeable in all cold diseases, either inward or outward, and as Galen faith, is me

effectuall, where there is any neede to extenuate or make thinne, thicke flegme or groffe humors, clenfing of the control of t

rupt and filthy fores or ulcers, purging of peccant and offensive humours, and opening the obstructions of the liver and lungs, gall and spleene, and freeing the parts affected, with any the diseases incident unto them, and

these things, Galen holdeth it to worke by the facultie of bitternesse therein; for assuredly if our stomacker could

brooke this and other bitter medicines, and were not so nice and daintie to refuse what soever is not pleasing to

the palate, it would worke admirable effects in the curing of many desperate and inveterate diseases inwards,

and clenfing and healing foule corrupt and desperate sores and ulcers outwardly, and therefore the Italian me undeservedly, doe call the Gentiana cruciata, Petimborsa, quast mettere in bursa, put it into your purse, either a Matthiolus faith that it was to be gathered wherefoever it was found and fit to be kept in ones purse, asredyn be used upon all occasions, or that it did by curing of diseases, get store of crownes to be put into the pure; a excellent they accounted this roote and herbe to be used: the decoction of the leaves, or the juice of them, a the rootes, worketh the same effects: and so doth the distilled water of the leaves, flowers, and rootes, artificial ly made in Glasse, and drawen by the vapours of a Balneum or Hot water; for this water drunke, hathbened blood, and killeth the wormes of the belly: the faid water used to the face, clenfeth it from all forts of possible to the face, clenfeth it from all forts of possible to the face, clenfeth it from all forts of possible to the face, clenfeth it from all forts of possible to the face, clenfeth it from all forts of possible to the face of the ly therewith; the powder of the roote, or the juyce thereof healeth all wounds that are fresh; as also is most to veraigne and effectuall for all forts of foule, putride, or rotten ulcers wherefoever, yea although they behollow, or filtulous, cancrous also fretting or running, for it mightily clenseth and drieth and healeth up also: the ame also or the powder of the dried rootes applied to the ulcers, knots, or kernells of the necke or throate, which called the Kings evill, healeth them certainely and speedily, as also the painefull swellings of the hemorrhoidal veines, which are called the piles when they are fallen downe and grow vicerous or fore: the juice either find or condensate, that is, made thicke by extraction and evaporation to his confistence fit to be kept, is used to be fused into the eyes, to take away inflammations and rednesse in them, and to cleare & clense them from skins and filmes growing upon them : the roote or the juice of them, or the decoction of the herbe or roote, is given like wife very often to cattell to drinke, to free them from the Bottes, and wormes, and many other difeases, and when they begin to swell, being poisoned by any venemous worme or ticke, which they often licke up with graffe; as also when such wormes or other hurtfull vermine have bitten Kine by the udders or other tents places, which presently thereupon swell, and put the cattle to much paine, making them forbeare their ments which when the countrey people see, they bruising the leaves of any of the Gentians, growing neare unto the and wringing out the juice, stroke therewith the udder, or bitten place, and they by two or three times so down are helped and cured : the rootes of the smaller Gentian of the Spring, being dried and given in powder to at to drinke, will cause much venting or farting, and is given with good success to helpe the torment of the wind continued to the spring of the wind to drinke, will cause much venting or farting, and is given with good success to helpe the torment of the wind continued to the spring of the wind the spring of the spring of the spring of the wind the spring of the sprin collicke, and other fore and grievous panges, or paines in the stomacke or bowells, it is also prostable to here the yellow faundife, as also any evill disposition in the liver or body, engendred by long sickenesse or bad disCHAP. XXVII.

Scorfonera. Vipers Graffe.

TRIBE. 3.

I though I have fet forth in my former Booke two forts of Scorfonera or Vipers Graffe which are the Spannife kinde and the low purple kinde, yet because there are some others that Clusius and others have made mention of, and some also not yet published by any, I thinke it meete to declare all those not spoken of before, in this place and Chapter.

1. Scorfonera major Pannonica latifolia.

The greater Hungarian broad leafed Vipers Grasse. This greater Hungarian Vipers graffe is very like unto the Spanish kinde, in all things almost, the leaves herefare more in number, that rife from the head of the roote, as broad and long as they, but not crumpled about of arcume in the grayish greene colour, but smooth, and of a darke or evil greene colour; this hath two or the use. The rifing up among the leaves, and sometimes but one, according as the roote hath encreased into seve-nilbead, laving some lesser leaves upon them, and at the top, a scaly somewhat long greene head, from the midraincan, manife whereof groweth the like double yellow flower as the Spanish kinde hath, and the like feede also, lying in fuch down fullance, neither of them to be well discerned the one from the other, after they have growne any time down untailed in the roote also is long and great, foreading into many branches, and shooting forth into divers head, from the upper part thereof, blackish on the outside, and white and pleasant within as the other, welding milke in every part in the fame manner also, abiding many yeares and not perishing after seede time, as the Goare beards doe, whereof all these are accounted as kindes.

Scorsonera humilu latifolia Pannonica. The dwarfe Hungarian Vipers grasse.

This warfe or low Scorfmera, shooteth forth not so many long leaves but almost as broad as the last, somewhat lifter and shorter; and of the same greene colour; from among which risethup oue firme, but hollow and whatmen all the state of the st hower, out of use whitewithin yeelding milke as the other doth.
3. Scorfonera minor angustifolia Pannonica. The small Hungarian Vipers grasse.

This small Vipers graffe hath long and very narrow greene leaves, very like the leaves of Tragopogon or Goates beard, but shorter and not so many, the stalkes are slenderer and much lower then the first, bearing smaller and more fingle flowers upon them then it, and leffer feede, but like in all other respects, lying in such downer the roote likewife is long and blacke withour and white within, but smaller and slenderer, never growing to be balle to great, neither yeeldeth fuch ftore of milke as the other doth.

Nn

s. Scolbera major Pannonica latifolia. The greater Hangarian broad leafed Vipers graffe.

5. Scorfonera tuberofa radice. The imallest Spanille Vipers graffe.

2. 3. Scorfonera bumille latifolia & anguftifolia. The greater low, and the leffer tall Hungarian Vipers graffe.

CHAP

4. Scorfoners

4. Scorsoner i clatior angustifulia Pannonica. Tall narrow leated Purple Vipers gratie.

The taller purple Vipers graffe, hath many fuch like narrow long leaves as the last, and longer stalkes, with some lesser leaves on them, divided sometimes into two or three branches, bearing every one a small flower in unto the last, but of a blewish purple colour, standing in a shorter greene head, wherein is contained show and thicker seede, then in the former, the roote is long, and blacke without and white within, like the other, we yeelding also but little milke, yet abiding as the rest.

S. Scorsonera minima tuberosa radice Hispanica. The smallest Spanish Vipers grasse.

This leaft Vipers graffe hath divers leaves very small and narrow, lying on the ground, some rootes give smooth leaves, and others crumpled about the edges, the stalkes are very small, and scarfe rising three of inches high, bearing out of a long small scaly head, a very small and single pale yellow slower, wherein smaller blacke seedes, and enclosed in farre lesser downe, then in any of the other, the roote is as thicke as the singles or more, but much shorter then in any other kindes, blackish without, and somewhat whitish with yeelding very little milke, when it is broken, but abideth the Winter almost as well as any of the rest.

6. Scorforera Illyrica. Vipers graffe of Sclavony.

The multitude of long narrow leaves with three ribbes in them to the number of fifty or an hundred, and twenty flender stalkes, of small yellow flowers, and smaller seed after them then most of the former, the route ing blacke and thicke, maketh this kinde differ from the rest.

The first groweth in many places of Germany, Bohemia, and Hungary. The second on the hils by Baden in G. many. The third in many of the same places with the first. The fourth on a small hill night unto Stampfen, which is two Dutch miles from Posonium, a chiefe City in Hungary, and in other places thereof. The fifth growin Spaine, and good store of the rootes being brought hither, I planted some of them in my Garden, perceive them in forme to differ from others, which growing yeelded such leaves, flowers, and seede, as is before a downe. The last in Illyria or Solavonye, as Alpinus saith.

They doe all flower in May, and their feede is ripe before the end of Iune.
The Name.

The first knowledge of Scorfonera to the world, came by Monardun a tamous Physicion in Sivell, although i was found out, and the use of it likewise, thirty yeares before he wrote thereof, who made a small rather thereof. and of the Bezarstone, which Clusius translated out of the Spanish into the Latine tongue, and the lished it with other of his workes translated also, and annexed to his booke of strange or Exoticke things, when in it is set downe that a Moore, a bondslave did helpe those that were bitten of that venemous beast, (or Vige as it is called by others) which they of Caralonia, where they breed in abundance, call in their language Eleunia (from whence Scorfonera is derived,) with the juice of this herbe, and the roote given them to cate, which both tooke away the poifon and healed the bitten place very quickely, when Treakle and other things woulder no good, which ever fince hath growne in estimation, as well against venome or poyson, as against other dilets. as you shall heare by and by. The first is called by Clusius, Scorfonera major Pannonica, by Matthiellus Sossium, Bohemica, whom Lobel and Lugdunensis follow, Tabermontanns and Gerard, call it Germanica, and Babby Latifolia altera. The second is called by Clusius, Scorsonera humilis latifolia Pannonica, by Tabermontanu, Sca. fonera Pannonica, and by Bauhinus, Scorfonera latifolia humilia nervola. The third is called by Lobel Storfoun altera, by Tabermontanus, Scorfonera Germanica angustifolia, and by Bauhinus Scorfonera folys nervist. The fourth is called by Clustus, Scorfonera angustifolia elatior Pannonica, by Thalius, Scorfonera tenuisolia altera, w by Baubinus, Scorfonera angusts folia subcarnica. The fifth because it came from Spaine without any name. I but entitled it according to the face and forme thereof, Scorsonera minima tuperofa radice Hispanica, it is very no bable that Baubinus in his Prodromus doth meane this plant, it commeths o nere unto it which he there called Hieracium capillacco store, for he saith it better agreeth to a Scorsonera then Hieracium. The last Alpinus sand forth under the same title it hath, some doe call them Viperaria and Viperina, and some Serpentina. The Vertues.

Baubinus faith that the rootes of the Spanish kinde, hath in their naturall places some bitternesse, which is be so (for I never saw such) is not perceived in those that have growne many yeares in our land, it is very likely that the temperature of the Climate, doth alter in some part the bitternesse thereof; but Monardus writes, but those that grow in Spaine are somewhat sweete in taste like a Parsneppe, and may be eaten in the same mans, the roote hereof saith Monardus, whether raw or dressed, or condited, as also the juice of the herbe taken by themselves, or with any other cordiall or Counterpoyson, doth not onely helpe the biting of that so venemons Serpent the Ejeuerjos, but of the Viper, and all other virulent creatures, the water diffilled in glasses, is a prefentremedy for all contagious fevers, for by cauling sweate the infection is evaporated, and the ficke person flored, the same also or the roote it selfe taken, is good against the passions and tremblings of the heart, as the against swounings, sadnes, & melancholy: the roote preserved and taken fastings or the said water drunke for for dayes together, doth open the obstructions of the liver, spleene, and the other inward parts, as also helpeds bring downe womens courses, and to ease the suffocation, or other diseases of the mother whatsoever, win those feminine griefes it hath a very powerfull effect as hath beene often and certainely found true; it is also very good against the swimming or turning of the braine, and all other paines in the head, it is also very one all both to firengthen the vitall spirits, when they are much subject to faint or swome, as also against metando or fadnesse; that ariseth without manifest cause, if the clarified juice of the herbe be set in the Sunne for ceruis dayes, and the purer liquor thereof mixed with a little hony, be dropped into the eyes, it both cleareth and ftrengthneth the fight, and taketh away the foots and blemillies in them. The rootes preferved with Sugar, or not onely very pleasant to the talte, but effectuall for many of the aforesaid griefes.

CHAP. XXVIII.

Tragopogon. Goates beard.

Lthough it is not certainely knowne, that the Goates beardes have the like Alexipharmicall property, to expell venome and poylon, as the Scorfoneras or Vipers graffes, yet because they are so like unto them in ontward forme and manner of growing, they being but as species ejustem general, the Trappogens or Goates beard, being the standard or genus, and herein principally differing, that all the species epistem graffer feede time many yeares. I have thought it not amisse to joyne them in neighbourhood as they be in kinded, whereof there be sundry stores, some delivered in my former worke, others here to be expressed, and of them some not written of by any before.

I. Tragopogo astivum. Sommer Goates beard.

The Sommer Goatesbeard, (which I so call because it is but annuall, to be sowen in the Spring, and perishing in the end of Sommer, when it hath given seed is a small Plant, rising up with one stalke little above a foore high, whereon grow three or source long and narrow leaves, yet shorter then in any of the other, that hath been described in my former booke, broader at the bottome then they, and growing lesse by little and little to the end, of a pale greene colour, with a whitish ribbe in the middle: the stalke brancheth out into two or three parts, each of them bearing a large greene head, wherein is contained a small slower, of a pale purplish ashconing, opening onely in the morning, and shutting up before noone, the long pointed ends of the buske or head, wherein is not usuall in most of the other Goats beards; which being past the head grow-chiggam, having the outermost seedes greater and thicker then the rest, spreading one from another, with no downer all at the ends of them; but the singular seede being in the middle, are smaller then any of the other, the root is somewhat long wooddy; perishing before winter, and yeeldeth but a very little shew of milke, when the large are broken, or the roots being young.

2. Tragopogon minual luteum. Small yellow Goates beard.

The small yellow Goates beard, hath a small slender stalke, about a foote high, with very sew leaves thereon, which are somewhat long and narrow, as it were dented but rather waved about the edges, and of a pale greene color, at the toppe of the stalke standesh one greene head, like other Goates beards with pointed ends, encloing a largeslower of a pale yellow colour, like unto the greater yellow kinds, which yeeldeth small seed with downeas the endes of them, and spreading in the same manner, the roote is somewhat long, and yeeldeth milke such color doth.

3. Tragopogon lacinia tum majua. The greater Goats beard with jagged leaves.

This jagged Goats beard hath his first leaves long, narrow, and smooth at the edges, like unto the pulple Goats

1. Tragopogon assistant.

3. Trigopogon lacinia tum majua.

Sommer Goats beard.

The greater Goats beard with jagged leaves.

Tragopogon purpureum.
Purple Goatsbeard.

412 CHAP.28. beard, long and narrow at the bottome, and broader towards the ends, but those that rise up afterwards, and those that grow next unto them upon the stalke, are jagged or torne as it were on the edges, on both fides in fome leaves, and in fome but upon the one, in some also more divided, and others lesse, of a paler greene colour underneath then above; the stalke reite, or a paier greene colour two foote high, with such leaves but smaller on it to the toppe, but lesse divided, and the uppermost not at all, where it is branched into three or foure smaller parts, every one bearing a small greene head, like unto the ordinary kinde, not having any pointed leaves rifing up, as is in the purple and some other forts, enclosing within it a smaller yellow flower, then the ordinary yellow fort, opening in the mor-ning, and shutting at noone, which being past, there commeth fuch like feede, but smaller and not rough, the roote is long and blackish on the outside, and white within, yeekling milke as others doe, and perishing after seede time, as others

4. Tragopogon laciniatum minus.

The leffer Goats beard with jagged leaves. This leffer kinde, shooteth forth from a long and somewhat thicke roote, brownish on the outside, divers long and very narrow leaves, more finely cut in on the edges, and into farre smaller parts then the former, among which riseth up the stalke a foote and a halfe high or better, with some such like leaves thereon, but smaller, and lesse divided at the toppe where it is divided into three or foure branches, with every one a flower on them, like unto the last, but of a paler yellow colour, standing in greene heads, without beardes, as most of the forts of yellow Goats beards doe, and after yeeldeth the like head of long rough feede, with downe at the ends of them as others doe.

5. Tragopogon luteum angustifolium.

Common Goats beard with narrow leaves. This Goatsbeard is very like unto the common yellow kind, but that it is not fo great, nor rifeth up fo high, and hath much narrower, or rather graffe like leaves, and almost as long, the flowers are not so large, nor so thicke of land

and give the like feede. 6. Tragopogon hir sutum humile. Small rough Goats beard.

This likewise differeth not much from the last, but that it is lower, and the leaves are not so long and at row, but a little broader, shorter, and rough withall, on both edges fer with haires, as in the hairy wood gut the flowers are small and yellow like the last, but lesser, and so is both seede and roote.

7. Tragopogon Inseum Apulum. Goats beard of Naples.

This Goats beard of Naples, hath many very long narrow leaves, somewhat broader then the next small with ple kind, but somewhat hairy, some of them growing upright, and others bending downewards, among with a stalke rifeth scarse higher then the leaves, bearing a large greene bearded huske, contrary to all other, and yellow flowers, tontaining a flower which confifteth of many yellow flort leaves, more like a Hawke we then a Goats beard, which paffeth with the downe at the feed like others, and not halfe so great but yellow. and smaller at the lower end, where others are greater.

8: Tragopogon crocifolium purpureum. Small purple Goats beard. This small purple Goats beard hath many very long and narrow leaves, lying on the ground at the headst roote, the stalke divideth it selfe into three or foure reddish branches, set with some leaves thereon, all of the narrower then graffe leaves, very like unto the narrow long leaves, of the manured or English Saffron with white line downe the middle of them, and hard in handling, each of the branches begring a branded greene mid. with a darke purple flower therein, dented at the endes of the leaves thereof, and having wellow three free led with meale as it were in the bottome of them, as the greater purple flower hath, and openeth but is the # ning, and closeth at noone in the same manner, after which come the seede, speading into a round plots head, with the downe at the ends of them, as in the greater, the roote is great and long, yetding mile we

others. 9. Tragopogon Apulum suave rubem. Rose coloured Goet's beard. The Rose coloured Goats beard sendeth forth many long and narrow leaves like into Grasse, with a whole in the middle of them, smooth and gentle, if you take them upwards, but as rough as Barly leaves, smooth me downewards, and broadest at the setting to of the stalks, which is two soots high, scartely dividing it into any branches, but beareth at the toppe one large and great head, in sespect of the Plaint, paned and long leaves or beardes, in the middle thereof is the flower, consisting of tenne of twelve leaves; of a pulpiple or blush colour, neere unto a Damaske Rose, having divers blackish blew threds in the middle of themsia a mealy dust upon them, which being nast, the head or bustle grounds the account with a long mida mealy dust upon them, which being past, the head or huske groweth formewhat narrow, with a long not containing within it the feed, which is not fashioned into a round globe, with downe as his head of the feet. as in all the former except the first, it hath five longer and greater leades on the outside, with little or no down at the ends of them, and the lesser in the middle, with a little downe at the ends, which are yellowish and small have the less of all others. but the least of all other : the roote is long and slender, even the smallest of all, white downewards and some

hard but more reddish at the toppe. This is very like the former or annuall Goates beard if it be not the same. hard Dutinion in his Hortus Medicus maketh mention of one with a white flower, which I never faw yet nor heard Flore-tive of by any other. The Place.

The full was fent me out of Italy among other feedes, but from whence they had it I know not. The fecond or Bentum faith groweth about Mompelier, and so doth the fourth also. The third groweth in many places. both in Italy and Spaine, tor I had feedes thereof out of Spaine, by my friend Boelus that gathered them: the fift Thund in the Medowes at out London, and other places of our land, but not so plentifully as our greater I found in the fixth, seventh, eighth and ninth, grow on the hills in Naples, as Columna recordeth, both in his Photobalanos, and stirpium minus cognitarum historia.

Theredoes flower about the time of the others, which is in the end of May, or in Iune, and the feede is ripe foot after : but all of them, except the first, doe abide greene the first Winter after it is fowen, or doth rife of isowne fowing, and flowreth and feedeth the next yeare after: but the first as I said, flowreth and seedeth the same yeare, and must be new sowen every yeare, for I never knwit fpring from any secces that it shed The Names.

Itis called in Greeke, τουρπάρων, and τραμετώρον, Tragopogon, Barba hirci and Barbula hirci, and γεοιθοπάρων Baba lenis, quod a calyce femina promisca hirci vel fenis barba instar pendent ; fo fay both Dioscorides and Theore with . The first came to me with the same name, I have set with it in the title Tragopogon aftivum : the second Bashinst calleth Tragopogon folio oblongo sinuato: the third, both Anguillara mentioneth, calling it Acorus Theo-Bushis he faith others did, and Fabius Columna in his Phytobofanos Tragopogon latiniatis folipi. The fourth Bushis he faith others made the first the first is called by Tabermont anns Barbula birei minor, and by Bushimu Tragopogon gramineo folio radice villofa. The fixt Columna calleth Tragopogon Apulum hirfutum humile; and Bankou Tragopogon hir stum, The seventh Columna calleth Tragopogon Apulum humile hir sutum lutenmithe eighth Came allow Tragopogon or Justin. He leventh Countina callecti 1 ragopogon appairm comme curji um intermitte eighth Came allo callett Tragopogon provocofolium montanum flore nigro purpureo, and Banbir un Tragopogon provoco carule-amaricafolium. The last is called by Columna Tragopogon gramineo folio fuzve rubente flore. Some have deubted that this is not the Tragopogon of Dioscorides and Theophrassum, because the leaves of the most of them are greater than the leaves of the Saffron, but notwithstanding it is generally taken to be the right, because of the head of feede, which agreeth fo well thereto, as no plant elfe can doe the like; and befides Columna hath fet forth fome ofthole before recited, which agreeth better with Dioscorides and Theophrasius Saffron leaves, than any of the rell, which therefore he taketh to be the trueft. It is called in Italian Saffifrica; and with se me Saffifica, and barka dibeco in Spanis Barba Cabrona, and Barba di Cabron : in French Barba de bouc : in High Dutch Bock, bart : in Low Dutch Boexbaert ende Iosephs bloemen : in English Goates beard, and goe to bed at Noone, or Noone tide, and of some Starre of Ierusalem, and others after the Dutch word Isfephs flower : of some also Saxifrage.

The Vertues. The roots of the greater wild yellow kinde chiefely, as also of the other kindes here set forth, being dressed as a Parineppe, is more delicate and pleasant to the taste in eating: the rootes boyled and dressed (or as some do eate them taw) is a fine fallet like wife to be eaten cold, and are very acceptable to the stomacke, helping to strengthen them that are growing into a confumption, or are become spare and leane by some long sicknesse: the distilled water faith Trages, is the most present remedy that is to helpe inward impostumes (such as is the Pleurisie) and all other paines and stitches in the sides: the Italians use it much and often against all the griefes of the flomacke, both to take away the heart burne as we call it (which is an hot and fharpe humour in the flomacke fretting and paining it) and doth helpe also in a dejected appetite, to incite and stirre it up, as also against the delects of the breast or liver, and to helpe to expell gravell and the stone from the reynes, kidneies, and bladder, whereof the name Saffi frica, which is as much as breakestone, declareth the propertie : fon e doe hold opinion, that the purple and ashcoloured kindes being more bitter, astringent and abstersive, have a more binding and dening qualitie than the others, and are therefore onely to be used for medicament, and the others as nutriment, and that they onely are effectuall to all the purposes before recited.

CHAP. XXIX.

Echium. Wilde Bugloffe, or Vipers Bugloffe.

Luftin that painefull and industrious searcher of plants, hath given us the knowledge of many more sorts of Vipers Buglosse as he hath done of many other plants, than any before him; whereof I meane to entreate in this place, and with them some others also.

1. Echium vulgare, The common Vipers Bugloffe. The common Vipers Buglosse hath many long rough leaves, lying on the ground, from among which rise up divers hard round stalkes, very rough, as if they were thicke set with prickles or haires, wherein are set, suchlike long rough hairie or prickly fad greene leaves, somewhat narrow, the middle ribbe for the most part being white: the flowers frand at the toppe of the stalkes, branched forth into many long spiked leaves of slowers bowing or turning like the Turnesole, all of them opening for the most part on the one side, which are long and bollow turning up the brimmes a little, of a purplish violet colour, in them that are sully blowne, but more reside, which at little, of a purplish violet colour, in them that are sully blowne, but more reddish while they are in the budde, and not blowen open, as also upon their decay and whithering, but in fome places of a paler purple colour, with a long pointell in the middle, fethered or parted at the toppe: after the flowers are fallen, the feedes (growing to be ripe, and enclosed in round heads) are blackish, cornered and pointed formulas title feedes (growing to be ripe, and enclosed in round heads) are blackish and wooddy. pointed somewhat like unto the head of a Viper: the roote is somewhat great and blackish and wooddy, when it groweth toward feade time, and peritheth in the Winter.

2. Echium valgare flore albo. White flowred Vipers Bugloffe.

There is little difference in any thing betweene this and the former, but in the colour of the flowers, which this is of a white colour wholly, and the leaves of a little fresher greene colour, and in some places growth

3. Echium flore rubro. Red flowted Vipersi Bugloffe.

The red wilde Burdotte is also like the former, but that his hairy stalkes are sometimes marked with purish from and the leaves thereof formewhat broader : the flowers which fland in the fame crooked and bowing man ner, upon short foote stalkes, are of a brave red colour, and in some a little paler: the seede and rootes are all and differ not.

4. Echium pullo flore. Vipers Euglosse with das ke reddish purple flowers.

This wilde Bugloffe hath shorter stalkes, and not so rough, but rather soft and woolly, whereon standleaver. more thinnely placed, and without order: toward the toppe of the stalkes it brancheth forth into divers there fprayes, with some flowers on them, but not so plentifully as in the former, and are of a dead or darke blacking purpler colour: there is no difagreement either in feede or roote.

5. Echium Creticum latifolium rubrum. Red flowred Vipers Bugloffe of Candy.

This Candy wilde Bugloffe, hath large rough leaves lying on the ground, of a fife betweene Bugloffe and Ptatane leaves, betweene whom rifeth up round rough ft alkes, two foote high, fometimes divided into many but ches, with divers rough smaller leaves on them to the toppes, which are bowing in the same manner with the former, from whence grow holllow flowers, ending in five cornered brimmes like unto the reft, of an exceller pale red or blush colour at the first, and more purplish afterwards, standing in rough huskes, made of five final leaves a peece: the feede that followeth is like the reft.

6. Echism Creticum angustifolium rubrum. Spotted V pers Buglosse of Candy.

This spotted wilde Buglosse hath rougher leaves and stalkes than the last, rising not fully so high, but both flalkes and leaves marked with red spots, almost as much as the stalkes of Dragons, but the spottes on the lemp are paler than on the stalkes: the leaves are very long, but narrower than the last: the flowers stand in the sum manner that the others doe, of so orient a red colour, that they will not lose it, but keepe their bravery the many yeares keeping drie : in the rest it is like the former.

7. Echium pumilum flore luteo. Dwarfe yellow Vipers Buglosse.

This dwarfe kinde is in all things like the former Vipers Buglosse, but in the smallnesse of the wholeplam, at growing to be a foote high: the leaves likewise are thereunto answerable, and so are the flowers also, of and yellow colour but not fo bushie as it.

8. Echioides lutea minima. The least yellow bastard Vipers Buglosse. This little bastard wilde Buglosse, hath divers leaveslying upon the ground, not above two inches long, and

1. Echium vuigare. The common Vipers Bugloffe.

Echium flore rubro. Red flowred Vipers Bugloffe.

4. Echium pullo flore. Viners Bugloffe with darke reddish flowers.

TRIBE 3.

11. 12. Echium Creticum album & nigrum. Hoary white and blacke Vipers Bugloffe of Canto.

ax full halfean inch broad, thicke, rough, and a little hard, but those that grow upward upon the stalke which is a foote high, are somewhat broader, rough and whitish, the leaves that grow towards the toppes being marked with yellowish purple spots : the toppe of the stalke is branched, and beareth small yellow long hollow flowers, like the other; the keede contained in the huskes are small, foure for the most part set together in a head or huske, and somewhat like the rest: the roote is small and somewhat long, browne on the outside, and white within.

9. Echioldes parva alba. The small white Vipers Buglosse. This small white wilde Buglosse, is in most things like unto the last, but that the leaves have no spots upon them, and the flowers are pale almost white : the feede differeth not, but the rocte is very small and threddy, yes browne as the other.

10. Echium Hispanicum flore calcari donato. Small Spanish Vipers Buglosse with spurres. This small plane which Baubimus referreth unto the kindes of wilde Buglosse, because I am not well acquainted withit, must passe as he hathcalled it, and that you may know it, he thus describeth it; from a wooddie sibrous browne coated roote, rise divers round and somewhat hairie stalkes, some of an hand breadth long, and others honer bending downewards, compassed with a few thicke leaves, like unto the mountaine Speedewell but thicker and rougher: the flowers that grow at the tops, are hollow, long, and ending in foure brimmes like unto the other forts, but of a blew colour, having a spurre or taile behind, like those of Todeslaxe: the seede is long.

rough, and blacke like the other. 11. Echium Creticum album. Hoarie white Vipers Buglosse of Candy. This Candy plant hath many thicke long and narrowith hoary leaves, formewhat like those of Alkonet, set full of sharpe haires, from whence rife fundry small hand-high stalkes, round and rough likewise with a few smallerleaves sparsedly set thereon, at whose toppes stand tures of yellow flowers in small long rough huskes unto whom small white seede doe succeede of the likenesse of Vipers heads, and of the bignesse of wheate cornes: the roote is long blacke imail and woddie, divided into other imaller partes.

brimmes, fome of them being blew, either pale or deepe, others more purple with four or five small threds in their middles, after whose fading rise blacke Viperhead-like seede in long code, or seede vessels; in whence the name of that, was imposed so diffinguish it from the other with white seede; it hath a single long white roote of a thombes bignesse, and small at the end: the whole plane is of little sent, but of a sweetish sharpe

The Place.

The first groweth wilde almost every where. The fecond about the Castle walles of Lewes in Suffex. The thing and fourth in Hungary, and Austria. The hith and fixth in Candy. The feaventh and tenth in Spaine. The eight and ninth on the hils in the Kingdome of Naples, as Columna reporteth. The eleventh and twelfth in Cast The Time.

They all flower in Sommer, and their feede is quickely ripe after.

The Names.

It is called in Greeke E zie Echium, aru ?id Stor & ar util v Alcibiadion, and Alcibion, or Alcibiacum, of the fif finder thereof, who being bitten by a Viper, gathered this herbe, and chewing it, and swallowing downe the juice, and applying the relt of the herbe to the bitten place, freed himselfe from danger, spuleius faithit ward led one officer theriorrhizon, Viperce radix and exister, trom the forme of the feede, which as Dioftorides faith tile the head of a Viper, and thereof tooke the name Echium, yet some others say from the effects in the rootes, in the rootes, in the tooke the bitings of the Viper, in Latine also Echium, of most Authours, yet of some Buglo sum silve fre vipering & Serpentaria, and some also tooke it for Anchusa, as 7 haline, and Casapinna, and under that name saith the feede of the Candy forts were fent him. Cordus on Diojeorides called the first Lycopfis and Lonicerus Bugliffe Streftre. Camerarius and Matthiolus mention the second, Clusius the third, fourth, fifth, and sixth, and the feventh in his Cure posteriores, Columna the eighth, and ninth, and Bauhinus the tenth, under their severall tile as they are here expressed, the two last by Alpinus in his booke de plantis exoticis. It is called of the Italian Ethi and Buglossa Salvatica. Of the Spaniarar Yerva di las bivoras. Of the French Borrache sausage, and L'hobissa viperes. Of the Germans wild ock fen fong. Of the Dutch men wild offentonghe. In English wild Bugloffe, m Vipers Bugloife.

The Vertues. It is as you have heard, by the first finder out of it, an especiall remedy against the biting of the Viper, and all other Serpents or venemous creatures, as also against poylon, and poylonfull herbes, it is added further by Dioscorides and others, that whosoever shall take of the herbe or roote, before they be bitten, shall not be him by the poyson of any Serpent. And I thinke from this and some other the like qualities in herbes, to heale the diseases, whereof some forme may be seene in them, hath come the application of many other, whose some have beene imagined to have beene found in them, which they call Signature plantarum, whereof Crollininhin Bastica chymica, hath given demonstration of all the parts of the body, from the head to the foote, and note. over of many the diseases of the body, and of divers other things, whereof they that will reade his workener be better informed that desire the knowledge thereof; the rootes or seedes, are thought to be most effectuall in the foresaid causes, as also to comfort the heart, and to expell sadnesse, and causelesse Melancholy, it temper the blood, and allayes the hot fits of agues, the feede drunke in wine procureth aboundance of milke in women brests; the same also being taken, easeth the paines in the loines, backe, and kidneies, the diltilled water of the herbe, when it is in his chiefest strength, that is in flower is excellent to be applyed inwardly or curwardly for all the griefes aforesaid. There is a syrupe made hereof, very effectuall for the comforting of the heart, and the pelling sadnesse and melancholly, which is made in this manner. Take of the clarified juice of the com, mon wilde or Vipers Buglosse foure pound, of fine Sugar three pound, of the infusion of the flowers thereof one pound, boyle these gently unto the consistence of a syrupe, which keepe by you, to use as you shall have cause. But because it is somewhat hard to presse forth this juice, by reason of the sliminesse thereof, it is st that after you have beaten the herbe well, you fet it close covered in a cold cellar, or other cold, and most place for two daies and nights, and then wring or presse forth the juice, and clarifie it with the whites of egges beath and passed gently of it selfe, through a thicke Hippocras bagge; and because many know not how to make in insulin, before spoken of rightly as it should be, it is thus. Gather of the flowers of the said wild Buelos, a good quantity, which you shall put into a pot, with some water, being made boyling hot aforehand, slope the pot close untill it be cold, and then wring forth the infinion; you may renew the infulion, by purting in freh flo wers as before, once or twice more, if you will have it strong of the slowers.

CHAP. XXX.

Fraxinella sive Diptamnus albin. False white Dictany.

Have given you the descriptions of all the sorts of false Bastard Dittany, or white Dittany, in m former Booke, whereunto I referre you. I shall onely here exhibite the figure and amplife the

Fraxinella may more fitly be called false white Dittany, then bastard Dittany, because there is one already fer forth in the first Tribe or Classis by the name of Pfeudodittammus, Bastard Dittany, lest two herbes should be called by one name, and then neither should be well understood when they were alled for: distinct epithites is most requisite therefore to avoid confusion.

The Vertues. The false white Dittany then is heating and drying, the rootes which are most in use doe attenuate or make the groffe humours, it openeth obstructions, provoketh the menstrnes and urine, and clenfeth that which is souleand contagious. It is very effectually both against poyson, and the venome of Serpents, and other poysonfull cratmer. and against the peltilence, and other contagious diseases, to take a dramme or two of the powder of the roots wine or brothithe fame also taken, killeth the wormes of the belly, breaketh the stone, causing it to avoid in the rine, it warmeth and cleanfeth the matrixe, expelleth the dead childe, and after-birth, if the part before migated with it and Penniroyall, or taken in Wine: it eafeth the paines and torments in the inward parts or bow els, and healeth inward hurts and wounds: it is much commended against the Epilepsie or falling sickness, sade ther cold griefes of the head and braines, and is hel 1 to be of great good use against the French disease, to use with the decoction of Guaiacum.

Fraxinella vulgeria.
The most common falle white Dittany.

CHAP, XXXII

Gelege. Goars Rue.

Coule this herbe is so effectuall against all insection on the could do no lesse their limer it here, and take it from the other leguminous plants, where it might be placed, which otherwise I would not have done; and hereunto I must adjoyne another, for the necreness, both for forme and vertues,

I. Galega vulgarin. Common Goats Rue.

The common or most usuall Goars Rue, sendeth forth many tound hard stalkes, foure or five foote high, whereon grow one above another at severall joynts, long winged leaves, that is, many leaves set on each side of a middle ribbe, which are small yet fomewhat broad and long, and pointed at the end, fmooth on the edges without any dentes, fomewhat like unto the laves of Virches, and of a faint greene colour, at the toppes of the flakes frand many small Leguminous flowers, one above another, of a pale blewish purple colour, and in some plants pure white, after which come small round pods, about an inch and a halfelong, a little bunched out in forme places, but no thing fo much as the Orabus or bitter Vetch, wherein lie three or fore or five small pale feede like unto a Vetch : the roote is whiteand wooddy, spreading well in the ground, and abiding

2. Galega mouteus Dalechampiy

Mountaine Goats Rue. This other Geats Rue shooteth forth divers round hard falket nothing to high as the former, whereon groweth such together, smooth also on the edges, but having the middle 1. Galega five Rata Capraria.

ribbe of every leafe, raifed up a little high : at the toppe of the stalkea stand divers such like flowers as the far. ribbe of every leafe, raifed up a little nign = at the toppe of the latterward yield finally long, blackiff, pot, mer, but all on one fide of a pale colour, tending to yellow, which afterward yield finally long, blackiff, pot, and the latter and blacke fording to yellow. mer, but all on one lide of a paie colour, tenning to yourway, which are made and blacke, fending forth very wherein lie small flattish seede, like unto Lentills: the roote is somewhat great and blacke, sending forth very long strings, whereby it fasteneth it selfe deepe in the ground.

The Place.

The first groweth commonly wilde by the way sides of moist fields and medowes, both in Italy, Savoy and ther places; as also found of late growing wilde in the Medowes by Linton in Cambridge foire: the other parts upon the toppes of mountaines, where any plaines are found.

They flower in the end of Iune and Iuly, and the seede is ripe in August.

The Names.

This herbe hath not beene knowne to the ancient Authors; and therefore hath no name, but is ufully called I his herbe nath not been knowne to the answer manior, and the vertues, gave that name of Rute thereum, a finding it no lesse effectuall than the best Rue : some call it Gralega, and some Herba Gallica as Fracastorius; a of some Capraria: the Florentines call it Lavanes; in other parts of Italy it hath divers other names as Gin of some Capraria; the Florentines can it Laurina, Martanica, Sarracena, Capragina, Herbanefe, and Giarga as Bra volus faith. Some with us call it Italian Vetch, but most commonly Goares Rue. The other Lugdanensis called Galega montana; and Baubinus referreth it to the Orobus Pannonicus of Clusius, which it cannot be, for he fithe perisheth every yeare; and also to the Arachus latifolius of Dodoness, which it cannot be neither, for Dodoness faith, his Arachus is called of divers Ervum Venetum, which differeth little or nothing at all from Chifin be first Orobus Pannonicus, so that in this, as in very many other things, he is much mistaken.

The Vertues.

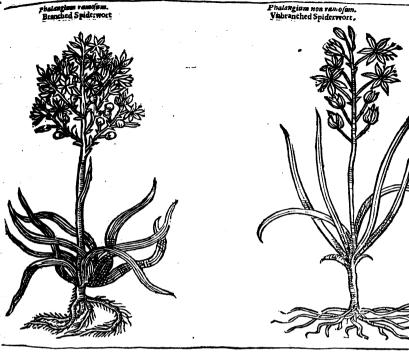

Goates Rew is most effectual against the bitings or stings of any venemous creature, yea those Italian and thers (as Pena and Lobel say) that use to gather Vipers (which are certainely Adders with us, by the judgment of the best) doe account it more effectuall to preserve them being bitten or stung, than any Treakle of thebe making, or to defend them from any other infection, and therefore eare it continually, as other herbes in fallence otherwise in their meates and brothes. It is no lesse powerfull and effectuall against poison then the plague po filence, or any infectious or pestilentious fevers oridifeases, that breake forth into spots or markes, as the metide purples, and the small pocks, in all which it is admirable, what effects it worketh, both to preserve from the infe ction, and to cure them that are infected, to take every morning some of the juice thereof, as also to cate the best it felfe, every morning falting, but it will be the more effectuall if the juice be taken with a little good Traile and some Tormentill rootes in powder, mixed with Cardus beneditive water, or with some vinegar and sine Bob armonicke, and Treakle in the faid water, and presently to sweat two houres thereupon, which it causes the in some sort it selfe, and may be used as well when any is insected, as when any seare themselves to be insected. with the plague; a spoonefull also of the juice given in a morning fasting, is very effectuall to kill the women children, or the herbe it selfe fried with a little oyle of bitter Almons, and laid hot unto the navell, as allow helpe the falling sicknesse before it grow strong, and old upon them; it is very profitably applied to the billy pained with gripings of winde and the collicke, being fried and laid to warme a in the fame manner allo ha pained with gripings or winde and the content, being tried and laid to warmer. In the laine manner allo me upon plague fores before they be broken, either dispersesh them (yet defending the heart, not striking it is wardly) or draweth them forth, and healeth them: it is also effectually applied with vinegar to gaugest running ulcers and sores, to stay the malignitie of them in their fretting and spreading, and to desend by the spirits from danger: it is held also to be very cordial to preserve this heart from palpitations, members. Iwounnings, and against melancholike vapours oppressing it. Some use a Syrupe made of the juice, and long the distilled water as a more familiar medecine, to take upon all occasions inwardly, for all the purposes in faid; and some use to make an oyle of the flowers digested in the Sun, by often repetitions of infution to make the wrests of the hands where the pulse is felt, as also the region of the heart, to defend it from the diseases after faid, and danger of infection: it is no lesse effectuall for Sheepe, Goates, and Cattle, for from the experience Goat-heards therein, came the name of Capraria added unto it: it fatteneth hennes also wonderfully, and cafeth them to lay egges the more plentifully. The other Mountaine Goates Rew, is held also almost as estimated against poyson and infection of the plague as the other.

CHAP. XXXII.

Phalangium. Spiderwort.

Here are divers forts of Spiderworts, some of antient knowledge, others of later accesse, of all which I have given the descriptions in my former Book, which although I means not to repeate here again yet I thinke it not amisse both to give you some of their names & figures, and to set down their terms. tues. It is thought it tooke the name and your and sanayour, Phalangian and Phalangite from

forme of the seede vessells, others from the forme of the leaves like to that Spiders legges in goth but more certainely I thinke from the propertie of curing the dangerous poison of that great Spiders For what purpose both Dioscorides and Galen doe commend the flowers, leaves, and seedes of it, as also against the reliencie of Scorpions and other Samuel of the Scorpions and other Samuel of Sc lencie of Scorpions and other Serpents, and to discusse the torments that rise from their hurts or otherwise. The names of those described are these Phalangiam Allobrogicum: The Savoy Spiderwort: Phalangiam majus Islam album. The greater Isalian Spiderwort. Phalangiam majus Islam ramojam. Branched Spiderwort. Phalangiam mon ramojam on John Tradefami. The soon islam or ramojam of Dirginia, or John Tradefamis Spiderwort of Dirginia, or John Tradefamis Spiderwort of Dirginia, which is of a deepe purplish blew colors. whereunto may be added of later knowledge one with a white flower, and another with a reddith or Caraca

CHAP. XXXIII.

Petafites vulgaris. The Butter burre.

HE Botter burre is of two forts, the one greaterthe other leffer, differing also in the flowers, as you shall heare: but because they are so like one another, one discription shall serve for them both. Each of them rifeth up very early in the yeare, that is, in February, with a thicke stalke about a foote high, whereon are fer a few small leaves, or rather peeces, and at the toppes a long spiked head of flowers, in the one which is the lesse and the more rare to finde, wholly white and of a better fent than the other (yet fome fay it hath no fent) in the greater which is more common with us of a blush or deepe red colour according wthe foile wherein it groweth, the clay ground bringing apaler colour somewhat weake, & before the stalke with the flowers have abidden a moneth above ground will be withered and gon, blowen away with the winde, and the leaves will beginne to fpring, which when they are full growne are very large and broad, that they may very well serve to cover the whole body, or at the least the head like an Umbello from Sunne and Raine, being fonewhat thinne and almost round, whose thicke red foote stalker about a foote long, stand toward the middle of the leaves; the lower parts being divided into two tound parts close almost one to another, and of a pale greene colour above, and hoary underneath, that with white flowers bringing smaller leaves than the other, and having divers ribbes and veines therein a the roote is long and foresding under ground being in fome places no begger than ones finger, in others much bigger, blackish on the outside, and white within, of a bitter and unpleasant

Petafites vu garis. The common Butter burre.

The Place and Time.

Both these forts grow in low and wet grounds by rivers and waters sides, their flowers, as is said, risingal decaying, that is, in February or March before the leaves appeare in Aprill. The Names.

It is called in Greeke relacirus, and Petastes also in Latine, deduced a Petaso, ideft, magno galero itanion aleri supplere possit. Some take it to be Iphium of Theophrastus; and some to be Personata or Persolata of Pin galers supplere possir. Some take it to be approximated a respect of a merarius in horto calleth the more common mas, and the other femina; but in his Epicome upon Manhida, h. and Matthiolus call the greater fort Tuffilago major. The Italians call it Capellazi; the Spaniards Sombrems the French Herbe aux tigneux : the Germans Peftilentz wurtz; the Dutch Dock bladeren. The Vertues.

The rootes hereof are hot in the first degree, but as Galen faith drie in the third, and are by long experien found to be very availeable against the plague, and pestilentiall severs by provoking sweat, if the powder then be taken in wine; as also resistent the force of any other poyson; the roote hereof taken with Zedoaria and day gelica or without them helpeth the fuffocation or rlfing of the mother : the decoction of the roote in wineles taken is fingular good for those that wheele much and are short winded: it provoketh arine also and women courses, and killeth the flat and broad wormes in the belly the powder of the roote doth wonderfully belgen drie up the moilture of fores that are hard to be cured and taketh away all spots and blemishes in the skinne

CHAP. XXXIV.

Polyrhizos Virginiana. The rattle Snakeweeke of Virginia.

A Ballis plant of Virginia so certaine a remedy against the biting of that venemous rattle Snake, a thr call it which breedeth in Virginia, must not be forgo: ten among the rest, for it is a Counterpoison, be compared, and I thinke preferred before any the foreremembred molt foveraigne plans god poysons: whose description as farre forth, as hath yet come to our observation, is this: It riches with divers small square stalkes, spreading not much above halfe a foote long, whereon are sending duskish hoary greene leaves, somewhat rugged as it were with many veines, and somewhat resembling theland of Pistolochia, whereunto it may be referred but smaller, set without order one at a joint: the flowers growmen at the bottome of the stalkes next the roote than on the branches as the Pistolochia doth, and are not much milite. but of a darke or fullen yellow colour, and somewhat lesse also; after which come very small heades with some somewhat like to the Pistolochia but lesser: the rootes are a number of very small blackish gray sibring threds, as small almost as haires, which have both an aromaticall and resinous smell, when they are drie, nor than when they are greene, and of an aromaticall refinous aftringent tafte, without any great or manifeld

Po'yibiqos Virginiana. The rattle Snakeweede of Virginia.

The Place.

It groweth very frequent in the upper parts of our Virginian plantation, in the fields and champion commit. where under the graffe and herbes, that venemous rattle Snake lurketh and abideth, ready to bite whomforth shall come neare unto it.

The Time

It flowreth with us in Iune and Iuly.

The Names. This may very well be referred to the Piftolochia I faid, but I have fevered it being fo notable an Amidot, but by what Latine name it might best be called, either Piffolochia Virginensis, or as I doe Polyrhizes Virginian I leave it to every man to doe as he will, or untill a fitter Latine title may be given it, if it be thought expedient our people in Virginia doe there call it the Snakeweede, or Snakeroose, and thereupon may be called CoTRIBE 3. biring Virginiana, I have kept the same English name, untill another of better respect may be given unto it. But being Virginiana, that a nope the same and same is a merican plants, calleth this (a horne plague on his head for his latter in connected Corners that among his American plants, calleth this (a horne plague on his head for his latter is a same of Snaoroel nother Anolie, the envy was hafe, whereby he was a few and the same of the there is a cornuted our more that almong the same plants, canten this (a horne plague on his head for his la-borr) Sugred or Snagroel nethe Anglie, the envy was base, whereby he wrote so, yet would colour it in that he could not write true, but salse English and Latine too, it were not amisse therefore that he were whipt at the schoole for it.

It is both a most certaine and present remedy against the venome of the Rattle Snake, which is a Serpent of large life, farre greater then any Snake or Adder with us, having naturally under the throate, certaine loose alargeme, faire 5: the toronto motion grate one against another, making a creking noise, which our people called hard kinny icaies, which our people called a nation, not that it hath any rattle indeed, but this noyfe it maketh, ftirre it felfe never so little, yet usually it is a nation, not that it hath any rattle indeed, but this noyfe it maketh, ftirre it selfe never so little, yet usually it is so foquicke and wary in leaping at any, that it doth it not but studdenly: Now the manner of the using hereof, is foquereaunt wary in the providing a remedy, out of the same place and ground, from whences the evill doth dis (God of the good and is bitten by that creature, (for oftentimes it happeneth that fome are bitten, before proceed,) as notine as any a second of them being to leape suddenly upon one, that the rattle cannot be heard they an avoid the Serpent, the manner of them being to leape suddenly upon one, that the rattle cannot be heard before they believe in they rake of this herbe and chaw it in their mouthes, and fwallow downe the juice thereof, and also apply of the herbe to the wound or bitten place, which instantly cureth them; for being taken quickly after they be bitten, it doth so defend the inward parts, that the party feeleth not so much almost as any onward paine, much leffe any of those inward Symptomes, are incident to those that doe not presently use this outwain pains, the present helpe of the present hurt, but if it so happen that any being bitten, cannot get of this remedy, this is the present hurt, but if it so happen that any being bitten, cannot get of this remeny, manufactures, the dyeth certainely, yet if within twelve houres after the biting; he doe use this nemently, it will affuredly recover him, but with more trouble and paine, and with longer time, before it hath wonght aprifect cure, for it is evident, that the poyson of this Serpent pierceth the blood, which runneth with all the speed it can unto the heart, the chiefest fortresse of life and health, which being infected, death must neentire per it can united the treat of the defended by the vertue and force of any medicine, it prefervesh the one, and expelleth and uniterly defeatesh the intent of the other. The powder of the herbe and roote taken in winco other drinke, hath beene found a certaine and present cure for the bitting of a madde dogge: as also to with the quartaine ague within three times taking, viz. halfe a dramme, or if neede be a whole dramme statime before the accesse of the fit, and any other ague, or pestilentian feaver, or the pestilence it selfe.

CHAP. XXXV.

Alexipharmacum Indicum five Contrayerve Hispanorum. The Indian Spanish Counterpoyson.

Ecanse the roote of this herbe also is of as certaine a cure, to helpe all forts of venome and poyson (as well of hurtfull beasts, as of herbes, rootes, &c. wherewith the Indians by dipping their arrow heads therein, did kill whomsoever they wounded,) as the former Virginian Plant, I thought fit to joyne it thereunto, although we have no more knowledge thereof, then what we may gather from feeing and observing the dryed rootes and from the relation thereof by Monardun, out of the from feeing and observing the dryed rootes and from the relation thereof by Monardun, out of the firm the lowest the latter to him, which is extant in his booke of the simple that are brought out of the new world, which Clusium translated out of the Spanish into the Latine tongue, and hath published it with

other of his workes and joyned it to his booke of Exorickes. It hath faith Monardus, the roote of a Flower-deluce, and is of the smell of a Figgetree leafe, this is all the description that Monardus hath made of it : but Ofma in his Epiftle maketh mention of the leaves to be like the Ribbewort Plantaine, Issua Ferrus also wrote thereof as he saith to Monardau, to Dr. Tovar, and to Valdes, and in his booke of fecrets maketh mention thereof in two Chapters, the one is of Contrayerva, the other he entituleth de Contrayerva Bezoar, whereby he meaneth the herbe or roote that is found in the middle of a Bezoar stone when it is broken, which he accounteth to be of more vertue then the stone it selfe, whereon it is engendred, but we in viewing many dryed rootes that came from Spaine unto us, have observed no good forme of any Flower-deluce in the roote, nor have feene any roote to exceed the bignesse of ones thumbe, and not one of many to be fo great, but for the most part of the bignesse of a finger or leffe, and not any fo long, but usually no longer then a joynt or two at the most, not so smooth on the outside as the roote of white Orris or the Flowerdeluce, but more rugged in all, &c in some more knobbed, (that is, with small knobs or bunches flicking out all along the roote) then in others, which are of an evenfile, and fome againe are greater at the one end, and fmaller at the other, divided as it were by little spaces, in the growing almost like the greater Figgewort roote of the roote of Dentaria Coralloides, being of a yellowith browns colour on the outside, and in some more blacke, but white on the infide, with many fibres or strings growing from roote lyeth or creepeth under the upper crust of the like as the Flower-deluce, Tormentill, Biftort, and

RIBE.4.

doe, and doth not grow downe right, like other forts of rootes, and are a little warme or hot in taile upon doe, and doth not grow downe right, like outer force of rootes, and are a like when the first to the in calle upon tongue, drawing water as Pellitory of Spaine, but nothing to hot nor sharpe, or drawing rheume to much which the heate shide any long time after tongue, drawing water as returny or spane, out nothing to not hot had any long time after the chemis not well perceived, unlesse heedfully observed, neither doth the heate abide any long time after the chemistry that the chemistry of the chemis is not well perceived, unlesse heedfully observed, neither doth the head and roll came any rolls time after the chour is soone gone, leaving the roote almost like a dry chippe, without any manifelt stipticity, aftringent but is soone gone, leaving the roote aumounts any supper, with and judgeth it to be hot and dry in the foundation that I could perceive, although Monardus faith it hath, and judgeth it to be hot and dry in the foundation.

It groweth faith Monardus in Charcas, and as Ferrus aforesaid, faith in Tonsaglia, provinces in Pers. inti It groweth faith Monardus in Charcas, and as I errin alore and a sure and for the sure and for the country of west-Indies, and in some other places there, and from thence brought into Spaine, and so to other Country of The Time.

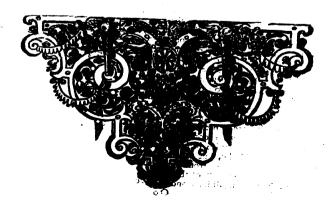

We must abide the time to know further hereof, before we can declare it to any other.

Monardus first wrote hereof from the intelligence he had by Ofmus Letter to him, and called it Radices Von Monardus first wrote hereof from the intelligence he nau by of the Letter to min, and cance it Kadice Vening adversances, and faid the Spaniards called it Contragerous, which is as much as Alexipharmacum, a comme adversances, and faid the Spaniards called it Contragerous, which is as much as Alexipharmacum, a comme nis adversantes, and said the Spaniards caused it Contrages on, which is a minute of the said beginning a count, poyson, or rootes refisting venome and poyson, especially of that where with the Indians, by dipping their any poyson, or rootes refisting venome and poyson, especially of that where with the wild begin and the will be will poyfon, or rootes refifting venome and poyion, especially of their warres, and the wild teafts whom the heads therein, killed both the Spaniards and other their enemies in their warres, and the wild teafts whom the heads therein, killed both the Spaniards and other their enemies in their wanter, and the whole the hunted, and is the same also that Clusius calleth Drakens radix. I have given it the title of Alexipharmacus later and in English the Indian Spanish Counterpoyson, from both places and pro-

The rootes hereof (faith Monardus, Petrus de Ofma and Iofua Ferras made into powder, and taken in white Wine is a most present remedy against all manner of venomes and poysons, of what kinde soever they be compared to the position of the position Wine is a most present remedy against all manner of venomes and poytons, of what kinds loever they be compared to the control of the control thereof, will atterly take them away. I have known fome that have made a composition of the powders dis thereof, will utterly take them away. I have knowne some that have made a composition of the powdersoring toote, Bezarfone and Scorfonera rootes made into a masse or lumpe, to be used upon occasion against poysomed insections of the Plague, or any other contagious disease, as the small pox, purples, measles, or other that mis spots in the sless, and is a most soveraine cordiall, to preserve the heart and the vitall spirits from danger, and the contagination of the sless that the sless that the based the sless that the sless t to expell it by fweating, &c. For the faid Ferrus saith, that the Bexarstone is engendred in the beast that breden it by the vertue of this herbe which it eateth, and by the naturall disposition of the beast, some also adde me the vertue of this herbe which it eateth, and by the natural disposition or the pear, some also adde up that confection, some other things, as besides Scorsoners rootes, Bistort, Tormentill, or the like, as every ones, fection leadeth them more or lesse. Ferrus saith he made a tryall hereof with the best Treakle, and found it may effectuall for the diseases aforesaid. Againe he saith, that the Indians doe not eate the bodies of those they have lyen three or foure dayes with their wounds washed with the said of the sa juice of this herbe, which rendereth them tender and fit to be eaten, which before were hard.

Vinto this Claffis alfo fhould appertaine divers other Plants, but that fome of them are already described fet forth in my former Booke, as Mirabilia, &c. And of the Antidotes, or remedies against poylon, some me there also set forth, as Angelica, Cardum Benedictus, &c. And some likewise not onely in the first Tribe of this worke here before, as Chamapitys, &c.but in fundry other Classes, hereof, as they happen to be entrested of

SAXI

XIFRAGÆ PLANTÆ

NEPHRITICE SIVE CALCV-LVM FRANGENTES.

SAXIFRAGES OR BREAKE-Stone Plants.

CLASSIS OVARTA, THE FOURTH TRIBE.

CHAP. I.

1. Saxifraga alba vulgaris. The common white Saxifrage or Breakestone.

Here are so many and divers sorts of herbes that beare the name of Saxisrage, that is, from the effects in breaking and expelling the stone, much differing in forme one from an other, that I have therefore thought a small good to make a peculiar Classis of them, and yet not of all, for there are sundry Vmbelliserous and other plants, which cannot so fitly be severed from their owne Tribes.

This white Saxifrage that is most common in our land, hath a few small reddish kerpells or rootes, covered with some skins, lying among divers small blackish fibres, which fend forth divers round faint, or yellowish greene leaves, and grayish underneath, lying above the ground, unevenly indented about the edges, and somewhat hairy, every one upon a little foote stalke; from whence riseth up a tound brownish

hairy greene stalke, two or three foote high, with a few such like round leaves thereon as grow below, but smallet, and branched formewhalf at the toppe, whereon ftand pretty large white flowers of five leaves speece, with formeyellow threds in the middle, ftanding in long crefted brownish greene huskes; after the flowers are past foretimes arifeth a round hard head, by-forked at the toppe, wherein is contained small blackith seede, but offu-ally they fall away without any seede, which yet is not that which is called white Saxifrage seede, for those same ternells or graines of the rootes, are they which are usually called the white Saxifrage seede and so used.

2. Saxifraga alba altera bulbifera. The Mountaine white kernelly Saxifrage. This other white Saxifrage is very like the former in every part, but yet hath many especially differences to dilinguish it, as first in the rootes, which although they are round, red, and bulbous like the other, yet are they twife as great, and made as it were of scales or cloves, one laid upon another, like the roote of a Lilly: the leaves are round and hairy, but somewhat leffer, with brownish soote stalkes: the stalkes are greater, having leaves thereon, as in the former, but at every joynt with the leafe commeth forh; a small bulbe or kernell, like unto those at the roote, which when it is thorough ripe, will encrease to be plants, as the bulkes of the bulbed Lilly, or of the bulbed Corrall roote will: the flowers and heades with feede are alike: the bulbes on the stalkes by the Cutters fault are not specified in the figures.

3. Saxifraga alba Alpina. Mountaine Saxifrage without kernelly rootes. This Mountaine Saxifrage groweth fo like unto the first white Saxifrage, that Baubinus taketh it to be no other but the very same with the first, but there is some varietie therein; first, in that this springeth up with fewer leaves at the ground, yetround and like to the white Saxifrage, then, although it hath small stalkes, with leaves thereon like it, yet at the toppes it hath pale yellowish flowers: and lastly the rootes are wholly composed to long strings or fibres, not having any of those small knots or kernells, that the former hath growing

The Place.

The Place.

The Place.

The Place.

The Med med month, as also in the upper die corners of Medowes, and graffie fandy places, on the backe fide of Grayes Inne, where Mr. Lambes Conduit heade flandeth. The second groweth on the hills in the Kingdome of Naples: the last on the high inowie Alpes under

TRIBE 4.

1. Sexifregealbe valgerie.
The common white Saxifrage.

They flower in May, and then they are gathered both for the feedes fake, which are as I faid the find graines or kernells at the rootes, or upon the stalkes, as also to distill: it quickly perisheth downe to the ground

This herbe is called Saxifraga or Saxifragia, from the effect to breake the stone, (but not known to any of the Greeke or antient Latine Writers, that we can finde) and also from the flowers, which is added to diffinguish from all the other forts. The first is generally called Saxifraga alba, by all the moderne Writers 1. Lobel asset Chelid orides, because of the kernelly rootes; of Banhinus rosundifolia, and of Clusius suberofa radice. Faim (a lumna onely maketh mention of the second, by the name of Saxifragia bulbofa altera bulbifer menumus; out Baubinus from him Saxifraga adfolia bulbos gerens : tl e last is called by Lugdunensis as it is in the title, who me keth it different: in English white Saxifrage or Breakcstone: the Italians and Spaniards call it Sassifragia hams; the French Romps pierre and Saxifrage blanche : the Germans and Dutch Wite Stein brech. The Verines.

This Saxifrage being somewhat bitter, and held to be not and drie in the second degree, is as essectively and other fore of Saxifrage whatfoever to clenfe the reynes and bladder, and to diffolve the stone engendered them, and to expell it and the gravell by urine; to provoke uting also abundantly being stopped, and to believe itrangury or piffing by droppes: for which purposes, the decoction of the berbe or rootes in white wine, or the powder of the small kernelly rootes, which is called the seede taken in white wine, or in the same decolism made with white wine is most usuall. The distilled water of the whole herbe, rootes and slowers, as it is the ctuall in a manner, fo it is much more familiar to be taken of any that hath neede thereof; it provoketh allowmens courfes, and freeth and clenfeth the stomacke and lungs from thicke and tough flegme, that troublents

CHAP. II.

Saxifraga alba Petrea. White Rocke Saxifrage.

dis white Rocke or Mountaine Saxifrage, I have joyned next unto the former, for the neare affinite it hash therewith. It fendeth forth from a small long reddish poace, with some shares among its hash therewith. It fendeth forth from a small long reddish poace, with some shares thereat, dient rises up a brownish hairy stake, about a foote and a nalfe high. stored with branches from the best or the soppe are shared a whereas some and a nalfe high. stored with branches from the best or the soppe are shared a whereas some and a nalfe high. tome to the toppe; at the ends whereof stand the flowers in greene huskes, confissing of five very white leaves a peece, having some yellowish threes in the middle, standing about a head or umbell, which

The Names. It is called Sanifraga anrea of most Writers, from the

time growing to be the feede vessell, hath divers small feede time growing it; the tafte of the leaves are fweetish at the first, but a little sharpe afterwards. The Place.

It groweth on Mount Baldus, not farre from Verona, in the territory of the Venetians. The Time.

This flowreth in the naturall places in the end of Iune. and the feede is ripe foone after, and perifheth wholly after-The Names.

wards.

It is called by Pona who let forth the description of Mount Baldun, and what plants doe grow in every part thereof by the name of Saxifragia alba petrea; but Banhimus according to his usuall manner, in all things almost that may beakered, doth vary the name twife, calling it first in his Phytopinax, Alfine Tridaltylites Alpina; but afterwards in his Pinax changing his former minde, calleth it Sedum trims reas changing his solution minute, cautett it Seaum Fri-dilylites Alpinum majus album, and none of them both in myopinion answerable to so famous an Herbarists judgement: as to referre them to fuch plants, as yeeld fo finall likenesse: for unto the Alfines, (whereunto I said he refenedicatthe first, but disclaimeth it afterwards) although it may seeme to have some resemblance, in the white flowers, yet the leaves and other parts thereof, withstandeth that comparison; and unto any kinde or fort of Sedam, it hath in my judgement farre leffe correspondencie, which sheweth astrong conceit in him beyond compare, to make his later opinion worfethan the former, which as is judged in most, fould be more confiderate and exact : but furely I thinke it doth so nearely resemble, as I said before, the former

white Saxifrage, both in forme and qualitie, that it is most fitly to be referred unto it, and unto no other plant so likely the chiefe differences confifting in the forme of the branches, leaves and rootes, as you may plaintly per-The Vertues. ceive both by the discription and figure.

It hath no doubt the same properties that the former hath, both the name arguing it, and the likenesse of face ingrowing not reclaiming, and the tafte especially, whereby the qualitie is chiefely discerned answering thereunto and although there is not any authorities extant to warrant this my conceit, yet those foreremembred conditiosstherein, may plead a firong perfwasion of veritie, and untill it be contradicted by sufficient triall and experience to be other wife, I hold it may passe for currant as a Saxifrage,

CHAP. III.

Swifraga aurea. Golden Saxifrage.

Olden Saxifrage is a fmall low herbe having many round leaves lying on the ground bluntly endented about the edges somewhat like the former common Saxifrage, but not hairy, some-what thicker also and of a darker greene colour,

among which rife up divers slender and weake stalkes, little above a hand bredth high, with fuch like leaves on them as grow below up to the toppes, where among the leaves come forth very small gold yellow flowers not easily observed, and falling away to quickly, that they are to feldome feene with them, and after they are past, there appeare in their places small round heads, wherein is contained small round reddish seede: theroote is composed of a number of imall strings or fibres: the whole plant is almost insipide or without tafte, but nothing hot that it may be judged to be effectuall to dissolve or expell the stone.

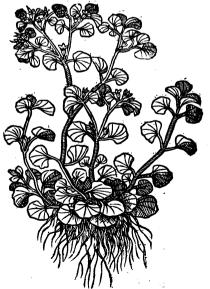

The Place Italwayes groweth in moist places by Well sides, or other flanding and fometimes running waters, and fometimes alfo in moorish grounds, as about Tidnabam in the Forrest of Deane, at Albford, and Iden in Kent, at Chepftow in Effex, and in divers other places.

The Time. It flowreth in May and fometimes in Aprill, but abideth greeneall the relt of the yeare, and perisheth not like the

Saxifraga alba petrad. White Rocke Saxifrage.

Saxifraga aurea. Golden Sxifrage

forme of the leaves and colour of the flowers, fcarfe any well knowing whereunto better to referre it, Late from the naturall place of the growing and infipidity of the tafte, calleth it Lichenis facie & natality, and Before that set forth the huge great booke of the Bishop of Exstat his garden, following Lobel calleth it Hepatica pales.

Tabermontanus calleth it Chrysospelaium: Visses Aldroandus tooke it to be a kinde of Erysonum but farre unlike.

The Vertues.

The infipide tafte as I faid before, doth not argue any certaine effect or property to worke upon the flone or gravell either to diffolve or expell it, unlesse it be by some specificall or hidden property therein, yet assured by could not in my opinion have received the name of a Saxifrage among fo many authors without some propert feet therefore, which rose no doubt from some Empyricall observation and practise, which gave it both the name and the opinion, unlesse it might from the likenesse of the leaves as I said before judged, which because cannot maintaine nor disprove, I leave it for others to disprove if they can.

CHAP. IV.

Saxifraga vera Dioscoridis Matthioli. Matthiolus his true Saxifrage of Dioscorides?

He true Saxifrage of Diofcorides, according to the judgement of Matthiolus and others, from whom he received it, is a small low shrubby Plant, that sendeth forth divers small wooddy, and fomewhat hairy stalkes, full of joynts close fet one unto another, having divers small short and whitish narrow leaves, growing divers together at every joynt, at the toppe whereof come from very small purplish white flowers, set with some leaves under them, this doth somewhat refer ble Time, both in the lownesse and manner of growing, but hath no such sweete sent, or he

sharpe taste like unto it, whereby it may be knowne to be a different Plant.

The Place

It hath beene fent unto us out of Italy among other rare feeds, but where the naturall place of growing is, it is not readily knowne.

The Time.

It is very flow in growing, so that it did not flower untill so late in the yeare, that an early frost caused it to perish, that we could gather no feede.

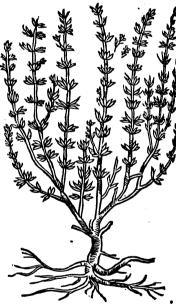

The Names

It is very probable that it is the true Saptiogapov Sarxiphragon or Saxifragon of Dioscorides, and differeth much from the Satureia or Thymbra St. Iuliani of Tena and Lobel, let forth before in this worke, which Baubinus calleth spicata, (that it may the better agree with Diofcorides his Satureia) and supposeth to be this plant of Matthiolus, but I by the fight and taste of the plant not finding it to agree, with the smell or taste of either Time or Savory, cannot agree unto him, but doe rather judge it to be a peculiar plant of it felfe, and to come neerer unto his Thymam inodorum before mentioned, and therefore have separated it from the other Saxifrages that follow Dodonem: (and Gerard who hath but onely translated his words) judgeth the Serpyllum vulgare, to be Dioscorides his Saxifrage, but they are both deceived.

The Vertues.

I doe verily beleeve that this plant, hath either the same especiall vertues against the stone and gravell, restraint of making water and other the qualities, whereunto Dio/corides doth appropriate his Saxifrage, or commeth somewhat neere thereunto, and I am hereunto chiefly led by the fight and forme of the plant, and from the name of Saxifraga Dioscoridia, whereby it was fent unto us.

Saxifraga vera Diofcoridis Matthioli. Matthiolus his true Saxifrage of Diefcorides.

CHAP. V.

1. Saxifraga major Italorum Matthioli. Matthiolue his Italian great Saxifrage.

He great Saxifrage of the Italians, as Matthiolus relateth it, hath a great wooddy stemme of the big neile of ones finger, toward the lower end, full of chinkes or clefts, fpreading very thicke, will many flender hard whitish branches full of joynts, and two small long whitish greene points leaves, fet at every joynt very like unto Pinkes, and many other smaller and shorter standing with them : the flowers stand at the toppes of the branches, out of whitish greene huskes, confishing of TRIBE 4. fre and formetimes fixe, finall white leaves, endented at the ends, of a fweete fmell, standing above the huskes, free and tomerunes in the frame, after which follow small round and somewhat long heads, full of small reddish round and somewhat long heads, full of small reddish round before the head of Popsiv. Lobel and Pens thinkerh that this Savifrage is the Control of the long heads of the l isdopenine a many run of imali reddish round for thinketh that this Saxifrage is the same that they have set succeeding the same than the same t kede, much restrict the saxifrage for in the saxifrage for interior and saxifrage for interior and saxifrage decision and saxifrage saxifrage decision and saxifrage s 2. Saxifraga Anglica Lobely Occidentalism. Lobels West Country Saxifrage.

This faith Lobel is very like the former, but that the flowers are white, and grow in small tusts at the toppes

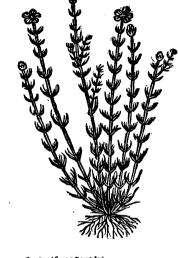

of the fmall stalkes, the whole plant being white,

2. Santfraga Anglica Occidentalium Lobelij. Lobels West Country Saxistrage.

3. Saxifraga palufiris Anglicana. Mr. Goodyers Marth Saxifrage.

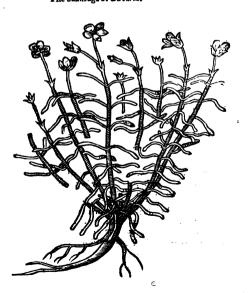

4. Saxifraga Cretica prior. The former of the two Saxifrages of Candy,

2. Saxifraga Bavarica. I he Saxifrage of Bavaria.

3. Saxifraga palustris Anglica. Mr. Goodyers Marsh Saxifrage.

This hath fundry small leaves about an inch long, very small and narrow lying next the roote, among who This hath fundry fmall leaves about an incn long, very intail and marrow symptoms and code, among what rife divers flender round stalkes about halfe a foote high, full of joynts and branched here and there, set it is the most eart longer then the rest. The stalk at the code of the most eart longer then the rest. file divers flender round traines about mane a roote might have port he most part longer then the rest, growing for the most part longer then the rest, growing from the part longer the part and shorter up to the toppes, where groweth one pretty large white slower, made of five round pointed less. peece, with some white chives in the mi dle, the roote is small and fibrons. 4. Saxifraga Cretica prior Alpino. Alpinun his first Candy Saxifrage.

From a small long white roote, having a few small sibres at the head, shooteth forth a hard white woods from a finall long white roote, naving a few main indeas into other leffer, which fland not upright but less downewards, fet at each joynt with two small long and pointed leaves, somewhat like to those of Tragging the less than the same of the long and pointed leaves, for the like to those of Tragging the less than the long and pointed leaves, for the like to those of Tragging the less than the long and pointed leaves for the long and pointed leaves for the long and pointed leaves. Goats Marjerome, and about the same bignesse: the flowers are small, made of many white threds set together standing betweene the leaves, this is wholly without either smell or taste almost.

flanding betweene the leaves, this is wholly without either lines of tale satisfies.

5. Saxifraga Cretica altera Alpino. Alpinous his other Candy Saxifrage.

They have also another kinde of Saxifrage growing in barren dry grounds, very like to a small Pinke, forty leaves and manner of growing, but the flowers stand at the toppes of the branches in tusts or umbels of a palety. dish colour, this is of an astringent and drying taste, with a little acrimony.

6. Saxifraga montana Neapolitana. Mountaine Saxifrage of Naples.

This small Saxifrage which Columna found growing out of the Chinkes of rocky steepe hile, beareth two small long leaves, at each joynt of the stalkes very like those of Matthiolus his great Saxifrage, but somewhat broadfofter, and whitish, with some smaller ones set with them likewise, where also rise branches, bearing win flowers at the toppes, made of foure small pointed leaves a peece, with divers small threds in the middle and are fucceeded by finall round skinny heades, with small browne seede within them; the roote is made of many small

7. Saxifraga maritima Neapolitana. The Sea Saxifrage of Naples.

This is another fort of the last described growing on the walls night he Sea at Naples, being twise as bigging having blush coloured flowers in Autumne and afterwards long pointed seed vessels, and small browne levels them, this creepeth on the ground, and standeth upright when it flowreth. 8. Saxifraga Bavarica. The Saxifrage of Bavaria.

The Saxifrage of Bavaria, spreadeth upon the ground, with a number of slender round branches, divided to others, set full of leaves, two at every joynt, which are narrow, somewhat long and thicke, and of a palegree. colour, at the toppe of every small branchstandeth one flower, set in a small cuppe or huske of whitish green leaves, of which colour the stalkes are also, consisting of five small pure white leaves, pointed at the ends, and fometimes a little purfied about the brims, and with a wash of purple, laid open like a little starre, with some pale coloured threds in the middle, the feede that followeth in fmal round and somewhat long heads, is small fire blacke and shining, the roote is small and white, and groweth downe somewhat deepe. The Place and Time.

The first two forts grow in the West parts of this land as Lobel faith, who relateth in his Adversaria, that he found the second betweene Chipnam and Marleborough in London high way to Briston on a chalky hill, yet Me. thiolus saith, he had the first from Mount Baldus where it groweth, the third Mr. Goodyer saith, he tound on boggy ground below the red Well of Wellingborough in Northamptonshire, the fourth and sith in Candy, the such and seaventh in Naples, and the last in Bavaria. They all flower late. The Names.

Lobel and Pena say that the third Saxifrage of Matthiolus which some call magna Matthioli, and others major lie dorum is the same which they have set forth in the first place, in their Adversaria, although it grow not sogreated entitle it also Saxifraga aniquiorum, but I enterposed my opinion of that in the last Chapter, but Bushins supposeth them to be two severall plants calling that of Matthiosis Carpophyllus Saxifragus, and that of Lobel Capophyllus Saxifragus strigosor: the second is a species as Lobel thinketh of the former, as is said in the description, and commeth nearest to the second fort of Candy Saxifrage, but differing in the flowers, yet Lobel doubtehili may not be a kinde of Chickeweede: but fure he need not doubtit, nor that it was Synanchice Dalechampi. The third here expressed commeth nere likewise unto Columna his first Neapolitane Saxifrage, but that ours growth in morish, and his in rocky places, and that the flowers of his have but source leaves, and ours five round pointed and his sharpe. Alpinus maketh mention of the Candy kindes, and Columna of the Neapolisane which he entitled Alfme Saxifraga mantana & maritina: the last Camerarius and Pona call Saxifraga Bavarica, but Banhium puteth a doubt or quere whether it be not the Saxifraga magna Matthioli, when as Pona in the description of men Baldus, mentioneth the magna Matthioli, in divers places thereof, and describeth and giveth the figure of Bavair ca distinctly.

The vertues. The Italians doe wonderfully extoll with praises the vertues of their Saxifrages, and so doe the Candins and Neapolitenes likewise, to breake and dissolve the sone in thereines and kidneics, and bladder, and to procure rine, and to confirme the truth thereof, Matthiolus faith he received from Calzolarius an Apothecary of Units, fuch great stones of fundry persons that were voided in making of their urine, that it could hardly be beleeved that they could passe through the pipes from the bladder; to give him knowledge how powerfull in operation these are, that can expell the stone in the kidnies and bladder, be they never so great, the other Saxifrages companies. the third, have the same properties taken in wine, or in a draught of the decoction of them, with Quich grafe rootes, doth effectually performe as much as the former, to dissolve and breake the stone.

CHAP. VI.

Gramen Parnaffi vulgare. The common graffe of Parnaffis

a His Grasse of Parnasses hath many leaves rising from the roote, not altogether round, but ending in a point, smaller and thicker than Violet leaves, with many ribbes or long veines in them, of a fresh greene colour, every one standing on a long soote stalke, among which there ariseth divers slender weake stalkes, scarse a foote high, and scarse able to stand upright, whereon grow in a point, smaller and thicker than Violet leaves, with many ribbes or long veines in them, of divers slender weake stalkes, scarse a foote high, and scarse able to stand upright, whereon grow at the feverall joynts fuch like leaves, but fmaller, without any foote stalke, but having the stalke joyning fo close to it, that it feemeth almost to runne through it, the toppes of the stalkes are na-

ted and bare of leaves unto the flowers for a good way, which are white and confift of five leaves standing round. adin the middle a small round greene head or button, with some yellow threds about them, which in time growing to be ripe is a round button, wherein is contained small reddish seede: the roote is a small blackish dreddy bush of fibres, not perishing as divers of the former doe.

Gramen Parnaffi duplicato flore. Double flowred Graffe of Parnaffus.

This is in all things like the former, faving in the flower, which hath a row of smaller leaves, within the other memont, which maketh a shew of the double flower: this seldome giveth any seede as the former. The Place.

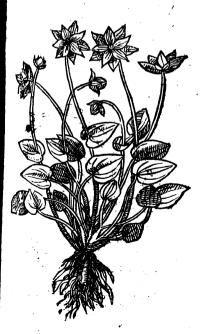

The first groweth in many moult moorish grounds in England, as in the Moore; neere Lynton and Cambridge, at Hefin and Drinkestone in Suffolke, in the Butchers close thereby; in a Medow close on the backefide of the Parsonage house of Burton, and at the bottome of Barton hills in Beafordshire, as also in the middle of the great Townefield of Hadington, which is about a mile from Oxford, and on the other fide of Oxford, in the pasture next unto Relatinthe high way. The other was found in the country of Brabant. The Time.

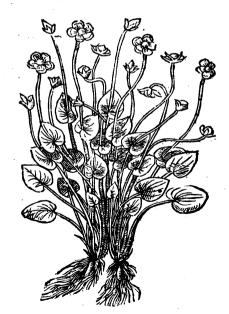

They flower not untill about Saint James tide, and the feede is ripe a moneth after. The Names.

Itiscalled Gramen Parnassis, and judged by most to be the right Gramen Parnassis of Diescovides, although Gefavinburis Germanie saith, that the right is not knowne to any in our dayes, but saith withall that the Polonians decall it Enneadynamic. It is very probable, that this herbe grew most plentifully upon Mount Parnassis, whereon cattell feeding, became fat and well liking, as our Clover or three leaved graffe doth with us, and thereupon took the name, as is usuall in divers countries to call herbes by the name of Graffe, although they have no like neffe with Guste indeede; and this may answer Mr. Gerards finding fault with the name of Parnassus Grasse, Cordus

Gramen Parneffi flore Gmplici. Singl Panaffus Griffe.

Gramen Parnoffi doplici. Double flowred Parna [us Graffe.

in his history of plants, calleth it Hepatica alba. Gesner in Colletione stirpium Unifolium pulustre, Lobel callethia Gramen Parnassi hederaceum recentiorum. Tabermontansus Gramen hederaceum and Flos hepaticus. The other is ch The Vertues.

Paulus Ægineta faith that Parnaffus graffe, is temperately cold, of thinne parts, and somewhat sowre, the juin of the herbe, or the decoction thereof, or of the rootes, doth diffolion and expell from the remains of the herbe, or the decoction thereof, or of the rootes, doth diffolion and expell from the remains of the herbe, or the decoction thereof, or of the rootes, doth diffolion and expell from the remains of the herbe, or the decoction thereof, or of the rootes, doth diffolion and expell from the remains of the rootes, doth diffolions and expell from the remains of the rootes, doth diffolions and expell from the remains of the rootes, doth diffolions and expell from the remains of the rootes, doth diffolions and expell from the remains of the rootes, doth diffolions and expell from the remains of the rootes, doth diffolions and expell from the remains of the rootes, doth diffolions and expell from the remains of the rootes. and bladder gathered therein, and provoketh urine aboundantly; and the feede thereof taken in powder, we keth more forcibly then either the herbe or roote, and withall doth flay any vomitings from the stomacke, at keth more forcibly then either the herbe or roote, and without any any any fluxe of the belly, the decoction of the rootes made with wine, being drunke, doth eafe torments and grant any fluxe of the belly, the decoction of the rootes made with wine, being drunke, doth eafe torments and grant any fluxe of the belly, the decoction of the rootes made with wine, being drunke, doth eafe torments and grant any fluxe of the belly, the decoction of the rootes made with wine, being drunke, doth eafe torments and grant any fluxe of the belly, the decoction of the rootes made with wine, being drunke, doth eafe torments and grant any fluxe of the belly, the decoction of the rootes made with wine, being drunke, doth eafe torments and grant any fluxe of the belly, the decoction of the rootes made with wine, being drunke, doth eafe torments and grant any fluxe of the belly, the decoction of the rootes made with wine, being drunke, doth eafe torments and grant and the rootes are the rootes and grant grant and grant and grant grant and grant gra paines in the bowels, and the ulcers that are in the bladder, it helpethalfo against the biting of any veneno paines in the bowers, and the licers that are in the bladder, it helpeth and against the eyes, to dry up the many beaft, the juice of the herbe or roote is good to coole any inflammation or heate in the eyes, to dry up the many beaft, the juice of the herbe or roote is good to coole any inflammation or heate in the eyes, to dry up the many beaft, the juice of the herbe or roote is good to coole any inflammation or heate in the eyes, to dry up the many beaft, the juice of the herbe or roote is good to coole any inflammation or heate in the eyes, to dry up the many beaft, the juice of the herbe or roote is good to coole any inflammation or heate in the eyes, to dry up the many beaft, the juice of the herbe or roote is good to coole any inflammation or heate in the eyes, to dry up the many beaft, the juice of the herbe or roote is good to coole any inflammation or heate in the eyes, to dry up the many beaft, the juice of the herbe or roote is good to coole any inflammation or heate in the eyes, to dry up the many beaft, the juice of the herbe or roote is good to coole any inflammation or heate in the eyes, to dry up the many beaft, the juice of the herbe or roote is good to coole any inflammation or heate in the eyes, to dry up the many beaft of the herbe of the or watering in them, and to cleare them from millinesse or cloudy skinns, that obscure the fight, if it be min with a little hony and dropped into them: it is held also effectuall to ease the toothache, being gargled in the mouth: the herbe, or roote, or feede, either the juice, decoction or powder, is very effectually applyed to de up greene wounds, that are much subject to bleeding, and restraineth inflammations that may discase the part,

CHAP. VII.

Lachryma Iob. Iobs Teares.

Have thought good to place this plant in a Chapter by it selfe, and not with the kinds of Gromel, because it differeth so much from them in growing, because the seede doth nearths. femble them and although divers Authors have thought is rather to be a kind of graffe or red and therefore have placed it among them; yet I cannot finde it agree with either of them, more than in the jointed, stalkes, and leaves, which in my judgement, is not so sufficient amark, to make it of that kinred, but as Columna saith, the slower and seede especially of plan, doth best demonstrate to what genus every species may be referred. It shootesh sims thicke bushie threddy roote, many reasonable thicke round jointed stalkes, about a soote and a halfe best

whereon at every joint standeth one narrow long, great leafe, somewhat like unto the leafe of Millet, or a small Reede, rather standing upright, than at any time bending downe; and at the joints with the leaves commeth forth one graine or scede, of the bignesse of a good Pease, wrapped in some huskes, round at the bottome, and pointed at the end, whereat hangeth two or three small chaffie huskes, or beards as Pliny calleth them, somewhat like unto small lanke fhort eares of corne, which are idle having nothing within them the feede it felfe, being taken out of the skins, wherein it was wrapped, is somewhat like unto a Gromelfeede, but much larger, brighter of colour, and harder to breake, round yet pointed at the one end, somewhat flat also, and with an hole at the bigger and lower part, where it stood upon a little short foote stalke; the taste whereof being broken, and having but little kernell within it, is a little drying without any other manifest taste. The Place.

This groweth naturally in the Iles of Candy and Rhodes, in Syria also and those Easterne Countries, but no where else in Europe, unlesse it be planted as it is faid. The Time.

It groweth flowly in our countrie, and feldome giveth ripe feede for the want of sufficient heite of the Sunne to ripen it, before the frosts doe take it.
